United States Adopted Names

List No 14

March 1, 1966 to June 30, 1966

The following nonproprietary names for the drugs described have been adopted by the USAN Council (the nomenclature committee sponsored by the American Medical Association, the American Pharmaceutical Association, and the United States Pharmacopeia) in cooperation with the interested manufacturers. The designation "United States Adopted Names" (U.S.A.N.) has been coined to distinguish these formally adopted nonproprietary names from other nonproprietary names. Adoption of such names does not imply endorsement of the products involved by the A.M.A. Council on Drugs, the USP, or the National Formulary.

Any comments or suggestions should be addressed to Doctor Joseph B. Jerome, Assistant Director, Council on Drugs, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

allobarbital: central nervous system depressant
betamethasone acetate: corticosteroid
betamethasone disodium phosphate: corticosteroid
cloperidone hydrochloride: sedative; tranquilizer
descinolone acetonide: glucocorticoid
gamfexine: antidepressant
guanethidine monosulfate: hypotensive
hycanthone: schistosomacide
isosorbide: oral osmotic diuretic
lidoflazine: cardiovascular agent
mesterolone: oral androgenic hormone
metyrapone tartrate: diagnostic test of pituitary function
niclosamide: anthelmintic
nitarsone: veterinary histomonastat
nonoxynol: spermatocide
prednival: topical anti-inflammatory
prilocaine hydrochloride: local anesthetic
propiram fumarate: analgesic
pyrantel tartrate: anthelmintic
rifamide: antibacterial
roxarsone: veterinary growth stimulant
sodium ampicillin: antibiotic
sodium edetate: chelating agent
tetroquinone: treatment of keloids
trimoxamine hydrochloride: antihypertensive
trisodium edetate: chelating agent
viridofulvin: antifungal antibiotic

United States Adopted Names (USAN) and United States Adopted Names (Proposed) (USAN)

QUARTERLY CUMULATIVE LIST

January 1, 1966–June 30, 1966

This is a revised alphabetical listing of the nonproprietary names *proposed for adoption* by the USAN Council which were published in the Trademark Bureau Bulletin during the period indicated. The listing also incorporates the revised lists of *adopted* nonproprietary names issued by the USAN Council, but not published in the Bulletin.

The Quarterly Cumulative List is intended to supplement USAN Cumulative List 4, 1961–1965, published annually for the Council by the United States Pharmacopeia; it is distributed with an issue of the Trademark Bureau Bulletin.

An asterisk (*) before a name indicates an *adopted name;* all other names on the list are *proposed for adoption.*

Since Q.C.L. is cumulative, only the latest issue need be consulted. All preceding lists may be discarded.

Any comments or protests regarding proposed names should be brought promptly to the attention of the USAN Council, American Medical Association, 535 N. Dearborn St., Chicago, Ill., 60610.

*allobarbital: central nervous system depressant
asperlin: antibacterial; antineoplastic
*betamethasone acetate: corticosteroid
*betamethasone disodium phosphate: corticosteroid
*cloperidone hydrochloride: sedative; tranquilizer
*cyheptamide: anticonvulsant
*descinolone acetonide: glucocorticoid
*gamfexine: antidepressant
*guanethidine monosulfate: hypotensive
*hycanthone: schistosomacide
*ibufenac: analgesic; anti-inflammatory
*isosorbide: oral osmotic diuretic
*lidoflazine: cardiovascular agent
*mefruside: diuretic
*mesterolone: oral androgenic hormone
*metyrapone tartrate: diagnostic test of pituitary function
*niclosamide: anthelmintic
*nifuraldezone: antibacterial
*nitarsone: veterinary histomonastat
*nitrazepam: hypnotic; anticonvulsant
*nitromide: veterinary coccidiostat and antibacterial
*nonoxynol: spermatocide
*norgestrel: progestin
*pemoline: central nervous system stimulant
phenobarb: proposed abbreviation for phenobarbital
phthalofyne: veterinary anthelmintic

New Applications Received During July 1966

Patents	6925
Designs	380
Plant Patents	2
Reissues	14
Total	7321

Issue—September 6, 1966

Patents	1427	No. 3,270,351 to No.	3,271,777,	incl.
Designs	51	No. 205,651 to No.	205,701,	incl.
Plant Patents	4	No. 2,667 to No.	2,670,	incl.
Reissues	5	No. 26,073 to No.,	26,077,	incl.
Total	1487			

•prednival : topical anti-inflammatory
•prilocaine hydrochloride : local anesthetic
•propiram fumarate : analgesic
•pyrantel tartrate : anthelmintic
quilazine maleate : oxytocic
•rifamide : antibacterial
•roxarsone : veterinary growth simulant
seperidol hydrochloride : neuroleptic
•sodium ampicillin : antibiotic
•sodium edetate : chelating agent
•sodium ethacrynate : diuretic
sulfabenz : veterinary antibacterial and anticoccidial
sulfafen : antibacterial ; anticoccidial agent
•tetramisole hydrochloride : anthelmintic
•tetroquinone : treatment of keloids
thyroglobulin : thyroid preparation
•trimoxamine hydrochloride : antihypertensive
•trisodium edetate : chelating agent
•viridofulvin : antifungal antibiotic
xolertine hydrochloride : vasodilator, anti-adrenergic ; anti-hypertensive

Extensions of Time

It is ordinarily desirable that notice of the action taken by the Patent Office on requests for extension of time be communicated to the persons making the requests as soon as is reasonably possible. In order to improve Patent Office service to patent and trademark applicants in this regard, the following procedure is being instituted effective immediately. If a request for extension of time is filed in duplicate and accompanied by a stamped return-addressed envelope, the Office will indicate the action taken on the duplicate and return it promptly in the envelope. Utilization of this procedure is optional on the part of applicant.

EDWARD J. BRENNER,
Aug. 3, 1966. *Commissioner of Patents.*

Second Action Rejection

Effective Sept. 1, 1966, on a trial basis until further notice, second actions on the merits will not be made final where the Examiner introduces new art or a new ground of rejection not necessitated by an amendment or change in the claims or specification. Also, a shortened statutory period of three months will be set in such actions. The third action should then be made final and include a three-month shortened statutory period. Thus, no shortened statutory period in excess of three months will be set in any action.

RICHARD A. WAHL,
Assistant Commissioner

Discontinuation of a Service by Mail Room

Effective Sept. 1, 1966, the privilege that has been extended to applicants and their representatives with respect to personal service in the Mail Room will be modified. Amendments and other papers may continue to be hand delivered to the Mail Room where they will be dated and then processed in the normal manner. However, in the interest of Office efficiency, the special privilege of having these documents returned to the applicant or his representative for the purpose of hand delivery to other Branches or Examining Groups will be discontinued. If it is considered necessary to discuss the subject matter of any document that has been officially deposited in the Mail Room, it would be appropriate to use a copy of the document for that purpose.

EDWARD J. BRENNER,
Aug. 8, 1966. *Commissioner.*

Adverse Decisions in Interferences

In the designated interferences involving the indicated claims of the following patents final decisions have been rendered that the respective patentees were not the first inventors with respect to the claims listed.

Patent No. 2,848,049, D. H. Robbins and V. M. Corrado, JUSTIFICATION INFORMATION COMPUTER AND TAPE PERFORATOR FOR PHOTOCOMPOSING MACHINES, decided Aug 27, 1963, Interference No. 90,599, claims 36, 37, 38, 39, 42, 43, 49, 57 and 58

Patent No. 2,958,927, M K Kravats, METHOD OF MAKING ANTIFRICTION BEARING, decided Apr 29, 1966, Interference No. 92,681, claim 1

Patent No 3,000,845, K. W Doak and A. E Jeltsch, PROCESS OF PROMOTING CRYSTALLIZATION OF ISOTACTIC POLYSTYRENE WITH A CRYSTALLIZATION ENHANCER, decided July 22, 1966, Interference No. 94,530, claims 1, 2, 3, 4, 5 and 6

Patent No. 3,084,421, D. L. McDaniels, R. W. Jech, J. W. Weeton and D. W. Petrasek, REINFORCED METALLIC COMPOSITES, decided July 21, 1966, Interference No. 94,675, claim 3.

Patent No. 3,105,216, J Clayton, Jr., and L. Morton, Jr., POTENTIOMETER, decided May 27, 1966, Interference No. 94,697, claims 1, 2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13 and 14.

Patent No. 3,105,216, J. Clayton, Jr. and L. Morton Jr., POTENTIOMETER, decided May 4, 1966, Interference No. 94,734, claim 10.

Patent No. 3,108,201, D. N. Summerfield, BRUSH HOLDER ASSEMBLY, decided Dec. 15, 1965, Interference No. 94,370, claims 1, 2, 3, 4, 6, 7 and 8.

Patent No. 3,113,234, H. Schlegel, DISCHARGE LAMP WITH MAGNETIC STABILIZATION, decided July 19, 1966, Interference No. 95,191, claim 1.

Patent No. 3,122,621, C. A. Ellis, MERCURY SWITCH CONSTRUCTION, decided July 11, 1966, Interference No. 94,923, claims 1 and 2.

Patent No. 3,146,872, C. T. Prucha, AUTOMATIC BRAKE SYSTEM, decided July 22, 1966, Interference No. 94,987, claims 1, 2, 3, 4, 5, 6, 7 and 8.

Patent No. 3,150,105, W. E. Ledding, WET OXIDATIVE REACTIVATION OF SPENT ACTIVE CARBON, decided July 6, 1966, Interference No. 94,771, claim 1.

Patent No. 3,152,380, B. E. Martin, PROCESS FOR TREATING POLYPROPYLENE FIBERS, decided July 13, 1966, Interference No. 95,185, claim 1.

Patent No. 3,189,076, J. E. Adams, SHEET METAL CAGE NUT, decided June 15, 1966, Interference No. 95,265, claim 1.

Patent No. 3,199,163, Z. M. Surletta, SPRING CLIP, decided July 21, 1966, Interference No. 95,304, claim 1.

Patent No. 3,213,116, G. W. Moersch and W. A. Neukils, AMINE COMPOUNDS AND METHODS FOR THEIR PRODUCTION, decided July 13, 1966, Interference No. 95,340, claims 1 and 2.

PATENT EXAMINING CORPS

R. A. WAHL, Assistant Commissioner

CONDITION OF PATENT APPLICATIONS AS OF JULY 1, 1966

PATENT EXAMINING OPERATIONS AND GROUPS	Actual Filing Date of Oldest Case Awaiting Action: New	Amended
CHEMICAL EXAMINING OPERATION—I. MARCUS, Director.		
GENERAL CHEMISTRY, GROUP 110—R. L. CAMPBELL, Manager. Inorganic Compounds; Inorganic Compositions; Organo-Metal and Organo-Metalloid Chemistry; Metallurgy; Metal Stock; Electro Chemistry; Batteries.	7-1-63	11-14-62
GENERAL ORGANIC CHEMISTRY, GROUP 120—G. D. MITCHELL, Manager. Heterocyclic; Amides; Alkaloids; Azo; Sulfur; Misc. Esters; Carbohydrates; Herbicides; Poisons; Medicines; Cosmetics; Steroids.	1-29-63	2-20-61
PETROLEUM CHEMISTRY, GROUP 130—J. R. LIBERMAN, Manager. Hydrocarbons; Halogenated Hydrocarbons; Mineral Oil Technology; Lubricating Compositions; Gaseous Compositions; Fuel and Igniting Devices; Organic Chemistry (Part) e.g.: Oxo and Oxy; Quinones; Acids; Carboxylic Acid Esters; Acid Anhydrides; Acid Halides.	7-1-63	4-13-62
HIGH POLYMER CHEMISTRY, GROUP 140—M. STERMAN, Manager. Synthetic Resins; Rubber; Proteins; Macromolecular Carbohydrates; Mixed Synthetic Resin Compositions; Synthetic Resins With Natural Polymers and Resins; Natural Resins: Reclaiming; Pore-Forming.	7-1-63	7-11-60
COMPOSITIONS AND MOLDING, GROUP 150—M. STERMAN, Manager. Compositions (Part) e.g.: Coating; Molding; Adhesive Compositions; Abrading; Liquid Purification or Separation; Gas Separation; Special Utility; Molding Processes.	7-23-63	2-26-60
COATING AND LAMINATING, GROUP 160—J. R. LIBERMAN, Manager. Coating: Processes, Apparatus and Misc. Products; Laminating Methods and Apparatus; Stock Materials; Ornamentation; Adhesive Bonding; Special Manufactures.	6-4-63	12-4-61
SPECIALIZED CHEMICAL ARTS AND INDUSTRIES, GROUP 170—W. B. KNIGHT, Manager. Bleaching and Dyeing; Fertilizers; Foods; Fermentation; Photography; Analytical Chemistry; Reactors; Sugar and Starch; Paper Making; Glass Manufacture; Metallurgical Apparatus; Gas, Heating and Illuminating; Cleaning Processes; Liquid Purification; Thermolytic Distillation; Preserving.	11-16-62	10-11-61
CHEMICAL ENGINEERING, GROUP 180—G. D. MITCHELL, Manager. Gas, Liquid and Solid Separation; Gas and Liquid Contact Apparatus; Distillation; Refrigeration; Concentrative Evaporators; Mineral Oils Apparatus; Misc. Physical Processes.	1-11-63	12-18-62
ELECTRICAL EXAMINING OPERATION—N. H. EVANS, Director.		
POWER AND ELEMENTS, GROUP 210—M. L. LEVY, Manager. Generation and Utilization; General Applications; Conversion and Distribution; Heating and Related Art Conductors; Switches, Miscellaneous.	12-31-62	10-19-61
SECURITY, GROUP 220—S. BOYD, Manager. Ordnance, Firearms and Ammunition; Radar, Underwater Signalling, Directional Radio, Torpedos, Seismic Exploring, Radio-Active Batteries; Nuclear Reactors, Powder Metallurgy, Rocket Fuels; Radio-Active Material.	8-26-63	1-16-62
INFORMATION TRANSMISSION, GROUP 230—E. J. SAX, Manager. Communications; Multiplexing Techniques; Facsimile and Related Art.	4-4-63	12-22-61
INFORMATION STORAGE AND RETRIEVAL, GROUP 240—E. J. SAX, Manager. Data Processing, Computation and Conversion; Storage Devices and Related Art.	12-28-62	2-6-61
ELECTRONIC COMPONENT SYSTEMS AND DEVICES, GROUP 250—F. M. STRADER, Manager. Semi-Conductor and Space Discharge Systems and Devices; Electronic Component Circuits; Wave Transmission Lines and Networks.	12-17-62	7-31-61
RADIATION AND INSTRUMENTS, GROUP 260—F. M. STRADER, Manager. Optics; Radiant Energy; Measuring.	1-8-63	8-8-61
PHYSICS, GROUP 280—R. L. EVANS, Manager. Photography; Sound and Lighting; Indicators and Optics; Measuring and Testing; Geometrical Instruments.	9-18-63	10-25-62
DESIGNS, GROUP 290—S. BOYD, Manager. Industrial Arts; Household, Personal and Fine Arts.	5-17-65	9-21-64

Total number of pending applications (excluding Designs)	196,314
Total number of Design applications pending	4,534
Total number of applications awaiting action (excluding Designs)	145,101
Total number of Design applications awaiting action	2,563
Date of oldest new application awaiting action	Nov. 16, 1962
Date of oldest amended application awaiting action	Feb. 26, 1960

EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during August 1966, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1965*.

Patents ..... Numbers 2,477,558 to 2,490,820, inclusive
Plant Patents ..... Numbers 858 to 869, inclusive

PATENT EXAMINING OPERATIONS AND GROUPS (Continued)	Actual Filing Date of Oldest Case Awaiting Action	
	New	Amended
MECHANICAL EXAMINING OPERATION—F. H. BRONAUGH, Director.		
MATERIAL HANDLING, GROUP 310—A. BERLIN, Manager Material or Article Handling and Dispensing; Conveyors; Hoists; Elevators; Article Handling Implements; Store Service; Sheet and Web Feeding; Fluid Sprinkling and Fire Extinguishers; Coin Handling and Check Controlled Apparatus; Classifying and Assorting Solids.	10-5-64	2-19-64
MANUFACTURING; METAL, PLASTICS WORKING; MACHINE TOOLS, GROUP 320—N. BERGER, Manager Manufacturing Processes, Assembling, Combined Machines, Special Article Making; Metal Deforming; Sheet Metal and Wire Working; Metal Fusion—Bonding, Metal Founding; Metallurgical Apparatus, Plastics Working Apparatus; Plastic Block and Earthenware Apparatus; Machine Tools for Shaping or Dividing; Work and Tool Holders.	3-3-64	3-6-62
TOOLS, JOINTS, AND HARDWARE, GROUP 350—T. J. HICKEY, Manager Miscellaneous Hardware; Tools; Joints; Cutlery; Locks; Fasteners; Rod Pipe and Electrical Connectors; Buckles; Buttons, Clasps, Etc.; Pushing and Pulling.	7-7-64	4-30-63
FLUID HANDLING, GROUP 360—T. J. HICKEY, Manager Fluid Handling; Valves; Pipes and Tubular Conduits; Fluent Material Handling; Lubrication; Baths, Closets and Sinks; Joint Packing; Centrifugal Bowl Separators.	5-18-64	11-7-62
HEAT AND POWER ENGINEERING, GROUP 370—C. F. GAREAU, Manager Power Plants; Combustion Engines; Fluid Motors; Pumps; Turbines; Heat Generation and Exchange; Refrigeration; Ventilation; Drying; Vaporizing; Temperature and Humidity Regulation; Machine Elements; Power Transmission.	8-17-64	11-14-63
AMUSEMENT, HUSBANDRY AND PERSONAL TREATMENT, GROUP 410—A. RUEGG, Manager Amusement and Exercising Devices; Projectors; Animal and Plant Husbandry; Butchering; Earth Working and Excavating; Fishing, Etc.; Tobacco; Artificial Body Members; Dentistry; Jewelry; Surgery and Toiletry.	10-14-63	1-3-62
CIVIL ENGINEERING, GROUP 420—T. J. HICKEY, Manager Building Structures; Bridges, Closures; Closure Operators; Safes; Earth Engineering; Drilling; Mining.	7-1-64	6-25-62
TEXTILES AND APPAREL, GROUP 440—W. S. COLE, Manager Textiles, Winding and Reeling; Tying Strands; Apparel; Boot and Shoe Making; Sewing Machines.	7-1-64	6-21-62
TRANSPORTATION, GROUP 450—A. BERLIN, Manager Railways and Rolling Stock; Brakes; Land Vehicles; Aeronautics; Ships.	7-16-64	7-22-63
FURNITURE AND RECEPTACLES, GROUP 460—W. S. COLE, Manager Furniture; Supports; Cabinet Structures; Receptacles; Baggage.	7-1-64	1-24-63
PRINTING, STATIONERY AND MATERIAL TREATMENT, GROUP 470—A. RUEGG, Manager Printing; Typewriters; Stationery; Material Treatment.	7-1-64	7-25-62

DECISIONS IN PATENT AND TRADEMARK CASES

U.S. Court of Customs and Patent Appeals

IN RE ERWINE LAVERNE AND ESTELLE LAVERNE

No. 7546. Decided March 10, 1966

[53 CCPA —; 356 F.2d 1003; 148 USPQ 674]

1. DESIGN—PATENTABILITY—35 U.S.C. 171.

"The patentability of designs is provided for in 35 U.S.C. 171, the second paragraph of which reads: 'The provisions of this title relating to patents for inventions shall apply to patents for designs, except as otherwise provided'."

2. SAME—SAME—OBVIOUSNESS—"ART" OF INDUSTRIAL DESIGN—35 U.S.C. 103.

"What is 'the art to which the subject matter pertains' in this case? Is it the molded chair 'art' or is it the ornamental design 'art'? In what field is the 'inventor' of the design operating? Since those who create designs are designers, not chair makers, it would seem to follow that he is operating in the field of industrial design and that it is the 'art' involved."

3. PATENTABILITY—OBVIOUSNESS—"PERSON HAVING ORDINARY SKILL IN THE ART"—35 U.S.C. 103.

"The next question, then, is who is a 'person having ordinary skill in' this art? In the mechanical, chemical, and electrical 'arts' we have distinguished, since *Hotchkiss* v. *Greenwood*, 52 U.S. 248 (1850), between 'an ordinary mechanic acquainted with the business' and the 'inventor': between the craftsman or routineer on the one hand and the innovator on the other, now, by statute, the innovator who makes *unobvious* innovations. With respect to such inventions, these two categories of persons are workers in the same 'art'."

4. DESIGN—PATENTABILITY—OBVIOUSNESS—35 U.S.C. 103.

"The codification of the design law provisions in 1952, continuing as it did the statutory provisions for design patents without change in substance (see former statutes R.S. 4929 and 4933), did nothing to alleviate the difficulties. One thing it did do, however, * * * was to abolish as the test whether or not the design is 'inventive,' substituting the unobviousness test of section 103."

5. SAME—SAME—SAME—SAME.

"We feel that the test of patentability of an admittedly new design cannot be whether it is no more than a 'competent designer' might produce. That would be parallel to saying of a mechanical invention that it is no more than a 'competent inventor' might produce. The test must be obviousness, for that is the dictate of section 103, but it must be applied in a way which will implement the legislative intent to promote progress in the field of industrial design by means of the patent incentive. This will not be done by denying patents to everything competent designers produce by the skill of their calling."

6. SAME—SAME—SAME—SAME.

"Following the mandate of section 103, it would seem that what we have to do is to determine obviousness [of a design] to the ordinary intelligent man. The test is inherently a visual test, for the design is nothing more than appearance, and the appearance is that of the article as a whole. * * * No special skill is required to determine what things look like, though individuals react differently. It is bound to be an individual reaction."

7. SAME—SAME—SAME—SAME STYLE TREND.

"The Board felt that the ordinary individual would take the two designs here involved to be mere variations of the same design rather than different designs. We do not see how this is possible. One might feel that the two chairs were part of the same style trend, just as competing automobiles or refrigerators or radios seem to follow similar patterns from year to year, but they are, in our opinion, distinctly different designs within that style trend. The design which initiates a new style does not automatically close the field to all other designs within the same style pattern."

8. SAME—SAME—PARTICULAR SUBJECT MATTER—CHAIR.

The decision of the Board of Appeals, refusing an application for a design patent on a chair as unpatentable over the prior art, is reversed.

APPEAL from the Patent Office. Serial No. 68,190.

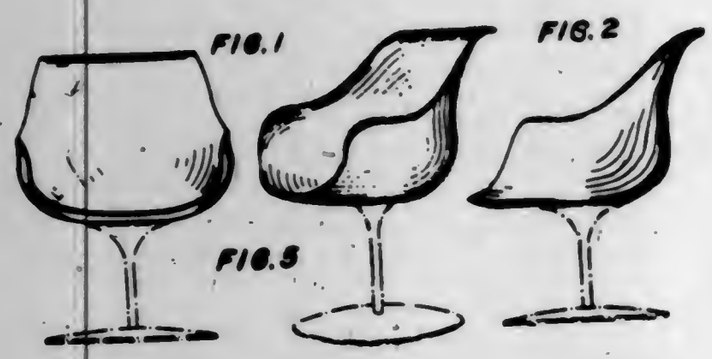
REVERSED.

Michael S. Striker, Gordon D. Coplein for appellants.

Clarence W. Moore (*S. Wm. Cochran* of counsel) for the Commissioner of Patents.

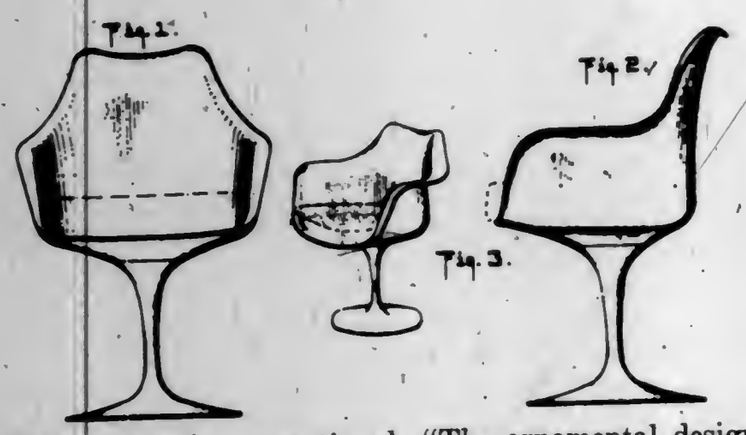
Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, JR., *Associate Judges*

RICH, *J.*, delivered the opinion of the court.



This appeal is from the decision of the Patent Office Board of Appeals affirming the rejection of application Serial No. D–68,190 filed January 4, 1962, for a Design for Chair or the Like.

The sole issue, as we see it, is the obviousness of appellants' design, under 35 U.S.C. 103, in view of the single reference relied on by the Board, the design patent to Eero Saarinen, Des. 181,945, issued Jan. 21, 1958. The Patent Office Solicitor so regarded the issue, but neither the Examiner nor the Board referred to any statutory ground of rejection.



Appellants' chair and the Saarinen chair are of the same general type in that each consists of a one-piece molded seat supported on a pedestal (the latter being no part of the design claimed), a back, and sides.

We reproduce front, a perspective, and side views of appellants' chair and below them corresponding views of the Saarinen reference chair.

APPELLANTS

REFERENCE

Appellants' claim is conventional: "The ornamental design for a chair or the like as shown and described." See Patent Office Rule 153. However, there is no description other than the showing of the drawings.

The Patent Office does not question novelty.

The following excerpts from the Examiner's answer show his grounds of rejection [emphasis ours]:

> It is the Examiner's position that the chair disclosed and claimed herein is *substantially similar* in overall appearance to the Saarinen chair and as such it possesses *no patentable merit* thereover.
>
> Applicant's [sic] omission of the peripheral edge employed by Saarinen is noted. However, the omission of this flange is well *within the expected skill of a competent designer* and in any event it is insufficient as a basis for patentability.
>
> • • • • • • • •
>
> Appellant directs attention to the lipped edge of Saarinen, the angle of the side walls and, to the curvature of the back thereof when viewed in side elevation. These remarks, however, are held to be directed to variations which constitute *differences in minutiae*. • • •
>
> • • • • • • • •
>
> Consequently, it is not believed that the difference between the Saarinen chair and the chair disclosed herein can be called *inventive* without defining the term *invention* to be nothing more than the sort of variation to be expected from any ordinarily skillful *mechanic* conversant with the art involved.

The Board, in affirming, expressed its reasons in one paragraph, saying:

> • • • the over-all similarity between the two designs is so close that the ordinary individual would take them to be mere variations of the same design rather than essentially new or different designs. *In re Johnson*, 36 CCPA 1175; 1949 C.D. 458; 627 O.G. 911; 175 F.2d 791; 82 USPQ 199, and *In re Lamb*, 48 CCPA 817; 1961 C.D. 219; 769 O.G. 1051; 286 F.2d 610; 128 USPQ 539.

[1] The patentability of designs is provided for in 35 U.S.C. 171, the second paragraph of which reads:

> The provisions of this title relating to patents for inventions shall apply to patents for designs, except as otherwise provided.

On the patentability issue, novelty under 35 U.S.C. 102 not being questioned, the statutory provision which controls here is 35 U.S.C. 103. Stating the issue in the words of the statute, it is whether

> • • • the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains.

It will be noted that section 171 distinguished between "patents for inventions" and "patents for designs," which would seem to indicate a legislative consciousness that "inventions" and "designs" are different in kind. Because they are, the language of section 103, designed to apply to inventions in the field of process, machine, manufacture, and composition of matter (35 U.S.C. 101), is somewhat difficult to apply to the problem of the patentability of designs.

[2] What is "the art to which the subject matter pertains" in this case? Is it the molded chair "art" or is it the ornamental design "art"? In what field is the "inventor" of the design operating? [1]

[1] The only reason to call the design-creator an "inventor" is the language of 35 U.S.C. 171, which contains its own problems. It is:

> Whoever invents any new, original and ornamental design for an article of manufacture may obtain a patent therefor, subject to the conditions and requirements of this title.

This is the problem: "Whoever invents" requires the applicant to have invented the design but this is the same thing as originating it, if "original" is given the meaning of doing it yourself without copying. With that meaning, either the word "invents" or the word "original" is superfluous. However, "original" has another possible meaning—something fresh, striking, or unusual and this clearly implies *novelty* to a considerable degree. If that is what is meant by "original" in the statute, then the word "new" becomes superfluous. Query: if "original" is given the second meaning of "out of the ordinary," then is not the section 171 requirement that the design be "original" redundant with respect to the section 103 requirement for unobviousness? It can scarcely be said that the statutory requirements are clear.

Since those who create designs are designers, not chair makers, it would seem to follow that he is operating in the field of industrial design and that it is the "art" involved.

[3] The next question, then, is who is a "person having ordinary skill in" this art? In the mechanical, chemical, and electrical "arts" we have distinguished, since *Hotchkiss* v. *Greenwood*, 52 U.S. 248 (1850), between "an ordinary mechanic acquainted with the business" and the "inventor"; between the craftsman or routineer on the one had and the innovator on the other, now, by statute, the innovator who makes *unobvious* innovations. With respect to such inventions, these two categories of persons are workers in the same "art."

In the field of design the analysis is not so easy. Design inventing or originating is done by designers. The Examiner here has referred to "the expected skill of a competent designer" as the basis of comparison. However, if we equate him with the class of mechanics, as the Examiner did, and refuse design patent protection to his usual work product, are we not ruling out, as a practical matter, all patent protection for ornamental designs for articles of manufacture? Yet the clear purpose of the design patent law is to promote progress in the "art" of industrial design and who is going to produce that progress if it is not the class of "competent designers"? We cannot equate them with the mechanics in the mechanic *vs.* inventor test for patentability. Correspondingly, we cannot solve the problem here, obviousness, by using for our basis of comparison the inventor class in the field of industrial design.

This court recognized and wrestled with the inherent difficulties of this problem under the old statutes twenty years ago in *In re Faustmann*, 33 CCPA 1065, 155 F.2d 388, 69 USPQ 541, with respect to the "existence of invention" and appreciated that the problem "must necessarily be approached from a different angle."

[4] The codification of the design law provisions in 1952, continuing as it did the statutory provisions for design patents without change in substance (see former statutes R.S. 4929 and 4933), did nothing to alleviate the difficulties. One thing it did do, however, as the Examiner seems not to have appreciated, was to abolish as the test whether or not the design is "inventive," substituting the unobviousness test of section 103.

[5] We feel that the test of patentability of an admittedly new design cannot be whether it is no more than a "competent designer" might produce. That would be parallel to saying of a mechanical invention that it is no more than a "competent inventor" might produce. The test must be obviousness, for that is the dictate of section 103, but it must be applied in a way which will implement the legislative intent to promote progress in the field of industrial design by means of the patent incentive. This will not be done by denying patents to everything competent designers produce by the skill of their calling.

[6] Following the mandate of section 103, it would seem that what we have to do is to determine obviousness to the ordinary intelligent man. The test is inherently a visual test, for the design is nothing more than appearance, and the appearance is that of the article as a whole. *In re Jennings*, 37 CCPA 1023, 182 F.2d 207, 86 USPQ 68. No special skill is required to determine what things look like, though individuals react differently. It is bound to be an individual reaction.

Having studied appellants' and Saarinen's drawings and tried to visualize what their chairs would look like in real life, we have concluded that under the statutory test, applied in the light of the foregoing analysis, appellants' chair design would not be obvious from Saarinen's. True, there is a general similarity in that they are both pedestal chairs with unitary molded seats, with the general features that go with molding a seat to accommodate the human anatomy. But we point out a number of differences, which we think are not properly characterized as "minutiae," legally speaking, the cumulative effect of which is unquestionably to create a different appearance.

From the front views in the above drawings it will be observed that appellants' general shape gives the impression of an upwardly tapering wine goblet with rounded bottom and straight top. The rear view, not shown here, gives even more of this impression, whereas the reference gives the impression of side arms flaring outwardly and of a narrow back with a concave top line.

The rounded bottom of appellants' goblet shape appears to stand upon the pedestal whereas in the reference the upward flare of the pedestal meets and blends with a downward flare of the seat in one smooth curve forming an integral unit.

The open edges of the reference seat, extending from the top corners of the back to the seat proper, are flared outwardly into arm rests of substantial width. The vertical front edges of the side arms are also flared outwardly. By contrast, appellants' chair has a thin edge providing no arm rests and from the front upper corners of the sides to the seat it curves inwardly, instead of outwardly, giving a closing-in rather than opening-out impression.

Looking at the side views, appellants' front and top edges consist of a pair of concave curves which seem to sweep upwardly to the right and the back has a reverse curve, from the top of the back downwardly, first concave and then pronouncedly convex at the back of the seat. The reference back is almost a straight line with a stiff rather than a form-fitting look, the back and seat bottom forming nearly a right angle.

Perhaps each of these differences by itself is a minor difference, but taken together the net result is a distinctly different appearance. These facts closely resemble those in the recent case of *In re McKay*, 50 CCPA 1257, 316 F.2d 952, 137 USPQ 558, opinion by Judge Martin, wherein we reversed the rejection of an application on a lint remover. We there said:

> In the present case, the cleaning implement of Sriminger may have "the same general overall shape" as appellant's design in the broad sense that both have a generally cylindrical body and a tapered handle attached at its smaller end to the body. However, the two devices are vastly different in the impression they make on an observer. The difference seems to us to have two aspects, one being in a difference in proportions of the elements and the other in particular features of the handle alone.

We found the differences "result in a new and ornamental design which would not be obvious from the prior art."

The previous year we reversed the rejection of a design for a rubber floor tile in *In re Bartlett and Fletcher*, 49 CCPA 969, 300 F.2d 942, 133 USPQ 204, pointing out that we felt the average observer would take the design of the appellants and of the reference to be different designs and might well have a preference for one over the other. We feel the same is true here. We there discussed the *Johnson* case, cited by the Board herein. We do not think the facts here any more resemble those in the *Johnson* case than did the facts in *Bartlett*.

The *Lamb* case cited by the Board, another of our recent decisions, also is distinguishable on its facts. We there found that the *same* design, which appeared in the prior art for a carving knife handle, had merely been *adapted to suit the size* of a steak knife, the prior art patent being appellant's own. We said, "the most appellant has done is to modify an already existing design in an obvious manner to harmonize with a smaller blade." We do not see how the Board could find that decision relevant to the facts here.

[7] The Board felt that the ordinary individual would take the two designs here involved to be mere variations of the same design rather than different designs. We do not see how this is possible. One might feel that the two chairs were part of the same style trend, just as competing automobiles or refrigerators or radios seem to follow similar patterns from year to year, but they are, in our opinion, distinctly different designs within that style trend. The design which initiates a new style does not automatically close the field to all other designs within the same style pattern.

[8] The decision of the Board is reversed.

REVERSED.

U.S. Court of Customs and Patent Appeals

AMERICAN CYANAMID COMPANY *v.* UNITED STATES RUBBER COMPANY

No. 7544. Decided March 17, 1966

[53 CCPA—; 356 F.2d 1008; 148 USPQ 729]

1. TRADEMARK—CONFUSING SIMILARITY—"CYGON" AND "PHYGON" FOR PESTICIDES.
"However, the similarity in sound and spelling [of 'CYGON' for an insecticide and of 'PHYGON' for fungicides], particularly the former, is sufficient, we think, to create a likelihood of various kinds of confusion and mistake, considering the close relationship of the goods in use. They are both for use on the farm and would, we presume, be used by workers of divers degrees of intelligence, experience, and carefulness. While a farm manager planning a spraying program would no doubt exercise such a degree of care in selecting and compounding his spray as to preclude mistake on his part, we see merit in appellee's argument that the sale, purchase, and handling of CYGON and PHYGON products at the verbal level, possibly under noisy conditions, might result in confusion or mistake and even damage to crops through a confused worker applying the wrong material."

2. SAME—SAME—LIKELIHOOD OF CONFUSION NOT LIMITED TO ORIGIN—LANHAM ACT, SECTION 2(d).
"Section 2(d) of the Lanham Act (15 U.S.C. 1052(d)) prohibits registration of a mark if it would 'be likely, when applied to the goods of the applicant, to cause confusion, or to cause mistake, or to deceive,' without limitation as to the kind of confusion, mistake or deception. This provision is not limited to confusion, mistake or deception as to origin of the goods, though that is the question most often involved."

Appeal from the Patent Office. Opposition No. 41,786.

AFFIRMED.

James Edwin Archer for appellant.

David B. Miller (*Elmer Stewart* of counsel) for appellee.

Before WORLEY, *Chief Judge*, and RICH, MARTIN, SMITH, and ALMOND, JR., *Associate Judges*

RICH, *J.*, delivered the opinion of the court.

This appeal is from the decision of the Trademark Trial and Appeal Board (142 USPQ 359) sustaining appellee's opposition to registration on the Principal Register of the word mark CYGON on application Serial No. 107,307, filed October 28, 1960, by appellant. The mark is sought to be registered for "an insecticide" and the claimed date of first use is September 15, 1960.

Opposition is based in part on prior use and registration of PHYGON for "fungicides," Reg. No. 430,237, granted June 10, 1947, to United States Rubber Company under the Act of February 20, 1905. The evidence shows extensive and continuing use of the mark. Opposer alleges similarity of the marks in sound, appearance, and meaning, and likelihood of misuse due to confusion of products when appellant's insecticides are sold under the mark CYGON, as well as damage from the registration is granted.

The record also shows that opposer has sold a combination fungicide-insecticide under the trademark PHYGON, marketed as a rose dust. Opposer sells insecticides under other trademarks.

PHYGON is marketed as a dry powder to be greatly diluted in water for use. CYGON is sold as an emulsifiable liquid in two different concentrations, also to be diluted in water for use.

There is some overlap in advertised uses in that both PHYGON and CYGON are recommended for use on apple trees, azaleas, and roses, albeit for different purposes.

Both products fall into the class of agricultural chemicals and they are both pesticides. They are sold through the same channels of trade consumers, namely, farmers.

The board felt that "it is clear that the products of the parties are of such a nature that they would be attributed to a single producer if sold under the same or similar mark." While that might be true in the case of the same mark, we cannot agree that the similar marks here, under the circumstances of this case, would likely lead to confusion *as to source*. The evidence shows that, with a single exception on the part of appellant, the producers' names are prominently associated with the marks on labels in such a way as to preclude mistake as to the origin of the goods. As to the exception, the evidence is that the distributor's name appears in place of that of the producer.

[1] However, the similarity in sound and spelling, particularly the former, is sufficient, we think, to create a likelihood of various kinds of confusion and mistake, considering the close relationship of the goods in use. They are both for use on the farm and would, we presume, be used by workers of divers degrees of intelligence, experience, and carefulness. While a farm manager planning a spraying program would no doubt exercise such a degree of care in selecting and compounding his spray as to preclude mistake on his part, we see merit in appellee's argument that the sale, purchase, and handling of CYGON and PHYGON products at the verbal level, possibly under noisy conditions, might result in confusion or mistake and even damage to crops through a confused worker applying the wrong material.

[2] Section 2(d) of the Lanham Act (15 U.S.C. 1052(d)) prohibits registration of a mark if it would "be likely, when applied to the goods of the applicant, to cause confusion, or to cause mistake, or to deceive," without limitation as to the kind of confusion, mistake or deception. This provision is not limited to confusion, mistake or deception as to origin of the goods, though that is the question most often involved.

We are aware that denial of registration is not a denial of the right

to use and that this decision may not affect existing practices but we are governed by the provisions of the statute.

We do not see error in the decision of the Board to sustain the opposition on the ground of likelihood of confusion or mistake and it is therefore affirmed.

AFFIRMED.

U.S. Court of Customs and Patent Appeals

TEXAS INSTRUMENTS INCORPORATED *v.* TECHNI-RITE ELECTRONICS, INC.

No. 7521. Decided March 17, 1966

[53 CCPA—; 357 F.2d 398; 148 USPQ 726]

1. TRADEMARK—CONFUSING SIMILARITY—CONFUSION AS TO SOURCE—15 U.S.C. 1052(d).

"While the record supports specific differences in the goods, this is not the test to be applied in determining likelihood of confusion. * * *. Similarly, markets and distribution channels are but factors which may be considered in resolving the sole issue before us, which is whether applicant-appellee's mark '* * * so resembles a mark registered in the Patent Office or a mark or trade name previously used in the United States by another and not abandoned, as to be likely, when applied to the goods of the applicant, to cause confusion, or to cause mistake, or to deceive: * * * 15 U.S.C. 1052(d).' We now consider the respective marks to determine whether it would be likely to regard the goods as coming from the same source."

2. SAME—DISTINCTIVENESS—SUFFIX "RITE" IN TRADE NAMES.

"Some effort was made by appellant to suggest that since the suffix 'rite' was used in several of its trade names, i.e., 'servo/riter', 'oscillo/riter' and 'event/riter' to designate particular of its products, the public had associated appellant as the source of goods on which marks ending with the suffix 'rite' was employed. It is not seen on this record how this result can follow from such use. Instead, the record establishes that the suffix 'rite' was a common suffix prior to appellant's adoption of its mark. Thus, taken alone, the suffix 'rite' so lacks in distinctiveness that it cannot be said to support appellant's position."

3. SAME—CONFUSING SIMILARITY—EVIDENCE.

"We point out * * * that even though the proofs fail to establish actual confusion, it is sufficient to sustain an opposition if the proofs establish a 'likelihood' of confusion, mistake or deception of purchasers."

4. SAME—SAME—"TECHNI-RITE" AND "RECTI-RITE" FOR ELECTRONIC DATA EQUIPMENT.

Upon reviewing the decision of the Trademark Trial and Appeal Board which found no likelihood of confusion between the appellant-opposer's mark "recti-rite" and the appellee's mark "techni-rite" that was sought to be registered, both marks being for electronic data equipment, *Held* that "Considering the marks as applied to the goods of the parties, as required by the terms of 15 U.S.C. 1052(d), including the technical nature of the goods, their high cost, their respective markets and channels of distribution, the discrimination of prospective purchasers, and the differences in the marks, we agree with the decision of the Trademark Trial and Appeal Board and it is therefore *affirmed*."

Appeal from the Patent Office. Opposition No. 41,999.

AFFIRMED.

Stevens, Davis, Miller & Mosher (*J. W. Gipple* of counsel) for appellant.

Elliot A. Salter for appellee.

Before WORLEY, *Chief Judge*, and RICH, SMITH, and ALMOND, JR., *Associate Judges*

SMITH, J., delivered the opinion of the court.

The Trademark Trial and Appeal Board dismissed appellant-opposer's opposition to the registration of appellee's mark "techni-rite" for "data presentation equipment, namely, dimensional gauges and electronic recording and indicating apparatus and equipment used in association therewith."[1] (141 USPQ 932). The opposition was based on appellant's prior use of the marks "recti/rite" and "recti/riter"[2] and ownership of registrations[3] therefor for similar goods.

The sole issue is likelihood of confusion under 15 U.S.C. 1052(d). The board found that while the goods of the respective parties were related, the marks were not likely to cause confusion or to cause mistake or to deceive.

Appellee argues that the goods, markets and distribution channels are different. Appellee points out that the respective goods have different utility, are technical in nature, are relatively expensive (450 dollars and up), and all prospective purchasers thereof would exercise discrimination in their selection.

[1] While the record supports specific differences in the goods, this is not the test to be applied in determining likelihood of confusion. See Vandenburgh, Trademark Law & Procedure, Section 5.41 (1959). Similarly, markets and distribution channels are but factors which may be considered in resolving the sole issue before us, which is whether applicant-appellee's mark

> * * * so resembles a mark registered in the Patent Office or a mark or trade name previously used in the United States by another and not abandoned, as to be likely, when applied to the goods of the applicant, to cause confusion, or to cause mistake, or to deceive: * * * 15 U.S.C. 1052(d).

We now consider the respective marks to determine whether it would be likely to regard the goods as coming from the same source. See Hoge, *Lanham Act's Housekeeping Amendments*, 52 T.M.R. 1245, 1249 (1962).

Considered in their entireties the marks in issue are similar because of their common use of the phonetic suffix "rite." The phonetic suffix "rite" suggests the words "right" and "write." In the first connotation it imparts to the respective marks the concept of correctness in the recording devices. In its second connotation it suggests that the record is written. As stated by appellee's witness Gipple:

> * * * we had felt that there was a rather broad usage in connection with the selling and marking of technical products with names that used the word "rite" as a suffix, and we brought this to the attention of Mr. Salter, our patent counsel, and suggested that he make a search restricted to technical products.

The result of the search made by Mr. Salter supported the above statement and was made of record. Exhibit A consists of 17 registrations of trademarks in which "rite" is the suffix. They support the testimony of appellee's witness Ondis that:

> * * * at the time the corporation was formed we had a rather clear plan as to the type and nature of the products that would be designed and manufactured by us. We decided to adopt a name that would have some relation to those products, and since the products were all technical in the sense that they were other than consumer, we decided to adopt a name that incorporated some portion of the word "technical" and we used "techni". We then decided to take the suffix "rite" which, as we analyzed it, had a dual meaning; the first meaning might be compared to the word "right" implying correctness or excellence, and

[1] Application Ser. No. 129,057, filed Oct. 2, 1961.
[2] The parties agree that all of the marks involved consist entirely of lower case letters. In the briefs and the board opinion, however, the marks are sometimes shown in capital letters.
[3] Registrations Nos. 660,542, 674,174, 674,578 and 676,680.

the second meaning of the suffix "rite" alluding to the fact that the equipments were writers, recording instruments that wrote caligraphically.

Thus, as we consider the entire marks in issue it is necessarily against a background of the common and well recognized usage of trademarks in which the phonetic suffix "rite" has been used. The recognized meaning which it imparts to the entire mark is the same in all marks in issue but it is not sufficiently distinctive as applied to such marks to indicate either appellant or appellee as the source or origin of the goods to which it is applied.

[2] Some effort was made by appellant to suggest that since the suffix "rite" was used in several of its trade names, i.e., "servo/riter," "oscillo/riter" and "event/riter" to designate particular of its products, the public had associated appellant as the source of goods on which marks ending with the suffix "rite" was employed. It is not seen on this record how this result can follow from such use. Instead, the record establishes that the suffix "rite" was a common suffix prior to appellant's adoption of its mark. Thus, taken alone, the suffix "rite" so lacks in distinctiveness that it cannot be said to support appellant's position. See *Servo Corp. of America* v. *Servo-Tek Products Co.*, 48 CCPA 978, 289 F. 2d 955, 129 USPQ 352.

We think we are supported in our decision by the results of a survey made by McGraw Hill Company for appellant. Appellant in its brief has summarized the record concerning this survey as follows:

> In November of 1962, McGraw Hill Research, a department of McGraw Hill Publishing Company, conducted an advertising survey including specifically an inquiry as to what "trade name" was used by the Opposer-Appellant, Texas Instruments Incorporated, on oscillographic recorders. Of the three hundred and eighty-six responses, two hundred and seventy-eight did not know Texas Instruments made oscillographic recorders, eighty-two knew Texas Instruments made oscillographic recorders but did not know the "trade name," nine incorrectly identified the oscillographic recorder by the name "recti/riter" (which is Opposer-Appellant's trademark for galvanometric recorders), six correctly identified the oscillographic recorder as "oscillo/riters," three identified Opposer-Appellant's oscillographic recorder as "techni-writer" (Exhibits 1, 23a, 23b, 23c, 23d, 24, 25a and 25b; R. 47–61; R. 64–69). * * *

We would add that the responses were received from a total of 2000 questionnaires which McGraw Hill sent to a randomly selected list of subscribers to its publication "Electronics." It seems but reasonable to assume that if appellant's position was correct more responses would have associated appellant with "rite" and "riter" type marks.

Distinctiveness of the marks in issue therefore must be found in their prefixes and in the effect of such prefixes in imparting distinctiveness to the entire mark with which they are used. The prefix "techni" in appellee's mark imparts to its mark as a whole an entirely different meaning than does appellant's prefix "recti."

Appellant cites *The Magnavox Corp.* v. *Multivox Corp. of America*, 52 CCPA 1025, 341 F. 2d 139, 144 USPQ 501, where we found a likelihood of confusion between the marks "Magnavox" and "Multivox," as applied to the goods of the parties, and argues that the facts before us in that case are remarkably similar to the facts in the present case. Appellant states in its brief:

> * * * the suffix "rite" is no weaker than the suffix "vox" as applied to the goods involved and that the prefixes "recti" and "techni" have as much in common as "multi" and "magna."

Appellee answers this argument as follows:

> * * * the suffix "vox" is not thought to be nearly as descriptive as the suffix "Rite," nor are the prefixes "Techni" and "Recti" thought to be nearly as similar as the prefixes "Multi" and "Magna," both of which comprise the same number of letters, start with the same letter, and have generally the same meaning and significance. * * *

We find appellee's reasoning more persuasive and, concerning the marks, we think the facts in the present case are more similar to those in *New Castle Products, Inc.* v. *American Door Co.*, 48 CCPA 1036, 291 F. 2d 954, 130 USPQ 167, where we found no likelihood of confusion between the marks "Modernfold" and "Magna-Fold" when applied to similar goods. See also *American Grease Stick Co.* v. *Chemplast, Inc.*, 52 CCPA 1103, 341 F. 2d 942, 144 USPQ 676.

The Board considered this survey evidence, discussed supra, as to whether or not it formed a basis from which a conclusion of actual confusion could be reached. We find, as did the Board, that the survey falls short of establishing actual confusion. [3] We point out, however, that even though the proofs fail to establish actual confusion, it is sufficient to sustain an opposition if the proofs establish a "likelihood" of confusion, mistake or deception of purchasers. Even when tested against this concept, the survey proofs are insufficient and unpersuasive.

[4] Considering the marks as applied to the goods of the parties, as required by the terms of 15 U.S.C. 1052(d), including the technical nature of the goods, their high cost, their respective markets and channels of distribution, the discrimination of prospective purchasers, and the differences in the marks, we agree with the decision of the Trademark Trial and Appeal Board and it is therefore affirmed.

AFFIRMED.

MARTIN, *J.*, took no part in the consideration or decision of this case.

U.S. Court of Customs and Patent Appeals

IN RE FRIEDRICH HEBBERLING

No 7566. Decided March 17, 1966

[53 CCPA—; 357 F.2d 1001; 148 USPQ 730]

1. CLAIM—CONSTRUCTION OF CLAIMS.

   "While applying the terms of claim 17 to Chadwick involved inclusion of a common portion of the Chadwick drive means in both the [claimed] 'means connected * * *' and the [claimed] 'reversal means * * *,' we think that reading those expressions on the reference disclosure involves no more than a reasonable interpretation of the claim language."

2. PATENTABILITY—PARTICULAR SUBJECT MATTER—"REINFORCED SHEET MATERIAL AND METHOD OF AND APPARATUS FOR FORMING SAME."

   The refusal of certain claims in an application entitled "Reinforced Sheet Material and Method of and Apparatus for Forming Same," as unpatentable over the prior art, is affirmed.

APPEAL from the Patent Office. Serial No. 80,477.

AFFIRMED.

Jack M. Wiseman for appellant.

Clarence W. Moore (*Jere W. Sears*, of counsel) for the Commissioner of Patents.

Before RICH, *Acting Chief Judge*, and MARTIN, SMITH, and ALMOND, JR., *Associate Judges*, and WILLIAM H. KIRKPATRICK, *United States Senior District Judge for the Eastern District of Pennsylvania*

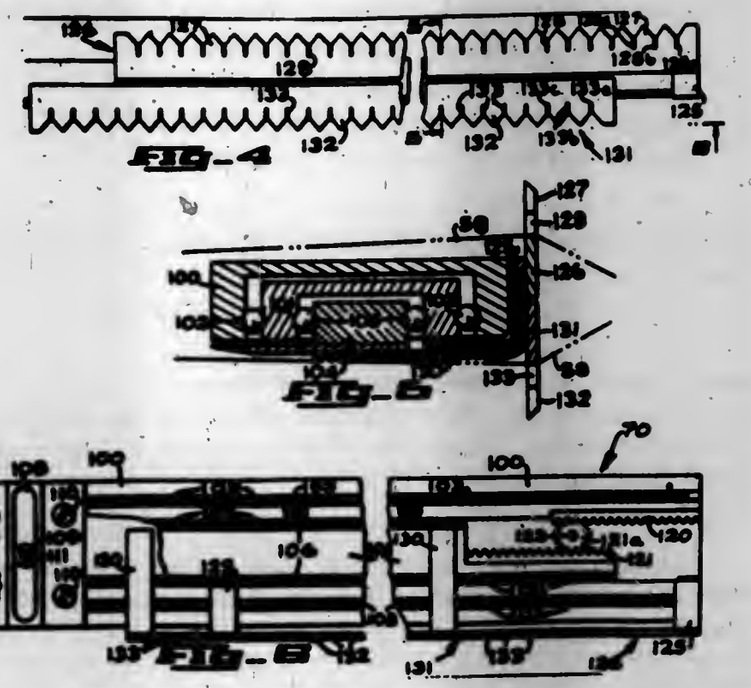
MARTIN, *J.*, delivered the opinion of the court.

This appeal is from the decision of the Board of Appeals affirming the Examiner's rejection, as unpatentable over the prior art, of claims 1, 2, 17 and 25 of Hebberling application Serial No. 80,477, filed January 3, 1961, entitled "Reinforced Sheet Material and Method of and Apparatus for Forming Same." Two claims stand allowed.

Claims 2 and 25 are representative and read:

2. A high speed reciprocating apparatus for imparting a cyclical motion to strands of filamentary material to produce a reinforced web material comprising a first carrier, a guide member carried by said first carrier for movement therewith and arranged to receive strands of filamentary material, means connected to said first carrier for imparting a reciprocating movement to said first carrier, a second carrier disposed adjacent to and in parallel relation with said first carrier, a guide member carried by said second carrier for movement therewith and arranged to receive strands of filamentary material, and means interengaging said first and second carrier and actuated by said first carrier for imparting a reciprocating movement to said second carrier to move said second carrier in a direction opposite from which said first carrier moves.

25. A method of forming reinforced sheet material comprising the steps of, continuously advancing spaced apart sheets of material, continuously advancing continuous strands of reinforcing material between confronting surfaces of said sheets of material, applying adhesive material to said strands of reinforcing material, guiding said sheets of material to converge toward one another with the confronting surfaces thereof meeting, imparting a cyclic motion to said continuous strands of reinforcing material with the adhesive material applied thereto, depositing said strands with adhesive material applied thereto between said sheets of material as the confronting surfaces of said sheets of material meet, and pressing said sheets of material toward one another with the strands of reinforcing material therebetween to form a reinforced sheet material.



Claims 1 and 17 are apparatus claims to the same combination as claim 2 but are somewhat broader in their recitation of the "guide members" and the element designated "means interengaging * * *" in claim 2.

As is apparent from the representative claims, appellant's application relates to an apparatus and process for forming reinforced sheet material made up of two flat sheets of material secured together with continuous reinforcing strands of filamentary material disposed therebetween. In forming the reinforced material, a plurality of reinforcing strands are drawn from supply packages on spindles through a comb guide to assume a predetermined spaced relationship in a horizontal plane. The strands may then be passed over a heated roll after which they are received by a reciprocating apparatus disposed at the height of the confronting surfaces of a pair of vertically aligned nip rolls that rotate on horizontal axes and receive two sheets of sheet material therebetween. The reciprocating apparatus imparts to each reinforcing strand a predetermined cyclical motion, preferably a sinusoidal motion. As the two sheets approach and converge at the nip rolls, the reinforcing strands, positioned in accordance with the cyclical motion imparted to them by the reciprocating apparatus, are deposited between the confronting surfaces of the sheets. The nip rolls prevent any slippage of the strands once they have been deposited between the sheets. The heated roll over which the strands are passed brings them to a temperature of 150 to 500 degrees F. which is sufficient to cause the strands to be heat bonded to both sheets of sheet material[1] at the nip rolls so that the sheets with the strands therebetween advance beyond the rolls as united reinforced sheet material.

[1] The sheet material may be "made of fibrous or plastic substances."

In one modified form of the apparatus, the reinforcing strands, instead of being heated, are passed over a roll which applies a suitable adhesive bonding chemical to them before they are received by the reciprocating apparatus and pass between the individual sheets into the nip rolls.

The reciprocating apparatus defined in appealed claims 1, 2 and 17 is illustrated adequately by part of FIG. 4 and FIGS. 5 and 6 of the application drawings, reproduced below:

The apparatus includes a pair of guide bars 126 and 131 mounted ahead of the nip rolls for reciprocating movement in opposite directions along a line perpendicular to the path of the reinforcing threads. The bars, which may be of graphite, have serrated edges 127 and 132 opening into strand or fiber receiving slots 128 and 133, respectively. The reciprocating bars impart a preferably sinusoidal motion to the strands as they are continuously advanced into the nip rolls.

The means for mounting and driving the bars 126 and 131 includes an elongated stationary support member 100 of inverted U-shaped cross-section, a first carriage member 101 of similar cross-section mounted within the member 100 for reciprocal longitudinal movement therein on ball bearings 102, and a second carriage member 104 of rectangular cross-section in turn mounted in member 101 for reciprocal longitudinal movement therein on ball bearings 105. Guide bar 126 is secured to the first carriage member 101, with its serrated edge up, by a bracket 125, while a bracket 130 secures guide bar 131 to the second carriage 104 with its serrated edge down. Gear racks 120 and 121 are secured to the outer ends of carriages 101 and 104, respectively, in spaced opposed relationship so that their teeth engage a pinion 121*a* supported therebetween for rotation about a fixed axis. At its inner end, the carriage 101 has attached thereto a slide plate 107 provided with an elongated transverse slot 108. That slot receives a follower roller 109, which roller is driven through repeated cycles of sinusoidal motion through an eccentric drive from the rotating shaft of a motor.

Appellant describes the operation of the reciprocating means in his application as follows:

During each cycle of sinusoidal motion of the follower roller 109, longitudinal

movement is imparted to the outer carriage 101, which, in turn, moves the guide bar 126 longitudinally therewith. The longitudinal movement of the carriage 101 drives the inner carriage 104 longitudinally in an opposite direction through the pinion 121*a*. Consequently, the guide bar 131 moves longitudinally in a direction opposite from which the guide bar 126 is travelling. Thus, the guide bars 126 and 131 are always 180° out of phase. Each guide bar 126 and 131 is substantially equal in length to the width of either sheet material 23*a* or 23*b* and completes a reciprocating cycle during each cycle of sinusoidal motion of the follower roller 109.

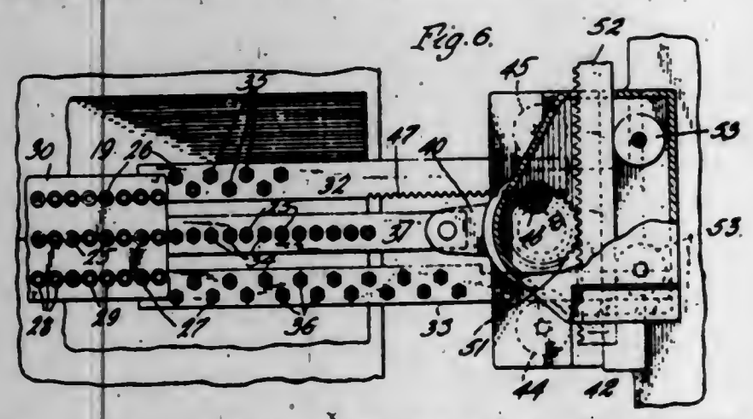
Benbow, 627,968, July 4, 1899.
Caretta, 2,026,459, December 31, 1935.



Chadwick discloses a machine for making reinforced sheet material such as composite paper that is reinforced by threads of fibrous material incorporated between two webs of paper which are secured together by an interposed adhesive film. The patent states:

• • • the thread reenforcement comprises a series of substantially straight spaced threads which run lengthwise of the web or sheet, and two series of spaced zig-zag threads, which extend lengthwise of the web or sheet in zig-zag courses with each of the zig-zag threads of one series crossing or intersecting several of the zig-zag threads of the other series and also several of the straight threads.

• • • • • • •

In the machine herein disclosed to illustrate my invention as usual in machines for producing reenforced material of the sort mentioned, two continuous webs of sheet material, such as paper, are caused to travel between presser rollers, an adhesive coating is applied to the inner surface of one or both of these traveling webs before it passes between the presser rollers, and thread guiding or laying means are also provided for introducing the reenforcing threads between the two traveling webs as they enter the bite of the presser rollers so that the threads will stick to the adhesive coating and be drawn with the webs between the rollers which press the two webs together, the webs being thus cemented together and the reenforcing threads cemented in place between the webs.

The pertinent features of the guide means employed by Chadwick to impart the desired displacement to the threads as they enter the sheets are illustrated in FIG. 6 reproduced below:

As shown in the drawing, a stationary beam 30, extending transversely of the machine in advance of the presser or nip rollers, is provided with three vertically spaced horizontal layers of orifices which receive threads from supply bobbins. Ahead of the beam 30 and just in advance of the rollers is a stationary bar 31 and upper and lower reciprocating bars 32 and 33. Stationary bar 31 guides threads passing therethrough so that they assume a position parallel to the direction of travel of the sheets of material and that bar is of

no further pertinence here. The reciprocating bars 32 and 33 have openings therein connected through flexible rubber tubes with corresponding openings in top and bottom rows of openings in the beam 30.

One end of the upper reciprocating bar 32 extends into a stationary guide box 42 and has rack teeth 47 on its lower edge for engagement with a pinion 46 in the box. The pinion also is engaged by teeth on a vertical rack bar 52 so that vertical reciprocating motion imparted to that bar will cause horizontal reciprocating motion of the bar 32. The opposite end of the lower guide bar 33 has teeth on its edge engaging another pinion driven by another rack bar which may be vertically reciprocated to cause horizontal reciprocating motion of that bar also. The two rack bars are driven from a common driving shaft by eccentric members arranged to cause the bars 32 and 33 to be driven simultaneously in opposite directions to cause a zig-zag configuration of the threads guided thereby as the threads pass into the rollers between the two sheets of material.

The Benbow and Caretta patents each show a mechanism wherein two parallel, longitudinally movable members are provided with teeth in facing edges in engagement with a pinion rotatable on a fixed axis located therebetween so that imparting a reciprocating motion to one member causes reverse reciprocating movement of the other member. In Benbow that mechanism is employed in a washing machine, while Caretta is directed to a general disclosure of transmission gearing.

The Examiner rejected apparatus claims 1, 2 and 17 as unpatentable over Chadwick. The Board affirmed that rejection as to claim 17 but reversed it as to claims 1 and 2. It made a new rejection, under Rule 196(b), of claims 1 and 2 as unpatentable over Chadwick in view of either Benbow or Caretta and adhered to such rejection on reconsideration.

It was the position of the Board that the structure recited in claims 1 and 2 is met by Chadwick except for the specific means for reciprocating the two carriers for the guide members and that it would be obvious to substitute well known mechanism for causing reverse reciprocation of two bars by means of a pinion interengaging racks on the two bars, as shown by Benbow and Caretta, for the carrier driving and reversing means of Chadwick.

Appellant argues:

• • • there is no suggestion or teaching in the art relied upon whether taken singly or in combination of the inventive concept of establishing an intimate correlation between the cyclic motions applied to strands of filamentary material, whereby the movement of the first carrier, which applies a cyclic motion to a first group of strands, activates the force transmitting means to impart a reciprocating movement to the second carrier, which applies a cyclic motion to a second group of strands. More significantly, the disclosure by Benbow does not suggest employing the rack and pinion thereof for establishing a time or phase relation between the agitators rotated thereby. Similarly, the disclosure by Caretta fails to suggest employing the racks and pinion thereof to establish a phase or time relationship between elements driven therefrom.

It cannot be argued that Chadwick fails to disclose the same concept of "an intimate correlation between the cyclic motions applied to the strands of filamentary material" that appellant employs. The guide bars 32 and 33 of Chadwick are interlocked through a common drive shaft so that they are "simultaneously reciprocated oppositely" transversely of the machine. It is true that Chadwick does not use a force transmitting means driven from the first driven means to

drive the second to accomplish that result. However, Benbow and Caretta show it is an old expedient to simultaneously reciprocate two driven members from the same source of power by driving one directly from the source and using a rack and pinion structure like that of appellant to drive the other. Since Chadwick's driving arrangement and that of the secondary references both provide the same function of driving the driven members from a single power supply with the same reverse reciprocating motions, we think it would clearly be obvious to a person of ordinary skill in the art to which the present invention is directed to substitute the drive arrangement of the secondary references in Chadwick's machine.

The decisions in *In re Ratti*, 46 CCPA 976, 270 F.2d 810, 123 USPQ 349, and *In re Shaffer*, 43 CCPA 758, 229 F.2d 476, 108 USPQ 326, relied on by the appellant, are not considered controlling here. In each of those cases, the court concluded that the modification of the basic reference relied on in the rejection reversed by it was not made obvious by the prior art. In the present case, we find nothing which satisfies us that the substitution suggested in the rejection of claims 1 and 2 would not have been obvious or provides any unobvious result. Appellant contends that his drive arrangement offers advantages because "the phase relationship between the carriers is intimately correlated regardless of wear, tear and setting of the drive mechanism" and because the arrangement, by reducing the number of parts required, "has reduced the oscillating mass to a large degree." However, we find no sound reason for doubting that a person of ordinary skill in the art would have been aware of any such characteristics of the drive arrangement of Benbow and Caretta as might provide those results and of the effects of substituting that arrangement in place of the Chadwick driving means.

Claim 17 differs from claims 1 and 2 in reciting "means * * * connected to said first carrier for imparting a reciprocating movement to said first carrier" and for "reversal means interconnecting said first and second carriers for imparting a reciprocating movement to said second carrier * * *." The Board regarded that language as making claim 17 broader than the other two claims and considered claim 17 unpatentable over Chadwick without finding it necessary to rely on the secondary references.

Appellant seems to argue that claim 17 should be regarded as requiring that the first carrier drive the second carrier even though that condition is not expressly recited. That interpretation, would appear to give claim 17 the same substance as claim 2. However, we agree with the Board that claim 17 is broader and was properly rejected on Chadwick alone. [1] While applying the terms of claim 17 to Chadwick involves inclusion of a common portion of the Chadwick drive means in both the "means connected * * *" and the "reversal means * * *" expressions set out above, we think that reading those expressions on the reference disclosure involves no more than a reasonable interpretation of the claim language. See *In re Kelley*, 49 CCPA 1359, 305 F.2d 909, 134 USPQ 397.

Regarding claim 25, rejected as unpatentable over Chadwick, appellant states:

> Method claim 25 distinguishes over the process disclosed by the patent to Chadwick in that it calls for the steps of applying adhesive material to strands of reinforcing material and imparting a cyclic motion to the strands of reinforcing material with the adhesive material applied thereto.

The Examiner and Board recognized that Chadwick applies adhesive to the sheet material rather than the strands but thought it would be obvious to follow the latter procedure. Although appellant argues there are some advantages to applying the adhesive to the strands, we do not think that either the procedure or the asserted advantages would be unobvious to a person of ordinary skill in the art.

[2] Since we think, for the foregoing reasons, that the Board was correct in finding the appealed claims unpatentable, the decision is affirmed.

AFFIRMED.

SMITH, *J.*, dissenting.

The majority finds that the reciprocating apparatus defined in the appealed claims would be obvious to one of ordinary skill in the art. I disagree with this finding and dissent for the following reasons.

Appellant in his brief states the case as I see it. He says:

> In support of applicant's contention that the reciprocating apparatus of the present invention is patentably distinct over the art of record, applicant points out that the following advantages flow from and are gained by the novel arrangement defined in claims 1 and 2:
>
> 1. By having the reciprocating movement of one carrier activate the force transmitting means to reciprocate another carrier, the phase relationship between the carriers is intimately correlated regardless of the wear, tear and setting of the drive mechanism. By virtue of the present invention, there is a precise and accurate phase relationship between adjacent strands of filamentary material to produce an improved and stronger reinforcing matrix.
>
> 2. By reducing the number of parts required, applicant has reduced the oscillating mass to a large degree. Consequently, applicant's machine attains greater operating speed with less power. This is significant, because the limiting factor in the speed of operation of the overall machine and the output of the reinforced sheet material is the reciprocator speed. Therefore, it is not just a matter of reducing parts, but more important it is a matter of output and speed of operation.

The majority opinion states that one of ordinary skill in the art would find these improved results to be obvious in view of the drive arrangement of Benbow and Caretta and concludes there is "no sound reason for doubting that a person of ordinary skill in the art" would be unaware of substituting these driving arrangements in Chadwick.

This reasoning involves a non sequitur. It is beyond question that the drive arrangement of Benbow and Caretta is *not* the same as that employed by appellant. Appellant clearly explains in his brief that:

> One carrier is driven directly by a drive mechanism and imparts a cyclical motion to strands of filamentary material. However, the other carrier is driven by the reciprocating movement of the first carrier. Stated otherwise, it is the movement of the first carrier which activates interengaging reversal means located between the first and second carriers that causes the reciprocating movement of the second carrier.

Benbow and Caretta, in contrast, utilize a pinion common to two racks to cause movement between the two racks. In Benbow, two washing machine agitators operate simultaneously. In Caretta, movement is transmitted to a remote element via parallel racks.

Thus, substituting the drive arrangements cannot *in fact* produce a mechanism capable of providing the improved results of appellant's claimed arrangement. Appellant's unique arrangement of the parts produces a result of apparent merit in that it:

> 1. correlates the phase relationship between the carriers regardless of wear and the setting of the drive mechanism;
>
> 2. maintains precise and accurate phase relationship between adjacent strands of filamentary material to produce an improved and stronger reinforcing matrix;

3. reduces the number of parts required and lessens the mass of the oscillating parts;
4. provides greater operating speed with less power;
5. results in greater output in reinforced sheet material.

The appealed claims define a machine and method which are new in this art and which permit improved results of substantial merit, all of which would not be mechanically possibly from any combination of the prior art teachings. Considering all of the teachings of record, I fail to see how such a machine and method can be found to be obvious to one of ordinary skill in the art when the statutory tests of 35 U.S.C. 103 are applied. I find that section 103 is not applied to the true fact situation before the court.

As the majority decision rests, as does the opinion of the Board, on what I believe to be the erroneous factual conclusion that the substituted prior art drive arrangements would in fact function as does appellant's claimed invention to produce the improved results first taught by appellant, the decision of the Board should be reversed.

U.S. Court of Customs and Patent Appeals

IN RE CARL DALTON LUNSFORD

No. 7512. Decided March 17, 1966

[53 CCPA —; 357 Fed 385; 148 USPQ 721]

1. PATENTABILITY — COMPOUND — OBVIOUSNESS — REFERENCES EVALUATED AS A WHOLE CONSIDERING SPECIFIC AND GENERAL TEACHINGS—35 U.S.C. 103.

"The rejection here is under 35 U.S.C. 103. The rejection is that the differences between the subject matter as a whole and the specific teachings of Biel I and III in view of the general teachings of the ancillary references are such that the subject matter would be obvious to one of ordinary skill in the art. We think as a matter of law that 35 U.S.C. 103 requires that the specific teachings, as well as the general teachings, be evaluated as a whole for what they fairly teach."

2. SAME—SAME—SAME—SAME.

"In the present case the claimed invention [pyrrolidyl compounds], considering the properties along with the structure, is clearly not obvious in view of the general teachings. It cannot be argued other than that these teachings are concerned only in a peripheral manner with the claimed invention. The Solicitor does not argue otherwise. The specific teachings, on the other hand, are closely concerned with the claimed invention. Absent any reason to the contrary, it is these teachings which a person [of] ordinary skill in the art would consider most pertinent and accord the most weight. The specific teachings, uncontradicted by the art of record, disclose that the ethyl-piperidyl form of compound performs as an antispasmodic in the stomach and duodenum and *will not perform as a lower intestinal antispasmodic*. As a matter of law and logic we think that it would not be obvious that the ethyl-pyrrolidyl form of compound would perform as an intestinal antispasmodic. Thus the Examiner erred in *ignoring* the specific teachings of the primary references, without citing other references containing specific teachings demonstrating that the specific teachings in Biel I and III could be ignored."

3. SAME—SAME—SAME.

"A person of ordinary skill in the art would consider all of the teachings in Biel I and III as well as the general teachings in the other references. It is not believed that he would consider only the *structures* of the compounds or would disbelieve specific teachings and rely only on less helpful general statements."

4. SAME—SAME—SAME—35 U.S.C. 103.

"The record thus does not support the Solicitor's position that the Examiner *in fact* 'suspected' that the compounds in Biel I possessed intestinal antispasmodic potency. Moreover, as a matter of law under 35 U.S.C. 103, the Examiner must substantiate his 'suspicions' on the basis of facts drawn from proper prior art. The issue to be resolved requires more than 'suspicions'; it requires *facts*."

5. SAME—SAME—SAME—SAME.

"The provisions of section 103 must be followed *realistically* to develop the *factual background* against which the section 103 determination must be made. *All* of the facts must be considered * * *."

6. SAME—AFFIDAVIT EVIDENCE SHOWING COMPARATIVE TESTS NOT PRIOR ART—35 U.S.C. 103.

"It is clear that the affidavit evidence [showing comparative tests of the claimed and prior art compounds] is not prior art under 35 U.S.C. 103 and may not be used alone or in combination with prior art references to support a rejection under that section."

7. SAME—COMPOUND—OBVIOUSNESS—AFFIDAVIT NOT REQUIRED WHERE ART LEADS AWAY FROM CLAIMED SUBJECT MATTER.

"Moreover, the record shows that this is not the type of case under 35 U.S.C. 103 where affidavits are needed. The prior art taught that the ethyl-piperidyl form of compound was effective as an antispasmodic for the stomach and duodenum [but not in the lower intestines]. Appellant therefore did not have to submit evidence that the potency of the claimed compounds [in the intestines] was unexpectedly superior to the potency of the prior art compounds in the intestines. He was entitled to rely on the fact that the most specific teachings cited by the Examiner, uncontradicted by the art of record, led away from what appellant claimed."

8. SAME—PARTICULAR SUBJECT MATTER—"1-SUBSTITUTED-3-PYRROLIDYL BENZILATES."

The refusal of certain claims in an application entitled "1-Substituted-3-Pyrrolidyl Benzilates," as unpatentable over the prior art, is reversed.

APPEAL from the Patent Office. Serial No. 29,156.

REVERSED.

George W. Hueschen for appellant.

Clarence W. Moore (*Fred W. Sherling* of counsel) for the Commissioner of Patents.

Before WORLEY, *Chief Judge*, and RICH, MARTIN, SMITH, and ALMOND, JR., *Associate Judges*

SMITH, *J.*, delivered the opinion of the court.

The issue in this appeal is whether the invention as embodied in the chemical compounds, defined in appealed claims 6 and 13, would be obvious in view of the teachings of the prior art references of record.[1] The claims read as follows:

6. 1-ethyl-3-pyrrolidyl benzilate hydrochloride.
13. 1-ethyl-3-pyrrolidyl benzilate methobromide.

The compounds are disclosed as being active in inhibiting intestinal spasms. The application[2] states that an object of the invention is "to provide novel acetylcholine antagonists having a high degree of activity and satisfactory activity when compared with known compounds currently in use as inhibitors of gastrointestinal motility."

Claims 6 and 13 stand rejected as "unpatentable over" the teachings of the following references:

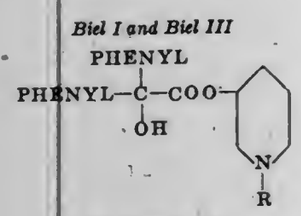
Martin et al., 2,987,517, June 6, 1961.
Biel [I], 2,918,406, December 22, 1959.
Biel [III], 2,918,408, December 22, 1959.
Ekenstam et al., 2,792, 399, May 14, 1957.
Bloxam (British), 483,258, April 14, 1938.
Richter, Organic Chemistry, Vol. 3 at p. 3 (1923).

[1] An appeal as to claims 1–5, 12 and 19 has been withdrawn.
[2] Filed May 16, 1960, Serial No. 29,156, entitled "1-Substituted-3-Pyrrolidyl Benzilates."

The two rejections made by the Examiner were treated by the Board of Appeals as follows:

Claims * * * 6 * * * [and] 13 * * * have been rejected as unpatentable over each of Biel I (2,918,406) or Biel III (2,918,408) in view of Richter and the British patent, and all the claims have further been rejected on these same references with the addition of the Martin et al. patent. The Examiner has also referred to the Ekenstam et al. patent as being cumulative in showing the equivalence of pyrrolidine and piperidine compounds. Inasmuch as the two rejections are quite similar, based upon the same references except for Martin et al., we will consider them together.

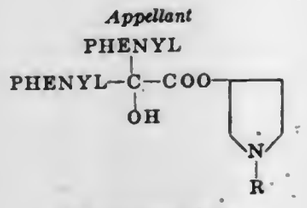
According to the Examiner,



* * * The primary references [Biel I and Biel III] disclose the corresponding homologous piperidine benzilates while the ancillary art shows the equivalence of pyrrolidine and piperidine compounds (British Patent 483,258) and the homology of pyrrolidine and piperidine (Richter's Organic Chemistry). No invention can be seen in obvious equivalents of the prior art.

In view of the manner in which we dispose of the issue presented here, we also shall consider the rejections together and shall adopt the Board's nomenclature of "Biel I" and "Biel III" in referring to these references.

Because of the nature of the issues presented in appellant's arguments, a detailed discussion of the chemistry involved in the subject matter sought to be patented and the prior art is not necessary. It will suffice to point out that concerning the "primary references," Biel I discloses antispasmodic specifics (N-ethyl-3-piperidyl benzilate compounds) which have selective action in the stomach; and Biel III discloses antispasmodic specifics (N-methyl-3-piperidyl benzilate compounds) which have selective action in the colon. The pertinent teachings of the "ancillary references" are as follows: the Richter text teaches that pyrrolidine and piperidine are adjacent members of a homologous series; the British and Martin patents were relied on to show that esters exhibiting antispasmodic activity may contain either the pyrrolidyl or the piperidyl ring; and Ekenstam was regarded "as cumulative in also showing pharmaceutical compounds containing either the pyrrolidyl or the piperidyl ring."



The structural difference between appellant's claimed compounds and those disclosed in the primary references is that the nitrogen heterocyclic rings of the claimed compounds are the five-membered pyrrolidyl rings whereas in the Biel compounds the nitrogen heterocyclic rings are the six-membered piperidyl rings, as shown in the following formulae:

Biel I and Biel III

(as onium salt)

Appellant

(as hydrochloride or methobromide salt)

Considering the closest compounds, in the appealed claims and Biel I, R is ethyl; and in Biel III, R is methyl.

Reference Teachings

Appellant argues that the rejections are improper because of certain teachings found in the primary references.

Biel I states:

Surprisingly, N-ethyl-3-piperidyl benzilate onium salts have a pronounced and selective action in the stomach, and have been found to be especially effective in the treatment of peptic ucler, without significantly altering normal tonus or motility of the stomach or intestines.

* * * * * * * *

Such unexpected specific activity in the stomach is even more surprising because the next adjacent homolog N-methyl-3-piperidyl benzilate, as the methyl bromide, does not have this specific activity but, instead, is specific for treating spasm of the colon.

Biel III states:

Surprisingly, N-methyl-3-piperidyl benzilate methonium compounds have a unique, highly selective antispasmodic action in the lower part of the gastro-intestinal tract, i.e., the colon. * * *

Such unexpected activity in the colon is even more surprising because the next adjacent homolog N-ethyl-3-piperidyl benzilate, as the methyl bromide, does not display activity in the colon but is a selective agent for peptic ulcer in the stomach and duodenum because of its action in suppressing gastric secretion and motility in this area.

For ease of consideration, the teachings of Biel I and III may be set forth as follows:

Ethyl-piperidyl Form of Compounds

1. "have a pronounced and selective action in the stomach" (Biel I)
2. "[are] especially effective in the treatment of peptic ulcer" (Biel I)
3. "[do not] significantly * * * [alter] normal tonus or motility of the stomach or intestines" (Biel I)
4. "[do] not display activity in the colon" (Biel III)
5. "is a selective agent for peptic ulcer in the stomach and duodenum because of its action in suppressing gastric secretion and motility in this area." (Biel III)

Methyl-piperidyl Form of Compounds

1. "have a unique, highly selective antispasmodic action in the lower part of the gastro-intestinal tract, i.e., the colon." (Biel III)
2. "[are] specific for treating spasms of the colon" (Biel I)
3. "[do] not have * * * [the] specific activity of [Biel I teachings 1, 2 and 3 under Ethyl piperidyl]"

Considering the teachings of the Biel references as a whole, we find that the ethyl-piperidyl form of compound is especially effective in the treatment of peptic ulcer, has selective action as an antispasmodic in the stomach and duodenum, does not display activity in the colon, and does not significantly alter normal tonus or motility of the stomach or intestines.[3] The methyl-piperidyl form of compound is especially effective in the treatment of spasm of the colon and does not display activity in the stomach or duodenum. The reference teachings convey a direct impression that each of the above forms of compounds operate in mutually exclusive areas of the gastro-intestinal tract as antispasmodics and that this is due to the influence of ethyl and methyl groups.

Appellant argues that given the teachings that the ethyl-piperidyl ring form of compound is an antispasmodic only in the stomach and

[3] The Biel compounds are effective only as to certain spasms and only in certain areas of the gastro-intestinal tract, meaning the stomach and intestines. This pinpointing of areas of effectiveness and the teachings as to the type of spasms controlled present some difficulties in interpretation of their teachings. Biel I states the compounds there have "selective action in the *stomach*" and are "especially effective in the treatment of peptic ulcer," which may occur in the esophagus, stomach or duodenum. They do not display activity in the colon, the large intestines. While Biel I compounds are effective in the duodenum, the initial portion of the small intestines, for treatment of peptic ulcer, they do not significantly alter "*normal* tonus or *motility* of the *stomach* or *intestines*." However, they are effective in reducing "either *involuntary* muscle or *nervous* spasm." For the purposes of this ex parte appeal, we think Biel I compounds are effective antispasmodics for the treatment of spasms associated with peptic ulcer in the stomach and duodenum; we also think that these compounds do not display such activity in the remaining portion of the intestines, because of the emphasis on peptic ulcer and the fact that the duodenum is but a small portion of the total intestines (approximately 1/25, the duodenum being 8–10 inches, the small intestines 20 feet, and the large intestines 5 feet).

duodenum and that the methyl-piperidyl ring form of compound is an antispasmodic only in the lower intestinal tract, it would not be obvious under the conditions of 35 U.S.C. 103 that the ethyl-pyrrolidyl ring form of compound would be an antispasmodic in the intestines, as disclosed in his application.

[1] The rejection here is under 35 U.S.C. 103. The rejection is that the differences between the subject matter as a whole and the specific teachings of Biel I and III in view of the general teachings of the ancillary references are such that the subject matter would be obvious to one of ordinary skill in the art. We think as a matter of law that 35 U.S.C. 103 requires that the specific teachings, as well as the general teachings, be evaluated as a whole for what they fairly teach.

[2] In the present case the claimed invention, considering the properties along with the structure, is clearly not obvious in view of the general teachings. It cannot be argued other than that these teachings are concerned only in a peripheral manner with the claimed invention. The Solicitor does not argue otherwise. The specific teachings, on the other hand, are closely concerned with the claimed invention. Absent any reason to the contrary, it is these teachings which a person of ordinary skill in the art would consider most pertinent and accord the most weight. The specific teachings, uncontradicted by the art of record, disclose that the ethyl-piperidyl form of compound performs as an antispasmodic in the stomach and duodenum and *will not perform as a lower intestinal antispasmodic*. As a matter of law and logic we think that it would not be obvious that the ethyl-pyrrolidyl form of compound would perform as an intestinal antispasmodic. Thus the Examiner erred in *ignoring* the specific teachings of the primary references, without citing other references containing specific teachings demonstrating that the specific teachings in Biel I and III could be ignored.

The Affidavits

The Board in its decision relied on certain evidence submitted by appellant as further establishing the obviousness of the claimed compounds. This evidence consisted of affidavits which the Board accepted as establishing that the compound of claim 13 was "4.8 times as potent as the corresponding piperidyl compound of Biel I." The Board found:

> • • • At the best, the compound of claim 13 may exhibit the same property to a somewhat enhanced degree. A mere improvement in the same property does not establish unobviousness of the claimed compounds. See *In re Lohr et al.*, 50 CCPA 1274, 794 O.G. 770, 317 Fed. (2d) 388, 137 USPQ 548, and *In re Riden et al.*, 50 CCPA 1411, 796 O.G. 863, 318 Fed. (2d) 761, 138 USPQ 112.

In its decision on appellant's petition for rehearing the Board elaborated further:

> • • • We can perceive nothing unexpected in finding that the claimed compounds have colonic antispasmodic activity, like the compounds of Biel III.
>
> Equally important is the fact that, despite the disclaimer by Biel, the ethyl substituted piperidyl compound of the Biel I patent has been shown by appellant to actually possess colonic antispasmodic activity. In short, the ethyl substituted compound of the reference actually exhibits the same type of activity as the compounds claimed by appellant in claims 6 and 13.

Appellant reasons the "discovery" (that the ethyl-piperidyl ring form of compound of Biel I does in fact possess intestinal antispasmodic properties) is his and the Board in effect used his own discovery against him.

The Solicitor in his brief does not dispute that the discovery set forth in the affidavits was used against appellant. Instead it is argued:

> • • • While appellant claims credit for this discovery, it might be noted that *the Examiner suspected such activity and required comparison* tests with the reference compounds (Br–6). Therefore, the true situation came to light, and as might be suspected, substitution of closely related groups results in a difference in potency rather than a change in activity. Thus, appellant's compounds do not have an activity which would be unexpected from the reference compounds. [Emphasis added.]

Prior to considering whether the Board erred in its use of the affidavit evidence, it must be decided whether the Solicitor's contentions are correct. We have examined page 6 of the appellant's brief cited by the Solicitor and do not find support for the Solicitor's statement that the discovery was a direct result of the Examiner's suspicions. At page 6 of his brief appellant argues:

> *Thirdly*, because the Examiner would not pay any attention to the teaching of the reference that the exactly corresponding piperidyl compounds of the prior art do *not* have intestinal antispasmodic activity, the appellant made and tested the closest representative one of them and presented actual comparative data as to the compound of claim 13 against the corresponding prior art compound having a piperidyl ring instead of the pyrrolidyl ring. In this test the appellant's compound was 480% as potent in decreasing intestinal spasm • • •.

Appellant argues throughout his brief that the Examiner *ignored* the specific teachings of Biel I and III. Additionally, he argues that the affidavits were submitted, in effect, as a last resort and that no affidavits were needed to overcome the rejection in view of the teachings in Biel I and III.

We think the record supports the finding that the Examiner *ignored* the statements in Biel I and Biel III, supra, which alleged the *methyl* and not the *ethyl* type of compounds were lower intestinal antispasmodics, and that the ethyl was effective in the stomach and duodenum. In his answer the Examiner stated:

> The argument that the "subject matter as a whole" under 35 U.S.C. 103 includes the compound and its utility is considered to be without merit. (In re Schmidt 130 U.S.P.Q. 404; In re Larsen 130 USPQ 209 at page 212, 2nd column). A bare compound will anticipate a claim to same regardless of the utility disclosed for it.
>
> The claimed compounds having been shown to be expected functional equivalents of the prior art, they are deemed obvious under 35 U.S.C. 103.

Ignoring the statement as to "anticipation,"[4] it is reasonably clear that the Examiner considered only the difference in *structures* between the claimed compounds and the prior art compounds.

Appellant was entitled to have differences between the claimed invention, *the subject matter as a whole*, and the prior art references of record evaluated. *In re Papesch*, 50 CCPA 1084, 315 F.2d 381, 137 USPQ 43. This the Examiner failed to do. We note that the Examiner's answer is dated December 13, 1961 and our decision in *Papesch* is dated March 20, 1963.

[3] A person of ordinary skill in the art would consider all of the teachings in Biel I and III as well as the general teachings in the

[4] There is no explanation for this statement in the record. It is clear from the record that there was no "anticipation" rejection, i.e., fully met in a single reference (35 U.S.C. 102(a)), before the Board nor was such a rejection presented or argued in this court. The claims stand rejected on the broader ground that the subject matter defined in the appealed claims is obvious under the terms of 35 U.S.C. 103.

other references. It is not believed that he would consider only the *structures* of the compounds or would disbelieve specific teachings and rely only on less helpful general statements.

[4] The record thus does not support the Solicitor's position that the Examiner *in fact* "suspected" that the compounds in Biel I possessed intestinal antispasmodic potency. Moreover, as a matter of law under 35 U.S.C. 103, the Examiner must substantiate his "suspicions"[5] on the basis of facts drawn from proper prior art. The issue to be resolved requires more than "suspicions"; it requires *facts*. As the Supreme Court recently stated concerning section 103:

> • • • the § 103 • • • condition [nonobviousness], when followed *realistically*, will permit a more practical test of patentability. The emphasis on nonobviousness is one of *inquiry*, not quality and, as such, comports with the constitutional strictures.
>
> • • • the § 103 condition • • • lends itself to several basic *factual inquiries*. Under § 103, the scope and content of the prior art are to be determined; differences between the prior art and the claims at issue are to be ascertained; and the level of ordinary skill in the pertinent art resolved. Against this background, the obviousness or nonobviousness of the subject matter is determined. [Emphasis added.] *Graham* v. *John Deere Co.*, — U.S. —, 148 USPQ 459, 466–67.[6]

[5] The provisions of section 103 must be followed *realistically* to develop the *factual background* against which the section 103 determination must be made. *All* of the facts must be considered and it is not realistic:

> • • • within the framework of section 103 to pick and choose from any one reference only so much of it as will support a given position, to the exclusion of other parts necessary to the full appreciation of what such reference fairly suggests to one of ordinary skill in the art. *In re Wesslau*, 53 CCPA —, — F.2d —, 147 USPQ 391 at 393.

We now return to the question of whether the Board erred in its use of the affidavit evidence. The record shows that appellant was unable to convince the Examiner that the specific teachings in Biel I and III must be considered. He then conducted experiments testing the potency of the compound of claim 13 and an ethyl-piperidyl ring form of compound from Biel I as an intestinal antispasmodic. The resulting data, demonstrating that the Biel I compound did in fact possess potency but that the compound of claim 13 was 4.8 times as potent as Biel I, was submitted in an affidavit. The Examiner and the Board reasoned that this evidence established that appellant's compounds were merely more effective than the Biel I compound as a colonic intestinal antispasmodic.[7] This reasoning ignores the critical fact that the prior art teaches that the compound in Biel I was antispasmodic for the stomach and duodenum.

[6] It is clear that the affidavit evidence is not prior art under 35 U.S.C. 103 and may not be used alone or in combination with prior art references to support a rejection under that section. *In re Lunsford*, 53 CCPA —, — F.2d —, — USPQ —. We think the Board erred in its use of the affidavit evidence.

[5] We distinguish between "suspicions," "hunches," etc., and statements of fact concerning the state of the prior art, advanced by the parties during prosecution about which there is no disagreement or challenge.

[6] The Supreme Court continues in its opinion, recognizing other considerations relevant to the inquiry under section 103:

> Such secondary considerations as commercial success, long felt but unsolved needs, failure of others, etc., might be utilized to give light to the circumstances surrounding the origin of the subject matter sought to be patented. As indicia of obviousness or nonobviousness, these inquiries may have relevancy. See Note, Subtests of "Nonobviousness," 112 U. Pa. L. Rev. 1169 (1964).

[7] While the Board refers to colonic antispasmodic activity, the affidavits cited by the Board show tests made concerning the ileum, which is ⅔ of the small intestine.

[7] Moreover, the record shows that this is not the type of case under 35 U.S.C. 103 where affidavits are needed.[8] The prior art taught that the ethyl-piperidyl form of compound was effective as an antispasmodic for the stomach and duodenum. Appellant therefore did not have to submit evidence that the potency of the claimed compounds was unexpectedly superior to the potency of the prior art compounds in the intestines. He was entitled to rely on the fact that the most specific teachings cited by the Examiner, uncontradicted by the art of record, led away from what appellant claimed.

[8] The decision of the Board is reversed.

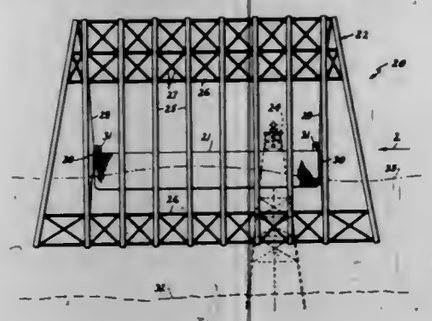
REVERSED.

WORLEY, *Chief Judge*, did not participate.

[8] The Board also expressed dissatisfaction with the data presented in the affidavits. As we do not rely on that evidence, we need not consider the Board's comments.

REISSUES

SEPTEMBER 6, 1966



Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

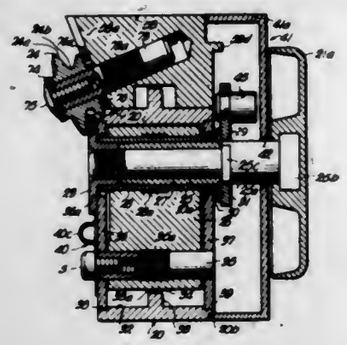
26,073
MOBILE SELF-ERECTING MARINE PLATFORMS

Ivan W. Mangone, Houston, Tex., assignor to Offshore Structures & Service Co., Houston, Tex., a partnership

Original No. 2,968,930, dated Jan. 24, 1961, Ser. No. 539,960, Oct. 12, 1955. Application for reissue Oct. 8, 1965, Ser. No. 495,768

6 Claims. (Cl. 61—46.5)

1. In a mobile self-erecting marine platform, the combination of an upstanding marginal framework having a substantially rectangular plan when erected and defining a rectangular opening at the center thereof, said framework comprising a pair of complemental half-sections of a U-shaped plan when erected, said half-sections having upper and lower edges and pairs of opposing side edges which are in abutment when the framework is erected, hinge means provided on said opposing side edges at said lower edges of said half-sections whereby the same may be swung from their erected position outwardly and downwardly to a substantially horizontal travelling position wherein their lower edges are in abutment, a substantially rectangular buoyant platform member disposed in said opening and having its marginal edges spaced inwardly from said framework, winch means carried by said platform member, cables extending downwardly from said winch means to the lower edge portions of said half-sections adjacent said hinge means whereby said framework may be raised and lowered relative to the platform member with the latter having sufficient buoyancy to float the framework when the framework is raised, and cables extending from said winch means to upper edge portions of said half-sections whereby the same may be swung between their erected and travelling positions and whereby said platform member may be raised relative to the framework when the latter is erected.



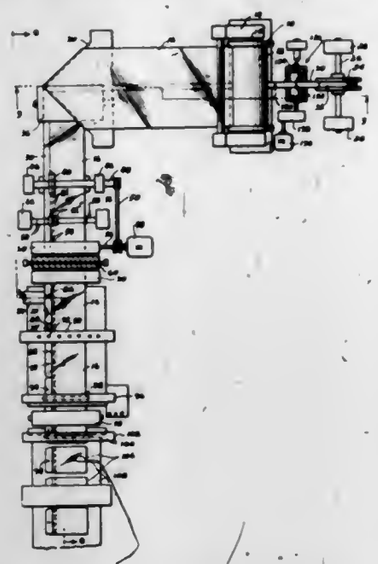
26,074
CAN OPENER *WITH IMPROVED SINGLE ACTION MECHANISM AND CUTTER MEMBER SUPPORT*

Robert E. McLean, Raytown, Mo., assignor, by mesne assignments, to Rival Manufacturing Company, a corporation of Missouri

Original No. 3,165,830, dated Jan. 19, 1965, Ser. No. 262,532, Mar. 4, 1963. Application for reissue Feb. 23, 1965, Ser. No. 455,355

12 Claims. (Cl. 30—9)

1. In a can opener, the combination of a main body having a cavity therein, a link member, means supporting said link member in said cavity on opposite sides thereof for pivotal movement about a fixed pivot axis, a feed wheel shaft journaled in said link member for rotation about an axis parallel with said pivot axis, a feed wheel mounted on one end of said shaft, a crank arm carried by said shaft, a pawl assembly connected with said main body and having means cooperating with said crank arm and operable to effect shifting of said link member between



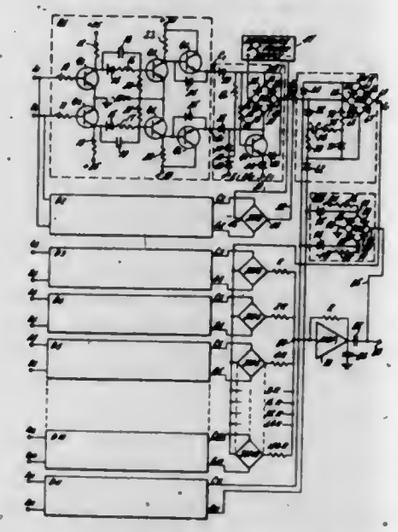
two end positions within said cavity in response to rotation of the feed wheel shaft, a cutter member, and means connecting said cutter member with said main body and supporting same so that in one of said end positions, said feed wheel is in can cutting relationship with said cutter member.

26,075
METHOD OF MAKING REINFORCED PLASTIC BAGS

Leonard E. Canno, New York, N.Y., assignor to Equitable Paper Bag Co., Inc., Long Island City, N.Y., a corporation of New York

Original No. 2,971,874, dated Feb. 14, 1961, Ser. No. 14,933, Mar. 14, 1960. Application for reissue July 2, 1962, Ser. No. 207,483

12 Claims. (Cl. 156—202)



1. The method of making plastic bags, each of which has a top compartment sealed off from the remainder of the bag and with a reinforcing strip enclosed in the sealed-off compartment, which method comprises advancing a web of plastic film from a supply source and simultaneously advancing a continuous length of the reinforcing strip with the film web, folding the web of plastic film with the strip within the fold, sealing confronting faces of the web to one another immediately below the strip to form, within the fold, a compartment enclosing the strip and extending lengthwise of the strip, also sealing the confronting faces of the web together at regions spaced from one another lengthwise of the length of the web and strip and with said regions extending transversely of the folded web, and severing the web at said regions across the full width of the web and through the strip to form separate bags.

26,076
DIRECT CURRENT DIGITAL TO ANALOG DECODER

John M. Bentley, Glen Burnie, and James H. Brown, Severna Park, Md., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Original No. 3,092,824, dated June 4, 1963, Ser. No. 130,430, Aug. 9, 1961. Application for reissue Dec. 13, 1963, Ser. No. 330,508

13 Claims. (Cl. 340—347)

1. A direct current digital to analog decoder comprising: a direct current reference voltage having outputs of both polarities; a polarity selecting switch means coupled to both outputs of said direct current reference voltage to produce the selected polarity on a single output thereof; an amplifier having an input and an output; a plurality of binary weighted resistors having output ends coupled in common to said amplifier input; a plurality of digit switch means having the inputs thereto coupled in common to said polarity selecting switch single output and their respective outputs coupled respectively to the input end of one each binary weighted resistor for selectively switching the direct current voltage of selected polarity to said resistors; and switch driver circuits each having an input to receive a digital binary register voltage signal and each having an output, the output of one switch driver circuit being coupled to said polarity selecting switch means and the outputs of the remaining switch driver circuits being coupled respectively to each one of said digit switch means to control the switching of said polarity selecting switch means, and said digit switch means in accordance with the digital binary voltage register signal combination whereby a direct current analog voltage is produced on the output of said amplifier of said digital binary voltage signal combination.

26,077
APPARATUS FOR GATHERING PLIOFILM SHEETING FROM A FIELD

Zelbert Gouker, Watsonville, Calif., and Richard C. Storkan, Los Gatos, Calif.; said Gouker assignor to said Storkan

Original No. 3,181,455, dated May 4, 1965, Ser. No. 361,401, Apr. 21, 1964. Application for reissue Apr. 7, 1966, Ser. No. 544,659

11 Claims. (Cl. 100—97)

1. Apparatus for gathering Pliofilm sheets from a field over which they lie as a fumigating cover comprising a wheeled vehicle drawn along such field adjacent one edge of such sheet, a puller on said vehicle and drivingly connected to a wheel thereof for receiving one end of such sheet for pulling the same from the field, a guide ring supported at the side of said vehicle adjacent said one edge of such sheet to receive one corner of the sheet for training the sheet into a loose narrow strand as it is pulled from the field, a guide grommet mounted on said puller between the latter and said guide ring for training the loose narrow strand coming from said guide ring into a more compacted strand as it enters said puller, and means on said vehicle for collecting said sheet material therein.

PLANT PATENTS

GRANTED SEPTEMBER 6, 1966

Illustrations for plant patents are usually in color and therefore it is not practicable to reproduce the drawing.

2,667
CRAB APPLE TREE
Albert J. Porter, Parkside, Saskatchewan, Canada, assignor to Inter-State Nurseries, Inc., Hamburg, Iowa, a corporation of Delaware
Filed Sept. 14, 1965, Ser. No. 487,345
1 Claim. (Cl. Plt.—34)

A new and distinct variety of crab apple tree, substantially as herein shown and described, characterized particularly as to novelty by its vigorous and hardy habits of growth, relative freedom from fire blight common to other varieties, a prolific annual blooming habit, attractive and relatively large white flowers which create a highly ornamental effect especially suitable for public plantings, and a sterile habit which minimizes its attractiveness to children because of the complete absence of fruit and also eliminates litter attributed to fallen fruit.

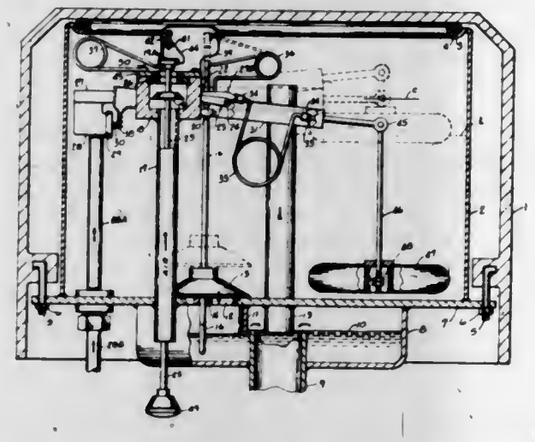
2,668
CAMELLIA PLANT
Herbert C. Swim, Ontario, Calif., assignor to Armstrong Nurseries, Inc., Ontario, Calif., a corporation of California
Filed Sept. 22, 1965, Ser. No. 489,447
1 Claim. (Cl. Plt.—62)

A new and distinct variety of camellia plant, substantially as herein shown and described, characterized particularly as to novelty by the unique combination of a moderately vigorous, upright-spreading and bushy plant habit, attractive, medium-sized, dark green, leathery and glossy foliage, a precocious flowering habit, with the flowers blooming well while the plant is still quite small and young, as compared with other *C. japonica* varieties, and a very floriferous habit, with the flowers borne both terminally and laterally on the stems, attractive, semi-double flowers of graceful, irregular form, a distinctive, attractive and bright general color tonality of the flowers corresponding to near Currant Red, with a glowing quality that is characteristic of *C. japonica* and *C. saluenensis* hybrids, a mid-season to late blooming period, and a habit of all flowers dropping cleanly as one flower.

2,669
ROSE PLANT
Andre Chabert, Paris, France, assignor, by mesne assignments, to Armstrong Nurseries, Inc., Ontario, Calif., a corporation of California
Filed Sept. 23, 1965, Ser. No. 489,772
1 Claim. (Cl. Plt.—18)

A new and distinct variety of rose plant intermediate of the floribunda and hybrid tea classes, substantially as herein shown and described, characterized particularly as to novelty by the unique combination of a more vigorous plant habit than other lavender flowered varieties, attractive, dark green, leathery, glossy, and mildew resistant foliage, good floriferousness, with flowers borne both singly and in small clusters on strong stems usually of medium length, quite double flower petalage, said flowers being of medium size and good form, and a distinctive and attractive bluish lavender general color tonality of the flowers.

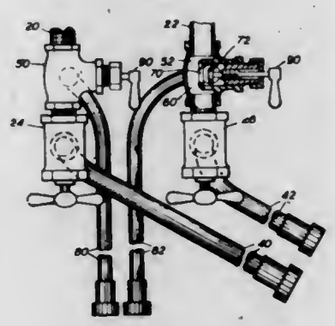
2,670
CHRYSANTHEMUM PLANT
William E. Duffett, Barberton, Ohio, assignor to Orville O. Dunham, Niles, Mich.
Filed Aug. 19, 1965, Ser. No. 481,153
1 Claim. (Cl. Plt.—78)



A new and distinct variety of chrysanthemum plant substantially as herein disclosed, characterized as to novelty by the strong orange yellow color of its blooms, the very double arrangement of its petals, and the shorter growth habit than its parent.

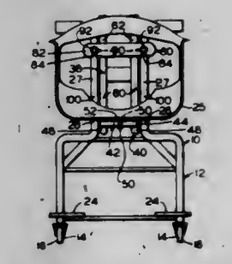
PATENTS

GRANTED SEPTEMBER 6, 1966



GENERAL AND MECHANICAL

3,270,351
TOILET FLUSHING PROCESS AND APPARATUS TO RESTORE HEIGHT OF WATER
Charles A. Adams, 614 Taylor St., Davenport, Iowa
Filed Aug. 31, 1964, Ser. No. 393,146
17 Claims. (Cl. 4—41)

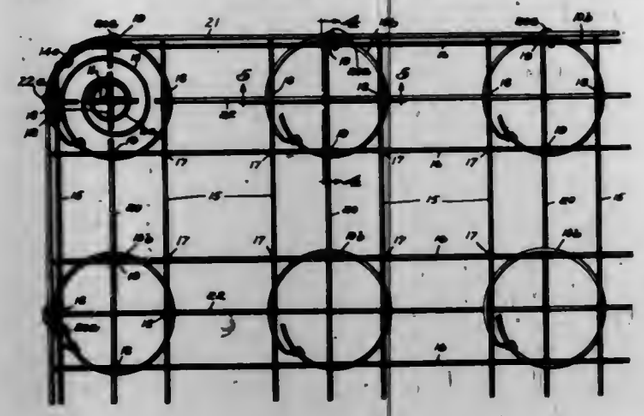


1. In cooperation with a vacuum controlled water storage tank, a water outlet in communication with a toilet bowl, a temporary water check valve for the outlet, a water service inlet valve, mechanical means adapted in one movement to lift the check valve to unseat it from the outlet and to close the service valve and in second movement to reseat the outlet valve and open the service valve, and a lost motion action in the mechanical means effective to delay reseating the check valve until after the service valve has opened.

3,270,352
PORTABLE LAVATORY PLUMBING SYSTEM
John M. Kerwin, 11022 Valley St., Omaha, Nebr.
Filed Nov. 14, 1963, Ser. No. 323,689
1 Claim. (Cl. 4—192)

In combination with hot and cold water lines each connected to a manually controllable valve, a clothes washer, hot and cold lines leading from said valves to said clothes washer, the provision of by-pass valves in said lines between said valves and the remainder of said lines, hot and cold water lines leading from said by-pass valves, a lavatory, faucet means for said lavatory having hot and cold fittings, means interconnecting said hot and cold lines from the by-pass valves and said hot and cold lavatory fittings, said lavatory having a drainage fitting, a drain pipe, a hose receiving pipe, means for connecting said hose receiving pipe to said drain pipe, a clothes washer hose disposed in operable relation to said hose receiving pipe, said means for connecting said hose receiving pipe and said drainage pipe comprising a Y fitting, a lavatory drainage hose connected to the drainage fitting of said lavatory, and in operable position with said opening of said Y fittings whereby said Y fitting receives drainage from said lavatory.

3,270,353
SECTIONAL WHEEL CHAIR ASSEMBLY
Calvin R. Berthelsen, Omaha, and Owen W. Berthelsen, Lincoln, Nebr., assignors to Century Mfg. Co., a corporation of Nebraska
Filed May 10, 1965, Ser. No. 454,380
5 Claims. (Cl. 5—81)

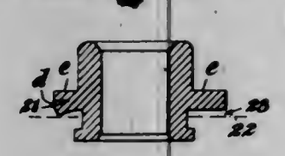


1. A sectional wheel chair assembly comprising a wheeled undercarriage, a seat, a seat-supporting lift frame having a first portion, means connecting said first portion to said seat, said seat lift frame having a second portion, first and second releasable rigid mutually interlocking means, means attaching said first rigid interlocking means to said first seat lift frame portion, means attaching said rigid second interlocking means to said carriage and said first and second interlocking means being so constructed that when said first and second interlocking means are interlocked, said first and second interlocking means are prevented from horizontally shifting with respect to each other sufficiently to substantially prevent horizontal shifting of said seat with respect to said carriage, third and fourth rigid releasable mutually interlocking means, means rigidly attaching said third rigid interlocking means to said seat lift frame whereby when said fourth rigid interlocking means is attached to a lift said seat-supporting lift frame can be lifted from said undercarriage, said third and fourth rigid interlocking means being so constructed that when they are interconnected substantially no horizontal shifting of said third and fourth rigid interlocking means with respect to each other is possible.

3,270,354
FURNITURE SPRING ASSEMBLY
Fred A. Ciampa and Angelo Serafini, East Boston, and Louis Mazzarella, Boston, Mass., assignors to Standard Box Spring Co., East Boston, Mass., a corporation of Massachusetts
Filed Jan. 7, 1965, Ser. No. 424,100
8 Claims. (Cl. 5—260)

1. A spring assembly for furniture comprising a plurality of spring coils arranged in longitudinal and transverse spaced rows, a set of longitudinal pairs of wires,

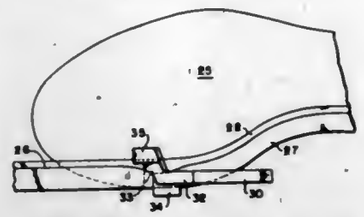
each pair overlying one of said longitudinal rows, a set of transverse pairs of wires each pair overlying one of said transverse rows and intersecting said longitudinal wires, said sets of wires being fixedly joined together at their intersections and each wire having crimps engaged with a coil intermediate adjacent intersections, a plu-



rality of longitudinal locking wires one passing through the crimps in the transverse wires engaged in each of said longitudinal rows of coils and a plurality of transverse locking wires one passing through the crimps in the longitudinal wires engaged in each of said transverse rows of coils.

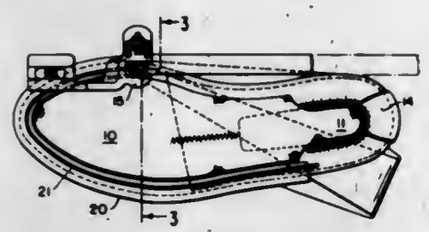
ERRATUM

For Class 8—151 see:
Patent No. 3,271,102



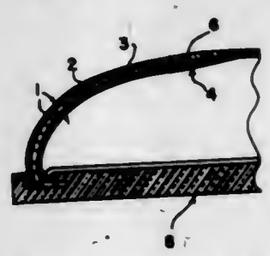
3,270,355
METHOD OF FORMING A PRESS NUT HAVING A SHROUDED SPIGOT
John Matthew Tildesley, Willenhall, England, assignor to Precision Screw & Manufacturing Company Limited, Willenhall, England, a British company
Filed Jan. 21, 1964, Ser. No. 339,253
Claims priority, application Great Britain, Feb. 12, 1963, 5,590/63; Feb. 27, 1963, 7,793/63; Aug. 9, 1963, 31,449/63
4 Claims. (Cl. 10—86)

1. A method of making a press-nut comprising a hexagonal flange having six flat edge portions and six apices and a spigot, which comprises indenting said flat edge portions of the flange by means of a chisel-like tool at positions located nearer the face of the flange from which said spigot projects than the opposite face and over substantially the entire circumferential length of each edge portion short of said apices, said indenting splitting the flange into two laminae of which the thinner is deformed to shroud the spigot and the thicker remains substantially undeformed.



3,270,356
FEED FOOT FOR A RIB APPLYING MACHINE
John R. Hubbard, Saugus, Mass., assignor to Prime Manufacturing Company, Lynn, Mass., a corporation of Massachusetts
Filed June 11, 1965, Ser. No. 463,172
4 Claims. (Cl. 12—20)

1. A feed foot for rib-laying machines, comprising an elongated body of substantially rectangular cross section terminating at its outer end in an outwardly flaring flange which is downwardly inclined from the upper surface of the body and merges into a transversely disposed downturned flange-engaging pad, a rectangular flange-engaging pad carried by the body of the foot and separated from said transversely disposed pad by a slot inclined inwardly

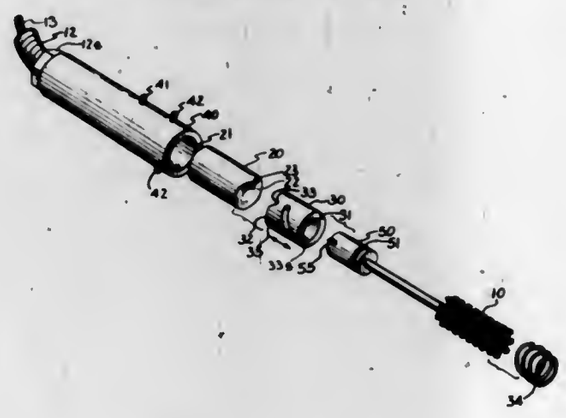


with respect to the plane of contact of the rectangular pad and located in advance of said flange-engaging pad, and a transversely extending blade in position to find and contact the fold vertex of the rib as determined by the inclined slot of the foot.

3,270,357
PROCESS OF MAKING WELT SHOES
Allan MacPherson, 14 Park Road, Brockton, Mass.
Filed Feb. 8, 1965, Ser. No. 430,823
3 Claims. (Cl. 12—142)

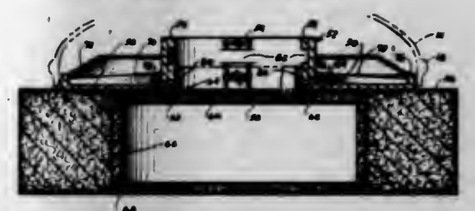
1. A process of making moccasin type shoes, comprising the steps of permanently cementing to the bottom of a lasted shoe a sole-shaped templet of material having edgewise stiffness and an inner body of yielding bottom filler consistency thereby setting off a marginal welt-receiving area and stiffening the enclosed area of the lasted shoe bottom, pulling the last, stitching a welt strip to the shoe bottom while the latter is supported by the cemented sole-shaped templet and while the welt strip is gauged progressively against the edge of the templet, and then incorporating the templet as a bottom filler into the permanent structure of the shoe by covering it with an outsole.

3,270,358
METHOD OF MANUFACTURING A SAFETY SHOE
George M. Milner, Waynesville, N.C., assignor to Ro-Search, Inc., Waynesville, N.C., a corporation of North Carolina
Filed Sept. 25, 1962, Ser. No. 226,122
2 Claims. (Cl. 12—142)



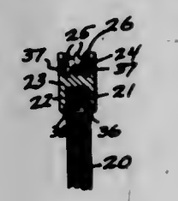
1. The method of manufacturing a safety shoe with an elastomeric sole molded and bonded and having a rigid toe cap positioned between the upper and lining of a vamp which includes the steps of placing a filler of elastomeric material at the rear edge of the toe cap between the upper and the lining before the sole is molded and bonded, and simultaneously curing said elastomeric material and molding and bonding the elastomeric sole to the vamp to produce a smooth stepless uninterrupted surface on the inside of the vamp.

3,270,359
METHOD OF SHOE PRODUCTION
Bernard Burshtyn, New York, N.Y. (1944 Unionport Road, Bronx, N.Y.)
Filed Apr. 23, 1963, Ser. No. 275,086
2 Claims. (Cl. 12—142)



1. In the method of making a shoe, the steps which comprise securing together the marginal portions of a shoe upper lining and an innersole at least about the fore part, forcing a last between said upper lining and innersole, applying and cementing a stiffener sole of selective length from the heel toward the toe against the outer face of said innersole and across the width and along the margins thereof, pulling the shoe upper over the lining, turning and securing the margin of the shoe upper to the sole area, and cementing an outer sole in position.

3,270,360
ROTARY OSCILLATORY MOTION FROM CONTINUOUS ROTARY MOTION
Willis A. Kropp, Stamford, Conn., assignor to General Time Corporation, New York, N.Y., a corporation of Delaware
Filed May 7, 1964, Ser. No. 365,623
7 Claims. (Cl. 15—22)

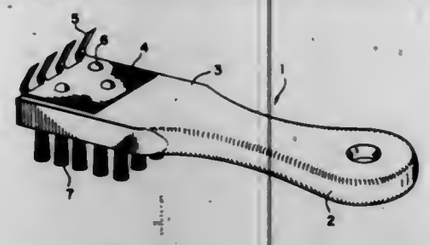


1. A mechanical transducer for converting continuous rotary motion to oscillatory rotary motion, in an electric toothbrush, said transducer comprising the combination of a continuous rotary driving mechanism, a cam member connected to said driving mechanism for continuous rotation of said cam member about an axis, a cam follower restrained against rotational movement and adapted to be displaced along said axis and engaging said cam member, said cam member displacing said cam follower linearly along said axis upon continuous rotation of said cam member, and a chuck member restrained against linear movement and having means for engaging said cam follower, the engaging means and said cam follower being adapted to oscillate said chuck member rotationally upon linear oscillation of said cam follower.

3,270,361
BASEBOARD SCRUBBING MACHINE
Nathaniel N. Okun, Cedarhurst, N.Y., assignor to The Cello Chemical Company, Baltimore, Md., a corporation of Maryland
Filed June 17, 1964, Ser. No. 375,756
8 Claims. (Cl. 15—98)

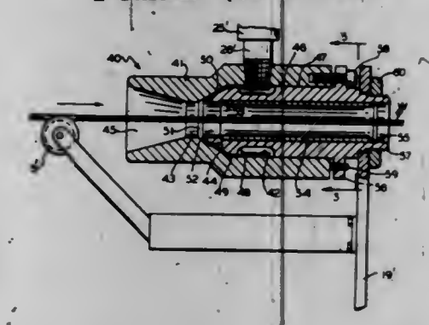
1. A tool for cleaning baseboards, said tool being designed for use on a floor scrubbing machine having a motor driven chuck and having a tank for detergent solution, said baseboard tool comprising a top plate having a hub with parts to detachably interlock with the chuck of a scrubbing machine, a cylindrical scrubber ring secured to the bottom of said plate, said ring having a diameter larger than that of the machine, the periphery of said ring being an upright cylinder having an axial dimension which is substantial and which is adequate for the baseboard to be cleaned, said ring being a body of fibrous material through which liquid will seep slowly, a disc closing the hollow inside of the ring somewhat below the top plate, said top plate having an opening over the disc, the arrangement being such that liquid supplied to the tool is thrown outward by centrifugal force above the disc to the inside of the ring and thence seeps outward and downward through the ring.

3,270,362
ELECTRICIAN'S FLEXIBLE CLEAN-OUT TOOL
Joseph J. Norton, Jr., 1711 Helmer St., Sioux City, Iowa
Filed Feb. 4, 1965, Ser. No. 430,302
2 Claims. (Cl. 15—104.3)



1. An electrician's flexible clean-out tool comprising an elongated flexible cable, a cutting device attached to one end of said cable, said cutting device including a plurality of peripherally arranged teeth, means for rotating said cable, said cutting device including an attaching member for attaching an electric cable thereto, said cutting device being substantially cylindrical and including a recessed annular portion for receiving a hooked member therein, said attaching member including an eyelet positioned centrally of said teeth.

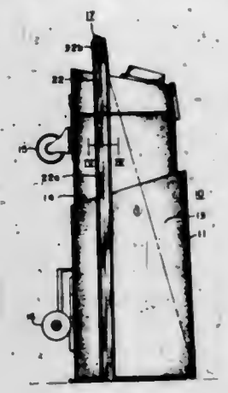
3,270,363
CLEAT CLEANER
Robert E. Harris, Jr., 1350 Cleveland Heights Blvd., Cleveland Heights 21, Ohio
Filed Mar. 11, 1964, Ser. No. 351,038
5 Claims. (Cl. 15—237)



1. A device for cleaning the cleats and exposed bottom shoe area of shoes having cleats mounted thereon, such cleats being of the type having a base portion and a conical spike portion, said device comprising a handle, a plurality of laterally spaced tines projecting outwardly from one side of said handle, and means for securing said tines

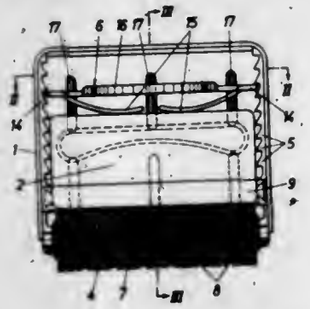
to said one side of said handle, said tines being bent at an acute angle of approximately 65° from said handle, said tines having a perpendicular height as measured from said

handle of approximately 5/8 inch, and a spacing of approximately 5/16 inch between the adjacent side edges thereof.



3,270,364
AIR WIPE DEVICE FOR WIRE
Maurice G. Steele, 312 N. George St., Rome, N.Y.
Filed Aug. 12, 1964, Ser. No. 389,163
2 Claims. (Cl. 15—306)

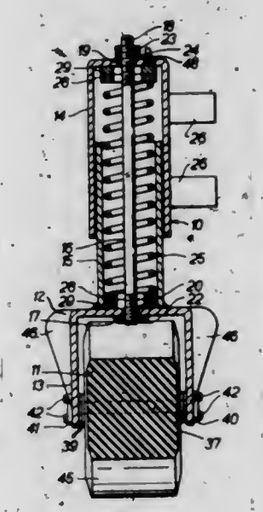
1. An air wipe device for wire, comprising: An outer body member having an axially extending passage therethrough, said passage having an enlarged cylindrical portion at one end and a restricted portion at the other end, an annular tapered female valve seat forming the wall of a portion of said passage connecting said enlarged and restricted portions, said passage at its restricted end tapering outward from said valve seat, an air inlet passage through the sidewall of said member communicating with the enlarged portion of the passage for receiving air under pressure; a tubular inner body member having a wire receiving axial passage therethrough and having an annular tapered male valve seat at one end aligned with the female seat and forming with said female seat a tapered annular orifice, the exterior of said inner body having a perimetrical portion closely fitting within the enlarged portion of the outer member passage and having on one side of said perimetrical portion an annular groove thereabout in communication with said air inlet passage, said perimetrical portion having axially disposed grooves therein communicating with said annular groove; an annular space between said outer and inner members communicating with said axially disposed grooves and said annular orifice; said outer and inner members being threadedly connected for securing the inner member within the outer member and for axially positioning the inner with respect to the outer member; and means for supporting the device for the wire to pass therethrough.



3,270,365
SUCTION CLEANER BUMPER
Robert S. Waters, Lexington, and John W. Gilliom, Mansfield, Ohio, assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Mar. 23, 1964, Ser. No. 353,747
1 Claim. (Cl. 15—325)

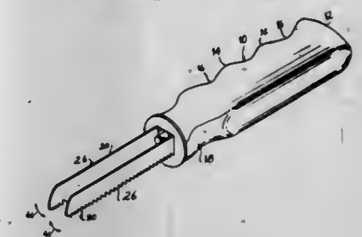
In a suction cleaner, a housing having a front wall, sloping side walls and a bottom wall, the distance between said side walls being greater at the bottom than at the top, a bumper effective as a carrying handle for said suction cleaner, said bumper comprising: a U-shaped member having a pair of curved legs immovably secured to said side walls, said U-shaped member further having a handle portion extending across said front wall and having a hand engaging surface, said curved legs extending forwardly beyond said front wall and downwardly toward said bottom wall whereby said hand engaging surface is disposed at right angles to a plane passing near the center of gravity of the suction cleaner, a resilient elongated member having diverging extensions, said U-shaped member having a cross section comprising a pair of L-shaped legs joined by a substantially

flat wall portion constituting said hand engaging surface, said L-shaped legs defining an outwardly facing opening therebetween for receiving said diverging extensions whereby said resilient member is detachably secured to said U-shaped member through coaction of said diverging extensions with said L-shaped legs, the points at which said bumper is secured to said side walls being intermediate said top and bottom walls and at a distance from said bottom wall whereby the outwardly extending surface of said resilient member extends beyond a plane passing through the lower edges of said side walls and perpendicular to the transverse axis of the cleaner.



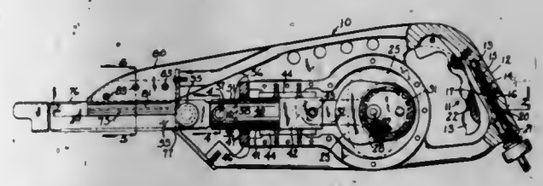
3,270,366
DEVICE FOR APPLYING CLEANING AND TREATING MATERIALS
Karl Maichen, 34 Bahnhofstrasse, Lauterach, Austria
Filed Oct. 23, 1964, Ser. No. 405,920
Claims priority, application Austria, Oct. 28, 1963, A 8,588; Apr. 9, 1964, A 3,092
5 Claims. (Cl. 15—559)

1. A device for applying cleaning and treating materials, comprising a container for holding a bar of the cleaning and treating material to be applied including a housing with an opening for the introduction of the bar of material to be applied, a cover for closing the housing when the device is out of use, said cover when applied leaving a vent opening in the container, a brush roller rotatably mounted in said housing and having a surface portion protruding therefrom, said brush roller being adapted to contact the bar of cleaning material to



pick up particles therefrom and being rollable on a surface to be cleaned to apply the cleaning particles, ratchet teeth provided on two opposite walls of the housing and directed toward the roller, and a resilient bridge engageable with said bar of cleaning material and gripped between the teeth on opposite walls, said bridge including two resilient leaves snapped in behind a pair of opposed ratchet teeth and being connected to each other by at least one element formed of resilient material, the said leaves being further provided with resilient extensions projecting toward the brush for exerting a force on a bar of cleaning material toward said roller.

3,270,367
NO BOUNCE CASTER ASSEMBLY
Edward Loos, 503 E. 19th Ave., Vancouver, British Columbia 10, Canada
Filed Oct. 18, 1965, Ser. No. 497,434
4 Claims. (Cl. 16—19)

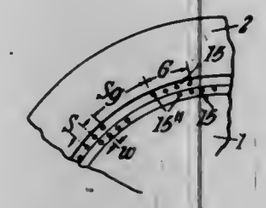


1. A caster adapted to support a heavy implement and to remain in rolling contact with a surface when supporting said implement, said caster comprising:
(a) a flanged plate having an upper surface and a lower surface;
(b) a wheel journalled for rotation between the flanges of said plate;
(c) an inner cylinder extending vertically upwardly from the upper surface of said plate and secured thereto;
(d) an outer cylinder having an upper end and a lower end telescoped over said inner cylinder, the lower end of said outer cylinder being adapted to be in end abutting relationship to said upper surface of said plate, said plate having a dimension greater than the diameter of said outer cylinder, said outer cylinder being normally urged away from said plate so that the lower end of said outer cylinder is spaced vertically from said upper surface of said flanged plate;
(e) a partially closed upper end on said outer cylinder defining a centrally located aperture;
(f) an axially extending rod secured to said plate and extending upwardly therefrom through said aperture;
(g) means cooperating with an end of said rod extending through said aperture to limit axial movement of said outer cylinder with respect to said inner cylinder;
(h) a compression spring in said inner cylinder bearing against said plate and said partially closed end of said outer cylinder to urge said outer cylinder away from said plate; and
(i) means on said outer cylinder to secure said outer cylinder to said implement.

3,270,368
FISH SCALING DEVICE
George L. Cook, Sr., and Russel H. Bloom, Atlanta, Ga., assignors to Julian B. Rozier, East Point, Ga.
Filed Oct. 7, 1964, Ser. No. 402,281
1 Claim. (Cl. 17—7)

A first scaling device comprising:
(a) a handle of a generally elongated cylindrical configuration having finger indentations thereon,
(b) said handle defining a hole of rectangular cross-section at one end thereof,
(c) two blades supported by said handle by having one end of each blade inserted into said rectangular hole on opposite sides thereof,
(d) means for supporting said blades in said handle comprising:
(1) a resilient cylindrically shaped tube disposed between said blades in said hole, and
(2) plug means wedged in said tube whereby said tube is forced against said blades,
(e) each of said blades having serrations on one side thereof with one edge of the serration being substantially perpendicular to the longitudinal axis of the blade and the other edge of said serration joining the outer end of one perpendicular serration near said handle to the inner end of another perpendicular serration away from said handle.

3,270,369
RECIPROCATING SAW
Orville William Mandell, Clinton, Conn., assignor to Jarvis Corporation, Guilford, Conn., a corporation of Connecticut
Filed Oct. 2, 1964, Ser. No. 401,075
9 Claims. (Cl. 17—23)

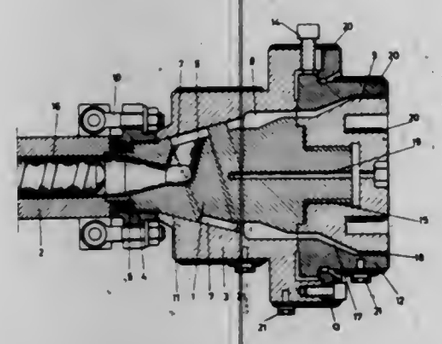


4. In a reciprocating saw, a housing, a ram at least partially enclosed within said housing, means for driving said ram in a reciprocating motion, said ram having a rectangular portion, and a round portion, said round portion extending forward of said rectangular portion and projecting partially from said housing and four flats positioned within said housing and forming guide means for preventing said rectangular portion from twisting during the use of said saw.

3,270,370
EXTRUDED PLASTIC NET
Frank Brian Mercer, Blackburn, England, assignor to Plastic Textile Accessories Limited, Blackburn, England, a British company
Filed Oct. 30, 1963, Ser. No. 320,031
Claims priority, application Great Britain, Nov. 6, 1962, 41,964/62
3 Claims. (Cl. 18—12)

1. In apparatus for continuously extruding integral plastic netting in tubular form comprising a pair of co-

axial, circular, relatively rotating die members each having a circumferentially extending series of cooperating complementary die orifices, and means for relatively rotating said die means to move the cooperative complementary die orifices into and out of registration one with the other during extrusion; the improvement which comprises die members wherein the circumferentially intending series of die orifices in each die member are arranged in spaced groups, the spacing between groups being at least as large as the arcuate extent of each

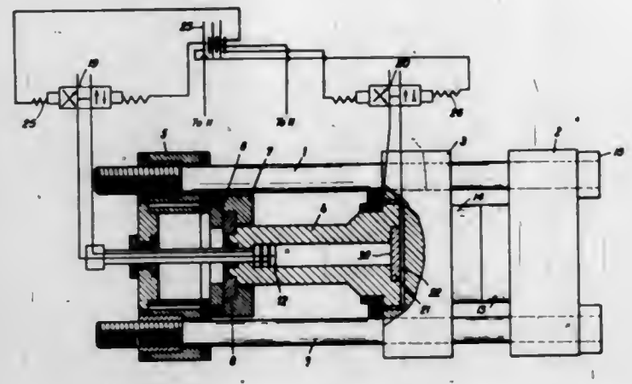


group in the series, and the spacing between orifices in each group being such, in relation to the orifice size, that plastic extruded through the grouped die orifices of one die member when passing in register with the complementary grouped die orifices of the other die member coalesce whereby the individual identities of the parallel and the crossing net strands merge to form bulk net intersections in which substantially no separation of individual strands persists.

3,270,371
AXIAL EXTRUDER HEAD WITH MANDREL FOR EXTRUDING HOLLOW PROFILES

Hans-Otto Schiedrum, Kelkheim, Taunus, and Kurt Worret, Frankfurt am Main, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning, Frankfurt am Main, Germany, a corporation of Germany

Filed Mar. 15, 1965, Ser. No. 439,739
Claims priority, application Germany, Mar. 18, 1964, F 42,356
4 Claims. (Cl. 18—14)



1. An axial extruder head with mandrel for extruding hollow profiles which comprises a mandrel carrier being directly connected to the extruder cylinder and carrying the housing of the extruder head by means of a conical fit, a channel system serving as passage for the material from the extruder to the orifice, said channel system beginning centrally in the mandrel carrier and leading at at least one position radially through the mandrel carrier to the exterior to at least one spiral channel between the mandrel carrier and the housing of the extruder head and finally ending in an annular channel for the distribution of the material between the mandrel and the housing of the extruder head.

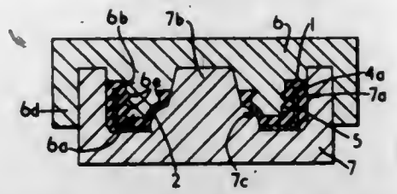
3,270,372
EXTRUSION MOLDING MACHINE

Heinrich Hesse, Rheydt, Germany, assignor to Mannesmann-Meer Aktiengesellschaft, Monchen Gladbach, Germany, a corporation of Germany

Filed Aug. 21, 1963, Ser. No. 303,477
Claims priority, application Germany, Apr. 30, 1963, M 56,649
1 Claim. (Cl. 18—30)

An extrusion molding machine to process synthetic thermoplastic materials comprising

a frame with guide bars,
a tool plate fixedly mounted to the frame,
a stationary mold-half fixed on the tool plate,
a second tool plate mounted slidably on the frame,
a traversing mold-half on the slidable tool plate and a sliding shift cylinder, both mold-half and cylinder being mounted as a unit,
a source of electrical energy,
an hydraulic fluid supply,
a stationary shift piston fitted within the shift cylinder,
a supporting end plate attached to the frame at that point which is most remote from the stationary mold-half unit at full open position,
shift cylinder and traversing mold-half unit operating means,
in combination with a rotary mechanism mounted concentrically with respect to the shift cylinder to lock the mold halves together comprising
a bayonet mount abutting the supporting end plate and carried thereon,
a toothed abutment ring immovably fixed to the shift cylinder so as to slide therewith,
a notched bayonet ring disposed in the bayonet mount and rotatable relatively to the toothed abutment ring,
an actuating lever connected to the notched bayonet ring,
and hydraulic drive apparatus connected to the actuating lever to operate the rotary locking mechanism.



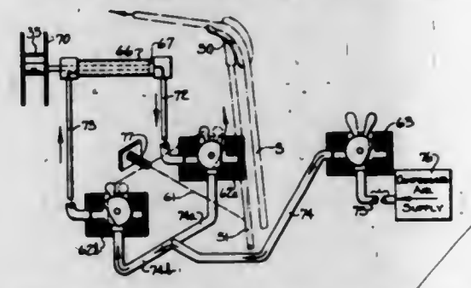
3,270,373
APPARATUS FOR THE MANUFACTURE OF REINFORCED SEALING OR PACKING RINGS

Ernest Thornton Jagger and Edward Ivison Hunter, Newcastle upon Tyne, England, assignors to George Angus & Company Limited, Newcastle upon Tyne, England

Continuation of application Ser. No. 177,076, Mar. 2, 1962. This application Apr. 23, 1965, Ser. No. 450,293
Claims priority, application Great Britain, Mar. 15, 1961, 9,446/61
4 Claims. (Cl. 18—36)

1. An apparatus for forming an annular U-section sealing ring of flexible and resiliently deformable material comprising: a female die having a central spigot, an annular flange, and a bottom, said spigot, flange and bottom forming sides of an annular U-section space in said female die; a male die having a bottom and an annular U-section projection extending outwardly from said

bottom, the dimensions of the U-section of the male die being smaller than the dimensions of the annular U-section space of the female die; said male die being designed to mate with the female die to form an annular U-shaped cavity having an inner limb, a bottom, and an outer limb, the said projection forming the inside of the U

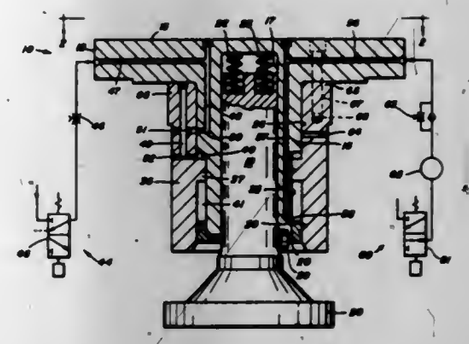


of the cavity and the said sides of the space forming the outside of the U-section cavity; and said male die having at least one circumferential groove on the outer side of its annular projection, said groove being positioned on the inner side of the outer limb of the cavity which is formed when the male member is mated with the female member.

3,270,374
CARD STOP MOTION

James H. Yon, Jr., Charlotte, N.C., assignor to Jett Mfg. Corp., Charlotte, N.C., a corporation of North Carolina

Filed Dec. 9, 1963, Ser. No. 329,004
8 Claims. (Cl. 19—.25)

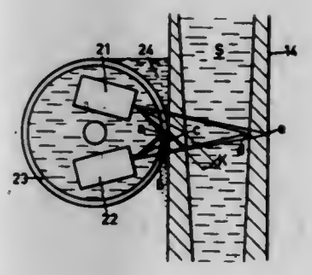


1. A stop motion for a carding machine comprising in combination, a movable sliver detector arranged to engage an advancing sliver formed by said carding machine, means on said carding machine for controlling the advance of said sliver, pneumatically operated means for actuating said control means, valve means including a movable element for operatively communicating said pneumatically operated actuating means with an associated source of fluid pressure, means for yieldingly urging said movable element against said sliver detector, said sliver detector with said movable element in engagement therewith being maintained in one position by said advancing sliver against said urging means to operate said pneumatically operated means with said fluid pressure through said valve means and actuate said control means for continuous advance of said sliver, said sliver detector with said movable element in engagement therewith being movable to a second position by said urging means upon the occurrence of a break or a reduction in tension in said sliver to operate said pneumatically operated actuating means with said fluid pressure through said valve means and actuate said control means to stop the advance of said sliver.

3,270,375
JOLTING MECHANISM FOR FOUNDRY APPARATUS

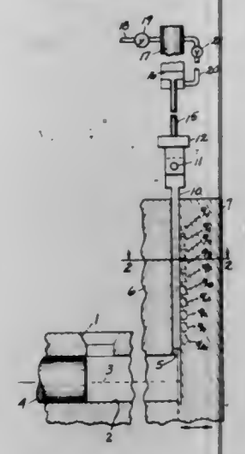
Lester C. Young, Cleveland, Ohio, assignor to Spo Incorporated, a corporation of Ohio

Filed Apr. 23, 1965, Ser. No. 450,351
13 Claims. (Cl. 22—45)



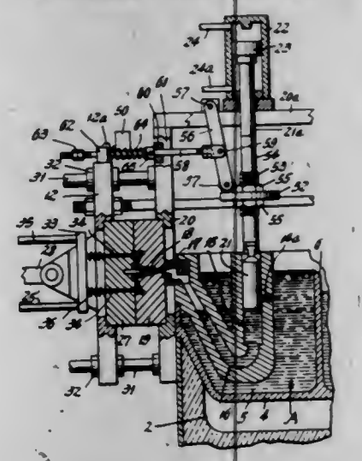
1. Apparatus for imparting a series of rapid blows to a device including a table member, a cylinder member connected to said table member and extending therefrom, a piston member cooperating with said cylinder member and movable between first and second positions with respect thereto, said piston member having a portion engageable with said table member, said cylinder and piston members defining first and second chambers, first port means for introducing gas under pressure into said first chamber in said first position of said piston member and causing said portion thereof to move away from said table member toward said second position, second port means for exhausting said gas under pressure in said first chamber to atmosphere in said second position of said piston member, third port means for introducing gas under pressure into said second chamber, movement of said piston member from said first to said second position causing further compression of said gas under pressure in said second chamber to a still higher degree and with exhausting of gas under pressure through said second port means said piston member is moved rapidly back toward said first position and said portion thereof imparts a blow to said table member.

3,270,376
METHOD AND APPARATUS FOR CONTINUOUS CASTING UTILIZING SOLIDIFIED SKIN THICKNESS DETERMINATIONS



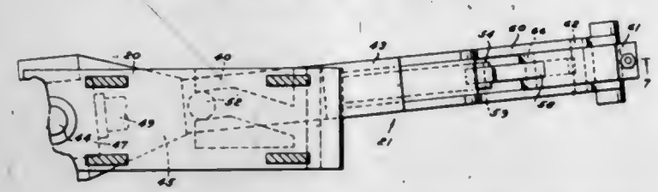
Armin Thalmann, Uster, Zurich, Switzerland, assignor to Concast A.G., Zurich, Switzerland

Filed Oct. 29, 1962, Ser. No. 233,723
Claims priority, application Switzerland, Nov. 4, 1961, 12,794/61
10 Claims. (Cl. 22—57.2)



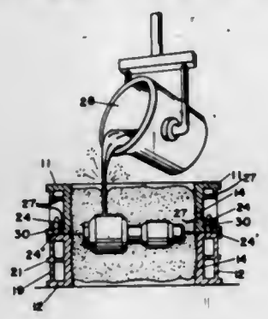
1. The method of continuous casting which comprises the steps of continuously casting molten metal into a mold, cooling said mold to solidify the metal along the periphery to form a strand having a solidified skin enclosing a molten core, withdrawing said strand from said mold in continuous manner, cooling said strand to progressively solidify the molten metal in said core, measuring the thickness of the solidified skin of the strand enclosing the molten core and controlling the casting process in accordance with said measurement of the skin thickness to maintain the skin thickness enclosing the molten core with sufficient material to withstand working operation according to the metal to be cast.

3,270,377
DIE CASTING MACHINE
Robert W. Parker, Erie, Pa., assignor to Parker White Metal Company, Fairview, Pa., a corporation of Pennsylvania
Filed Mar. 30, 1964, Ser. No. 355,655
7 Claims. (Cl. 22—68)



4. In a die casting machine, a stationary die, a movable die closed against the stationary die, a sprue between the dies, a plurality of cavities respectively fed from different sections of the sprue spaced along its length, a chamber in the stationary die communicating with one end of the sprue, means for forcing molten metal under pressure from the chamber into one end of the sprue, and means for producing a back pressure retarding movement of the metal along the sprue to compel sequential filling of the cavities under pressure.

3,270,378
DIE CASTING APPARATUS
Albert Madwed, Bridgeport, Conn., assignor to Automatic Casting Corporation, Bridgeport, Conn., a corporation of Connecticut
Filed Jan. 16, 1964, Ser. No. 338,084
9 Claims. (Cl. 22—70)



1. In a die casting machine having separable die parts and means for moving said die parts to closed position to form a die cavity and to open position for removal of a casting therefrom, a pot, a shot cylinder having a fill-port communicating with the pot, a gooseneck and nozzle connected with the shot cylinder, a shot plunger in the cylinder means for traveling the plunger from a starting position above the fill-port to close the fill-port and force molten metal from the cylinder through the gooseneck and nozzle into the die cavity and for returning the plunger to its starting position: the improvement comprising mechanical stop means for positively arresting the return movement of the plunger before it passes the fill-port and opens the same to the cylinder; and means actuated by the movable die part as an incident to the opening movement of the latter for causing said stop means to be rendered inoperative to arrest the plunger and hence permit movement thereof to starting position above the fill-port after the die parts have separated.

3,270,379
DIE CAST UNLOADER
Francis J. Sehn, Bloomfield Hills, and Maurice M. Clemons, Franklin, Mich., assignors to Press Automation Systems, Inc., Detroit, Mich., a corporation of Michigan
Filed Aug. 15, 1963, Ser. No. 302,353
3 Claims. (Cl. 22—94)

1. In combination a die casting unloader comprising a swinging arm mechanism adapted for direct mounting on a die casting machine, a die casting machine having tie bars extending in the direction of die movement in opening and closing, said swinging arm mechanism having a plane of operation substantially normal to the direction of die movement in opening and closing, said swinging arm movement including a jaw mechanism, means for actuating said jaw mechanism to engage the sprue of a die casting when the die casting machine is open and to extract it from one of the dies in a direction generally corresponding to the direction of die opening, and means for actuating said swinging arm mechanism to remove the die casting to a position outside of the machine and to release the same, said die casting unloader including a frame, said swinging arm mechanism including linkage pivotally connected to said frame, a fluid pressure cylinder for actuating said linkage, and a fluid pressure cylinder for actuating said jaw mechanism, said jaw mechanism and associated fluid pressure cylinder including means for converting piston movement of said associated fluid pressure cylinder to initially effect jaw closure and secondarily effect die casting extraction during successive portions of piston movement.

3,270,380
FOUNDRY FLASK
Russell W. Taccone, Erie, Pa., assignor to Taccone Corporation, Erie, Pa., a corporation of Pennsylvania
Filed Feb. 2, 1965, Ser. No. 429,785
1 Claim. (Cl. 22—110)

A flask made up of a cope and drag each having integral walls extending completely therearound and defining an enclosure open at the top and bottom,

said walls comprising an inner wall and an outer wall,

said cope and said drag each having a top flange integrally attached to the top of said inner wall and extending outwardly therefrom,

a bottom flange integrally attached to the lower edge of inner wall and extending outwardly therefrom,

said outer wall of said cope and said outer wall of said drag each being integrally attached to the outer ends of the respective said flanges thereof whereby said inner walls, said outer wall and said flanges define a box like section forming said integral walls,

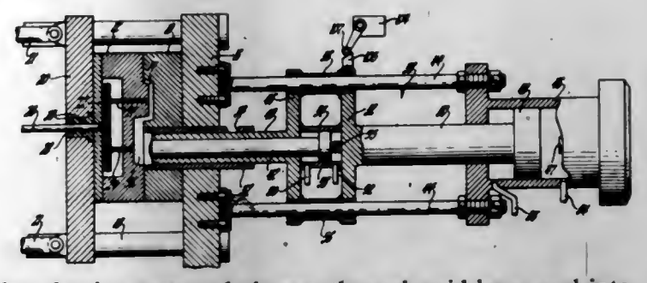
said drag having a locating pin attached to its said upper flange and extending outwardly therefrom,

a recess formed in said outer wall of said cope and plates attached to said inner wall and extending outwardly and attached to the marginal edges of said recess in said outer wall,

an opening in the lower of said plates and an opening in said bottom flange in vertical alignment with said opening and said bottom flange,

said cope being attached to rest on said drag with said bottom flange of said cope resting on said top flange of said drag and said locating pin extending through said openings.

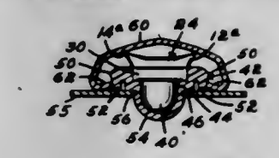
3,270,381
PRODUCTION OF DUCTILE FOIL
Hugh R. Smith, Jr., Piedmont, Calif., assignor to Temescal Metallurgical Corporation, Berkeley, Calif., a corporation of California
No Drawing. Filed Aug. 4, 1965, Ser. No. 477,298
6 Claims. (Cl. 22—200)



1. A process for the manufacture of dense ductile metallic foil by vacuum evaporation comprising, vaporizing a metal bearing coating material within a vacuum, condensing at least a portion of the metallic content of the vaporized coating material upon a substrate within the vacuum, maintaining the temperature of the substrate above a minimum substrate temperature of at least about 25 percent of the melting point of the condensed material in degrees Kelvin, and removing the condensed material from the substrate in the form of a dense ductile metallic foil.

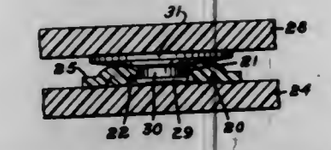
3,270,382
SHELL MOULD PROCESS
Harold Garton Emblem, Grappenhall, and Earl Whiteway Fothergill, Liverpool, England, assignors to Philadelphia Quartz Company, Philadelphia, Pa., a corporation of Pennsylvania
No Drawing. Filed Nov. 5, 1963, Ser. No. 321,401
Claims priority, application Great Britain, Nov. 16, 1962, 43,525/62
10 Claims. (Cl. 22—196)

1. A method of making a shell mould which comprises applying to an expendable pattern alternately a coating of gel-forming acid-hydroylsed alkyl silicate solution and a coating of a gel-forming basic silicate ester material comprising an amino alkyl silicate, refractory material being suspended in at least one of the liquids used to form the coatings, the acid-hydrolysed solution and the basic silicate ester of the applied coatings each acting upon the other so as to cause the gelation of the other.



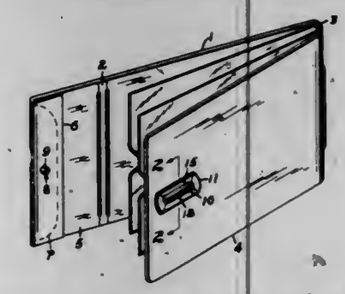
3,270,383
METHOD OF DIE CASTING
Harry D. Hall, Birmingham, David C. Salatin, Royal Oak, Don R. Sutherland, Mount Clemens, and Clayton J. Trible, Berkley, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed June 24, 1963, Ser. No. 289,903
10 Claims. (Cl. 22—200)

1. The method of die casting comprising the steps of moving by means of a plunger a molten metal mass into the cavity of die casting dies through a substantially non-restricted passage at a velocity such that a substantially solid front of the molten metal enters the die cavity, maintaining pressure on the molten metal by means of said plunger until substantially only a layer of the metal has solidified adjacent the said die cavity and passage walls to arrest the further application of pressure on the molten portions of the meal mass by said plunger, and



then forcing a second plunger through said layer and into the molten interior portion of the metal mass to maintain pressure on the molten portions of the mass until it has solidified.

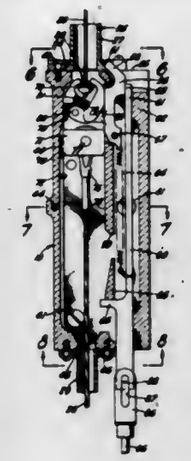
3,270,384
MOLDING FASTENER WITH PENETRATING PRONGS
Stefan Bätz, Sindelfingen, Wurttemberg, Heinrich Overhoff, Lorrach, Baden, and Karl Stark, Sindelfingen, Wurttemburg, Germany, assignors to A. Raymond, Baden, Germany, a firm
Filed Jan. 20, 1964, Ser. No. 339,020
3 Claims. (Cl. 24—73)



3. The combination of a fastening device, molding, and a support, said fastening device comprising a stud assembly and a socket element, said stud assembly comprising a shell element and a plug element, said shell element being formed of a hardened, resilient metal and including an arced substantially rectangular base having at least one prong extending from each corner of said base, said prongs defining continuations of the arc provided by said base, each of said prongs terminating in a sharp tip, said plug element being formed of a plastic material and comprising a foundation portion and an integral barrel portion extending from said foundation portion, said base of said shell element having a pair of arms extending therefrom in directions generally opposed to said prongs, and having means of engaging said barrel portion, said means having an aperture formed therethrough, said socket element comprising a support portion having an engagement aperture formed therein and a socket portion in the form of a closed end tube extending from said support portion and having its axis coincident with that of said engagement aperture, and having a pair of bar portions extending from said support portion in spaced substantially parallel relationship and a pair of engagement portions connecting said bar portions to provide a rectangular area, said engagement portions having a pair of leg portions extending therefrom, and said support having a support aperture formed therethrough, said socket portion having a part thereof engaged within said support aperture, said engagement aperture formed in said support portion having a diameter which, when said barrel portion is not inserted in said engagement aperture, is slightly less than the diameter of said barrel portion, an edge of each of said engagement portions engaging a part of said barrel portion, said foundation portion being in abutting relationship with said support adjacent said support aperture, and said molding being in the form of a channel providing a pair of wings in spaced opposed relationship, each of said wings engaging a leg portion extending from said foundation portion.

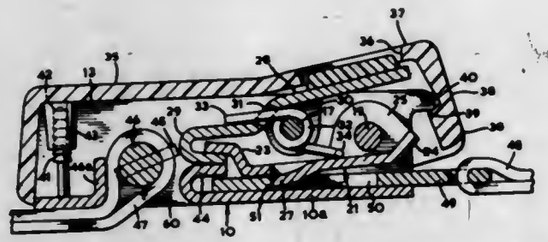
3,270,385
HEAT-SEAL FASTENER ASSEMBLY
Everett Melanson, Wakefield, Mass., assignor to United-Carr Incorporated, a corporation of Delaware
Filed Mar. 27, 1964, Ser. No. 355,348
1 Claim. (Cl. 24—216)

An assembly comprising in combination a support and a snap fastener socket, said socket having a base portion, a flange in the form of a pellicle of heat sealable material surrounding said base portion, an annulet extending from a surface of said base portion, and a thin inner wall integral with said base portion and defining an aperture in said base portion and co-operating with said annulet to provide a cavity capable of receiving a stud in snapping engagement with said socket, said flange being heat sealed to said support at its surface adjacent said annulet.



3,270,386
ADJUSTABLE FASTENER
Stuart T. Shears, Belmont, Mass., assignor to United-Carr Incorporated, a corporation of Delaware
Filed Oct. 3, 1963, Ser. No. 313,470
3 Claims. (Cl. 24—217)

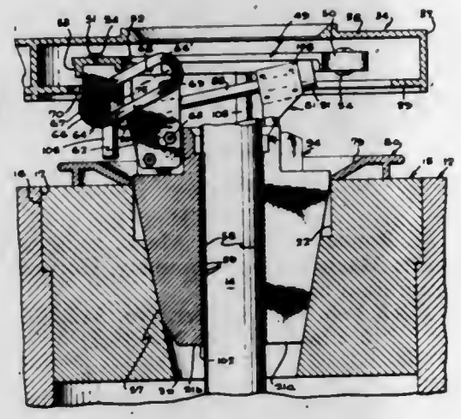
1. A means for securing two overlapping panels in releasable, slidable relationship relative to each other comprising, in combination, a first panel having a snap fastener stud secured thereto and a second panel having a snap fastener socket secured adjacent an opening therein, said socket member being of generally oblong shape and including a metal housing having a generally flat base portion with upper and lower surfaces, side walls and end walls turned downwardly from said upper surface to provide a shallow recess adjacent said under surface, a resilient plastic insert conforming in size and shape to said recess overlying the entire under surface of said base, a pair of opposed, U-shaped runners formed as an extension of the side walls of said housing, portions of which overlie a substantial area of said insert to maintain the latter in said recess and other portions of which are secured to said second panel along edges defining said opening, and a pair of generally aligned oblong slots formed in and extending over a major portion of said base and said insert, said stud being seated in said slots in snap engagement with said insert and being freely movable along the length of said slots to allow for relative sliding adjustment of said panels.



3,270,387
FLEXIBLE ENCLOSED CABLE OPERATING AND DISCONNECT MECHANISM
Wallace F. Ziegler, Glendale, and Norris D. Whitehill, Tujunga, Calif., assignors, by mesne assignments, to Walter Kidde & Company, Inc., a corporation of New York
Filed July 2, 1964, Ser. No. 379,780
11 Claims. (Cl. 24—230)

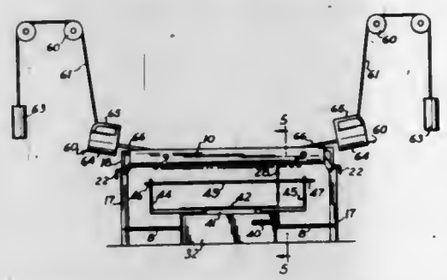
2. In a mechanism to sequentially operate and disconnect a tension actuated cable and enclosing sheath, the combination of: a latch having means for engaging and retaining the sheath, said latch movable between positions for retaining and releasing the sheath, release means mounted for engaging and locking said latch in the sheath-retaining position and movable to a position for permitting movement of said latch to release the sheath, a movable slide mechanism having releasable claw means for

grasping the cable, said slide mechanism movable through an adequate distance for operating the tension actuated cable, means for engaging said claw means and retaining the cable-grasping position thereof during said actuating movement and then releasing said claw means, and said slide mechanism engaging and moving said release means to release the sheath upon the actuating movement of said slide mechanism.



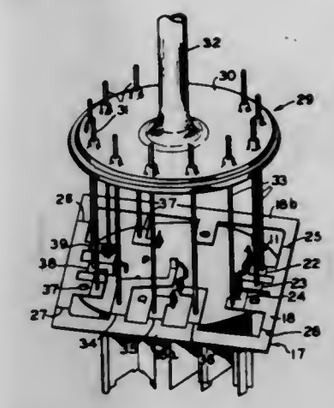
3,270,388
BUCKLE FOR A SAFETY BELT
Frederick H. Humphrey, Markham, Ontario, Canada, assignor to Alnwick Investments Limited, Nassau, Bahamas
Filed June 22, 1965, Ser. No. 465,976
10 Claims. (Cl. 24—230)

1. A buckle for a belt, said buckle comprising a base member; first and second level members; a catch member carried by said first lever member; means pivotably mounting said first lever member on and above said base member about a first pivot axis for movement of said catch member towards and away from said base member, said catch member when moved towards said base member being adapted to engage a catch engageable part of a tongue of a belt when the tongue is inserted between said base member and said first lever member and to disengage from the catch engageable part moved away from said base member; means pivotably mounting said second lever member on the side of said first lever member remote from said base member about a second pivot axis parallel to said first pivot axis; parts of said first and second lever members being coupled together at a point spaced from but on the same side of both of said pivot axes so that movement of the end of said second lever member on the other side of said second pivot axis towards said first lever member lifts the part of said first lever member carrying said catch member; spring means



biasing said one end of said second lever member away from said base member and biasing said part of said first lever member towards said base member; a cap member having an opening therein; and means for securing said cap member fixed in position on said base member with said cap member positioned over said first and second lever members but with said one end of said second lever member being accessible through the opening in said cap member.

3,270,389
POWER DRIVEN WELL SLIP STRUCTURE
Guy W. Kingsbury, Long Beach, Calif., assignor to Abegg & Reinhold Co., Los Angeles, Calif., a corporation of California
Filed Mar. 15, 1965, Ser. No. 439,780
11 Claims. (Cl. 24—263)



4. Slip apparatus comprising a carrier to be received above a well drilling rotary table, a plurality of slips supported from said carrier, and means suspending said slips movably from said carrier and including a hanger having a lower portion connected to and suspending one of the slips, and a guide connected to an upper portion of the hanger and mounting it and the suspended slip for retracting movement relative to said carrier along a longitudinal axis of the guide and for swinging movement about said axis.

3,270,390
DISPENSER
Forrest H. James, Jr., Opelika, Eldridge H. Cockrell, Auburn, and Thomas D. Nixon, Opelika, Ala., assignors to Diversified Products Corporation, Opelika, Ala., a corporation of Alabama
Filed Sept. 16, 1963, Ser. No. 308,975
7 Claims. (Cl. 25—41)

1. A dispenser for aggregate material comprising a trough for containing said aggregate material, spouts extending from said trough for feeding aggregate material from said trough, a vibrator for supporting containers to be filled in positions and for receiving said aggregate material from said spouts, and a relatively movable external vibrator including vibrator rods selectively positionable within said trough for vibrating said aggregate material therein.

3,270,391
ELECTRON DISCHARGE DEVICE ASSEMBLY AND METHOD FOR MANUFACTURE THEREOF
Francis R. Linehan, Owensboro, Ky., assignor to General Electric Company, a corporation of New York
Filed Aug. 31, 1964, Ser. No. 393,259
5 Claims. (Cl. 29—25.15)

1. In the manufacture of electron discharge devices having an insulating stem supporting a plurality of stem-leads of equal, predetermined length in parallel, axial relation thereon and an electrode cage including an electrode structure mounted on an insulating support, the electrodes of said electrode structure including connector surfaces extending through said insulating support wherein selected ones of said stem-leads are to be electrically connected to associated ones of said connector surfaces, a method of assembly comprising:

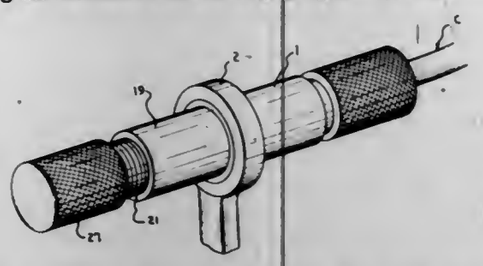
(a) cutting said stem-leads to an equal, predetermined length,

(b) forming a planar interconnecting plate into a configuration providing a plurality of interconnecting bands to be connected to the inner end of said selected ones of said stem-leads and to the electrode connector surface associated therewith and providing rupture seams delineating between said interconnecting bands and a peripheral portion of said interconnecting plate,

(c) supporting said interconnecting plate in a horizontal plane,

(d) supporting said stem with said stem-leads depending vertically therefrom and with each of said stem-leads vertically aligned with, and displaced from, said associated ones of said interconnecting bands,

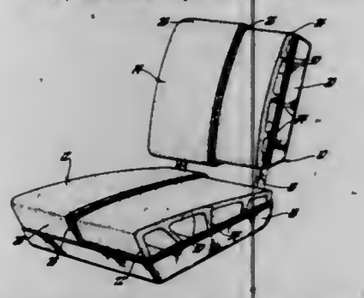
(e) connecting said selected ones of said stem-leads and said interconnecting plate to a source of electrical energy to establish an electrical potential difference therebetween,



(f) moving said stem and said interconnecting plate relative to each other to bring said selected ones of said stem-leads into forging engagement with said associated ones of said interconnecting bands to effect a percussive weld therebetween, and

(g) removing said peripheral portions of said interconnecting plate by breaking said rupture seams.

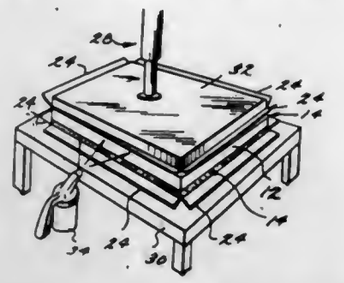
3,270,392
COAXIAL CONNECTOR TOOL
Henry W. Demler, Lebanon, and George W. Ziegler, Jr., Carlisle, Pa., assignors to AMP Incorporated, Harrisburg, Pa.
Filed Oct. 14, 1963, Ser. No. 315,787
16 Claims. (Cl. 29—33)



1. A device for applying coaxial connector members to a coaxial cable means comprising hollow body means, means on said body means to secure one end of said cable means to said body means, and means on said body means adjacent the end of said cable means to guide and apply

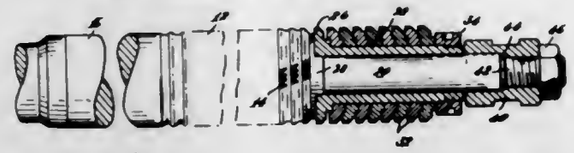
a connector member to a conductor means so that said connector member is mechanically and electrically secured thereto, wherein said securing means includes a chuck device having inclined jaw members, a sleeve member having an inclined surface engaging said jaw members,

means on said jaw members to bias said jaw members against said inclined surface, and means on said body means to move said chuck device and said sleeve relative to each other so that said chuck device is moved into a position engaging said cable means and another position disengaging said cable means.



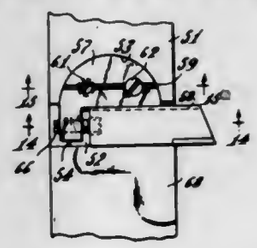
3,270,393
METHOD FOR FORMING RESILIENT PLASTIC SEAT ELEMENTS
John J. Levenson, St. Clair Shores, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Original application Dec. 13, 1962, Ser. No. 244,475, now Patent No. 3,222,698, dated Dec. 14, 1965. Divided and this application Mar. 23, 1964, Ser. No. 353,951
6 Claims. (Cl. 29—91.1)

1. A method for making a vehicle seat cushion comprising extruding a resilient material through a die, said die being adapted to form a truss design in the extruded strip, transversely cutting the strip into desired seat width lengths, blanking the necessary openings for mounting said lengths, applying padding to the upper surface of said seat length extrusion, securing a seat cover over said extrusion and said padding, and attaching said extrusion to a seat frame by means of said mounting openings.



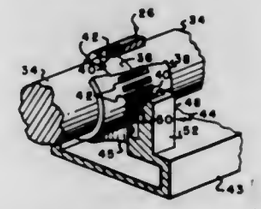
3,270,394
METHOD OF MANUFACTURING CUSHIONS
John A. Marsh and George W. Armfield, High Point, N.C., assignors to Marsh-Armfield, High Point, N.C., a corporation of North Carolina
Original application Mar. 19, 1964, Ser. No. 353,222. Divided and this application Aug. 19, 1965, Ser. No. 487,650
5 Claims (Cl. 29—91.1)

1. A method of assembling a cushion comprising a cover and a filler which includes a slab-like backbone member of resilient but somewhat stiff material and at least one batt of loosely-matted fibers overlying at least one side of said backbone member, the steps comprising: assembling in overlying relation and in the order stated a first cover part, a batt having generally the same configuration but of smaller outline than said first cover part so that marginal edge portions of the latter extend beyond the edges of said batt, a backbone member of generally the same configuration but of smaller outline than said first cover part, and a second cover part generally coextensive with said first cover part; compressing the assembly to a predetermined extent in a direction transverse to the direction of its major dimensions; applying an adhesive to the peripheral edges of the filler and to the inner



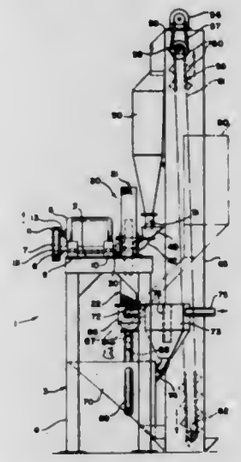
surface of the marginal edges of the cover parts; folding the marginal edges of the cover parts into overlapping relation against the peripheral edges of the filler whereby said marginal edges become bonded to each other and to the peripheral edges of the filler; and decompressing the assembly.

3,270,395
BROACH
Oliver W. Bonnafe, Hudson, Mass., assignor to The Lapointe Machine Tool Company, Hudson, Mass., a corporation of Maine
Filed Feb. 3, 1964, Ser. No. 342,295
8 Claims. (Cl. 29—95.1)



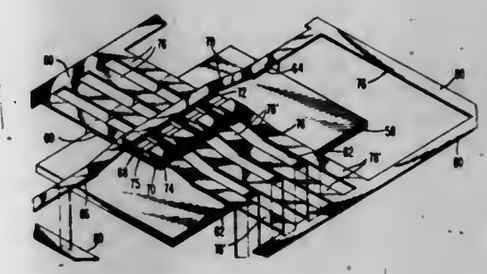
1. A broach comprising a support, a plurality of cutters, each cutter having peripherally thereof a plurality of radial teeth disposed at an angle to the axis of the support such that the teeth on successive cutters form helical rows of teeth lengthwise of the support, and means nonrotatably mounting the cutters on the support with the teeth on successive cutters in any helical row lengthwise of the support spaced axially by an amount corresponding to the lead of the helix divided by the number of helical rows of teeth.

3,270,396
BIT HOLDER
Thurston V. Williams, Wilton, N.H., assignor to The O.K. Tool Company, Inc., Milford, N.H., a corporation of New Hampshire
Filed Feb. 25, 1965, Ser. No. 435,278
2 Claims. (Cl. 29—105)



1. A tool comprising a carrier part movable in a predetermined direction, the carrier having a recess defined by a bottom and two sides, one side facing in said direction and the other side facing in the opposite direction, in said recess a bit bearing on one of said sides and a locator part bearing on the other of said sides, said bit and locator part having abutting surfaces to prevent movement of the bit relatively to the locator toward said bottom, a screw extending through the locator into engagement with said bottom to adjust the bit and locator relatively to said bottom, means for locking the locator in adjusted position, and means for adjusting said bit parallel to said bottom, said means including a screw threaded in one of said parts and bearing on the rear end of the bit.

3,270,397
AIR DRAFTING ARRANGEMENT
Robert M. Ingham, Jr., Norman E. Klein, and Richard V. Putnam, Spartanburg, S.C., assignors to Deering Milliken Research Corporation, Spartanburg, S.C., a corporation of Delaware
Original application Aug. 14, 1963, Ser. No. 302,211. Divided and this application Oct. 23, 1964, Ser. No. 405,913
2 Claims. (Cl. 29—121)



1. A drafting roll for a drafting system comprising: an elongated one-piece solid shaft member, a plurality of narrow annular grooves formed in said shaft member, a one-piece collar member telescoped over each of said narrow annular grooves, said collar members having an internal diameter substantially equal to the external diameter of said shaft member, a plurality of notches in the periphery of each of said collar members and an aperture in each of said notches providing communication with said annular groove.

3,270,398
METAL SHOT PRODUCING METHOD
Orald L. Stewart, Lakewood, Ohio, assignor to The Cleveland Metal Abrasive Co., Cleveland, Ohio, a corporation of Ohio
Filed May 7, 1965, Ser. No. 454,090
3 Claims. (Cl. 29—148.4)

1. A method of increasing the yield of fine metal shot from a single heat of metal comprising:
pouring a heat of molten metal and interrupting the stream to produce randomly sized metal shot particles;
segregating said shot into a plurality of groups by size;
crushing the shot of a selected size to form metal grit;
segregating said grit into a plurality of groups by size;
impacting at least one of said groups of grit against a target;
collecting said impacted grit and impacting it against a target again;
repeating said impacting until said grit is formed into the approximate shape of said shot, thereby supplementing the inventory of fine shot produced from said heat.

3,270,399
METHOD OF FABRICATING SEMICONDUCTOR DEVICES
Frederick F. Ohntrup, Plymouth Meeting, Pa., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Filed Apr. 24, 1962, Ser. No. 189,752
4 Claims. (Cl. 29—155.5)

1. The method of fabricating semiconductor circuit assemblies comprising the steps of:
(a) providing a dielectric supporting member with a plurality of discrete parallel conductors and other conductors arranged in a repeating discontinuous pattern adjacent an edge portion of said dielectric supporting member thereby providing a strain relief build-up for conductors which are to be attached thereto,
(b) registering a plurality of semiconductors on certain ones of said parallel conductors in a desired pattern,
(c) conductively bonding said semiconductors to the conductors of said dielectric member while so registered,
(d) orthogonally registering a conductive element of a self-supporting conductive grid with the conductors bearing said semiconductors so that the element of said conductive grid extends at right angles to the conductors of said dielectric member, and in alignment with said strain relief forming conductors and meeting the latter conductors at a slight depthwise angle thereto,
(e) conductively bonding said semiconductors to the conductors of said grid and to said strain relief conductors so that the forces developed in connecting said assembly to a receptacle are distributed over said strain relief conductors and are not transmitted to said semiconductors, and
(f) encapsulating said assembly but leaving the ends of certain of said conductors of said dielectric member exposed for interconnection to a utilization device.

3,270,400
PROCESS OF MAKING NIOBIUM STANNIDE BODIES
Eugen J. Saur, 20 Jahnstr., Giessen, Germany
No Drawing. Filed Aug. 9, 1963, Ser. No. 301,167
3 Claims. (Cl. 29—155.5)

1. A method of making electromagnets, such as solenoids and the like, comprising the steps of preparing an elongated superconductor with a thin layer of Nb_3Sn and excess tin on a refractory metal base, electrically insulating the superconductor with an insulation capable of withstanding temperatures in the range of from at least 200° C. to about 800° C., winding the superconductor

into a solenoid, testing the solenoid to detect any loss of critical current in the wire, then heating the solenoid between 200° C. and the upper temperature limit of the insulation whenever a lowering of critical current capacity is indicated by the test for a time sufficient to restore at least a portion of the lost critical current capacity but less than the period required to consume all of the excess tin.

3. A method of making superconductive elements comprising the steps of preparing adjacent layers of niobium and tin, heating the layers at 900–1200° C. to form a diffusion layer of Nb_3Sn and excess tin, testing the resultant product for critical current, working the resultant product into a desired shape and retesting for critical current, and heating the superconductor between 200° C. and 600° C. whenever lowering of the critical current capacity is indicated, the heating being continued for a sufficient time and sufficiently low temperature to restore a substantial portion of the critical current without reacting all the excess tin.

3,270,401

METHOD AND APPARATUS FOR PRODUCING INSULATED ELECTRICAL CONDUCTOR

John Staley and Thomas E. Lewis, Louisville, Ky., assignors to Reynolds Metal Company, Richmond, Va., a corporation of Delaware

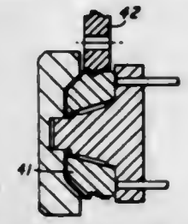
Original application Jan. 7, 1957, Ser. No. 632,809. Divided and this application Aug. 28, 1962, Ser. No. 226,194

8 Claims. (Cl. 29—155.57)

1. In a method of producing an insulated metal conductor by the operation of an electrolytic bath and an anodic element partially submerged in said bath and including electrically conductive means and isolating means, the steps comprising: introducing an elongated metal strip continuously into simultaneous contact with said bath and said anodic element, with said conductive means contacting one side of said strip over an area which is large in comparison with the cross-sectional area of said strip, said isolating means contacting the same side of the strip as said conductive means and preventing said bath from contacting either said conductive means or the portion of said strip in contact with said conductive means, and said bath contacting the other side of said strip; passing an electrical current from said both through the thickness of said strip to said conductive means, with substantially no electrical current flowing from said bath through said isolating means to said conductive means, thereby forming a thin coating of insulating material only on the portion of said strip which is not in contact with said conductive means or said isolating means; and withdrawing the insulated strip from said bath and from contact with said anodic element.

4. In a method of producing a completely insulated electrical coil, the steps comprising: producing according to claim 1 an insulated electrical conductor in the form of a single strip; and thereafter winding said conductor upon itself so that the uncoated portion of each turn is covered by the coated portion on the adjacent side of the next turn.

3,270,402



WHEEL MANUFACTURE

George Edward Adams and George Henry Whale, Coventry, and John Harry Arthur Hanson, New Cubbington, near Leamington Spa, England, assignors to Dunlop Rubber Company Limited, London, England, a British company

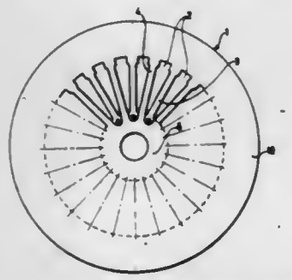
Filed Nov. 5, 1963, Ser. No. 321,453

Claims priority, application Great Britain, Nov. 7, 1962, 42,017/62

5 Claims. (Cl. 29—159.01)

1. Method of making a wheel having a load supporting disc part and a rim part as a seamless unitary structure which comprises pressing a substantially flat disc shaped blank by pressing operations to shape the radially outward zone of the blank to form the rim part, rolling the portion of the rim remote from the disc portion to a reduced diameter, pressing the reduced diameter portion of the rim axially toward the disc portion to form the axially outer surface of a lock-ring gutter adjacent to the disc portion, expanding the reduced diameter portion of the rim radially outwardly from said gutter wall and rolling the rim against a profile roller to its final rim and gutter form.

3,270,403



METHOD OF MAKING A SPOKED WHEEL

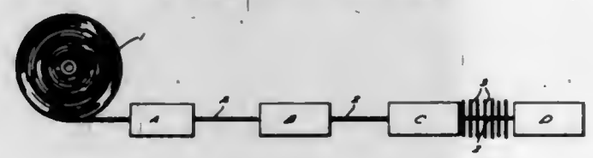
Johannes Hendrikus Bullens, Best, Netherlands, assignor to N.V. Metaalindustrie Caja, Acht (Eindhoven), Netherlands, a limited-liability company of the Netherlands

Filed June 14, 1963, Ser. No. 287,877

Claims priority, application Netherlands, June 18, 1962, 279,852

4 Claims. (Cl. 29—159.03)

1. A method of making a spoked wheel comprising cutting from a flat, circular metal plate a series of angularly spaced, radial directed, wedge-shaped pieces which, at their ends, are spaced from the periphery of the plate and from the center of the plate, thereby to define, between the resulting cutouts, a series of spokes joined at their outer ends to a continuous rim-forming annular portion and at their inner ends to a central portion destined to form a first hub-holder, severing the alternate spokes from said central portion to form eyes at inner ends of said alternate spokes, bending each of said spokes into a U-shaped cross-section along a length of the spoke between the opposite ends thereof, bending said annular portion into a U-shaped cross-section opening at one side and having a relatively short inner leg extending from the spokes perpendicular to the original plane of the plate and a relatively long outer leg also perpendicular to said original plane, then bending said outer leg against said inner leg to form a rim of generally U-shaped cross-section opening radially outward and having a double-wall at one half of the rim where a portion of said outer leg lies against said inner leg, bending said alternate spokes having eyes at their inner ends so that the latter are to one side of a plane extending through the center of said rim, forming a disk with a circular series of projections extending perpendicularly therefrom and being spaced apart by distances corresponding substantially to the width of said spokes at the inner ends thereof, engaging said inner ends of the spokes having eyes between successive projections of said disk, and securing said eyes to said disk so that the latter constitutes a second hub-holder.



3,270,404

METHOD OF MAKING METALLIC SHELVING

Alfred E. O. Andreassen, Waterloo, Iowa, assignor to Chamberlain Corporation, Waterloo, Iowa, a corporation of Iowa

Filed Aug. 6, 1963, Ser. No. 300,271

8 Claims. (Cl. 29—160)

1. The method of making a metallic shelf structure, including the steps of

feeding and unrolling cross-bar stock from a supply coil,

severing cross-bar lengths from said stock in a manner to provide a projecting tongue on each end of a cross-bar,

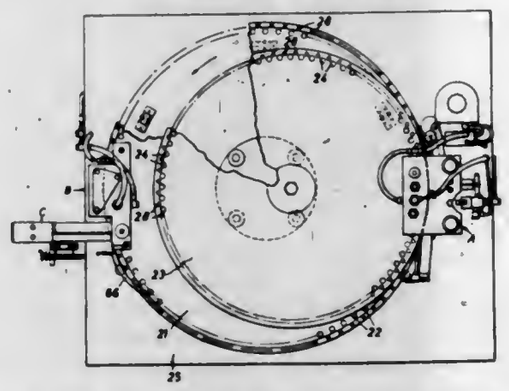
placing each cross-bar on edge,

notching each cross-bar by downward pressure to provide spaced notches therealong with a widened saddle at the base of each notch,

placing wires in said notches on said saddles,

flattening the upper marginal portion of each cross-bar into a T-shape by downward pressure between said notches in a manner to cause said flattened portions to overlie the wires and anchor the same in said notches, and

riveting said tongues to shelf side members.



3,270,405

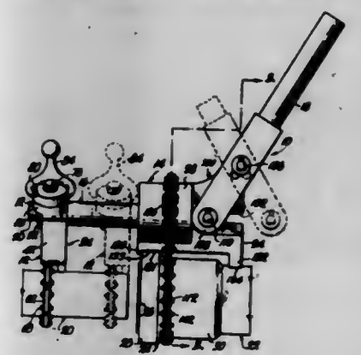
MACHINE FOR ASSEMBLING LIPSTICK COMPONENTS

Edward Webster, Poole, Dorset, England, assignor to Edward Webster Limited, Hampshire, England, a British company

Filed Oct. 25, 1963, Ser. No. 319,054

7 Claims. (Cl. 29—208)

1. A machine for assembling components of the type adapted to be slid and telescoped one into another comprising a first circular table having adjacent to its periphery a series of spaced holes to receive components, a first vertical axis about which said first table is rotatable, means for rotating said first table step-by-step about said first axis, a second circular table of a diameter smaller than the diameter of said first table wholly superimposed on said first table and having adjacent to its periphery a series of spaced holes to receive components, a second vertical axis offset from said first vertical axis and about which said second table is rotatable, means for rotating said second table step-by-step about said second axis, holes in the two tables registering at least one point after each angular step-by-step movement of the tables, and intermittently operating means actuating in synchronism with the tables to force a component in a hole in one of said tables into engagement with a component in a hole in the other of said tables at a point where said holes are in registry.



3,270,406

PIPE FITTING TOOL

William B. Gorman, 6607 N. Wayne, Kansas City, Mo., and John P. Gorman, 2527 Lee St., Simi, Calif.

Filed Mar. 1, 1965, Ser. No. 436,234

11 Claims. (Cl. 29—237)

1. A tool for telescopically joining a first section of pipe with a second section of pipe comprising:

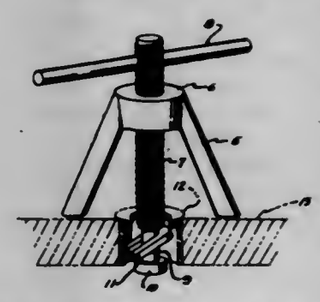
a first assembly for gripping said first section of pipe;

a shaft reciprocably carried by said first assembly;

a second assembly operatively connected to said shaft for gripping the second section of pipe;

aligning means carried by said assemblies for maintaining said first and second sections of pipe in axial alignment, said aligning means including head means shiftably mounted on said shaft; and

means coupled with said shaft for reciprocating the same to thereby effect relative movement between said first assembly and said second assembly so that on reciprocation of said shaft said first section of pipe is telescopically joined with said second section of pipe.

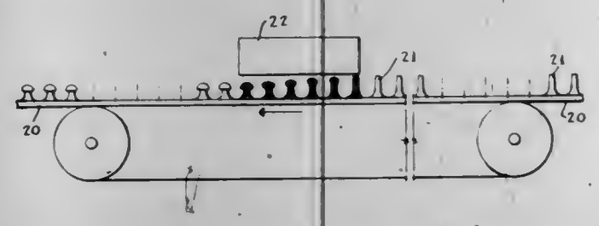


3,270,407

SCREW THREADED FREEZE PLUG PULL-OUT TOOL WITH WORK ENGAGING MEANS

Nat E. Araujo, 3837 S. Main, Fort Worth, Tex.

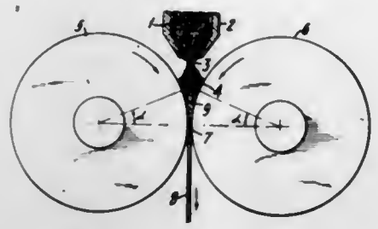
Filed Aug. 3, 1964, Ser. No. 386,871



1 Claim. (Cl. 29—259)

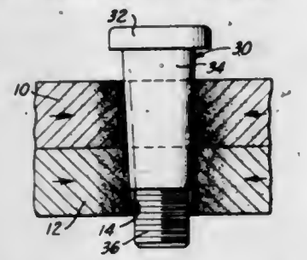
A plug pull-out tool, for removing a plug from an engine block, with said plug having a hole drilled therein for receiving an end of said tool, said tool comprising

means to engage side walls of said hole, a V-shaped support to straddle the plug to be removed, said V-shaped support having a threaded opening extending through the apex thereof and bisecting the V, a screw in threaded engagement with said opening, a handle secured to the end of the screw extending outward from the apex of the V-shaped support, a reduced cylindrical portion extending axially from the end of said screw within the V-shape support, said means to engage the side walls of said hole, comprising a flat U-shaped member positionable on said reduced cylindrical portion in an inclined manner, a button head of substantially the same diameter as said screw secured to the outer end of said reduced cylindrical portion, adapted to retain said U-shaped member on said reduced portion, whereby the reduced cylindrical portion with the U-shaped member in an inclined position can be inserted in the hole of said plug, upon rotation of said screw said U-shaped member assumes a position at right angle to said cylindrical portion, and upon continuing rotating said screw will force the U-shaped member to bear against the walls of the hole and thereby remove the plug from the engine block.



3,270,408
SEPARABLE INTERLOCKING FASTENERS AND METHOD OF MAKING THEM
Raymond N. Nealis, 11 Harvest Road, Levittown, Pa.
Application Aug. 13, 1962, Ser. No. 216,613, now Patent No. 3,191,255, dated June 29, 1965, which is a continuation of application Ser. No. 847,841, filed Oct. 21, 1959. Divided and this application May 4, 1965, Ser. No. 453,151
4 Claims. (Cl. 29—408)

1. The method of forming fastener units which comprises: providing a base sheet of flexible plastic material with upstanding integral, flexible elements and heating each element progressively in a direction from its end toward the base sheet to an extent to cause the material of the element to flow transversely and toward the base sheet so that the element is progressively shortened in length and the flowing of the material forming a mass of larger cross section than the cross section of the element and then cooling the mass, the mass forming a head on the element.

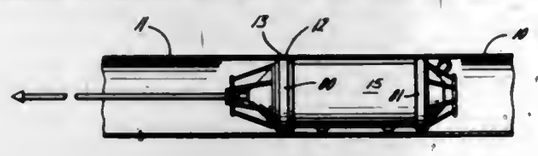


3,270,409
PRODUCTION OF FLAT SHAPES BY THE HOT ROLLING OF METAL POWDERS
Nicholas J. Grant, 10 Leslie Road, Winchester, Mass.
Filed Feb. 19, 1963, Ser. No. 259,651
13 Claims. (Cl. 29—420.5)

1. A method for continuously hot consolidating metal powders into wrought elongated flat shapes which comprises continuously gravimetrically feeding free flowing hot coarse metal powder of melting point above 1100° C. to the nip of a pair of rolls having an effective roll gap, said powder being fed at a temperature above the minimum recrystallization temperature of the metal and having a shape which insures free flowability and a relatively high apparent density at said temperature, continuously maintaining a reservoir of the free flowing hot metal powder against the metal drawn into the gripping zone of the rolls sufficient to continuously feed metal into the gripping zone, the surface characteristics of the rolls relative to the metal powder being such as to provide a gripping angle with the metal corresponding to a coefficient

of friction of at least 0.1, such that the cross-sectional width of the reservoir of the powder across the rolls at which the gripping zone begins is at least sufficient relative to the effective roll gap to provide a compaction ratio for effectively densifying the metal, and continuously hot rolling the metal powder into a wrougth metal shape.

3,270,410
METHOD OF PRESTRESSED FASTENING OF MATERIALS
Larry Salter, Palos Verdes Estates, and Franklin S. Briles, Rolling Hills, Calif., assignors to Briles Manufacturing, El Segundo, Calif., a co-partnership
Filed May 20, 1963, Ser. No. 281,550
3 Claims. (Cl. 29—446)

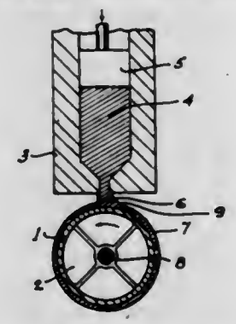


1. A method of prestressed fastening of layers of material which comprises the steps of: providing a tapered bore through the layers of material to be fastened; applying expansive force to the layers of material substantially uniformly and simultaneously throughout substantially the entire depth of the bore until the elastic limit of the material has been exceeded; relieving the expansive force; and providing an interference fit between a tapered fastening device and the tapered bore so as to prestress the layers of material under compression in the area surrounding the tapered bore.

3,270,411
METHOD FOR PREPARING AND GIRTH WELDING PIPE ENDS
Robert Thomas, Houston, Tex., assignor to American Machine & Foundry Company, New York, N.Y., a corporation of New Jersey
Filed Apr. 22, 1963, Ser. No. 274,722
7 Claims. (Cl. 29—471.1)

1. In a method for welding together the adjacent ends of pipe joints which have been strung along a pipeline right-of-way in approximate end-to-end positions, the steps comprising
measuring adjacent ends of the pipe joints to determine if the diameter of any one of a pair of adjacent ends is sufficiently smaller than that of the other end of said pair that the ends cannot be satisfactorily welded together;

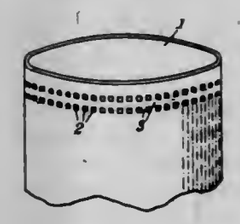
radially expanding the circumference of any such smaller end by applying sufficient expansive force thereto to exceed the yield of the metal of the smaller



end until its diameter is such that it can be welded to said other end; and
then girth welding said ends together.

3,270,412
METHOD OF PRODUCING DISPERSOID STRENGTHENED MATERIAL
Milton B. Vordahl, Beaver County, Pa., assignor to Crucible Steel Company of America, Pittsburgh, Pa., a corporation of New Jersey
No Drawing. Filed June 7, 1962, Ser. No. 200,626
7 Claims. (Cl. 29—472.3)

1. A method of producing stable dispersoid strengthened base metal articles comprising:
(a) rolling the metal to foil;
(b) applying to the foil a coating of a stable dispersoid forming material selected from the group consisting of metal oxides, nitrides, borides, silicides, carbides, and sulfides which are stable and insoluble in the base metal at temperatures up to the maximum end use application temperature of the article;
(c) forming laminae by cutting the coated foil into desired lengths;
(d) stacking a plurality of laminae into a pack for rolling;
(e) rolling the pack to a reduced thickness;
(f) repeating the cutting, stacking and rolling steps until a unitary article is obtained wherein the laminae are welded together to form a continuous metal matrix and wherein submicron-sized particles of the stable dispersoid material are substantially uniformly distributed throughout the matrix volume.

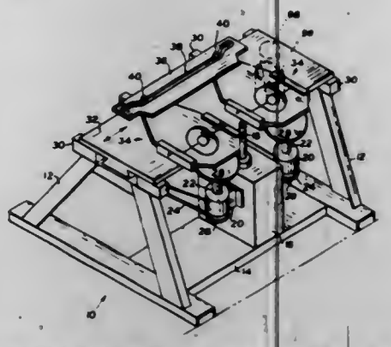


3,270,413
PROCESS FOR PRODUCING A DIFFUSIONLESS BOND BETWEEN METALS
Robert D. Watson, Deep River, Ontario, Canada, assignor to Atomic Energy of Canada Limited, Ottawa, Ontario, Canada, a corporation
Filed Dec. 2, 1963, Ser. No. 327,311
3 Claims. (Cl. 29—527)

1. A method of forming a leak-proof bond between aluminum and one of the metals of the group zirconium, zirconium alloys, uranium, and stainless steel comprising:
(a) forming a thin oxide layer on the surface of a tube of the metal to be bonded,
(b) heating the said tube to a temperature in the range 400° C. to 600° C.,
(c) rotating the tube on a mandrel slowly under the orifice of an extrusion die, and
(d) extruding an encircling built-up layer of aluminum onto the oxidized surface of the tube, said aluminum having been heated in the die prior to extrusion to a temperature of approximately 500° C.

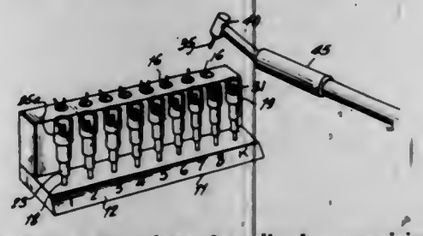
2. A method of preparing tubes made of the metals of the group zirconium, zirconium alloys, uranium, and stainless steel for subsequent fabrication in the field comprising:
(a) forming a thin oxide layer on the surface of a tube of the metal to be employed,
(b) pre-heating the said tube to a temperature in the range 400° C. to 600° C.,
(c) extruding an encircling, built-up layer of aluminum onto the surface of the tube adjacent one end thereof, said aluminum having been heated prior to extrusion to a temperature of approximately 500° C., and
(d) cutting away a portion of the tube to leave an extending collar of aluminum, said collar being such that subsequent joining of the aluminum collar to another aluminum tube is readily achieved.

3,270,414
METHODS OF MAKING THIN REINFORCED TUBULAR DIAPHRAGMS AND IN DIAPHRAGMS MADE ACCORDING TO THESE METHODS
Pierre Plurien, Paris, Maurice Quenault, Palaiseau, and Roger Rigot, Paris, France, assignors to Commissariat à l'Energie Atomique, Paris, France, an organization of France
Filed Mar. 28, 1961, Ser. No. 98,917
Claims priority, application France, Mar. 30, 1960, 822,893
1 Claim. (Cl. 29—527)



The method of making a thin-walled tubular diaphragm which comprises forming a thin-walled tube of a metal which is oxidizable so as to form thereon a strongly adhering oxide layer, mechanically forming stiffening projecting ribs on the outer face of the wall of said tube while leaving the inner face smooth, placing a conductor rod in said tube, said rod being electrically insulated from said tube, circulating an electrolyte through said tube and connecting said rod and said tube to the respective terminals of a direct current source so as to exert an electrolytic oxidizing treatment on the inner surface of said tube, said treatment being pursued until the whole thickness of the portions of said tube extending between these ribs is oxidized without the metal of these ribs being oxidized.

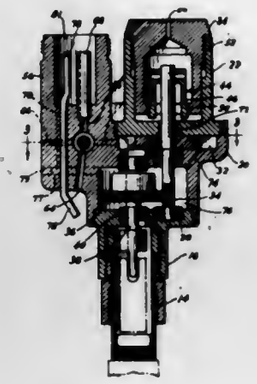
3,270,415
TRIMMING APPARATUS FOR MOLDED ARTICLES
Julius Lakatos, 647 Lincoln Ave., Maywood, N.J.
Filed Oct. 13, 1964, Ser. No. 403,613
10 Claims. (Cl. 29—558)



9. The method of trimming and finishing molded articles comprising the steps of:
(1) clamping an article to be trimmed in a holding means;
(2) advancing the holding means and article to a cutting apparatus to sever the article and unwanted portion thereof;

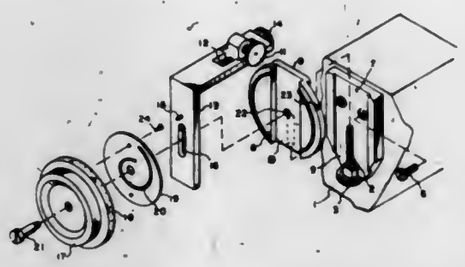
(3) moving the article through the cutting means in the way of the path of travel of the article;
(4) advancing the cut article to a finishing station;
(5) finishing the cut surface by advancing a rotating cutting tool to the cut surface of the article;

(6) returning the holding means to the clamping station; and
(7) unclamping the article from the holding means.



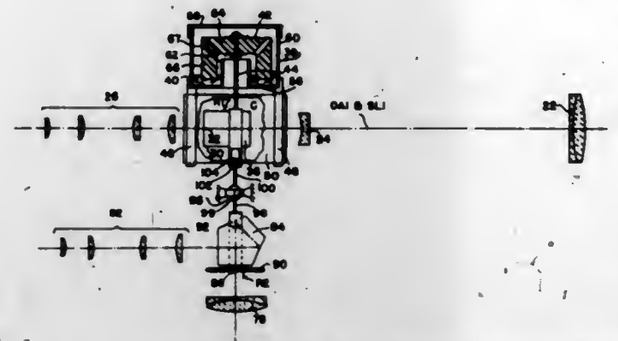
3,270,416
BURR DISPENSER
Anthony Massa, Staten Island, N.Y., assignor of one-half to Leo A. Feula, Staten Island, N.Y.
Filed July 2, 1963, Ser. No. 292,414
9 Claims. (Cl. 32—22)

1. A device of the class described comprising a base and a plurality of units mounted forward of said base; a first and a second of said units each being comprised of an element adapted to support the cutting end of a burr and a guide means having a cup-like depression for receiving a drill head and directing its burr receiving opening to receive the shank of a burr supported by said element, said guide means having a bore extending from said depression to receive and position a burr shank for entry into a burr receiving opening of a drill head biasing means urging said guide means away from said base, said guide means mounted for movement toward said base by a force applied to a drill head as a burr shank moves more deeply into a burr receiving opening.



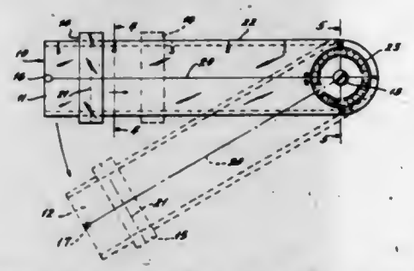
3,270,417
FLUID OPERATED DENTAL HANDPIECE
George H. Stram, Hellam, Pa., assignor to The Dentists' Supply Company of New York, York, Pa., a corporation of New York
Filed July 5, 1963, Ser. No. 292,873
19 Claims. (Cl. 32—26)

1. A grinding or cutting tool of the hand type comprising a housing, an elongated tubular member connected at one end to said housing, a drive shaft mounted for rotation within said member, means on the outer end of said shaft to connect a grinding or cutting tool thereto, a turbine shaft having a turbine rotor thereon and supported for rotation within said housing, and brake means comprising frictionally coengageable brake members respectively stationary and movable relative to said housing, the movable brake member being responsive to centrifugal force when rotated in direct response to the speed of said turbine shaft and said members being relatively adjustable so that when said turbine shaft revolves at a predetermined speed said movable brake member will be moved into frictional engagement with said stationary brake member and thereby maintain a predetermined constant speed controlled by braking friction corresponding to the relative adjustment of said members,



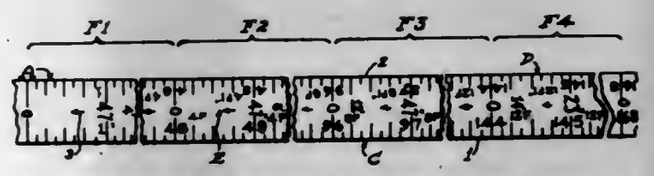
whereby when a tool on said drive shaft is placed under load the speed of said drive shaft is reduced sufficiently to effect separation of said brake members and thus permit the full power of the turbine to be applied to said drive shaft and tool carried thereby.

3,270,418
RIFLE SIGHT
Robert A. Simeone, 121 Linwood St., Milford, Conn., and Anthony B. Simeone, 100 Broadfield Road, Hamden, Conn.
Filed Apr. 21, 1964, Ser. No. 361,402
3 Claims. (Cl. 33—56)



1. In a gun sight comprising a base plate adaptor to be secured to the receiver of the gun, a sight supporting member, means permitting vertical sliding of said member with respect to the base plate, said means including a rotatable cam member provided with a slot therein and a slot engaging projection on the sight supporting member, the improvement which comprises,
(a) the slot is in a form approximating an involute of the trajectory of a bullet of the particular gun caliber in air,
(b) a member slidable vertically in the base plate and carrying on its opposite face a groove in which the sight supporting member is slidably mounted for vertical movement,
(c) micrometric adjusting means connecting the base plate to the member sliding therein and capable of sliding the member vertically in accurately predetermined amounts,
(d) means for attaching the cam member to the member sliding in the base plate to form a unitary whole, and
(e) a direct reading linear scale on the periphery of the cam member.

3,270,419
OPTICAL LEVEL FOR BUILDERS
John H. Lowe, P.O. Box 924, Seaside, Oreg.
Filed Oct. 8, 1964, Ser. No. 402,436
18 Claims. (Cl. 33—73)

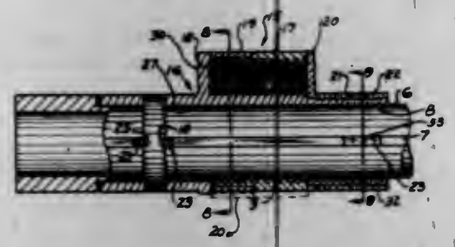


1. In a level for builders and the like, a refracting telescope having a relatively fixed optical axis; a reticle support tube having a longitudinal axis; a reticle in said support tube having a center lying on said longitudinal axis; means mounting said support tube for universal movement about a point lying on both the optical axis of the telescope and the longitudinal axis of the support tube, which point is offset axially from the center of said reticle; a float chamber vertically adjacent said support tube, said chamber including wall means for confining a body of liquid, with an outlet in said wall means opening towards said support tube; a body of liquid in said chamber at a level below said outlet; a float in said chamber supported by said body of liquid; and means extending through said outlet and interconnecting said float and said support tube so that movement of the former is transmitted to the latter and the longitudinal axis of the support tube is maintained in parallelism with the surface of said body of liquid.

3,270,420
GONIOMETER
Wayne A. Simril, 21 Somerset Downs, St. Louis County 24, Mo.
Filed Mar. 13, 1964, Ser. No. 351,685
1 Claim. (Cl. 33—75)

A goniometer for measuring the angle of curvature of the spine from an X-ray film comprising a pair of arms pivotally connected together adjacent to one end, said arms being at least semi-rigid and transparent and having their side edges beveled inwardly, slide members longitudinally movable along each arm for positioning each of the arms perpendicular to the lateral edge of the vertebrae defining the curved portion of the spine on an X-ray film of the spine, each of said slide members having a groove with undercut side portions receiving said arm, said undercut portions cooperating with said bevel surfaces to slidably secure said members on said arms with the inner side of the end portions of each member substantially in the plane of the inner side of its respective associated arm, each of the arms being provided with a longitudinal score line, said line intersecting at the pivotal attachment, said slide members being transparent and each provided with a transverse score line perpendicular to the score line of the associated arm, said transverse score lines in operative position being positioned along the edges of the vertebrae forming the curved portion of the spine, and protractor means fixedly positioned on one of the arms centered on the pivotal connection, said protractor means reading from 0–180–0 in increments with the 0 point being most removed from the associated slide and the 0–180 line being aligned with the score line on the arm, whereby the angle of curvature of the spine may be read between the 0 mark on the protractor and the intersection of the longitudinal score line of the other arm with the protractor.

3,270,421
CONSTRUCTION CALCULATING RULER
Orval Jones, 1209 Knickerbocker Drive, Sunnyvale, Calif.
Filed Mar. 7, 1963, Ser. No. 263,562
1 Claim. (Cl. 33—137)

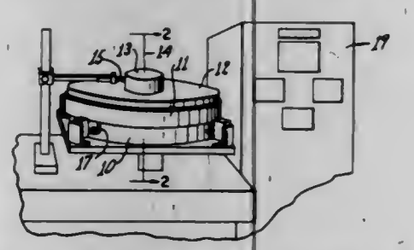


A construction calculating ruler comprising:
(a) a first scale disposed along an edge of the ruler and divided into inches and fractions of inches starting from zero and ascending in one direction, the inch markings being designated 1, 2, 3, 4, etc., up to the full length of the scale;
(b) a second series of scales each being divided into inches with each successive scale being termed a section, these sections being arranged end to end to form connected scales; the division into inches in each section being designated 1, 2, 3, 4, etc., up to the full length of the section and ascending in an opposite direction to said first scale; the inch numbers in the second series of scale sections being aligned transversely on said ruler with the inch numbers in said first scale; and
(c) base numbers in each section of said second series of connected scales for designating the total lengths of the sections measured from the zero marking in said first scale, all of the base numbers in a section being the same and differing in value from the base numbers in each of the other sections and referring to the different lengths of the members to be cut, the base numbers in each successive section being increased in ascending order when measured from the zero marking in said first scale;
(d) whereby any desired distance in inches on the first scale when transversely aligned with an inch marking in one of said second series of scales, such said designated second scale marking will have the base number associated therewith to indicate the length of the member to be cut and the aligned inch marking in the designated second scale indicating the number of inches to cut off from the member so that the length of the remaining portion of the member will equal the chosen distance on said first scale.

3,270,422
MICROMETER CALIPER
Robert L. Coope, 3946 W. Clarendon, Phoenix, Ariz.
Filed July 6, 1964, Ser. No. 380,250
3 Claims. (Cl. 33—165)

1. A micrometer caliper comprising a stationary frame having a head end and a foot end, a cylindrical bar extending from the head end of said frame, said bar having a partial thread formed on one side with its center eccentric relative to the center of said bar; a gaging blade

extending substantially radially from the head end of said frame; a longitudinal groove extending along said bar; indicia marked on said bar parallel to said groove to indicate measures of length of said bar; a sliding gage assembly having a head end and a foot end, a main body on said head end having an eccentrically disposed flange and a bore with a slidable fit on the bar of said stationary frame, a gaging blade supported on the head end of said main body and extending radially therefrom and aligned with the gaging blade on the head end of said stationary frame, a threaded boss at the foot end of said main body, a micrometer nut having an inner bore threaded to engage the partial threads on said stationary bar; a spring



within said micrometer nut resiliently holding said nut in position on said head and urging said internal threads to operating contact with the partial thread on said bar; an adjusting nut on said boss on said body holding said micrometer nut slidably between said annular flange and the inner face of said nut; an adjusting nut having a face bearing against said micrometer nut to adjust pressure against said micrometer nut, a locking ring nut engaging said adjusting nut, a depth gage attached to said sliding gage assembly and adapted to slide in the longitudinal groove on said bar; a graduated ring on said threaded micrometer nut having an annularly arranged indicia on its outer surface.

3,270,423
POSITIONING DEVICE

Kirk E. Birrell, Bellbrook, Robert E. Esch, Kettering, and James M. Stemple, Springfield, Ohio, assignors to The Sheffield Corporation, Dayton, Ohio, a corporation of Delaware

Filed Sept. 30, 1963, Ser. No. 312,623
14 Claims. (Cl. 33—174)

1. A device for supporting a workpiece for rotation about an axis of rotation and for positioning said workpiece to position a central axis of the workpiece to coincide with said axis of rotation comprising,

a base,

a support,

bearing means cooperating between said support and said base mounting said support on said base for rotation about said axis of rotation,

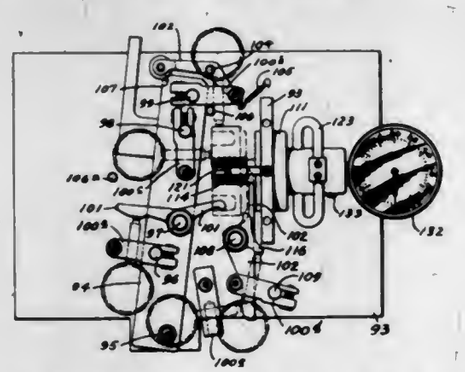
drive means operatively connected to said support for rotation thereof on said base and about said axis of rotation,

a worktable carried by said support,

supporting means cooperating between said support and said worktable carrying said worktable on said support for adjustment of said worktable and a workpiece mounted thereon transverse said axis of rotation and for pivoting movement relative thereto, coupling means interconnecting said support and said worktable for simultaneous rotation thereof,

gaging means providing a gaging signal responsive to the position of the workpiece with respect to said axis of rotation,

first actuating means carried by said support operatively connected to said worktable and controlled by said gaging signal for adjusting the worktable and a workpiece carried thereby in a plurality of angularly related directions transverse to said axis of rotation,



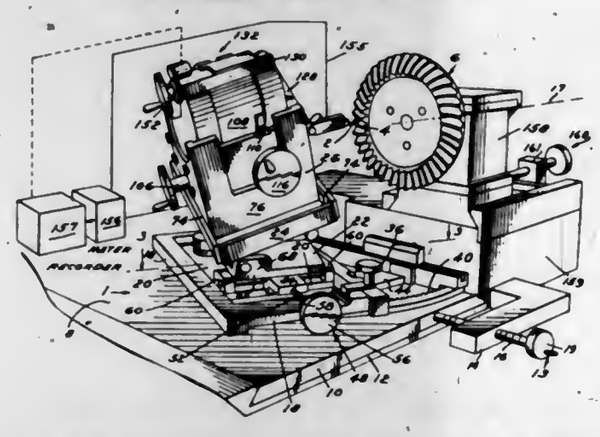
second actuating means carried by said support operatively connected to said worktable and controlled by said gaging signal for inclining the worktable and a workpiece carried thereby relative to said support and said axis of rotation, each of said actuating means including a pair of drive motors relatively spaced at ninety degrees about said axis of rotation and lying in a common plane perpendicular thereto,

and force transmitting means cooperating between each respective motor and said worktable for applying positioning forces to said worktable substantially radially to said axis of rotation while allowing relative movement transverse the direction of force application.

3,270,424
GAGE WITH FIXED SPACED GAGING ELEMENTS AND AN AXIALLY MOVABLE GAGING ELEMENT THEREBETWEEN

Paul W. Johnson, Bloomfield, Conn., assignor, by mesne assignments, to The Johnson Gage Company, Bloomfield, Conn., a corporation of Connecticut

Original application Aug. 5, 1959, Ser. No. 831,757. Divided and this application July 29, 1963, Ser. No. 299,684
10 Claims. (Cl. 33—174)

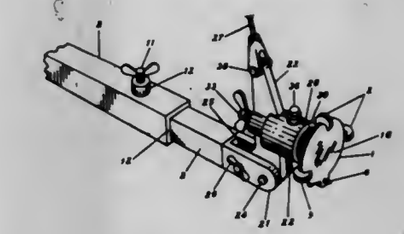


1. A gage for a test part with a groove having opposite surfaces and adapted to carry an indicator having a contactor comprising a frame member, an axially extending guideway carried by the frame member; operating means including an operating member mounted on the guideway for axial movement and having an axis, spring means propelling the operating member axially along the guideway, and manual means connected with the operating member to move the same against the spring means, gaging means to gage the groove of the test part including fixed gaging elements spaced from each other by gaps spaced apart circumferentially with respect to the axis by at least 90 degrees and secured to the frame member, each of the fixed gaging elements having gaging ridges at least at the edges of the gaps, the gaging ridges corresponding with the groove of the test part, each ridge havin a gaging surface to engage one flank surface of the groove of the test part and having an axis coaxial with the axis of the operating member, the gaging surfaces engaging the flank surface of the test groove facing in one axial direction, movable cooperating gaging elements located in each gap between the spaced gaging elements and coaxial with the axis of the operating member and connected with the operating member and movable thereby, and the cooperating gaging elements having at least one gaging means on the opposite side of a plane at right angles to a radial plane through one gaging means and including the axis, each gaging means being equally spaced from the axis and corresponding with the groove of the test part, each gaging means having a gaging surface to enage opposite surfaces of the groove; the spring means propelling the operating member in a direction to bring the gaging means into contact with opposite surfaces of the groove to be gaged, and indicator mounting means carried by one member and located to have an indicator contactor engage the other member for indicating the relative position of the members and the gaging means.

3,270,425
GEAR TOOTH FORM CHECKER

Earl J. Tishler, Dearborn, and Glen A. Weinert, Detroit, Mich., assignors to Ford Motor Company, Dearborn, Mich., a corporation of Delaware

Filed Mar. 20, 1964, Ser. No. 353,497
15 Claims. (Cl. 33—179.5)



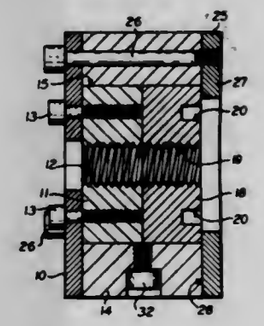
1. A gear checking mechanism comprising, in combination, a conically cut gear tooth form scanning apparatus for scanning the lengthwise curvature of a gear tooth cut by a conical cutter, and a test gear mounting member positioned adjacent said apparatus, said apparatus including a tooth form scanning device, a deviation responsive recording indicator adjustably mounted on said device and having a relatively deflectable pickup adapted to contact the surface of a tooth of a test gear mounted on said member, means for adjusting the position of said indicator and pickup relative to said test gear mounting member for movement through an arc simulating the actual arc of one lengthwise curvature of the test gear tooth, said latter means also being adjustable to effect an angular movement of said indicator pickup along an arc corresponding to a theoretically correct lengthwise curvature of the test gear tooth being scanned, and means responsive to deflection of said indicator pickup due to variations between the theoretically correct and actual lengthwise arcs of the test gear tooth upon movement of said indicator pickup lengthwise along the surface of the test gear tooth while adjusted for the theoretically correct arc for recording the variations between the actual and theoretically correct lengthwise curvatures of the test gear tooth.

3,270,426
ADJUSTABLE GAUGE AND TEMPLATE

William Fischer, Fullerton, and Virgil D. Rogge, La Habra, Calif., assignors to Chevron Research Company, a corporation of Delaware

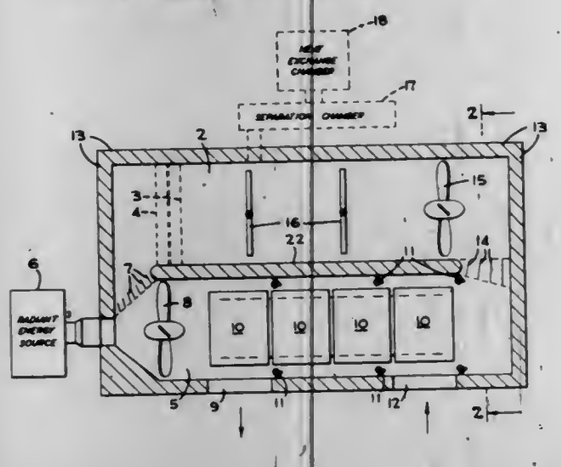
Filed Nov. 12, 1963, Ser. No. 322,684
5 Claims. (Cl. 33—180)

1. An adjustable gauge for measuring the relative positions of two spaced apart pipe ends located in an adverse environment comprising a pair of end plates each including a face adapted for connection to a pipe end with the plate face tight against the pipe end, means connecting said end plates, said connecting means including adjustable means permitting variance of the distance and angle between said plate faces for connection to pipe ends disposed at various angles and distances relative to each other, selectively engageable means for locking said adjustable means against movement of said plate faces relative to each other after said plate faces are tightly connected to said pipe ends, releasable means separate



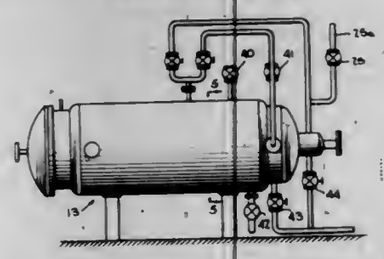
from said engageable means permitting said plate faces to move relative to each other for easy release from said pipe ends with said engageable means locked, means preventing rotation of said end plates relative to said connecting means about an axis perpendicular to the corresponding said plate face when said plate faces are being connected to and released from said pipe ends, and means for re-engaging said releasable means only in one position so that said plate faces may be restored to the relative position which they assumed when attached to said pipe ends.

3,270,427
THREAD GAGE SETTING OR CLAMPING DEVICE



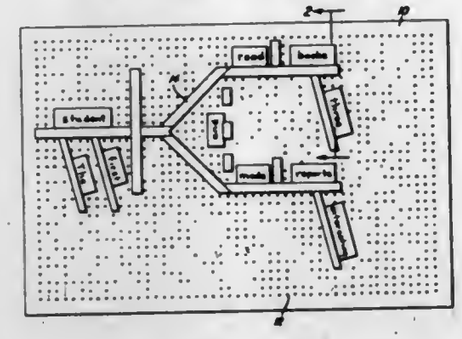
Stanley G. Johnson, West Hartford, Conn., assignor to The Johnson Gage Company, Bloomfield, Conn., a corporation of Connecticut

Filed Aug. 5, 1963, Ser. No. 300,020
5 Claims. (Cl. 33—199)



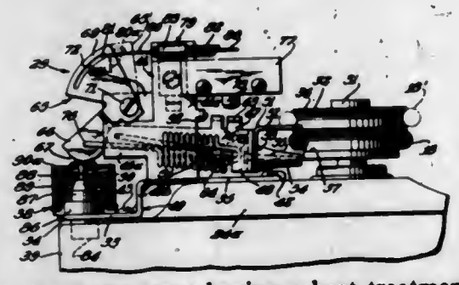
1. A thread gage setting and clamping device comprising a frame member, a cooperating member, each member having a screw thread of the same size and pitch and with their axes in axial alignment, mounting means carried by the frame member to mount the cooperating member thereon solely for rotation on the thread axis as a center, friction means carried by the frame member and engaging the cooperating member and applying a frictional drag of a fixed amount on the cooperating member against relative rotation with respect to the frame member and in all rotary positions, and the frictional drag being of the order of three inch pounds for a thread of a quarter of an inch in size and being progressively greater for larger diameters, and circumferentially spaced screw adjusting means carried by the frame member and engaging the peripheries of the two members.

3,270,428
METHOD OF AND APPARATUS FOR DEHYDRATING FOODS OR OTHER PRODUCTS
George C. W. van Olphen, 3720 Benton St., Santa Clara, Calif.
Filed Apr. 6, 1962, Ser. No. 185,743
9 Claims. (Cl. 34—4)



1. The method of dehydration of foods or other products which comprises the steps of supporting the product in the dehydration zone of a continuous conduit, at substantially atmospheric pressure applying microwave frequency radiant energy to the product to heat the same, blowing cold, dry air through the dehydration zone in an amount and at a temperature to maintain the radiantly-heated product below 32° F. whereby ice in the product will be sublimated and entrained in the air, then cooling and demoisturizing the air in an air-conditioning zone of the continuous conduit at a position removed from the dehydration zone, and finally returning the conditioned air to the dehydration zone.

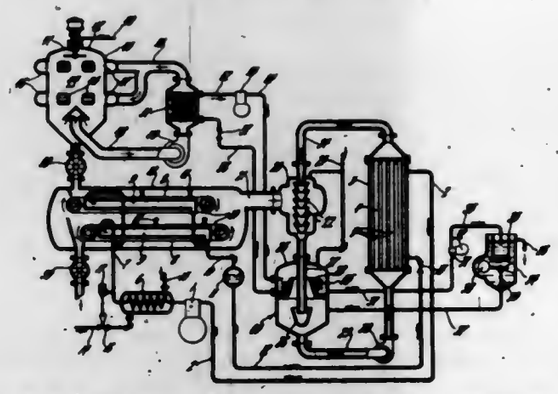
3,270,429
APPARATUS AND METHOD FOR FINISHING FABRICS
Pietro Alberto, Biella, Italy, and Gerhard Moers, Aachen, Germany, assignors to Biella Shrunk Process, S.A.S., Biella, Italy, a limited partnership of Italy, and Gerhard Moers Maschinenfabrik, Aachen, Germany, a corporation of Germany
Filed Dec. 20, 1963, Ser. No. 332,170
Claims priority, application Italy, Jan. 5, 1963, 140/63
2 Claims. (Cl. 34—6)



1. The method of treating wool fabric to obtain dimensional stability and permanent set comprising the steps of:
dehydrating the fabric to a point where less than 7% of the original moisture in the fabric remains,
immediately thereafter, passing dry steam under pressure at a controlled rate through said fabric to displace substantially all of the air held within said fabric,
subjecting said fabric to a dry steam environment having a pressure between approximately 13 and 30 pounds per square inch above atmospheric, and
maintaining said dry steam environment for a period of no more than substantially three minutes.

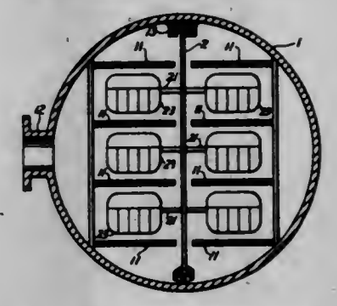
3,270,430
EDUCATIONAL AID
Patricia L. Hurst, 225 Clifton St., Oakland, Calif.
Filed Dec. 24, 1963, Ser. No. 333,079
6 Claims. (Cl. 35—35)

1. An educational aid for visually demonstrating sentence diagramming comprising a panel having a plurality of symmetrically arranged perforations therein, a plurality of strips of elongated relatively narrow construction for illustrating the components of a sentence diagram, each of said strips having a pair of projecting pegs on the back surface thereof for reception in the perforations of the panel, a plurality of cards having words thereon for use as various components of a diagrammed sentence oriented above the strips for illustrating the words forming the sentence components designated by the strips, each of said strips having a longitudinal recess on the inner surface thereof forming a groove when combined with the panel for receiving the linear edge of one of the cards.



3,270,431
DRYER AND AUTOMATIC BELT SHIFTER
Samuel H. Schwartz, Deerfield, Ill., assignor to The Dole Valve Company, Morton Grove, Ill., a corporation of Illinois
Filed June 1, 1964, Ser. No. 371,709
20 Claims. (Cl. 34—48)

1. In a dryer apparatus having a heat treatment zone, a motor, a two-speed blower having a driving hub with two pulley grooves of different diameter, and a pulley belt connected to said motor and said blower drive hub to rotate said blower, a belt shifting mechanism comprising:
a frame having a base mounted adjacent the blower and outwardly extending mounting bracket means,
a first lever pivotally mounted to the mounting brackets and spaced a predetermined distance from said pulley belt,
pivot stop means mounted on said frame to limit the pivotal movement of said first lever,
a belt shifting member mounted on said first lever and having a pair of spaced legs extending a predetermined distance therefrom such that they overlap the pulley belt and are spaced apart such that the pulley belt moves freely therebetween,
said first lever stop means permitting the first lever to pivot a predetermined amount such that one of the belt shifting legs will contact the pulley belt and shift the pulley belt from one blower hub groove to the other blower hub groove,

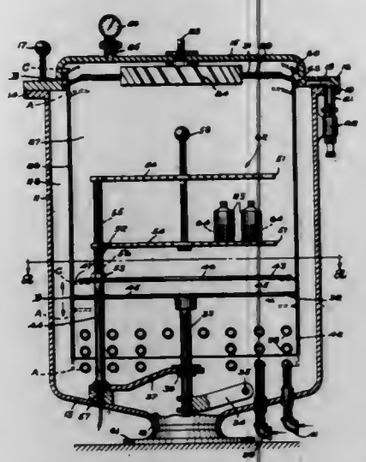


a spring lever pivotally mounted to said bracket means,
said spring lever having means to pivot said first lever,
a second lever pivotally mounted to the bracket means,
an over-center spring attached to the spring lever and the second lever,
said spring being connected to instantaneously pivot said spring lever when said second lever is pivoted a predetermined distance to thereby pivot the first lever, and
automatic means in communication with the dryer treatment zone to sense temperature changes therein and in communication with said second lever to automatically pivot said second lever in response to changes of temperature in said treatment zone.

3,270,432
APPARATUS FOR REMOVING SOLVENT FROM A SOLUTION
Carlo Barbareschi, Via San Gallo 40, Milan, Italy
Filed Mar. 1, 1963, Ser. No. 262,822
Claims priority, application Italy, Mar. 1, 1962, 4,069/62
1 Claim. (Cl. 34—92)

Apparatus for continuously removing solvent from a solution comprising,
(a) a pulverizer for the solution,
(b) a refrigeration circuit having a condenser and evaporator, means for circulating air over the evaporator and through said pulverizer,
(c) valve means for transferring frozen solution from said freezer,
(d) means including a chamber for receiving the frozen solution from said valve means and being adapted for the sublimation and the evaporation of solvent from the frozen solution,
(e) means for the recovery of the solute from said chamber means, and
(f) means for the recovery of the solvent, said solvent recovery means comprising,
(1) a condensing chamber in communication with said chamber means for receiving the vapors of the solvent,
(2) said condensing chamber also being in communication with a supply of recirculating, unfreezable liquid whereby the vapors and unfreezable liquid contact one another and a mixture of solvent crystals and unfreezable liquid is produced at an outlet of said condensing chamber,
(3) a pressure vessel communicating with the outlet of said condensing chamber and having the condenser of the refrigeration circuit in the pressure vessel in heat exchange relationship with fluids from the outlet of the condensing chamber whereby the positive heat utilized to change solvent crystals in said vessel back to liquid is equal to the negative heat surrendered by said condenser,
(4) separator means connected to said vessel for separating the unfreezable liquid from the liquid solvent formed by the heat exchange relationship,
(5) said vessel having a conical member with a hemispherical bottom to assist in separating the unfreezable liquid from the solvent crystals, and
(6) said condensing chamber having a series of vertically spaced funnel-shaped orifices through which the unfreezable liquid is passed downwardly therethrough.

3,270,433
FREEZE-DRYING APPARATUS
Wilhelm Nerge, Gartenstr. 42, Rodenkirchen, near Cologne, Germany; Ulrich Hackenberg, Alter Trasweg 9, Bensberg, Germany; and Horst Ehlers, 9 Perham St., West Roxbury, Mass.
Filed July 15, 1963, Ser. No. 295,617
Claims priority, application Germany, July 13, 1962, L 42,446
5 Claims. (Cl. 34—92)



1. A freeze drying apparatus comprising an evacuable chamber adapted to receive a material to be freeze dried, a plurality of vertically adjacent radiant heater means positioned within said evacuable chamber, a plurality of heat conducting container devices removably positioned between said radiant heater means within said evacuable chamber, said container devices having base and cover portions in good heat transfer connection and adapted to receive radiant heat from said radiant heater means and to conduct the heat thus received to a material contained by said container devices, said container devices having open portions of substantial size which permit escape of water vapor from a material contained therein, and wherein said container devices comprise solid portions which interrupt all rectilinear paths between said heater means and the interiors of said container devices so as to completely shield the material contained by the container devices from direct radiant heat emanating from said radiant heater means.

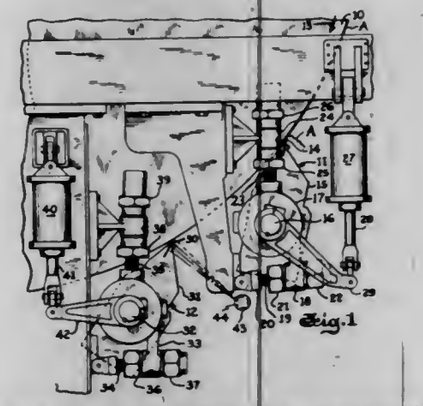
3,270,434
FREEZE-DRYING APPARATUS
Ulrich Hackenberg, Bensberg, Harald Kamps, Brühl, and Helmut Rink, Bonn, Germany, assignors to Leybold Anlagen Holding A.G., Zug, Switzerland
Filed May 6, 1964, Ser. No. 365,533
Claims priority, application Germany, May 10, 1963, L 44,856
20 Claims. (Cl. 34—92)

1. An apparatus for the freeze drying of moisture containing material including in combination:
(a) an evacuable chamber comprising,
a demountable portion adapted to provide access into said evacuable chamber, an evacuable chamber internal portion adapted to contain the material to be dried,
evacuation means adapted to permit evacuation of said evacuable chamber,
heating means adapted to heat the material to be dried in said evacuable chamber internal portion,
condenser means positioned within said evacuable chamber and adapted to both freeze the material to be dried and condense moisture sublimating therefrom;

(b) divider means adapted to provide a closed gas circulation path between said condenser means and said evacuable chamber internal portion; and

(c) valve means having open and closed positions and adapted to isolate said condenser means from said evacuable chamber internal portion.

3,270,435
PAPERMAKING MACHINE
Rudolf A. Moravek, Neenah, Wis., assignor to Kimberly-Clark Corporation, Neenah, Wis., a corporation of Delaware
Filed July 24, 1963, Ser. No. 297,452
4 Claims. (Cl. 34—117)



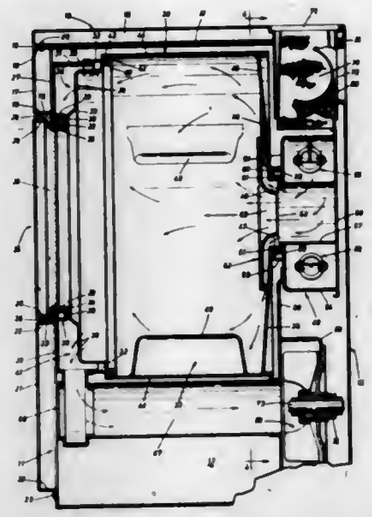


Fig. 1

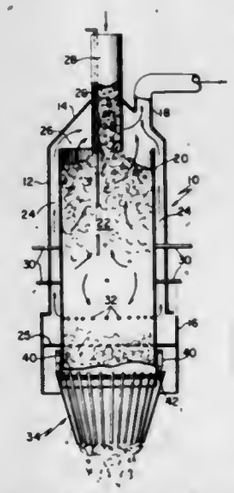
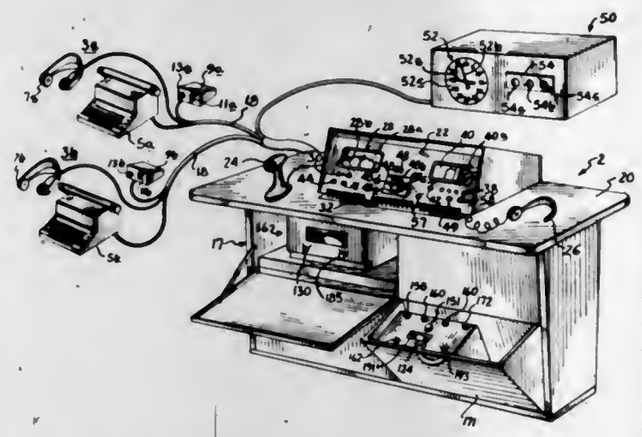
1. In a papermaking machine, the combination of a heated rotatable drier drum for drying a web of paper on the surface of the drum, a pair of thin metal doctor blades for doctoring the paper web off the drum, means for moving each of said doctor blades into doctoring engagement with the exterior surface of the drum along spaced lines on the drum surface so that one blade constitutes a leader doctor blade and the other blade constitutes a follower doctor blade with respect to drum rotation, and means for spraying a cooling fluid on said follower doctor blade to prevent buckling of the blade as it is moved out of doctoring engagement with the drier drum.



3,270,436
CLOTHES DRIER
Donald F. Fairgrieve, Toronto, Ontario, Canada, assignor to Fairgrieve & Son, Limited
Filed Aug. 26, 1963, Ser. No. 304,591
2 Claims. (Cl. 34—131)

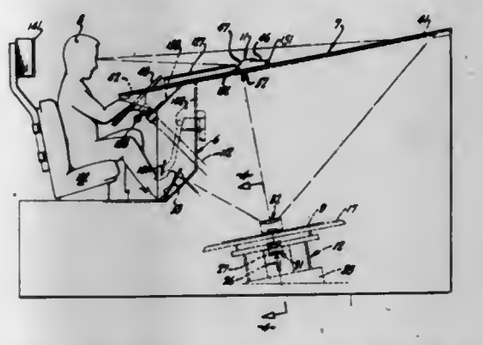
1. In a clothes drier having a cabinet, a substantially cylindrical drum in said cabinet mounted for rotation about a horizontal axis and having co-axial openings in the ends thereof, the forward end of said drum being perforated to communicate with said cabinet, a door in one wall of the cabinet closing the front opening in said drum, a fixed air heating enclosure positioned at the rear of said drum and embracing a first opening therein co-axial with said rear opening in said drum, said enclosure having a second opening to permit entrance of air and communicating with said first opening, a housing enclosed exhaust fan positioned in said cabinet outside said drum, said housing having openings connecting said cabi-



net with an exhaust duct and means positioned in said drum adjacent its rear opening for directing a portion of the incoming air towards the peripheral walls of said drum, said means comprising an open-ended frusto-conical member axially disposed of said first opening with its wall spaced from said drum but flaring towards its periphery terminating short thereof and a plurality of spacing members in said drum attached thereto and secured to said wall of said frusto-conical member.

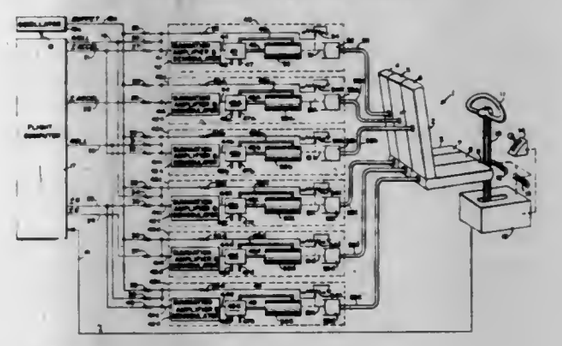
3,270,437
CONTINUOUS OPERATION VEGETABLE MATTER ESSENCE EXTRACTION APPARATUS
Carlos Castillo Lara and Eduardo Antonio Castillo Cofino, both of 2nd Ave. A 13–34, Zona 1, Guatemala, Guatemala
Filed Apr. 22, 1963, Ser. No. 274,645
6 Claims. (Cl. 34—168)

4. Apparatus for the extraction of essence from vegetable matter by evaporation and comprising a vertically elongated evaporator vessel having a top portion arranged for the collection of vapor and entrained evaporated essence products, a vapor outlet from said top portion, cylindrical plate means coacting with and spaced from the walls of said vessel to form an interior vertically elongated material evaporation chamber having an opening at the bottom and an annular vapor riser and opening directly to said top collection portion of said vessel, annular plate means disposed in the lower portion of said vapor riser to seal the bottom thereof, a vegetable matter feed products inlet to the upper portion of said interior vertically elongated chamber, adjustable orifice means disposed across said bottom opening of said interior chamber and adapted to vary the discharge flow rate of the treated vegetable matter therefrom, said orifice means including a plurality of closely spaced lath-like members pivotally mounted intermediate their length to form a generally cone shaped structure adjustable to various slope angles from the highest where said orifice is fully open to the lowest where such orifice is fully closed, a ring tangentially contacting the inside of said members above said pivots, means for selectively positioning said ring vertically, control means receiving indications of feed product flow rate through said orifice and regulating said selective positioning means in accordance with a predetermined desired flow rate of feed product, steam nozzles in communication with said interior evaporation chamber arranged to introduce steam into said feed products, and a vapor outlet in the lower portion of said interior chamber directly in communication with said annular riser and in the lower portion thereof.



3,270,438
TESTING AND MONITORING APPARATUS
Bernard Ephraim, Chicago, Ill., assignor to Rich Engineering, Inc., Franklin Park, Ill., a corporation of Illinois
Filed Aug. 12, 1963, Ser. No. 301,349
11 Claims. (Cl. 35—5)

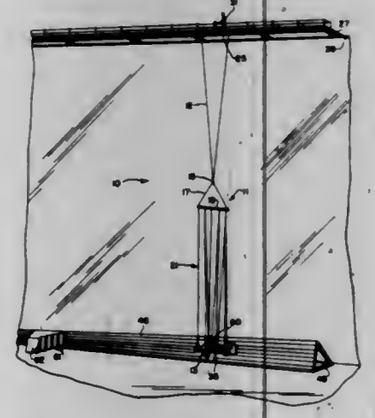
1. Typewriter speed and rhythm indicating apparatus comprising: pulse generating means for generating a unidirectional pulse of standard width and amplitude each time the operator depresses a type key or spacer bar, averaging means for providing a measurement of the average area of the waveform of a series of pulses of the output of said pulse generating means over a given base period including only a small number of pulses at the lowest type rate to be measured, and indicating means for displaying said measurement in words per minute, for indicating the instantaneous variations in typing speed and rhythm.



3,270,439
DRIVER TRAINING APPARATUS
Alvan F. Davenport, 3415 May Road, Richmond, Calif.
Filed Nov. 19, 1963, Ser. No. 324,643
12 Claims. (Cl. 35—11)

1. A driving simulator apparatus including an operator's seat comprising, an operator engageable steering control, a substantially horizontal screen positioned for viewing by the operator, scene means providing a road scene mounted for lineal and rotary displacement, miniature vehicle means representing the vehicle being driven mounted on said screen in fixed relation thereto, right angular projection lens means projecting the image of a portion of said road scene onto said screen, the center point of said image being projected at a point located directly beneath said vehicle means and said image rotating about said center point, masking means mounted on

said screen covering a portion of said image to the rear of said vehicle means, and motorized scene control means connected to said road scene means for advancing said scene means thereby causing said road scene image to move with respect to said fixed vehicle means and being connected to said steering control for manually controlled rotation of said road scene means for permitting the operator to track said vehicle means on said moving road scene image.



3,270,440
SEAT FOR FLIGHT MOTION SIMULATOR
Theodore Radosevic, Jr., North Canton, Ohio, assignor to Goodyear Aerospace Corporation, Akron, Ohio, a corporation of Delaware
Filed Feb. 8, 1963, Ser. No. 257,204
1 Claim. (Cl. 35—12)

In a flight simulator
(1) an inflatable pilot's seat comprising,
  (a) a back cushion having rectangular inflatable air cells vertically arranged in edge to edge abutting relation, and
  (b) a bottom cushion having rectangular inflatable air cells arranged in edge to edge abutting relation and running from front to rear of the seat bottom,
(2) a control stick adjacent the seat capable of left and right movement and fore and aft movement,
(3) a pair of rudder pedals with one pedal on each side of the control stick,
(4) a T-frame mounted on the lower end of the control stick,
(5) a plurality of bellows operatively connected to the T-frame to create varying air pressure upon movement of the control stick,
(6) a bellows operatively connected to each rudder pedal to create varying air pressure upon movement of the rudder pedals, and

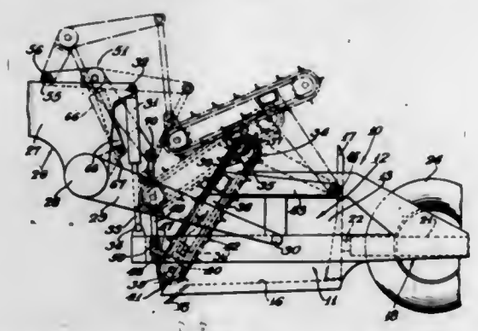
(7) a conduit from each bellows connected to at least one air cell in the seat to transmit the bellows pressure to the connected air cell thereby providing changes in seat pressure upon the pilot's body in response to movement of the controls to furnish the appropriate sensation associated with flight maneuvers resulting from such control movement.

3,270,441
REDUCED GRAVITY SIMULATOR
Donald E. Hewes, Newport News, and Amos A. Spady, Jr., Hampton, Va., assignors to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Aug. 26, 1963, Ser. No. 304,749
14 Claims. (Cl. 35—29)

6. A reduced gravity simulator for a test subject, comprising:
an inclined plane walkway for the test subject so constructed and arranged to simulate a surface gravitational field less than that of the Earth's surface,
cable means for partially supporting the weight of said test subject so as to nullify a portion of the normal vertical gravity vector,
a plurality of elements to engage the head, torso, and extremities of said test subject, said plurality of elements each being connected to one end of said cable means,
means for securing the other end of said cable means angularly a distance above said walkway,
whereby said test subject while in partially supported condition may perform locomotive tasks along the plane of said walkway under simulated reduced gravitational conditions.

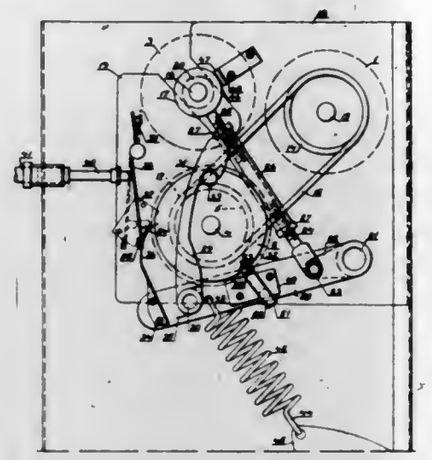
ERRATUM

For Class 35—35 see:
Patent No. 3,270,430



3,270,442
DECORATIVE COVER FOR WOMEN'S SHOES
Jack S. Liebmann, 420 Lincoln Road, Suite 206, Miami Beach, Fla.; Ralph Memole, 4911 Tyler St., Hollywood, Fla.; and Harold Barkowitz, 312 Alido Ave., Coral Gables, Fla.
Filed May 7, 1965, Ser. No. 454,052
9 Claims. (Cl. 36—2.5)

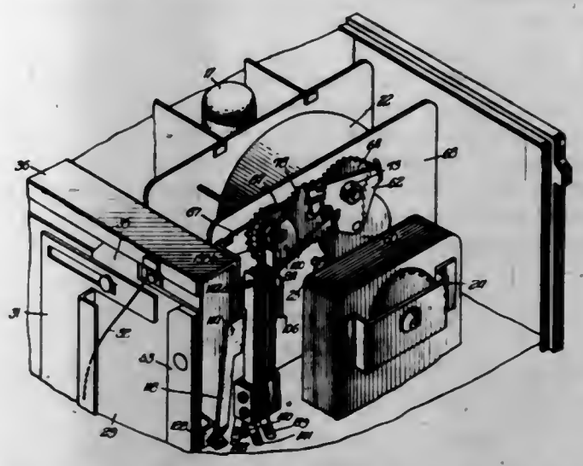
1. In a decorative cover for a woman's shoe of the type having a sole, a projecting heel and an upper defining a foot opening, the combination comprising, a flexible upper member shaped to conform to the outer surface of a woman's shoe when fitted thereon and having a toe end and a heel end and a foot opening, a flexible sole member in the shape of a woman's shoe, said sole member being integrally formed with a sole shank portion and a heel breasting member, means attaching said upper member to said sole member and said sole shank portion to provide a pocket therewith for receiving a woman's shoe, said upper member having an opening at its heel end for receiving in outwardly-projecting relation thereto the heel of a woman's shoe fitted in said pocket, and a heel cover member secured to said upper member in surrounding relation to the heel opening thereof, said heel cover member comprising an inner heel wall cover portion of a flexi-



ble yet fairly stiff fabric, and an outer heel wall cover portion of a relatively supple fabric joined to said inner heel wall portion and together therewith forming a hollow member having upper and lower end openings adapted to be fitted over the heel of a woman's shoe in embracing relation with respect thereto and with the heel tip projecting outwardly of said lower end opening, said heel breasting member comprising an outer wall portion of said heel cover member.

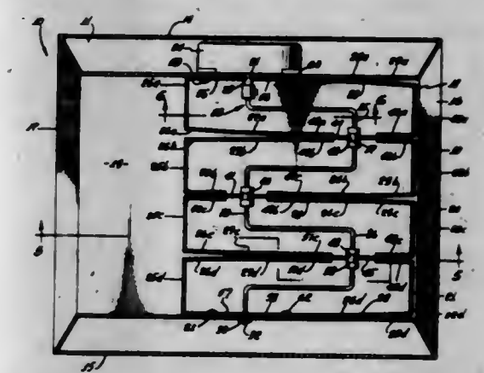
3,270,443
EARTH SCRAPER WITH SELF-LOADING ENDLESS CONVEYOR
Edward D. Duke, Chicago, and Vernon E. Rezabek, Palatine, Ill., assignors to International Harvester Company, Chicago, Ill., a corporation of Delaware
Filed Dec. 11, 1963, Ser. No. 329,845
8 Claims. (Cl. 37—8)

1. In a self-loading scraper having a mobile bowl including an open material receiving end, material ejector means on said bowl, a draft frame connected to said bowl including means for raising and lowering said bowl from and into material digging position relative to the ground, and an endless conveyor pivotally supported in an inclined position within said bowl whereby the lower end thereof may be raised and lowered relative to said open end; a raising and lowering mechanism for said conveyor comprising a lever having first and second arms, means pivotally connecting said first arm to said draft frame for hinging movement about a horizontal axis, means pivotally connecting said second arm to said first arm for hinging movement about a second horizontal axis, a fluid ram on said draft frame connected to said first arm, means connecting said second arm to said endless conveyor, means on said arms limiting the hinging movement of said second arm relative to said first arm whereby during the lowered position of said conveyor, said lower end may raise and lower with said second arm in response to the material conveyed to said bowl, and said ram being operable for raising and lowering said conveyor.



3,270,444
LAUNDRY MANGLES
Arne Wilhelm Stenestam and Karl Tage Schill, Hjo, Sweden, assignors to Hjo Fabriks AB, Hjo, Sweden
Filed Dec. 3, 1963, Ser. No. 327,590
Claims priority, application Sweden, Dec. 4, 1962, 13,030/62; Aug. 27, 1963, 9,326/63
5 Claims. (Cl. 38—49)

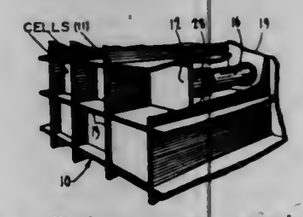
1. A laundry mangle comprising:
at least one driving roller;
a driven roller;
means supporting said driven roller parallel to said driving roller;
a shaft;
means supporting said shaft for rotation about an axis parallel to the axis of said driving roller;
a lever firmly connected at one end to one end of said shaft and extending radially outwardly of said shaft and adjacent said driving roller;
link means connecting said driven roller with said lever;
resilient means connected with said lever and tending to swing said lever in a direction away from said driving roller whereby said driven roller is moved into engagement with said driving roller;
an arm pivoted on the other end of said lever, said arm having a hooked end;
a disc;
a shaft supporting said disc adjacent said driving roller and for rotation concentric with the axis of said driving roller;
a pin carried eccentrically on said disc; and
means for swinging said arm into the path of movement of said disc when said disc is rotated, whereby said pin engages the hooked end of said arm and said lever is swung in a direction towards said driving roller thereby disengaging said driven roller from said driving roller.



3,270,445
SLIDE CHANGING MEANS
Walter J. Hall, Chicago, Ill., assignor to Sawyers Research Development Corporation, Chicago, Ill., a corporation of Delaware
Filed Nov. 1, 1963, Ser. No. 320,766
17 Claims. (Cl. 40—36)

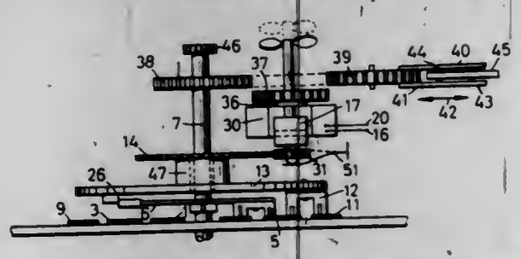
1. In a slide projector of the type including a slide changer movable between at least two opposite positions, an electric cycle motor for moving the slide changer, switch means connected with the motor so that actuation of the switch means causes energization of the motor when electric power is supplied thereto, the improvement which comprises, a movable switch actuating member for actuating said switch means and mechanical timing means adapted, after a timed cycle of operation, to move said member into a position for actuating said switch means, said timing means including timer-start means adapted to cooperate with means associated with the slide changer, when the latter is in one of its opposite positions, for initiating a timed cycle of operation of the timing

means, said switch means including a plurality of yieldably mounted contacts, and said timing means further including gear train means for sequentially closing said contacts in pairs at predetermined intervals of time.



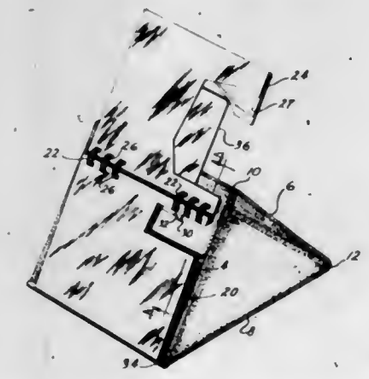
3,270,446
ANIMATED DISPLAY DEVICE
Benjamin P. Gurule, 3055 S. Union Ave., Los Angeles, Calif.
Filed Dec. 23, 1963, Ser. No. 332,421
4 Claims. (Cl. 40—36)

1. An animated display device which comprises housing means having an open forward end and an open rear end, a plurality of display units arranged generally in lateral sequence in the housing and cooperating to provide a pair of composite displays, one at the front and one at the rear of the housing, each of said units comprising a loop of generally flat panels hinged together in series, each panel loop having a forwardly facing display panel and a rearwardly facing display panel, said forwardly facing panels being arranged edge-to-edge with their hinged edges closely proximate each other and with the panels in generally co-planar relationship, the rearwardly facing panels being arranged edge-to-edge with their hinged edges closely proximate each other and with the panels in generally co-planar relationship, the remaining portions of the loops extending between said forwardly and rearwardly facing panels with the sides of adjacent loops closely adjacent to each other, driving means connected to the loops for shifting successive corresponding panels of the loops into generally forwardly and rearwardly facing co-planar relationships, respectively, to vary the displays, and means providing direct mechanical engagement between at least one pair of corresponding panels belonging to each adjacent pair of loops whereby the hinged panels of each loop will



move in fully synchronized relationship with the panels of the adjacent loops, the panels hingedly connected within a panel loop so as to face the forward open end of said housing means having one panel fixedly attached to a member within said housing means which does not move within said housing means and another panel fixedly attached to a member within said housing means which is free to move within said housing means, and the panels hingedly connected within said panel loop so as to face the rear open end of said housing means having one panel fixedly attached to a member within said housing means which does not move within said housing means and another panel fixedly attached to a member within said housing means which is free to move within said housing means.

3,270,447
DISPLAY PANEL
Richard H. Langdon, Tarrytown, N.Y., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed Nov. 14, 1963, Ser. No. 323,804
13 Claims. (Cl. 40—52)



1. An image display screen comprising, in combination, a lattice of recessed cells each of which adjoins adjacent cells by common sidewalls in a plane and all being of a color having an attribute of low saturation and low brilliance; a reflector operable in each cell, means for moving each reflector from a first extreme position to a second extreme position, said first extreme position rendering each reflector to be shaded by the sidewalls of its respective cell, each reflector separately operable through a succession of progressively less shaded positions to said second extreme position in which it is substantially unshaded by the sidewalls of its respective cell, all such reflectors being of a color having low saturation and an attribute of high brilliance.

3,270,448
APPARATUS COMPRISING A TIMING MECHANISM AND AN INTERMITTENT SWITCHING MECHANISM
Walter Holzer, Drosteweg 19, Meersburg (Bodensee), Uberlingen (Bodensee), Baden, Germany
Filed Mar. 29, 1965, Ser. No. 443,590
4 Claims. (Cl. 40—78)

1. Drive mechanism for a picture-changing slide projector with adjustable time intervals comprising a timing mechanism having a slide slowly driven by gearing and carried by a rotating part, while contacting with an interrupted contact track on a printed circuit and with another contact track comprising conductive contact-segments on the same printed circuit, an intermittent switching mechanism having a rapidly rotating driving connection to a coaxially mounted, rotating part carrying a slide which slides on said interrupted contact track and on a circular track, both of which are conductive, a one-way slip clutch for mechanically connecting the rotating parts with each other during rotation and for electrically connecting them with the segments and with switches, a picture-changing mechanism having a crank and thrust rods, and a motor the rotor of which in one position drives through a gear the rotating part of the intermittent switching mechanism and also the picture-changing mechanism and in another position through gears the rotating part of the timing mechanism.

3,270,449
PHOTO DISPLAY DEVICE
Walter J. Robbie, Pittsfield, Mass., assignor to Eaton Paper Corporation, Pittsfield, Mass., a corporation of Delaware
Filed Sept. 1, 1964, Ser. No. 393,631
5 Claims. (Cl. 40—102)

1. A picture display case comprising a plurality of panels hinged together to be selectively folded into superposed relation and to be disposed in oblique angular relationship in an upright position on a supporting surface, a plurality of picture holders disposed on one of said panels and hinged for swinging movement through an upright arc, and a support tab slidable from a position coextensive with the said one panel to a position extending beyond the upper edge thereof and in the path of said arc, whereby two of said picture holders may be simultaneously supported in display position.

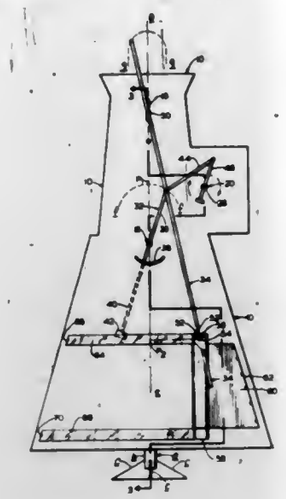
3,270,450
POINT-OF-PURCHASE MOTION DISPLAY
Paul L. Flum, 7449 Kingsbury Blvd., St. Louis, Mo.
Filed Sept. 8, 1964, Ser. No. 394,896
5 Claims. (Cl. 40—106.41)

1. For imparting horizontal reciprocative motion to a movable member of the type used in point-of-purchase displays, the apparatus comprising

a display backboard having mechanism including

a vertical guide defining a vertical centerline,

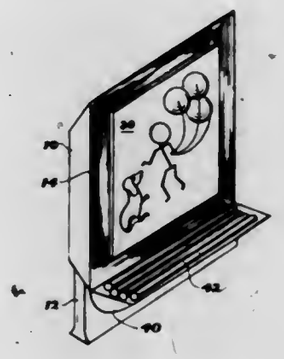
an arm pivotally mounted to said backboard spacedly below said guide and at the vertical centerline, said arm having an arc-describing portion extending above said pivot and below said guide for arcuate movement to both sides of the centerline,



powered means coupled to arm to move said arc-describing portion reversingly in a predetermined arc to both sides of the backboard centerline,

an elongated member pivotally coupled at a point between its ends to said arc-describing portion of said arm and including

guide-engaging means confined within the vertical guide for vertical movement therealong, and

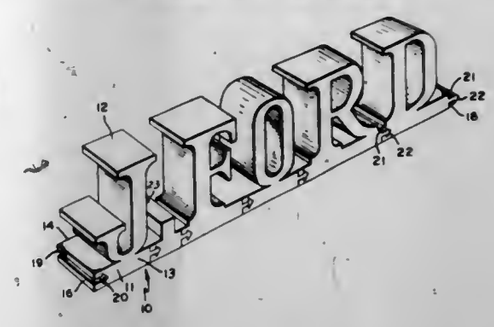


a suspension mount carried by said elongated member spacedly below the pivot mounting of said arm to said backboard,

whereby such movable member of the type used in pivot of purchase displays may be suspended from

said mount and by said mechanism be reciprocated horizontally across said backboard.

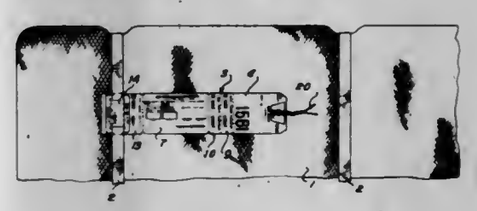
3,270,451
METHOD AND APPARATUS FOR EXHIBITING A DISPLAY
Christian James Bartleson, Edwin J. Breneman, and David L. MacAdam, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Oct. 21, 1963, Ser. No. 317,519
7 Claims. (Cl. 40—130)



1. In a display for exhibiting a reflection-type color reproduction of a subject in an environment of ambient light having a given level of illumination so that it will appear as a back-lighted transparency, the combination comprising

(a) a substantially vertical support having a front surface on which said reflection-type reproduction is mounted and completely covers the same;

(b) means, including a light source, for uniformly illuminating said reproduction to a level of illumination substantially greater than said given level of illumination of said ambient light; and



(c) a light trap means of a dark contrasting color completely surrounding said support to prevent light from said illuminating means which does not impinge upon said reproduction from being reflected back to an observer located in front of said support and thereby provide a dark contrasting border completely surrounding said reproduction.

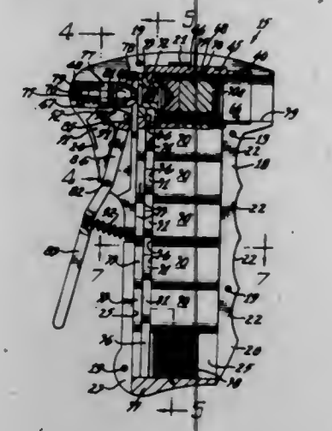
3,270,452
SIGN WITH INTERCHANGEABLE CHARACTERS
Anthony N. D'Elia, 3555 Netherland Ave., Riverdale, N.Y., and Edward M. Stolarz, R.F.D. 2, Horton Drive, Yorktown Heights, N.Y.
Filed Feb. 2, 1966, Ser. No. 524,560
7 Claims. (Cl. 40—140)

1. A sign formed from a plurality of individual graphic metal components including letters, rigidly mounted in straight line relation, each component including a base section and a graphic character formed integrally with and extending upwardly from the base section and having a dimension extending in a direction longitudinally of the character substantially equal to the dimension in a direction extending transversely thereof said base having along one transverse edge thereof an undercut recess being formed along its opposed transverse edge with a projection shaped complemental to, and being received in said recess in an adjoining component, the shape and contour of said projections corresponding closely to the recesses as to effect a rigid straight line mounting and constituting the sole means for effecting the same.

3,270,453
COTTON BALE TAG
Joseph L. Mitchell, Mesa, Ariz., assignor to Texas Tag & Specialty Co., Wolfe City, Tex., a corporation of Texas
Filed July 13, 1964, Ser. No. 382,246
5 Claims. (Cl. 40—305)

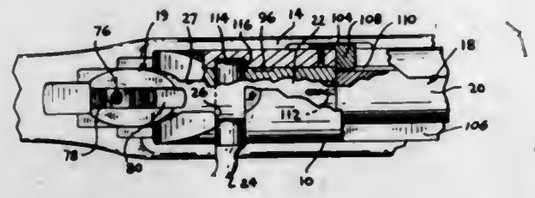
1. A cotton bale or the like identification tag comprising, a pliable tag comprised of a plurality of sections severably attached together; means for attaching the pliable tag to a bale of cotton; a rigid tag having a raised central section with aligned passages through the ends thereof arranged to receive a bale tie band; and means for severably attaching the rigid tag to the pliable tag; the said sections and rigid tag having corresponding identification numerals thereon.

3,270,454
PUSHER HANDLE CONSTRUCTION FOR GROCERY CARTS
Gerald J. Lachance, North Brookfield, Mass., assignor to Armand A. Lachance, Auburn, Mass.
Filed Mar. 2, 1964, Ser. No. 348,600
6 Claims. (Cl. 40—308)



1. A pusher handle construction for a cart wherein said cart includes a basket, means forming a pair of narrow spaced loops on said basket, and a plastic tube ex-

tending between and held by said loops, said plastic tube having a transparent area, a removable printed member in the sube, the printing on the member appearing through the transparent area thereof, means holding the printed member in generally fixed position in the tube and securing the ends of the tube with respect to said



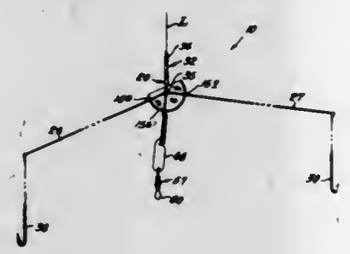
loops, said means comprising a non-circular tube within the first tube and means on the loops having mating portions engaging the ends of and securing said non-circular tube in non-rotative position with respect thereto, the printed member lying on and being generally confined by a non-circular surface of the non-circular tube.

3,270,455
SEMI-AUTOMATIC REPEATING FLARE PISTOL
Ronald B. Smernoff, Los Angeles, Calif. (5396 Park Ave., Garden Grove, Calif.), and Russell O. Stefan, Downey, Calif. (10950 Vulcan St., South Gate, Calif.)
Filed Dec. 28, 1964, Ser. No. 421,441
8 Claims. (Cl. 42—1)

5. A semi-automatic repeating flare pistol for firing projectiles from cartridges with relatively low powder charges, said pistol comprising a body including a handle and a cross-head formed on said handle; magazine means provided in said handle for confining a column of said cartridges and spring-biasing the same towards said head; projectile discharge barrel means on said head; a cartridge receiver rotatably mounted in said head concentrically with said barrel means and having a single central chamber which has a radial passage opening broadside from said chamber for receiving one cartridge at a time broadside from said magazine when said passage is in alignment with the latter, to align said cartridge co-axially with said barrel means; means on said body for detonating the powder charge in said cartridge and thus propel the projectile from said cartridge through and from said barrel means; and means for rotating said receiver a partial rotation about its axis to accomplish the discharge of said cartridge from said pistol, and for then rotating said receiver to its original position for receiving another cartridge from said magazine.

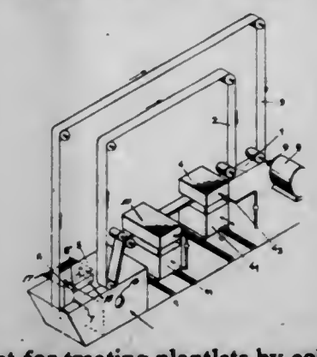
3,270,456
BREECH-BOLT MECHANISM FOR BOLT-ACTION FIREARMS
Carl H. Benson, New Haven, Conn., assignor to O. F. Mossberg & Sons, Inc., North Haven, Conn., a corporation of Connecticut
Original application Dec. 17, 1964, Ser. No. 419,061, now Patent No. 3,234,679, dated Feb. 15, 1966. Divided and this application Sept. 1, 1965, Ser. No. 484,213
3 Claims. (Cl. 42—16)

1. A bolt-action firearm having a receiver and an elongated breech-bolt supported in said receiver for reciprocal movement longitudinally into and out of breech-closing position, said breech-bolt comprising a forward portion confined to longitudinal movement and a rear portion rotatably connected to said forward portion for limited rotation relative thereto into and out of bolt-locking position, a bolt-handle fixedly mounted on said rear portion, said receiver having a longitudinal slot through which said bolt-handle passes when the breech-bolt is reciprocated longitudinally, a locking slot in said receiver disposed transversely of and opening into said longitudinal slot at its forward end to receive said bolt-handle when said rear bolt-portion is rotated into bolt-locking position, said longitudinal slot being opened at the rear end of the receiver such that said bolt-handle may travel rearwardly thereof when the breech-bolt is retracted, said longitudinal slot being shorter than the full rearward stroke of said breech-bolt, spring detent means interconnecting said forward and rear bolt-portions for preventing rotation of said rear portion when said breech-bolt is retracted in order to maintain alignment of said bolt-handle with said longitudinal slot in the receiver, the forward portion of said breech-bolt having a groove disposed longitudinally thereof and opening at the rear end of said forward bolt-portion, and a finger member mounted on said receiver and extending inwardly into said groove, said spring detent means being disposed in said rear bolt-portion for engagement in the end of said groove when said breech-bolt is unlocked and said finger member being disposed relative to said spring-detent means such that movement of said breech-bolt into breech-closing position causes said finger member to be engaged by said spring-detent means in order to release said rear bolt-portion for rotation relative to said forward bolt-portion.



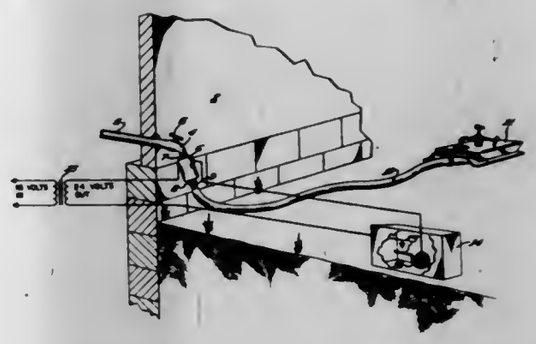
3,270,457
FISHING ROD AND ATTACHMENT THEREFOR
John Wells Austin, Rte. 1, Moselle, Miss.
Filed Sept. 24, 1964, Ser. No. 398,964
11 Claims. (Cl. 43—15)

1. An attachment for a fishing rod comprising a support member, a trigger means, the trigger means being mounted on the support means and movable between first and second positions, the trigger means extending away from the support member and including means located at a point remote from the support member for receiving a first portion of a fishing line, an arm means, the arm means being mounted on the support means at a point remote from the trigger means, the arm means extending away from the support means and including a portion remote from the support member which is movable between first and second positions, resilient means, the resilient means urging the arm means from the first position toward the second position, the trigger means including means for retaining the arm means in the first position when the trigger means is in the first position, means operative when the trigger means is in the first position for retaining a second portion of the fishing line a substantially different distance from the support means than the first portion, means for receiving a third portion of the fishing line mounted on the support means between the points of mounting for the arm means and the trigger means, the means for receiving the third portion of fishing line being substantially in alignment with the means on the trigger for receiving the first portion of fishing line, the means for retaining the second portion of the fishing



line being carried by the arm means and located between the means for receiving the third portion of fishing line and the trigger means when the arm means is in the first position, the trigger means being movable from the first position to the second position upon movement of the first portion of the fishing line therefrom in a direction away from the second portion, the means for retaining the arm means being rendered ineffective to retain the arm in the first position when the trigger means is moved from the first position to the second position whereby the arm means is released and is urged to the second position by the resilient means, and the arm means including means for pulling on the fishing line when the portion of the arm means is moved from the first position to the second position.

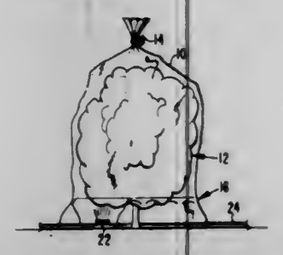
3,270,458
FISHING TACKLE
William R. McAfee, Rte. 1, Sanger, Tex.
Filed Jan. 4, 1965, Ser. No. 422,956
7 Claims. (Cl. 43—42.74)



2. A fishing device including: a positioning plate; means supporting said positioning plate and permitting pivotal movement of said plate about a horizontal axis; a mass operatively associated with said positioning plate in any one of a plurality of adjusted positions relative thereto to hold said positioning plate in any one of a plurality of predetermined angular positions about said axis; and a plurality of spreader members extending outwardly of said positioning plate, said positioning plate having means for holding said spreader members in any one of a plurality of predetermined positions relative to said plate and said axis.

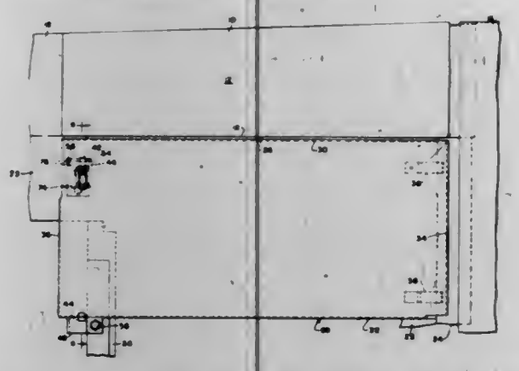
3,270,459
EQUIPMENT, MORE PARTICULARLY FOR TREATING PLANTLETS BY COLD SHOCKS
Jacques Georges Pottier, 123–125 Rue Notre-Dame-des-Champs, Paris, France
Filed Sept. 5, 1963, Ser. No. 306,742
Claims priority, application France, June 19, 1963, 938,675, Patent 1,361,644
8 Claims. (Cl. 47—1)

5. Equipment for treating plantlets by cold shock, comprising refrigerating apparatus, reheating apparatus, a water tank, and a pair of endless conveyor belts for carrying plantlets through the refrigerating apparatus and reheating apparatus in succession and then into said tank, the lengths of the belts extending through said apparatus being superimposed for holding the plantlets between them, the belts being separated from each other before the refrigerating apparatus and inside the tank to expose portions of the lower belt for receiving and removing the plantlets, and each belt being formed from a material of great thermal conductivity lined with hydrophilic material that engages the hydrophilic material of the other belt while passing through said refrigerating and reheating apparatus.



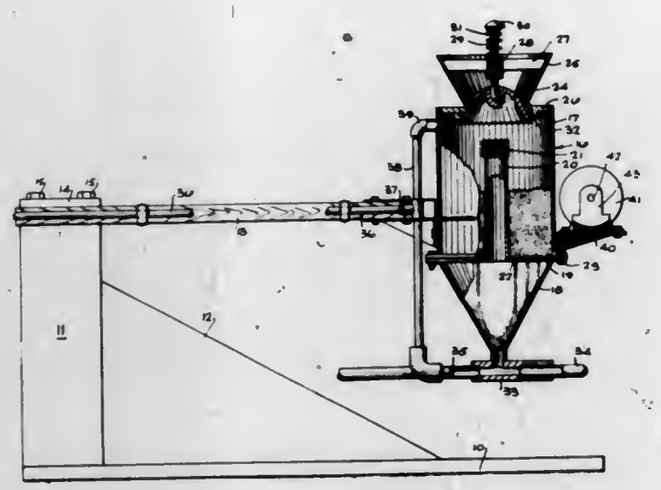
3,270,460
THERMOSTATICALLY CONTROLLED SPRINKLING SYSTEM
Joseph C. Wild, 7701 Modern Road, Minneapolis, Minn.
Filed Jan. 6, 1964, Ser. No. 335,898
2 Claims. (Cl. 47—2)

1. The method of preventing frost damage to garden plots by applying a continuous water cover thereto while mean outside temperatures are at or below frost level, said method comprising at least one sprinkler head in said garden plot, said sprinkler head being connected to a source of water pressure, said water being controlled by a valve energized by a thermostat, said thermostat being adjacent but beyond the range of the sprinkler head and its water discharge, electric switch mean cooperating with the thermostat to close and open the valve according to predetermined adjustments of the thermostat actuated by the mean outside temperature at the location of the same in the garden plot, and an electric circuit originating at a conventional source of electric current whereby the switch means cooperating with the thermostat is energized to



close or open the electric circuit as the temperature fluctuates between the high and low settings of the thermostat and its switch means.

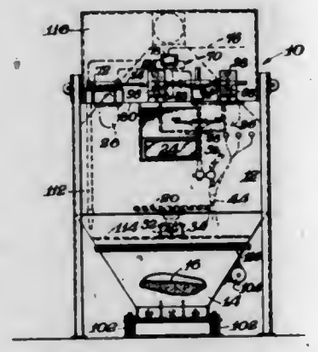
3,270,461
PLANT PROTECTOR
Seeber T. Fowler, Rte. 2, Box 116, Citra, Fla.
Filed Aug. 3, 1964, Ser. No. 387,078
12 Claims. (Cl. 47—2)



10. Means for protecting plants comprising a tube of flexible non-metallic material substantially impervious to water, said tube being open at both ends and being telescopically disposable over a vertically extending plant with one end of the tube next adjacent the ground and the other end of the tube disposed above the plant, the other end of the tube being sealable by gathering together the tube adjacent said other end thereof, means for engagement about the gathered portion of the tube to hold the same tightly gathered, said one end of the tube being redirected inwardly of the tube to provide a reentrant portion extending entirely about the tube and within the same, the reentrant portion being discontinuously sealed to the tube in a plurality of areas spaced apart circumferentially about the tube to provide a water inflatable bladder at said one end of the tube with said bladder having openings defined in part by the tube and facing toward the other end of the tube, and means for providing an upwardly directed discharge of water engageable at least in part with the inside of the tube to provide a flow of water downwardly along the inside of the tube and into said openings to inflate said bladder, said bladder when inflated being engageable with the ground to provide an air seal around the bottom of the plant enclosed by the tube.

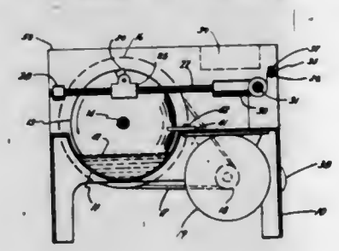
3,270,462
CLOSURE MOUNTING
Richard D. Obadal, Cedar Falls, and John G. Johnson, Waterloo, Iowa, assignors to Deere & Company, Moline, Ill., a corporation of Delaware
Filed Oct. 2, 1964, Ser. No. 401,162
1 Claim. (Cl. 49—257)

In combination, frame structure having spaced apart upright front and rear members; a closure element spanning the members in a closed position and having front and rear portions respectively proximate to said members; means mounting the element for shifting between front and rear positions while closed, for outward swinging to an open position and for separation from the structure, comprising a retaining device forwardly engageable between the element front portion and the front member to sustain the element and to prevent outward displacement thereof in its front position and rearwardly disengageable upon movement of the element to its rear position, a lower part carried by the frame structure adjacent to the rear member and including an upwardly facing fore-and-aft guide, an upper part on the frame structure adjacent said rear member and having front and rear spaced apart downwardly facing recesses spaced apart according to the front and rear positions of the element, an upwardly biased, downwardly retractable upper pin carried by the element rear portion for upward engagement with the front recess when the element is in its front position and for downward retraction from said front recess and for upward engagement with the rear recess upon shifting of the element to its rear position, fore-and-aft slot means on the frame structure closely underlying the upper part and generally coextensive with the spacing of said recesses and receiving and guiding the retracted upper pin during shifting of the element, a lower pin coaxial with the upper pin and downwardly receivable in and fore-and-aft slidably sustained by the lower part, said lower part having a rear end portion vertically coaxial with the rear recess and in which the lower pin seats in the rear position of the element, said end portion, said recess and said pins providing a hinge about which the element is swingable towards its open position following shifting thereof to its rear position to disengage the retaining means, said lower pin being retained in seated relation to said end portion by the weight of the element as said element is swung toward its open position, said lower part having an open forward end enabling forward escape of the lower pin upon upward and forward rocking of the opened element to clear said lower part and to enable downward separation of the upper pin from the upper part and from said slot means so that the element is removable from the structure; and means for selectively retracting the upper pin from either recess.



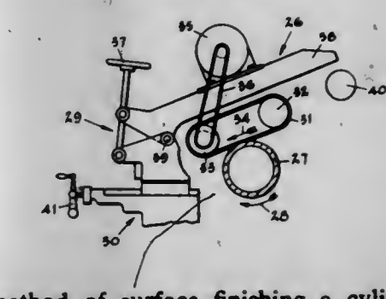
3,270,463
BLASTING MACHINES
Stewart Ives Ashworth, Studley, and Anthony Gerard Field, Redditch, England, assignors to Abrasive Developments Limited, Henley-in-Arden, England, a British company
Filed Oct. 15, 1963, Ser. No. 319,088
Claims priority, application Great Britain, Oct. 16, 1962, 39,054/62
19 Claims. (Cl. 51—8)

1. A blasting machine including a blasting nozzle and means to supply abrasive to the nozzle, said means including a container for abrasive, a sieve in the container



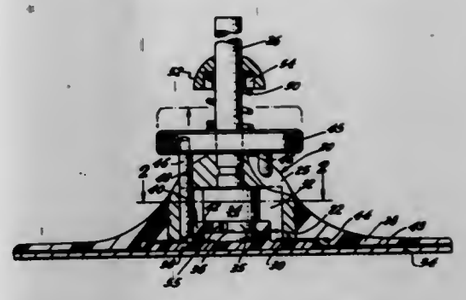
through which the abrasive passes as the container is vibrated, resilient means supporting the container for vibration, the container and the resilient means forming forming a system having a fundamental resonant frequency, driving means for applying power to the system to cause it to vibrate at or adjacent to its fundamental resonant frequency, said driving means comprising an electric motor mounted in the system and having a characteristic such that the speed of the motor varies inversely as the load applied thereto and a bob-weight connected to the motor to be rotated about a generally horizontal axis, control means to vary the power input to the electric motor to control the amplitude of the vibration of the system at said resonant frequency and thus to control the rate of flow of abrasive through the sieve and abrasive-conveying means connecting the container on the output side of the sieve to the nozzle.

3,270,464
ABRASIVE BLASTING APPARATUS
Joseph E. Bowling, Jr., Waynesboro, Pa., and Robert A. Murphy, Hagerstown, Md., assignors to The Pangborn Corporation, Hagerstown, Md., a corporation of Delaware
Filed Apr. 28, 1964, Ser. No. 363,100
20 Claims. (Cl. 51—15)



1. Abrasive blasting apparatus for machining work pieces comprising a housing, nozzles in said housing, air supply means connected to said nozzles for causing a flow of air therethrough, a work table in said housing disposed under said nozzles, an abrasive supply hopper under said work table for receiving abrasive material, vibrating means cooperating with said hopper for maintaining said abrasive material substantially level and in a constant state of agitation in said hopper, and abrasive return means connecting said hopper to said nozzles for ejecting said abrasive material from said nozzles and for recirculating said abrasive back to said nozzles after it falls into said hopper.

3,270,465
LAPPING MACHINES
John J. Decoulos, 18 Calumet St., Peabody, Mass.
Filed July 12, 1963, Ser. No. 294,596
3 Claims. (Cl. 51—98)



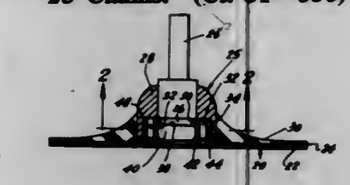
1. A lapping machine comprising a base, a trough mounted on said base, an abrasive mixture in said trough, a solid wheel having a peripheral and side surfaces mounted on a rotary shaft, means for supporting and rotating said shaft, the lower portion of said solid wheel being immersed and rotating in the abrasive mixture, whereby a film of abrasive mixture covers the peripheral and side surfaces of said solid wheel, means for controlling the thickness of said film of abrasive mixture, means for supporting material to be processed in contact with said film of abrasive mixture.

3,270,466
SHEET GLASS BENDING ROLL
John E. George and James T. Zellers, Jr., Charleston, W. Va., and Roger P. King, Waterville, and Alfred H. Miller, Toledo, Ohio, assignors to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Filed Nov. 15, 1963, Ser. No. 324,110
3 Claims. (Cl. 51—289)

1. A method of surface finishing a cylindrical sheet glass bending roll including hard carbide particles imbedded in a matrix of relatively soft material with an endless abrasive belt trained over a pair of spaced pulleys and having diamonds adhered thereto to form an abrasive surface substantially harder than said carbide particles comprising, rotating the bending roll about its longitudinal axis, driving said endless abrasive belt in contact with said bending roll with the region of contact being between said spaced pulleys so as to uniformly cut through said carbide particles and matrix metal and cleanly remove the abraded material, and shifting said belt back and forth across the length of said roll to form on said roll a relatively smooth surface of undisturbed material free from an amorphous layer.

3,270,467
ABRASIVE DEVICE
Aleck Block, Los Angeles, and Joseph W. Purcell, Jr., Playa del Rey, Calif., assignors to Merit Products, Inc., Los Angeles, Calif., a corporation of California
Filed July 1, 1963, Ser. No. 291,701
16 Claims. (Cl. 51—358)

15. In an apparatus of the character described, means for mounting an abrasive disc member on a rotary drive member, comprising:



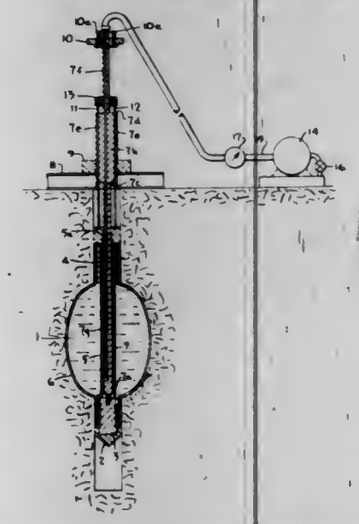
a first structure adapted to be mounted on said drive member, said first structure including a boss with an axially inwardly facing peripheral shoulder;

a second structure adapted to be united with the abrasive disc to enclose said boss and releasably engage said peripheral shoulder to resist axial separation of

the two structures, said hub structure being formed with a plurality of annularly disposed segments annularly separated from one another by gaps; and

means on said first structure positioned radially of said boss and extending through the gaps between adjacent pairs of annularly disposed segments to engage said second structure to cause the second structure to rotate with the first structure.

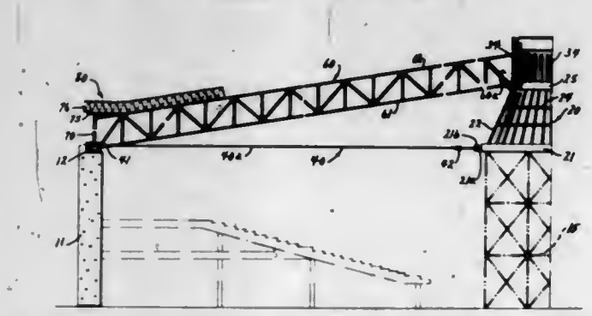
3,270,468
ABRASIVE DEVICE
Aleck Block, Los Angeles, and Joseph W. Purcell, Jr., El Monte, Calif., assignors to Merit Products, Inc., Los Angeles, Calif., a corporation of California
Filed July 1, 1963, Ser. No. 291,830
25 Claims. (Cl. 51—358)



21. In an apparatus for the character described, means for mounting an abrasive disk member on a rotary drive member, comprising:

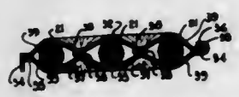
a first structure on said drive member for rotation with the drive member and forming a boss with an axially inwardly facing peripheral shoulder;

a second structure united with the abrasive disk to enclose said boss and releasably engage said peripheral shoulder to resist axial separation of the two structures, the second structure being provided with at least one radial projection; and



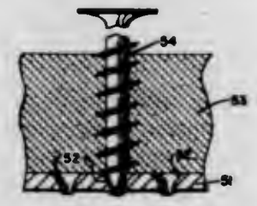
means on said first structure and positioned radially of said boss and responsive to the rotation of the drive member to engage the radial projection of said second structure and cause the second structure to rotate with the socket structure.

3,270,469
EXPANSIBLE, REMOVABLE GROUND ANCHORING DEVICE
Etienne Clément Debiton, Levallois-Perret, France, assignor to Centre Experimental de Recherches et d'Etudes du Batiment et des T.P., Paris, France
Filed Jan. 16, 1964, Ser. No. 338,065
Claims priority, application France, Jan. 28, 1963, 922,851
2 Claims. (Cl. 52—2)



1. An anchoring device comprising an inflatable flexible vessel adapted to be connected to a fluid source, two opposite sheaths secured to said vessel and being movable in opposite directions towards each other when the vessel is inflated and, respectively, away from each other to deflate the vessel, guide means operable for guiding the sheaths during their movements and to limit the relative movement of the sheaths towards each other including a rigid elongated anchor pin connected to one of the sheaths and at least two rods parallel to the anchor pin and guided in the anchor pin and connected to the other sheath, a traction collar connected to the other end of said anchor pin, and a tension collar connected to the other ends of said rods, the collars abutting when the vessel is deflated, said collars, anchor pin and rods being operable to move apart said sheaths thereby to deflate the vessel when said collars are being moved together into the abutting position.

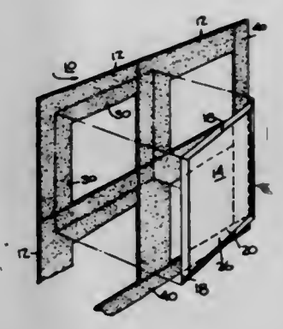
3,270,470
ROOF STRUCTURE AND METHOD OF ERECTION
John R. Wilkie, 8400 Petersburg Road, Vanderburgh County, Ind.; Boleslaw Szostak, 203 Green Valley Road, Greensboro, N.C.; Reginald B. Johnson, 1581 Stop & Shop Court, Owensboro, Ky.; and Frank D. Cain, Jr., 732 State St., Bowling Green, Ky.
Filed Nov. 26, 1962, Ser. No. 240,096
11 Claims. (Cl. 52—82)



6. A roof structure comprising a series of support columns disposed in a circular pattern, a ring member slidably positioned on said support columns, a cage centrally disposed with respect to said support columns, and trusses and cables extending radially between said cage and said columns, said trusses being positioned above said cables.

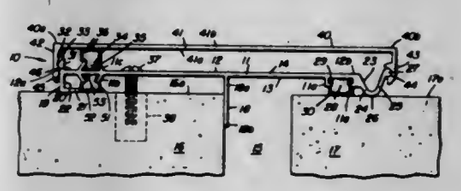
3,270,471
POST-TENSIONING APPARATUS FOR PRESTRESSING CONCRETE
Karl H. Middendorf, Costa Mesa, Calif., assignor to The Prescon Corporation, a corporation of Texas
Original application Nov. 15, 1954, Ser. No. 468,762. Divided and this application Oct. 10, 1961, Ser. No. 144,112
2 Claims. (Cl. 52—223)

1. A post-tensioned prestressed concrete structural member having a concrete body portion having a flat bottom face, an elongated prestressing tendon for said concrete body portion embedded therein having a transversely flat body portion consisting of a plurality of closely transversely adjacent high tensile strength steel wires extending in parallelism longitudinally of said tendon and means for holding said wires in a single straight row in close side by side adjacency with said row extending transversely of said tendon parallel to the bottom face of said concrete body portion, consisting of clamping means frictionally gripping said wires adjacent opposite ends of said main body portion of said tendon and at longitudinally spaced intervals along the same therebetween, each of said clamping means consisting of duplicate paired sheet metal members, one member of each pair extending transversely across said wires in engagement therewith on one side thereof and the other member of each pair extending transversely across said wires in engagement therewith on the other side thereof, said paired members having means for holding the same assembled with said wires to connect said wires slidably with said clamping means for movement of said wires relative to said clamping means longitudinally of said wires independently of each other.



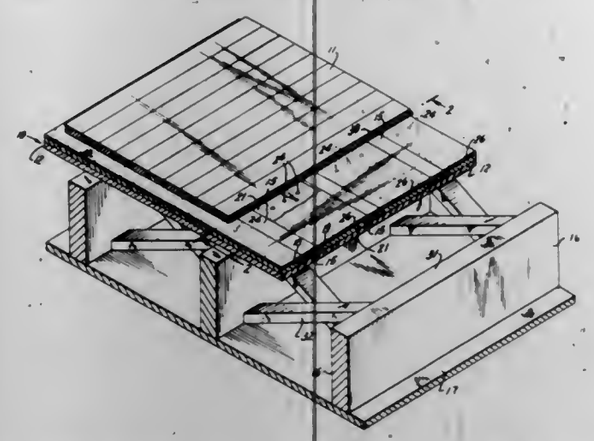
3,270,472
METAL STUD SYSTEM FOR SUPPORTING NON-LOAD BEARING CONSTRUCTION MATERIALS
Sam Gilbert, Los Angeles, Calif., assignor, by mesne assignments to Kaiser Gypsum Company, Inc., Oakland, Calif., a corporation of Washington
Filed Nov. 8, 1962, Ser. No. 236,343
2 Claims. (Cl. 52—348)

1. A system for erecting and supporting non-load bearing walls comprising a base provided with a web and flanges extending outwardly from opposite side edges of said web and including bendable cut out members, a sheet metal stud member engaging said base member and removably anchored thereto by said bendable cut out members, said sheet metal stud member including a flange provided with at least one flat surface having a plurality of foramen coextensive therewith to provide a plurality of trapping centers for screw points over said surface of said flange, each said foramen extending completely through said flange and being generally frustum-conical in cross-sectional configuration with the major base thereof being located at the said flat surface against which a wall covering member is adapted to be affixed, the inside surface of said foramen being relatively smooth and unbroken and having a length measured along the central axis thereof which is greater than the thickness of the sheet metal material from which said stud member is made and a wall covering member affixed to said flat surface of said stud member and a sheet metal screw insertable through said wall covering member and completely through a foramen.



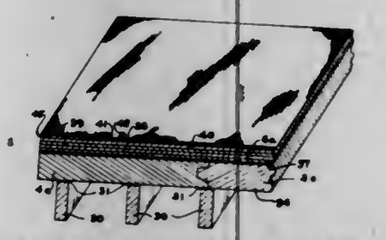
3,270,473
TILED WALL AND FLOOR SURFACE COVERING AND METHOD AND MEANS FOR APPLYING SAME
Irving Smith, Flushing, N.Y. (% Arrow Art Finishers, 1201 Evergreen Ave., Bronx 72, N.Y.)
Filed May 8, 1963, Ser. No. 278,889
1 Claim. (Cl. 52—390)

A tiled surface covering releasably adhered to a supporting surface, said covering comprising numerous square tiles arranged in ordered abutting fashion and a network composed of a multiplicity of identical thin flexible water-impermeable L-shaped elements for applying the square tiles to a supporting surface, each element being formed from sheet material and having two coplanar legs defining a right angle therebetween, said legs being of the same length and width and having pressure sensitive adhesive on both broad faces thereof, the length of each leg being the same as the length of an edge of a tile, said elements being similarly oriented and being releasably adhered to said supporting surface, each of the legs of the elements having a free end and a common end, the free ends of the legs of each element abutting the common ends of the legs of different adjacent elements whereby to align one set of legs of the elements in parallel columns and the other set of legs of the elements in parallel rows at right angles to the said columns so as to



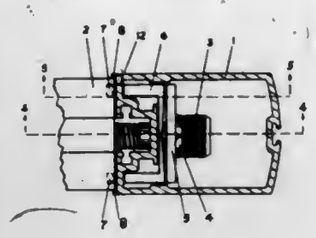
form ranks and files of hollow rectangles with the legs of the elements underlying the abutment zones between said tiles and with the abutting edges of the tiles disposed intermediate the edges of the associated legs to effect a water impervious seal.

3,270,474
EXPANSION JOINT COVER
Randolph W. Driggers, Doraville, Ga., assignor to Miscellaneous Manufacturing Corporation, Tucker, Ga., a corporation of Georgia
Filed Sept. 27, 1963, Ser. No. 312,213
7 Claims. (Cl. 52—395)



3. An expansion joint cover for first and second structural bodies which confront each other relatively movably across an intermediate zone to be covered: including a base and a cover therefor, said base comprising a rigid web secured to one only of said structural bodies against movement relative thereto and having a width sufficient to bridge said intermediate zone and extend in covering relation to a face of both of said bodies, said base having first and second walls coextensive with said web and extending angularly therefrom to be brought into facing relationship with the respective structural bodies and the said second wall being disposed to extend into contiguous relation with the second of said bodies while permitting substantially unrestrained lateral displacement of said body relative to said web, first wall structure extending outwardly of said web and first wall to define one outermost longitudinal edge of said base and having wall surfaces forming a latching member coextensive with said base, second wall structure integral with said second wall and extending outwardly of said web and second wall to define the opposite outermost marginal edge of said base, and wall means integral with said base for the support thereof on said one structural body; and said cover including a web adapted to cover said base, and first and second transversely opposed parallel edge walls coextensive longitudinally with said cover, one of said edge walls having surfaces interfitting with the said second wall structure of the base and the other of said edge walls having wall surfaces defining a latching member interfitting with said base latching member.

3,270,475
IMPACT NOISE ISOLATION FLOOR CONSTRUCTION
Michael J. Kodaras, 157 Brewster Road, Scarsdale, N.Y.
Filed Sept. 19, 1963, Ser. No. 310,030
1 Claim. (Cl. 52—480)

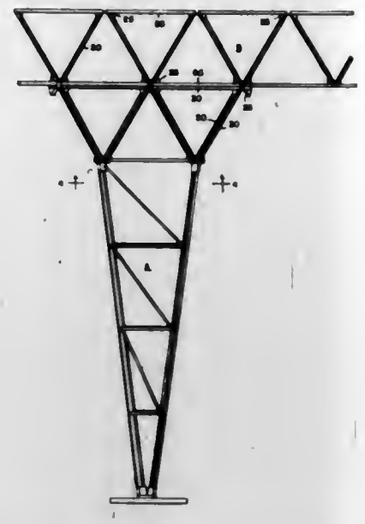


A prefabricated impact noise isolation sub-floor panel adapted to be secured to a building structure and to carry wood strip flooring, comprising a cushioning layer of relatively low density material and of dimensions substantially equal to that of the panel size, a plurality of nailing strips of rigid material arranged over said cushioning layer and bonded thereto in spaced parallel relation, a plurality of spacer strips of relatively higher density material than said cushioning layer arranged respectively between said nailing strips, and spacing said nailing strips one from the other, said nailing strips being formed with outwardly inclined beveled edegs and said spacer strips being formed with inwardly inclined beveled edges coacting with the associated edges of said nailing strips, the tops of said nailing strips extending beyond the top of said spacer strips and a dampening layer of compressible material arranged over said spacer strips between said nailing strips, whereby when conventional wood strip flooring is secured to the panel by nails driven into the nailing strips, and the spacer strips of the panels are secured to the building structure, any impact load imparted to the wood strip flooring will be absorbed by said cushioning layer, and as the nails which secure the flooring strips to the nailing strips are isolated by the spacer strips from the building structure, there will be no direct transmission of noise to the building structure.

3,270,476
INSULATING BOARD
Richard H. Enslen and Edward M. Jenkins, Somerville, N.J., assignors to Johns-Manville Corporation, New York, N.Y., a corporation of New York
Filed Jan. 22, 1962, Ser. No. 167,582
4 Claims. (Cl. 52—516)

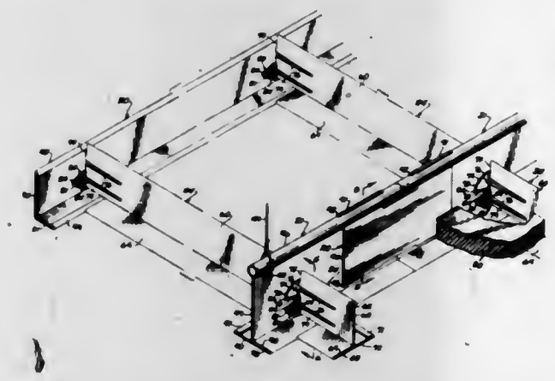
1. A roof covering comprising a roof base, a plurality of cellulosic fiberboards on said roof base, said fiberboards being juxtapositioned to form a relatively continuous surface, said fiberboards having a density between approximately 10–15 pounds per cubic foot, each fiberboard having a coating mixture of clay and an asphaltic substance integrally bonded to the upper major surface thereof, a built-up roof covering on said major surfaces of the fiberboards, said covering being adhered to the major surfaces by a bituminous composition.

3,270,477
DOOR STRUCTURES
Alex M. Johnston, Norwalk, Calif.
(4802 Pinehurst, Garland, Tex.)
Filed Jan. 11, 1965, Ser. No. 424,501
1 Claim. (Cl. 52—627)



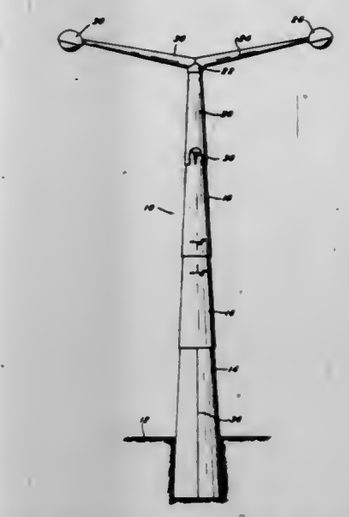
In a door structure including four separate members arranged into a rectangular framework surrounding a flat sheet, a mechanical corner joint between the square cut end of the horizontal member and the side of the vertical member, the horizontal member being provided with a longitudinally continuous recess to receive the edge of the flat sheet to a depth substantially less than the total height of the horizontal member, and such horizontal member including a longitudinally continuous partial cylinder, the vertical member including a surface which contacts the square cut end of the horizontal member, the outermost edges of said surface being provided with longitudinally continuous protrusions forming between them a recess which contains the square cut end of the horizontal member, and said surface of the vertical member being provided with a longitudinally continuous recess for receiving the edge of the flat sheet to a depth substantially less than the total width of that member, the innermost wall of the recess being provided with a slot which extends from the nearest end of the vertical member a distance slightly longer than the distance from the outermost edge of the horizontal member to the innermost wall of the partial cylinder in the horizontal member, the mechanical joining of the vertical and horizontal members being accomplished by the application of a bolt through a channel member which transfers the pressure created by the bolt from the center of the recess in the vertical member to the outside edges of the vertical member, such bolt passing then through the slot in the vertical member and threading into the longitudinally continuous partial cylinder in the horizontal member, and wherein the horizontal member includes a longitudinally continuous horizontal wall, and wherein the surface of the vertical member which contacts the square cut end of the horizontal member is provided with at least one integral rail locating protrusion formed from that wall by punching out a tab from the material of that wall, said tab being located in such a position as to protrude into the horizontal member adjacent the longitudinally continuous horizontal wall of the horizontal member when the horizontal member is located in vertical alignment with the end of the vertical member.

3,270,478
BUILDING CONSTRUCTION
Charles W. Attwood, 4118 S. Wayne Road, Wayne, Mich.
Filed Sept. 20, 1960, Ser. No. 58,874
19 Claims. (Cl. 52—648)



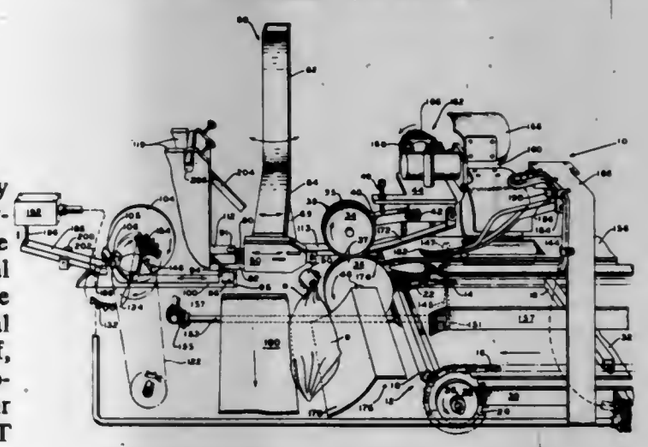
1. A building construction comprising a skeletonized structure consisting of a multiplicity of identical channel members bolted at their ends to identical junction plates

and arranged to form alternate erect and inverted square pyramids, the base members of the pyramids forming chords in parallel planes and the inclined edges forming web members or struts, each strut constituting an edge



of two adjacent pyramids, all eight edges of which are of equal length and said channel members in the parallels planes being arranged with their open sides outwardly of the structure.

3,270,479
SUSPENSION GRID SYSTEM FOR A CEILING CONSTRUCTION
Roger N. Weinar, 129 San Clemente Drive, Oxnard, Calif.
Filed Aug. 9, 1963, Ser. No. 301,146
8 Claims. (Cl. 52—667)



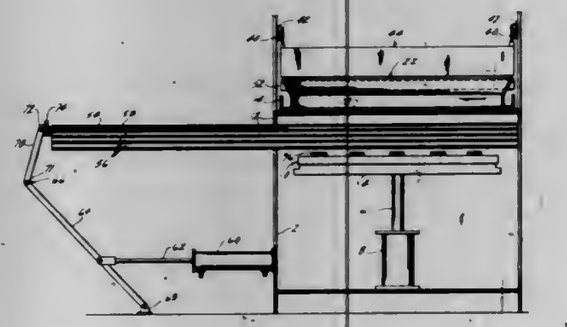
1. A grid for a ceiling, comprising a pair of generally horizontal and parallel spaced supporting bars each having a vertical web and at least one horizontal side flange extending longitudinally thereof, a generally horizontal supported T extending transversely of and bridging the space between said vertical webs and having a vertical web and a side flange extending longituidnally thereof, said web of each supporting bar having at least one supporting shoulder offset toward the other supporting bar and arranged at the corresponding end of said cross T but offset from the major axis of said supported T, and projections on the opposite ends of said supported T offset from said major axis thereof and in the normal unstressed condition of said supported T being out of engagement with said supporting shoulders, said projections engaged with said supporting shoulders thereby causing the grid to be under stress; the supported T being assembled by manually twisting said supported T about said major axis and thereafter releasing said supported T in position to effect engagement between said projections and supporting shoulders.

3,270,480
TAPERED SECTIONAL SUPPORT POLE
William Beecker, P.O. Box 735, Lansdale, Pa.
Continuation of application Ser. No. 198,679, May 29, 1962. This application Apr. 7, 1965, Ser. No. 448,562
5 Claims. (Cl. 52—726)

1. In a pole structure comprising a plurality of hollow overlapping tapered sections, each section overlapping the section therebelow by a distance between one hundred twenty percent and one hundred fifty percent of the greatest inside diameter on the overlapping section, each section being a tapered metal member having a butt-joint weld extending in a longitudinal direction thereof, said tapered sections having a thinner wall thickness than sections therebelow, and each section having a uniform taper so that a pole constructed thereof will have a taper corresponding to a true linear cone.

3,270,481
METHOD OF AND MECHANISM FOR CLOSING BAGS
Hans Gerd Rocholl, Salt Lake City, Utah, assignor, by mesne assignments, to Kwik Lok Corporation, Yakima, Wash., a corporation of Washington
Continuation of application Ser. No. 91,008, Feb. 23, 1961. This application Oct. 22, 1965, Ser. No. 502,665
17 Claims. (Cl. 53—14)

14. A method of closing the slack neck of a partially filled flexible plastic bag, said method including the steps of flattening said neck in a given plane, with said neck extending away from the filled portion of said bag, pinching and pulling a side edge of said flattened bag neck at two fixed positions spaced from each other along said edge, said pulling being in parallel directions away from and normal to said bag neck, progressively advancing the grip of said pinching and pulling step to successive bag neck portions as the latter are drawn through said



fixed positions so as to progressively draw a transverse section of said bag neck through said positions, and presenting a closure tab having a narrow edge opening, inwardly enlarged to form a closure aperture, with said opening lying abreast of and between said positions and close to said plane and facing the advancing bag neck section whereby the latter is progressively delivered through said opening and into said closure aperture, thus applying said closure tab to said bag neck and closing said bag.

3,270,482

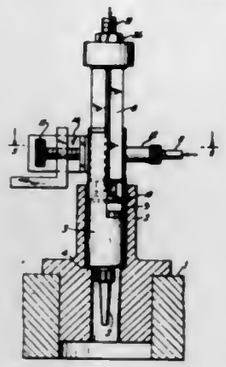
METHOD AND APPARATUS FOR SKIN PACKAGING ARTICLES AND PACKAGES FORMED THEREBY

Herman G. Kraut, New Britain, Conn., assignor to The Stanley Works, New Britain, Conn., a corporation of Connecticut

Filed Oct. 31, 1963, Ser. No. 320,260
22 Claims. (Cl. 53—30)

1. In the method of skin-packaging articles between an air-pervious substrate and a thermoplastic film, the steps comprising placing an article on the upper surface of an air-pervious substrate to form a packaging subassembly; supporting a length of thermoplastic film about its margins in spaced, generally parallel relationship above said packaging subassembly; supporting between said film and packaging subassembly a heat-resistant shield member dimensioned and configured to overlie substantially all of said packaging subassembly; directing heat downwardly into said film sufficient to heat said film to deformability, said shield member substantially shielding said packaging subassembly from the heat; withdrawing said shield member from its position between said heated film and packaging subassembly; and moving said packaging subassembly and heated film into contact while drawing vacuum through said substrate, said vacuum drawing said heated film downwardly about said article into a close-fitting sheath and into laminar contact with said substrate surrounding said article, said film being bonded to said substrate upon being drawn into laminar contact.

3,270,483



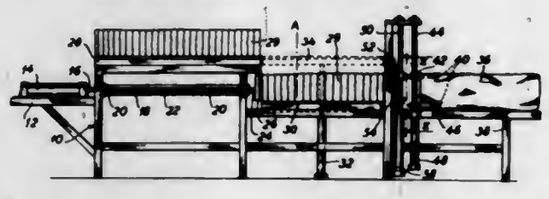
METHOD AND APPARATUS FOR ASSEMBLING SYRINGES

Loyd L. Smoyer and Jack D. Vail, Jr., Overland Park, Kans., assignors to Richardson-Merrell Inc., New York, N.Y., a corporation of Delaware

Filed Sept. 20, 1963, Ser. No. 310,361
4 Claims. (Cl. 53—43)

1. A method of inserting plungers into syringes having a round resilient barrel and being partially filled with a liquid which comprises squeezing the barrel of the syringe at a point above the level of said liquid whereby the shape of the barrel is deformed from its round to an oblong shape while simultaneously inserting the plunger into the barrel of said syringe, the air in the barrel of said syringe being allowed to escape through the passage created by said deformation of shape.

3. Apparatus for inserting plungers into resilient syringes which comprises a holder in which the lower part of the syringe barrel is inserted, means for bringing pressure against the outer surface of the barrel of the syringe in said holder at a point above the level of a liquid in said syringe said pressure being applied at right angles to the vertical axis of the barrel of the syringe, means to support the opposite side of the syringe at a point opposite the side of the syringe at which pressure is



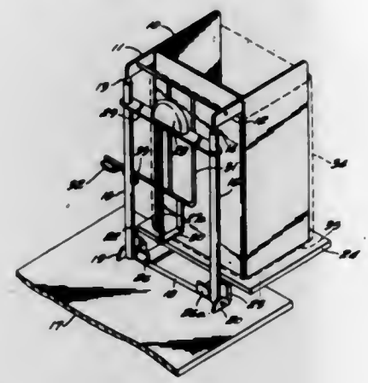
applied while said pressure is being applied thereby making it possible to change the cross-sectional shape of the barrel at the point where the pressure is being applied from round to oblong thus providing a passageway for the escape of air within the barrel of said syringe above the level of the liquid therein while pressure is being exerted on the syringe and the plunger is being inserted, and means to push a plunger for said syringe into the barrel past the point at which pressure is being applied.

3,270,484

MACHINE FOR COMPRESSING AND SUBSEQUENTLY PACKING COMPRESSIBLE ARTICLES SUCH AS PULP EGG TRAYS

Kurt Sandahl Sørensen, Bagsværd, Denmark, assignor to Skandinavisk Emballage Aktieselskab, Lyngby, Denmark

Filed Oct. 29, 1963, Ser. No. 319,709
10 Claims. (Cl. 53—124)



10. A machine for compressing and subsequently packing compressible material, said machine comprising in combination feeding means for feeding said material and having a delivery end, package holding means for holding a package in its open state, said package holding means being placed in spaced relationship to said delivery end of said feeding means and out of alignment therewith, transferring means for transferring said material from said feeding means to said package, said transferring means being movable between a first position in which said transferring means is approximately aligned with said feeding means and a second position in which said transferring means is out of alignment with said feeding means and is adjacent to the open end of said package, means for moving said material from said feeding means to said transferring means in said first position thereof, stop means movable between a package opening blocking position and a non-blocking position when said transferring means is in its second position, means movable towards said stop means in its blocking position and in a path substantially coincident with said material on said transferring means in the second position thereof as to compress said material against said stop means in its blocking position and to subsequently pack said compressed material by pushing it from said transferring means into said package when said transferring means is in its second position.

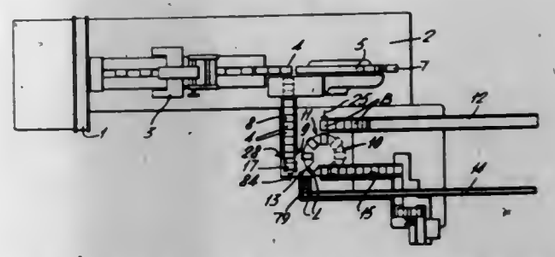
3,270,485

ARTICLE LOADER

Dale L. Knepper, 104 Willard Drive, Pickerington, Ohio

Filed Oct. 1, 1965, Ser. No. 492,249
16 Claims. (Cl. 53—255)

1. A loading device comprising
(1) a base member;
(2) a trough provided with an open end, said trough being adapted to be positioned horizontally for loading with articles and being adapted to be swung into a vertical position to make said open end the bottom;
(3) a telescopic assembly comprising an extensible member and a non-extensible member, said extensible member secured to said trough for simultaneous translational movement therewith, and said non-extensible member being swingably secured to said base member for simultaneous swingable movement with said trough;
(4) a gate member swingably mounted relative to said trough to swing, when said trough is in its horizontal position, from a vertical position where said member closes said open end to a horizontal position where said member does not obstruct said open end; and
wherein, in sequence, the trough may be loaded with articles, a sack may be slid over said trough from the open end thereof, the gate member may be swung against the bottom of the sack, the trough may be swung into a vertical position, and the trough may be lifted vertically away from said sack by extension of said telescopic assembly.



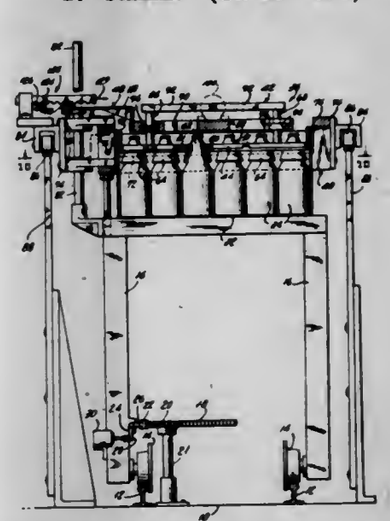
3,270,486

APPARATUS FOR PACKING ARTICLES OF RECTANGULAR BLOCK SHAPE IN BOXES HAVING SEPARATE LIDS

Charles Thomas Hall, Deptford, London, England, assignor to The Molins Organisation Limited

Filed Mar. 6, 1963, Ser. No. 263,216
Claims priority, application Great Britain, Feb. 8, 1963, 5,251/63
7 Claims. (Cl. 53—282)

1. Apparatus for packing articles of a rectangular block shape in boxes having separate lids, comprising a rotatable turret having pockets equally spaced around its axis of rotation to receive and hold box bodies, means for intermittently rotating said turrent in angular stages corresponding to the angular pitch of the pockets to move the pockets successively to different positions of rest, a pusher for feeding a body into a pocket at one rest position, means for feeding an article to a subsequent rest position, a further pusher arranged to push the article into said body after the turret has rotated to move said pocket to said subsequent rest position, and at a lid-applying position to which the loaded box body is brought by a further movement of the turret, means for applying to the filled box body a lid having a top panel and four side flanges constituting a skirt, said means comprising a lid carrier movable from a lid-receiving position to a lid-applying position, said carrier being pivoted at one end of a pivoted

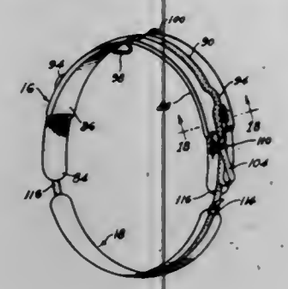


lever, a cam for causing a swinging movement of the lever to swing the carrier and bring a flange of the lid into contact with the box body at one side thereof so that part of the skirt of the lid slides over the open end of the box body at said side, whereby the lid top panel is disposed at an angle to the plane of the open end of the body, and means for thereafter swinging the lid through such angle comprising a further cam operable to rotate the carrier on its pivot at the lever end, whereby the remaining part of the skirt of the lid is slid over the remainder of the said open end to complete the fitting of the lid on the box.

3,270,487

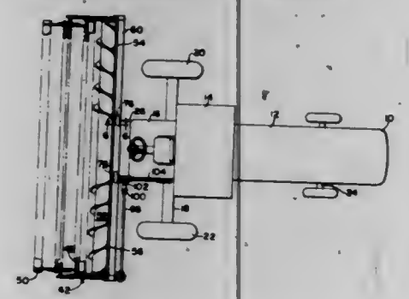
MULTI-UNIT BOTTLE SET-UP MACHINE

Alexander S. Tchimenogiov, 422 N. 8th St., Fairview, N.J.; Louis J. Iocca, Jr., 46 Leonard St., Jersey City, N.J.; and Gilbert L. Offenhartz, 15 Parkview Drive, Millburn, N.J.



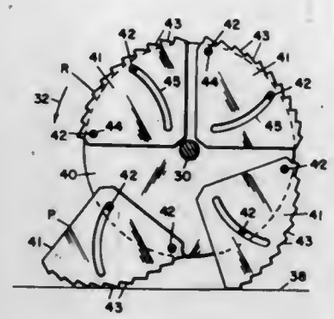
Filed Apr. 17, 1962, Ser. No. 188,124
13 Claims. (Cl. 53—393)

1. An automatic device that will enable a plurality of bottles in a case unit group to be processed while still partially within their case, comprising:
(a) a clamping means operable to be inserted into the case to grasp the bottles concurrently,
(b) a substantially saddle-shaped frame operable to fit on the outside of the case, and supporting the said clamping means such that when the bottles are held by the clamping means said frame permits a clear space directly over the necks of the bottles to be completely transversed from front to back for processing, and



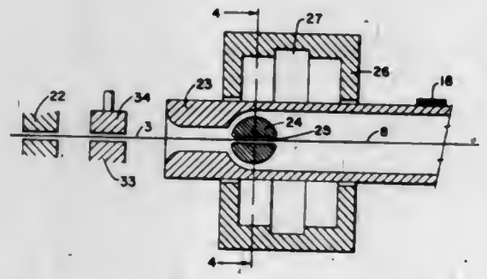
(c) means to separate said bottles from the floor of the case a predetermined distance, whereby said bottles may be presented for the process of cleaning, filling or capping.

3,270,488
LIGHTWEIGHT HARNESS
Willard C. Beach, R.D. 1, Glen Rock, Pa.
Filed Apr. 28, 1964, Ser. No. 363,118
4 Claims. (Cl. 54—39)



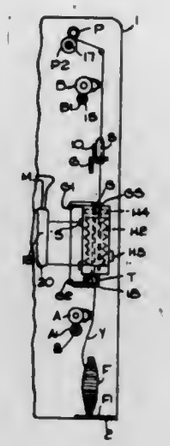
1. A lightweight saddle for a set of harness, said saddle being free of metal bracing and comprising a covering of a plurality of closely overlying plies of moisture-resistant textile fabric woven from synthetic resin filaments having high tensile strength, said covering being stuffed with material to provide desired cushioning characteristics and shape thereto, and loop means comprising a relatively narrow strip of multi-ply material similar to that from which said covering is formed and stitched longitudinally to the upper surface of said stuffed saddle covering, said strip being spaced from said upper surface of said covering at intervals to provide loops for guiding lines when extended therethrough and to connect reins and the like thereto, whereby said stuffing and stitching solely impart shape to said saddle, thereby rendering the same light in weight.

3,270,489
MOUNTING AND DISMOUNTING MEANS FOR AGRICULTURAL MACHINES
Glen W. Rohweder, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Delaware
Filed July 15, 1963, Ser. No. 295,086
10 Claims. (Cl. 56—21)



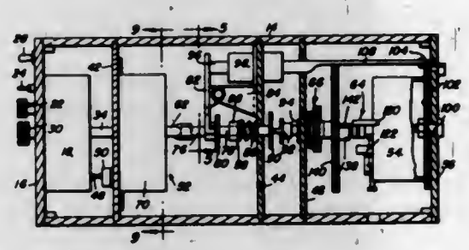
1. In a mobile agricultural machine having a fore-and-aft body including a vertically adjustable forward supporting and crop-feeding housing provided with a front end crop inlet opening, and a transverse header ahead of said housing and including a rear generally upright wall provided with a crop-transfer opening registrable fore-and-aft with the inlet opening, the improvement residing in means for mounting and dismounting the header on and from the housing, comprising: first and second structures rigidly secured respectively to the housing and header in proximity to the respective openings and including vertically connectible and disconnectible means having cooperative elements respectively on said structures enabling vertical connection and disconnection thereof upon opposite vertical adjustment of the housing; and additional disconnectible fastener means connectible between said structures when said elements are connected.

3,270,490
COTTON SCRAPPER
Walker R. Nisbet, San Angelo, Tex., assignor to A. R. Nisbet & Sons, Inc., San Angelo, Tex.
Filed Nov. 5, 1963, Ser. No. 321,554
6 Claims. (Cl. 56—28)



1. In a waste cotton salvaging machine, a picker head comprising a rotatable drum-like body consisting of a plurality of spaced parallel circular plates, a rotatable shaft having said plates mounted thereon, and sets of toothed sectors pivotally mounted between said plates for swinging movement from a retracted to a projected position and vice versa by gravity, said sectors in their projected position being engageable with the ground to pick up cotton therefrom.

3,270,491
APPARATUS FOR TWISTING YARN
Lambertus H. de Langen, Arnhem, Netherlands, assignor to American Enka Corporation, Enka, N.C., a corporation of Delaware
Original application Feb. 8, 1962, Ser. No. 171,901. Divided and this application Sept. 17, 1965, Ser. No. 496,222
Claims priority, application Netherlands, Feb. 13, 1961, 261,181
5 Claims. (Cl. 57—77.45)

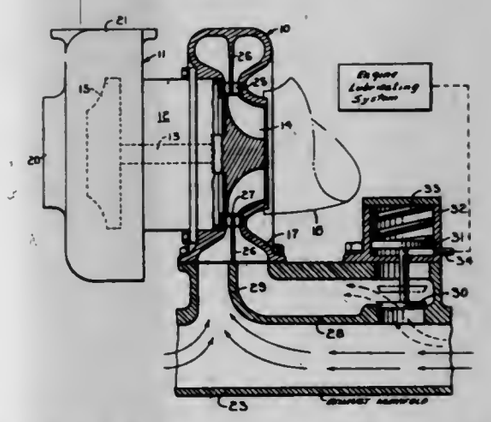


1. A twist apparatus comprising an elongated tubular body provided with a longitudinal thread passageway, means mounting said tubular body for rotation, a thread clamp supported within said longitudinal thread passageway for rotation with and for turning with respect to said tubular body, said thread clamp operating to grip thread passing through said tubular body only in one position of said clamp relative to said body, a bushing slidably supported by the external surface of said tubular body, means transposing sliding movement of said bushing into rotation of said thread clamp relative to the tubular body, and means for rotating said tubular body.

3,270,492
PRODUCTION OF YARNS
Sydney Fitton, Spondon, and Kishan Vallabhdas Vidhani, Arnold, Nottingham, England, assignors to The Hosiery and Allied Trade Research Association
Filed Aug. 21, 1962, Ser. No. 218,338
Claims priority, application Great Britain, Aug. 23, 1961, 30,361/61
11 Claims. (Cl. 57—157)

1. A process for crimping a thermoplastic filament, which comprises the sequential steps of submitting the filament to a shrinking treatment in which the molecular structure of the filament is modified, stabilizing the filament in its molecularly-modified condition, submitting the filament to a second molecularly-modifying treatment and physically distorting the filament to impart a crimp thereto.

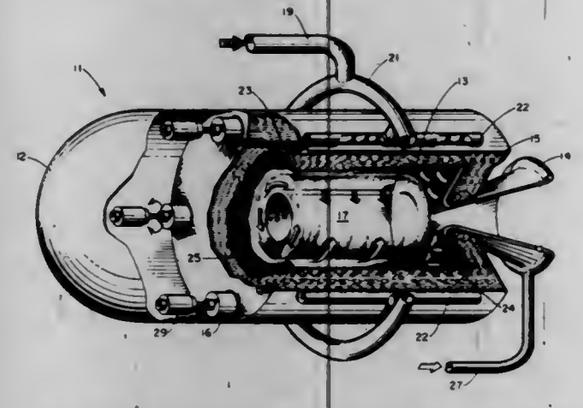
3,270,493
TIME CONTROLLED LOCATING ALARM SYSTEM
Archie C. Wallace, Rte. 1, Box 10, Elmer, La.
Filed Apr. 23, 1965, Ser. No. 450,334
12 Claims. (Cl. 58—152)



1. In combination with an alarm clock, a time controlled alerting mechanism comprising a mechanically settable timer, a timer setting motor, solenoid operated clutch means operatively connecting said motor to the timer for setting movement thereof, relay means responsive to alarm operation of the alarm clock for simultaneously energizing said motor and said clutch means, manually settable means operatively connected to the relay means for deenergization thereof in response to movement of the timer from a zero position by a predetermined amount, an alerting circuit, and switch means connected to said timer and the alerting circuit for sequentially energizing the alerting circuit and the relay means in response to approach of the timer to said zero position following deenergization of the relay means, whereby said alerting circuit is periodically energized for preset intervals spaced apart by a timing period predetermined by said manually settable means.

3,270,494
SNAP-EYE
Tracy S. Holmes, 649 Hightree Road, Santa Monica, Calif.
Filed Mar. 30, 1964, Ser. No. 355,755
4 Claims. (Cl. 59—86)

1. A snap shackle comprising in combination:
a pair of hook-shaped jaws disposed in side-by-side relation in a common plane facing in opposite directions and with abutting surfaces of distal portions normally in overlapping mutual contact to form a closed loop, said distal portions being tapered toward the distal ends thereof so that said abutting surfaces form a joint surface oblique and at an acute angle to said common plane;
interfitting projections and recesses formed in said surfaces of said jaws to prevent relative motion of said jaws along said joint surface;
hinge bearings formed in said jaws adjacent the proximal ends thereof, said bearings being aligned on a transverse axis in said common plane;
a hinge pin received in said bearings to permit relative swinging movement of said jaws by manual manipulation to separate said contacting surfaces, open said loop, and permit attachment or detachment of said shackle;
and means secured to said hinge pin for attaching said shackle to a line.

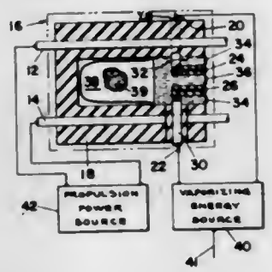


3,270,495
APPARATUS FOR CONTROLLING SPEED AND VIBRATION OF ENGINE TURBOCHARGERS
Donald H. Connor, Chillicothe, Ill., assignor to Caterpillar Tractor Co., Peoria, Ill., a corporation of California
Continuation of application Ser. No. 63,067, Oct. 17, 1960. This application Aug. 14, 1963, Ser. No. 302,074
5 Claims. (Cl. 60—13)

1. An engine turbocharger system comprising a turbocharger having a rotor arranged for rotation on a longitudinal axis in an annular housing, an engine manifold operatively connected to said turbocharger and terminating at said housing, said housing comprising an annular inlet for said manifold gases arranged in substantial perpendicular and surrounding relationship with respect to said axis for discharging gases onto said rotor and control means for preventing overspeeding of said rotor,

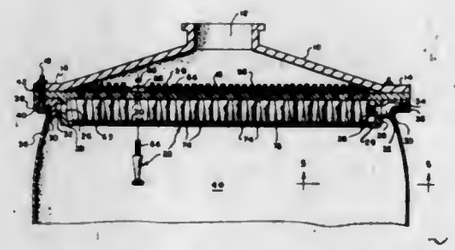
said control means comprising an annular partition in said housing arranged to extend in a substantial radial direction from and in surrounding relationship with respect to said axis to divide said inlet into first and second annular compartments, said first compartment arranged in constant communicating relationship with said manifold, a wall member arranged in said manifold to form a chamber therein in communicating relationship with said second compartment, means forming an opening in said wall member at a location spaced from the connection of said first compartment and the inlet toward some of the cylinder outlets in connection with said manifold, and valve means for opening or closing said opening for either permitting gases in said manifold to flow through said first compartment or through said first and second compartments.

3,270,496
GASEOUS VORTEX REACTOR FOR A ROCKET MOTOR
Frank E. Rom, Avon Lake, Ohio, assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Mar. 20, 1964, Ser. No. 353,635
10 Claims. (Cl. 60—35.5)



1. In a gaseous core nuclear reactor of the type wherein a light propellant is heated by diffusion through a heavy fissionable fuel; the improvement comprising
a hollow housing surrounding the reactor core and having a plurality of tangentially-formed slots therein, said slots forming a communication between the interior of said housing and said core, and
means for supplying a mixture of the propellant and fuel to said slots whereby said mixture is injected tangentially into the gaseous core to maintain the heavy fissionable fuel outwardly of the core center by centrifugal action.

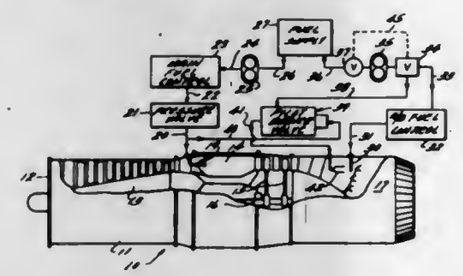
3,270,497
ANTI-ICING ADDITIVES FOR HYDROCARBON FUELS
Emil A. Malick, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Filed Jan. 18, 1962, Ser. No. 167,178
8 Claims. (Cl. 60—35.4)



1. In the method of operating a jet engine which encounters subfreezing temperatures, said engine being equipped with a fuel supply system through which a liquid hydrocarbon fuel is passed to a combustion zone of said engine, said fuel supply system is subject to becoming plugged by ice formation at said subfreezing temperatures due to the presence of water in said fuel, and to prevent said plugging there is incorporated in said fuel from 0.01 to 3 volume percent of an anti-icing additive consisting essentially of a glycol ether having the formula $R(OCH_2CH_2)_xOH$ wherein R is selected from the group consisting of a hydrogen atom, methyl, ethyl, propyl, butyl, phenyl, and tolyl groups, when R is hydrogen x is an integer of from 2 to 4, and when R is other than hydrogen, x is an integer of from 1 to 4, and where in said method and in those instances when said additive as prepared has a pH outside the range of from 6 to 7 which can contribute to other malfunctioning of said fuel supply system and said engine, the improvement of: adjusting the pH of said additive from a value outside the range of 6 to 7 to a value within the range of from 6 to 7 prior to incorporating said additive in said fuel.

3,270,498
CONTROLLABLE VAPORIZING GAS ACCELERATOR
Aldo V. La Rocca, Villanova, Pa., assignor to General Electric Company, a corporation of New York
Filed Nov. 5, 1963, Ser. No. 321,540
3 Claims. (Cl. 60—35.5)

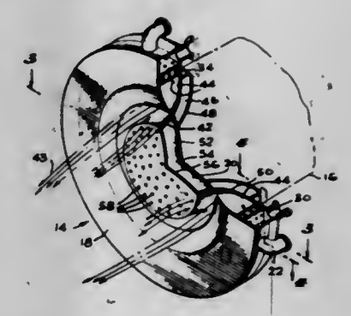
1. A device for producing thrust by the electrical acceleration of gas, comprising:
a store of non-gaseous material capable of being altered by electrical discharge at least partly to an ionizable gas;
a member having a porous surface connected with the said store to receive a coating of the said non-gaseous material;
vaporizing electrode means disposed in proximity to the said porous surface for controlled production of electrical discharges to controllably convert the said coating of non-gaseous material into an ionizable gas;
propulsion electrode means for producing an electrical discharge through the said ionizable gas for addition of energy thereto;
nozzle means for directing the said gas, to discharge the said gas to produce a thrust reaction.



3,270,499
INJECTOR ASSEMBLY FOR LIQUID FUELED ROCKET ENGINES
William J. D. Escher, Woodland Hills, Calif., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Jan. 23, 1964, Ser. No. 339,825
9 Claims. (Cl. 60—35.6)

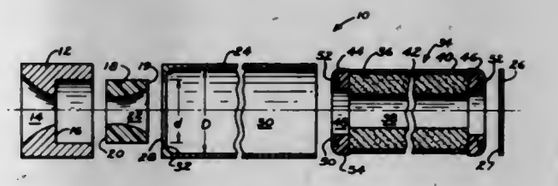
1. An injection system for a rocket thrust chamber including a combustion chamber comprising:
A. a first propellant manifold having a propellant inlet and an open side;

B. a backplate disposed across said open side and having a plurality of uniformly spaced apertures therein;
C. an injector nozzle removably mounted in each of said apertures and extending outwardly from said manifold and terminating in an outer end,
(1) a propellant passageway extending through each of said nozzles and opening into said combustion chamber and said first propellant manifold,
(2) each of said nozzles having an impervious flange on said outer end forming with said backplate a second propellant manifold;
D. a propellant inlet communicating with said second manifold; and
E. each of said flanges having faces spaced from corresponding faces on the flange of adjacent nozzles to form the only opening communicating with said combustion chamber and said second propellant manifold whereby the propellants from the first and second manifolds are mixed and react in said combustion chamber to form gaseous reaction products under high pressure.



3,270,500
AFTERBURNER FUEL CONTROL
Raymond L. Williams, Evendale, Ohio, assignor to General Electric Company, a corporation of New York
Filed Feb. 27, 1964, Ser. No. 347,818
5 Claims. (Cl. 60—35.6)

1. A fuel system for an afterburning gas turbine engine comprising
a main combustion system including a combustor and conduit means for the delivery of fuel thereto,
an afterburner combustion system comprising
at least one afterburner nozzle and
an afterburner pilot nozzle,
means for selectively supplying fuel to said afterburner nozzle and stopping flow of fuel thereto, and
means for simultaneously supplying fuel to the afterburner pilot nozzle and igniting same when fuel is supplied to said afterburner nozzle and stopping flow of fuel thereto when the flow of fuel to the afterburner nozzle is stopped, said means initially supplying a substantially large amount of fuel to said afterburner pilot nozzle and then a lesser amount of fuel during continued operation of the afterburner nozzle.

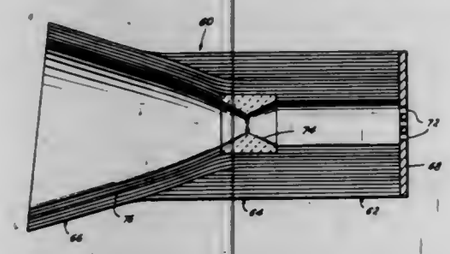


3,270,501
AERODYNAMIC SPIKE NOZZLE
James E. Webb, Administrator of the National Aeronautics and Space Administration, with respect to an invention of Thomas E. Cowell and Ira B. Madison
Filed Mar. 5, 1964, Ser. No. 349,781
10 Claims. (Cl. 60—35.6)

1. A method of providing thrust for a spike-free, shroud-free propulsion nozzle, comprising:
the step of expelling a first propulsion stream at a subsonic velocity in a selected amount from said nozzle;
the step of expelling a second propulsion stream at a supersonic velocity from said nozzle; and,
the step of directing said supersonic propulsion stream contiguous to said subsonic propulsion stream, to form said subsonic propulsion stream into the shape of an aerodynamic conical spike, and also forming an aerodynamic throat to increase the velocity of said subsonic stream to a supersonic level.

3. In a spike-free, shroud-free propulsion nozzle, the combination comprising:
a first injector constructed to eject a first propulsion stream at a subsonic velocity;
a second injector circumscribing said first injector and constructed to eject a second propulsion stream at a supersonic velocity; and,
structure to direct said second propulsion stream contiguous to said first subsonic propulsion stream to form said first propulsion stream into an aerodynamic conical spike.

3,270,502
GAS-GENERATING DEVICES
Bernard Silver, Alexandria, Va., assignor to Atlantic Research Corporation, Fairfax County, Va., a corporation of Virginia
Filed Sept. 30, 1964, Ser. No. 400,479
11 Claims. (Cl. 60—35.6)



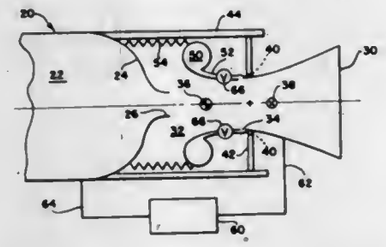
1. A gas-generating element comprising, in combination, a solid gas-generating grain and a heat-resistant, resilient member abutting against each end of said grain, one of said members having a passage extending therethrough from side to side thereof and one of said members having a recess disposed in the exposed side surface thereof.

3,270,503
ABLATION STRUCTURES
Andre J. Meyer, Jr., Houston, Tex., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Jan. 13, 1965, Ser. No. 425,364
6 Claims. (Cl. 60—35.6)

4. An ablation structure forming a rocket engine, said rocket engine having a combustion chamber portion, a nozzle portion, and an exhaust portion, said engine comprising:
a surface layer exposed to heat in said rocket engine and forming the inner surface of said rocket engine;
a plurality of outer layers arranged substantially parallel to said inner surface layer and integrally formed therewith;

means for allowing gases generated upon heating of said structure to readily vent towards said inner surface comprising threads of fiber arranged in a cellular fashion and disposed axially and circumferentially to

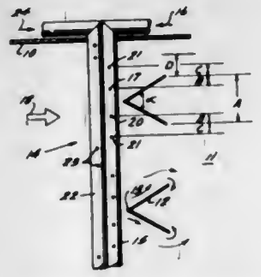
said engine axis, the spacing between adjacent threads being several times greater than the thickness of said threads; and



ablation material impregnated in the cellular area and in the area between the threads of successive layers.

3,270,504
AUTOMATICALLY DEPLOYING NOZZLE EXIT CONE EXTENSION
Donald R. Ward, Garfield Heights, Ohio, assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed July 20, 1965, Ser. No. 473,535
10 Claims. (Cl. 60—35.6)

1. An exit cone assembly comprising an exit nozzle for a rocket, an exit cone extension having a collapsed position in which it is in a telescoped relationship with said nozzle and an extended position effective to extend the length of the nozzle and increase the cross-sectional area thereof, means for moving the extension from its collapsed position to its extended position comprising a plurality of snap columns, operably connected between said nozzle and said extension, that are in a bent position in said collapsed position of the extension and are in a straight rigid position in said extended position of the extension.

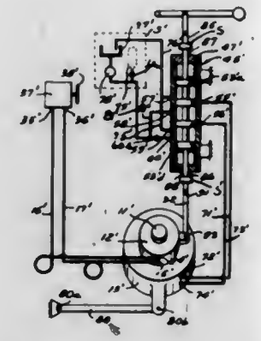


3,270,505
CONTROL SYSTEM FOR ROCKET VEHICLES
Norman L. Crabill and John M. Riebe, Newport News, Va., assignors to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Oct. 21, 1964, Ser. No. 405,632
11 Claims. (Cl. 60—35.55)

1. A control system for an aircraft propelled by a reaction motor comprising: nozzle means for directing an exhaust stream; means for pivotally mounting said nozzle means; said mounting means located rearward of the center of gravity of said nozzle means; secondary injection means for introducing a jet of fluid into the exhaust stream flowing through said nozzle; and said secondary injection

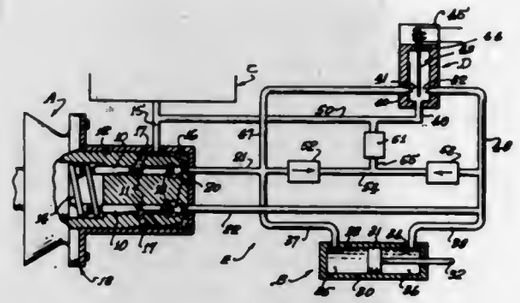
means located for introducing the jet upstream of said means pivotally mounting said nozzle whereby the nozzle orientation is controlled by injecting a fluid into the rocket exhaust stream to establish reaction magnification and thrust vector control.

3,270,506
LIQUID-VAPOR FUEL INJECTOR FLAMEHOLDER
Donald W. Bahr, Cincinnati, Ohio, assignor to General Electric Company, a corporation of New York
Filed Oct. 31, 1961, Ser. No. 149,023
15 Claims. (Cl. 60—39.72)



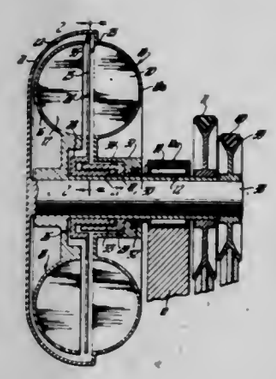
1. A wide range liquid-vapor fuel injector-flameholder for a reaction engine combustion chamber comprising, a V-gutter circumferentially disposed in said combustion chamber with its apex upstream, a first vapor spray bar extending substantially radially into the combustion zone closely adjacent the apex of the V-gutter and substantially perpendicular thereto, a first set of oppositely directed orifices in the spray bar oriented to spray vapor fuel substantially transverse to the air flow through the chamber, said orifices disposed at least one quarter inch inside the V-gutter trailing edge, said orifices providing a vapor pilot flame on the V-gutter, a second liquid spray bar backing and closely adjacent said first spray bar, a set of oppositely directed orifices oriented to spray liquid fuel substantially transverse to the air flow, said orifices for liquid being disposed at least one quarter inch outside of the V-gutter trailing edges to provide liquid fill flame adjacent said vapor pilot flame.

3,270,507
HYDRAULIC CONTROL SYSTEM
Jean Mercier and Bernard Mercier, 1185 Park Ave., New York, N.Y.
Filed June 16, 1965, Ser. No. 464,397
7 Claims. (Cl. 60—51)



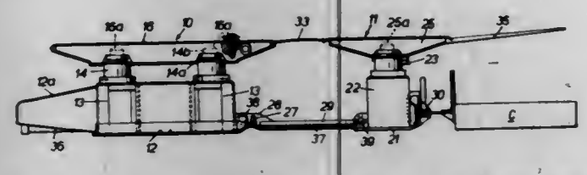
1. A hydraulic control system for effecting rotary movement of a shaft on each side of neutral position, comprising a hydraulic motor operatively connected to said shaft to rotate the latter, said motor having control ports, a valve having control ports connected to the control ports of said motor, said valve having a fluid pressure inlet port, and a return port, a source of fluid under pressure connected to said pressure inlet port, and adapted

to provide a constant source of pressure thereto, a reservoir connected to said return port, said valve having a movable valve member, resilient means reacting against said valve member normally retaining the latter in neutral position to block flow of fluid from said first pressure source through said control ports of said valve to said first hydraulic motor and to connect said pressure inlet port and return port of said valve, a control valve having a pair of control ports and a pair of operating ports, said valve having valve means controlling said ports, said valve means having a neutral position in which said operating ports are connected and said control ports are blocked and an operating position in which said control ports are connected respectively to the operating ports, a



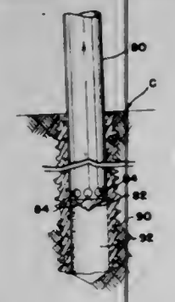
second source of fluid under pressure adapted to supply fluid under pressure only when actuated, said second source having a pair of ports connected respectively to said control ports of said control valve, said second fluid source ports selectively defining a pressure port and a return port, a second hydraulic motor operatively connected to said shaft, said motor having a pair of ports connected respectively to the operating ports of said control valve, and means opeartively connecting the ports of said second source to said first valve, to effect movement of said valve member to operative position, upon actuation of said second source, thereby to connect said pressure inlet port and said return port to said control ports of said first valve and to said first hydraulic motor.

3,270,508
ELECTRO-HYDRAULIC SERVO POWER CONTROL SYSTEM
Paul A. Smith, Tarzana, and Leonard N. Fox, Glendale, Calif., assignors to Crane Co., doing business as Hydro-Aire Division, Burbank, Calif., a corporation of Illinois
Filed Mar. 17, 1965, Ser. No. 440,480
5 Claims. (Cl. 60—52)



1. An hydraulic servo power system comprising, in combination: a reversible actuator having movable pressure responsive means and respective power chambers arranged for opposed fluid pressure action against said pressure responsive means; a servo valve having opposed control orifices, a second movable element between said orifices, and a remotely controlled servomotor acting upon said second movable element to vary the restriction of said orifices solely in response to command signals transmitted thereto; multiple pump means having two outlets independently receiving pressure fluid flows pumped by respective pump elements; and mutually isolated fluid delivery lines each connecting a respective pump outlet to a respective power chamber of said actuator and, in parallel, to a respective control orifice of said servo valve, whereby displacement of said second movable element toward one of said control orifices and away from the other will restrict escape of fluid from said one control orifice and correspondingly will increase the fluid pressure in the power chamber connected thereto, while permitting increased flow from said other control orifice and relieving pressure in the other power chamber so as to effect movement of the actuator toward said other power chamber, utilizing the full pressure and flow delivered from a respective pump outlet, said system having a power input requirement less than half that of an hydraulic servo power system of equal output capacity having a common path of flow from pump outlet to both power chambers of a reversible actuator.

3,270,509
ACCESSORY DRIVE MECHANISM
Keith H. Carpenter, Pittsford, N.Y., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed May 14, 1965, Ser. No. 455,855
6 Claims. (Cl. 60—54)



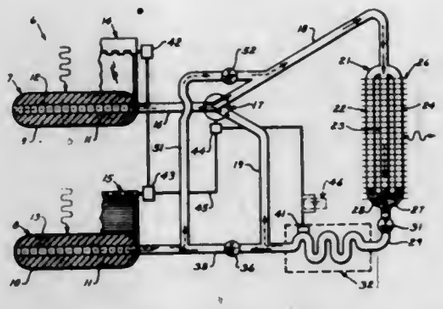
1. A hydraulic accessory drive unit for driving the accessories of an engine driven vehicle comprising an engine driven power input shaft, an impeller driven by said shaft, a turbine, a power delivery shaft for driving said accessories and driven by said turbine, open faced pockets in said impeller and turbine, respectively, and disposed in axial spaced relationship with the open faces facing each other, working fluid adapted to be circulated through said pockets in response to rotation of said impeller, a valve having a hub supporting a plurality of valve blades thereon, said valve blades extending upwardly into the space between said impeller and turbine, yieldable means connecting said valve to said impeller whereby said valve is caused to rotate with said impeller, said yieldable means normally biasing said valve to position said valve blades to permit unrestricted fluid flow between said impeller and turbine, magnetic means operable upon said valve tending to brake rotation of said valve, said yieldable means permitting relative rotation of said valve and said impeller in response to the brake effect of said magnetic means in a predetermined speed range of rotation of said impeller to progressively reduce the effective area of the path of fluid flow as the speed of rotation of said impeller increases throughout said predetermined speed range.

3,270,510
MINE ROOF AND LIKE SUPPORTS
Donald T. Walsh, Hindley, England, assignor to Gullick Limited, Lancashire, England, a British company
Filed Nov. 12, 1963, Ser. No. 323,008
Claims priority, application Great Britain, Dec. 5, 1962, 46,026/62
5 Claims. (Cl. 61—45)

1. A mine roof support comprising a rear unit and a forward unit, each of said units comprising a base, hydraulically extensible prop means on said base and a roof-engaging member mounted on the upper part of said prop means, the roof-engaging member of the forward unit having a forwardly extending extension member and a pivotal seating on its prop means whereby it can adjust itself to roof irregularities, at least one flexible elastic member positioned between opposed ends of the roof-engaging members of the rear and forward units, means at one end of said flexible elastic member hingedly connecting it to one of said roof-engaging members so that it can pivot towards and away from the roof and means at the other end of said flexible elastic member rigidly connecting it to the other of said roof-engaging members whereby said self-adjustment of the roof-engaging member of the forward unit is elastically controlled.

3,270,511
METHOD OF FORMING PILES
Ervin R. Colle, Haddonfield, N.J., assignor to Intrusion-Prepakt, Inc., Cleveland, Ohio, a corporation of Ohio
Filed Oct. 10, 1963, Ser. No. 315,190
4 Claims. (Cl. 61—53.52)

1. A method of forming a concrete pile in the earth comprising sonically driving a hollow grouting mandrel into the earth to define the location and depth of a pile cavity, forcing a settable fluid hydraulic grout through said mandrel and radially outward from said mandrel as it is being driven into the earth, allowing the grout to commence setting, removing the mandrel to evacuate said cavity, and filling the evacuated cavity with a hardenable cement grout.



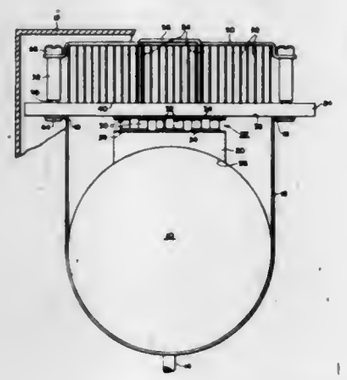
3,270,512
INTERMITTENT TYPE SILICA GEL ADSORPTION REFRIGERATOR
James E. Webb, Administrator of the National Aeronautics and Space Administration with respect to an invention of John Michael Frank Vickers and Ernest Romvary, Jr.
Filed Dec. 9, 1963, Ser. No. 329,331
11 Claims. (Cl. 62—2)

8. An adsorption type refrigeration system adapted for operation in a zero gravity environment, said system comprising:

first and second adsorber-generator vessels each containing a refrigerant-adsorbing substance and adapted to be exposed to solar radiation, one of said vessels containing refrigerant which has been adsorbed by the refrigerant-adsorbing substance, said refrigerant-containing vessel being exposed to solar radiation and the other of said vessels being shielded from solar radiation;

a condenser having an inlet for receiving refrigerant fluid and an outlet for discharge of said fluid;

an evaporator connected in fluid communication with the outlet of said condenser and adapted to evaporate refrigerant liquid introduced therein to thereby produce refrigeration by extracting heat from its environment, said evaporator having an outlet for the discharge of refrigerant fluid;



a conduit system including valve means for communicating the exposed adsorber-generator vessel with the inlet of the condenser and the other of said vessels with the outlet of the evaporator whereby refrigerant liberated from the exposed adsorber-generator will be circulated through the condenser and evaporator;

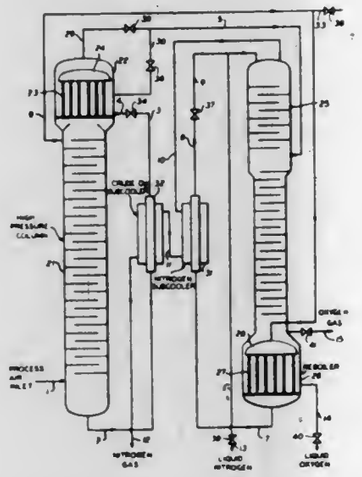
a porous wick occluding the outlet of said condenser for separating the liquid and gaseous phases of the refrigerant fluid whereby refrigerant liquid is communicated to the evaporator by wicking action; and

an automatic control means for periodically reversing the conditions of exposure and non-exposure of the adsorber-generator vessels to solar radiation and simultaneously actuating said valve means to reverse the connections of the adsorber-generator vessels with the condenser and evaporator.

3,270,513
THERMOELECTRIC WATER COOLER
Charles F. Ter Bush, Grove City, Ohio, assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed June 21, 1965, Ser. No. 465,342
7 Claims. (Cl. 62—3)

1. Thermoelectric water cooling apparatus comprising:

a thermoelectric module including a cold shoe, a heat sink, and an array of thermocouples sandwiched between said shoe and sink;



a water tank against which said shoe seats;

a tension band in saddle relation about said tank and having ends adapted to be pulled toward points on said sink outside of said thermocouple array;

fastener means for pulling said ends toward said sink points to place said band under tension; and

means for simultaneously applying a compressive force against the area of said sink aligned with said array, and in the direction of said array, as said fastener means are tightened.

3,270,514
SEPARATION OF GAS MIXTURES
Jeram S. Kamlani, Fairfield, Conn., assignor to Gas Equipment Engineering Corporation, Milford, Conn.
Filed Apr. 23, 1963, Ser. No. 275,009
1 Claim. (Cl. 62—29)

Apparatus suitable for separation of a gas mixture including a low boiling component and a high boiling component by liquefaction and fractionation comprising:

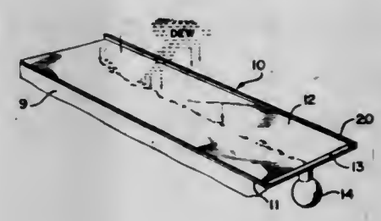
(a) a first fractionating column for fractionating the mixture at a relatively high pressure to provide an overhead vapor rich in the low boiling component and as bottoms a crude cut of the high boiling component in liquid state, a condenser for said first fractionating column for condensing by indirect heat exchange overhead vapor of said first fractionating column for use as reflux in said first fractionating column, means communicating said first fractionating column with said condenser for transfer of overhead vapor to the condenser for condensation, and means communicating the condenser with the said first fractionating column for transfer of condensate to said column for use as reflux therein;

(b) a second fractionating column for fractionation of crude cut produced in said first fractionating column to provide a second fractionating column overhead vapor rich in low boiling component and a second fractionating column bottoms rich in the high boiling component, a reboiler for the bottoms of said second fractionating column for reboiling of said bottoms by indirect heat exchange;

(c) conduit means interconnecting the bottom of the said first fractionating column with the condenser of the first fractionating column for transfer of first fractionating column bottoms to the condenser for indirect heat exchange with the overhead vapor transferred to the condenser;

(d) conduit means interconnecting said first fractionating column and said reboiler of the second fractionating column for transfer of overhead vapor of the first fractionating column to said reboiler for indirect heat exchange between said overhead vapor of the first fractionating column and bottoms in said second fractionating column;

(e) conduit means interconnecting the condenser of the first fractionating column and the second fractionating column for transfer of crude cut used in the condenser for condensing overhead vapor of the first fractionating column to the second fractionating column for the fractionation thereof in the second fractionation column;



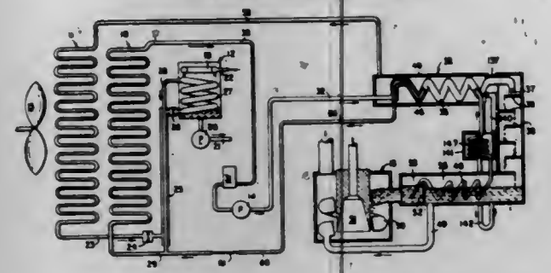
(f) means for supplying low boiling component in liquid state to the top of said second fractionating column for use as reflux in said second fractionating column;

(g) said conduit means interconnecting the bottom of the first fractionating column with the condenser being outfitted with a pressure reducing means for reducing the pressure of crude cut transferred through said conduit;

(h) said means for supplying reflux to the second fractionating column comprising conduit means interconnecting the reboiler of the second fractionating column with the top of said second fractionating column for transfer of liquid formed in the reboiler by condensation of the first fractionating column overhead vapor utilized therein, to the top of the second fractionating column, whereby said liquid is provided as reflux for the second fractionating column;

(i) said conduit means for transferring crude cut from the first fractionating column condenser to the second fractionating column being connected to the second fractionating column for introduction of said crude cut at an intermediate point over the height of the second fractionating column, the diameter of the second fractionating column below said intermediate point being less than the diameter of said second fractionating column above said intermediate point.

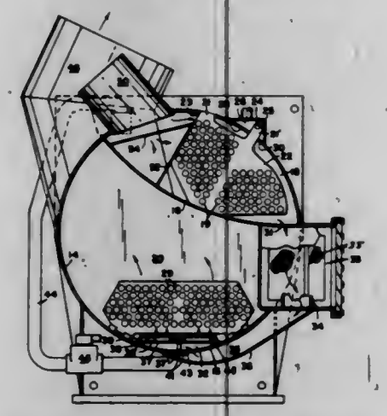
3,270,515
DEW COLLECTING METHOD AND APPARATUS
Maria Telkes, Falls Church, Va., assignor to Melpar, Inc., Falls Church, Va., a corporation of Delaware
Filed Aug. 9, 1965, Ser. No. 478,373
15 Claims. (Cl. 62—93)



14. The method of collecting water from the atmosphere comprising the steps of

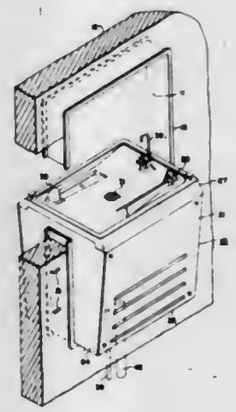
placing a sheet of material having a relatively high reflectivity and low absorptivity for radiation having wavelengths in the range of 0.3 to 2.0 microns and a relatively high emissivity for radiation having wavelengths in the range of 5 to 30 microns, on a supporting surface such that the plane of said sheet is inclined to said supporting surface;

directing the accumulation of condensation toward one area of said sheet; and



collecting said accumulated condensation from said one area.

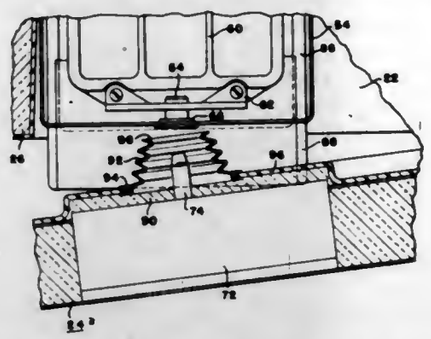
3,270,516
ABSORPTION REFRIGERATION
Lowell A. McNeely, Indianapolis, Ind., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed Mar. 30, 1965, Ser. No. 443,803
7 Claims. (Cl. 62—101)



7. In a method of operating an absorption refrigeration system having an absorber, an evaporator, a generator, a condenser, a rectifier, and an analyzer, the steps comprising:
(A) evaporating refrigerant in said evaporator to cool a heat exchange liquid;
(B) absorbing refrigerant vapor formed in said evaporator in absorbent solution in said absorber;
(C) boiling weak absorbent solution in said generator to concentrate said absorbent solution and to form vapor;
(D) passing vapor formed in said generator through said analyzer in mass and heat transfer relation with weak solution passing from said absorber to said generator to enrich the refrigerant content of said vapor;
(E) passing vapor from said analyzer to said condenser in heat transfer relation with weak solution passing from said absorber to said generator, to further enrich the refrigerant content of said vapor by condensing absorbent therefrom;
(F) passing vapor from said rectifier to said condenser to condense said vapor;
(G) passing absorbent condensed in said rectifier in heat exchange relation with strong solution passing from said generator to said absorber to vaporize refrigerant from the condensed absorbent; and
(H) passing said refrigerant vapor formed from the condensed absorbent to the rectifier for subsequent passage to said condenser.

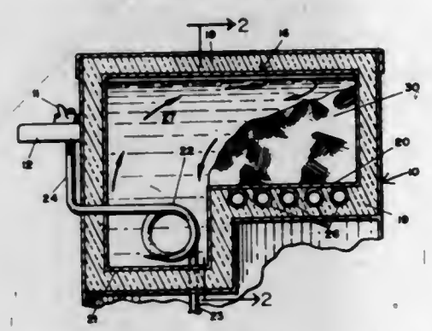
3,270,517
REFRIGERATION APPARATUS
William E. Clark, Syracuse, N.Y., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed May 20, 1963, Ser. No. 281,400
9 Claims. (Cl. 62—115)

6. The method of supplying refrigerant to an evaporator having a tube bundle assembled therein and including a compressor, a condenser and a refrigerant control means connected with said evaporator to form a closed circuit for the flow of refrigerant which comprises the steps of presenting relatively low pressure liquid refrigerant to an axial collection space beneath the tube bundle and directing refrigerant upwardly and outwardly from the space at a plurality of spaced locations to a chamber provided with a perforated cover so that liquid refrigerant flow continues upwardly over the tube bundle in a substantially uniform flow pattern.



3,270,518
WATER COOLER STRUCTURE
George L. Fugere, Columbus, Ohio, assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Oct. 28, 1964, Ser. No. 407,011
3 Claims. (Cl. 62—263)

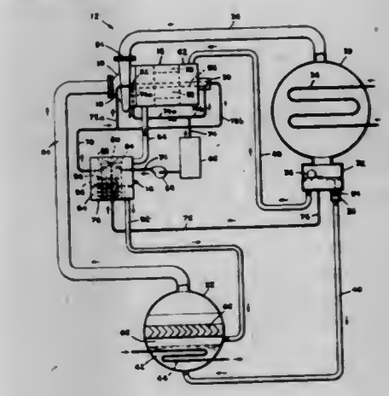
1. In combination:
a building structure partition wall separating opposite side spaces;
means defining an opening in said wall of a size adapted to accommodate a water cooler cabinet in its lower part with the upper part of said opening being generally unobstructed;
a water cooler including said cabinet mounted in generally centered relation in said lower part of said opening, said cabinet including a sink top provided with a drainage outlet;
said cooler including a first bubbler disposed near an edge of said sink top in said one space;
a second bubbler disposed near an opposite edge of said sink top in said other space;
conduit means connecting each of said bubblers with a supply of cooled water in said cabinet; and
a waste water tube having one end connected to said sink outlet and the other end connectible with a sewer drain.



3,270,519
ICE MAKER WITH DOOR MOUNTED DRIVE MEANS
Ernest E. Pohl, Jr., Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 1, 1964, Ser. No. 415,069
4 Claims. (Cl. 62—353)

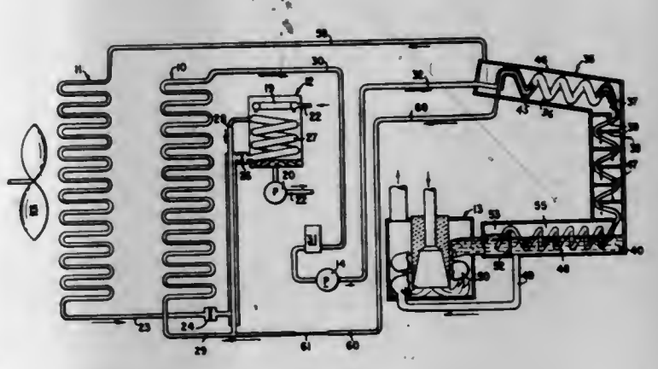
1. A refrigerator including insulated walls and a door enclosing a compartment to be cooled, a mold located in said compartment, means for delivering liquid to be frozen to said mold, means for cooling the liquid in said mold below its freezing point, said mold having a front located adjacent the front of said compartment and a rear located adjacent the rear of said compartment, an electric drive motor and operating means driven by said motor fitted in and mounted on and bodily movable with said door, said operating means having a disconnectible mechanical connection with the front of said mold for

twisting said mold for ejecting the frozen liquid from said mold, said connection being disconnected when the door is open and connected when the door is closed.



3,270,520
WATER COOLER FOR GOLF COURSES AND THE LIKE
Harvey N. Geisler, 591 NE. 5th St., Pompano Beach, Fla.
Filed Dec. 3, 1965, Ser. No. 511,397
2 Claims. (Cl. 62—395)

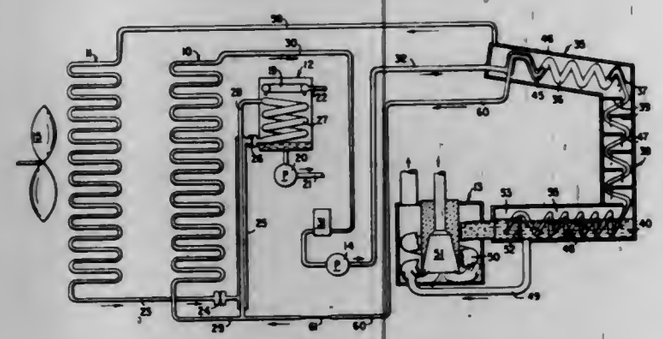
1. A continuous working absorption type refrigerator comprising a reservoir, having a stepped bottom wall, one portion of said bottom wall being elevated with relation to the remainder of said bottom wall forming a lower and an upper bottom wall portion, a heat transfer liquid substantially filling said reservoir, a coil for drinking water immersed in said heat transfer liquid in close proximity to said lower bottom wall portion and a plurality of cooling coils in substantial contact relation with said upper bottom wall portion whereby ice is formed in said reservoir above said upper bottom wall portion and convection currents are created causing said heat transfer liquid to flow across the upper portion of said reservoir to said ice, then downwardly along the ice to become chilled toward said lower bottom wall portion where said water coils are chilled and then upwardly in the reservoir to again flow in the direction of said ice.



3,270,521
REFRIGERANT COOLED OIL COOLER SYSTEM
Raymond E. Rayner, Colonia, and Donald E. Chubb, Caldwell, N.J., assignors to Worthington Corporation, Harrison, N.J., a corporation of Delaware
Filed Sept. 8, 1965, Ser. No. 485,682
12 Claims. (Cl. 62—469)

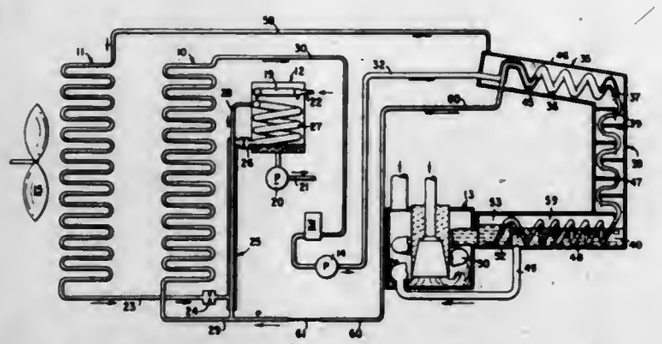
1. A refrigeration system in which refrigerant is circulated between a high pressure side and a low pressure side comprising:
(a) a compressor driven by a motive means,
(b) a condenser means to receive the high pressure refrigerant and condense the same,
(c) an expansion device to expand the condensed refrigerant into a low pressure liquid,
(d) an evaporator to receive the low pressure liquid to evaporate the same, the gas being drawn into the compressor,
(e) an oil lubrication means to supply oil to and receive the returned oil from the motive means,
(f) an oil cooler disposed in the oil lubrication means,
(g) a coil means disposed in the oil cooler in communication with the oil lubrication means,
(h) a delivery line connected between the oil cooler and said system to deliver high pressure refrigerant to the oil cooler,

(i) spray means connected to the delivery line and disposed in the oil cooler, and to receive high pressure refrigerant from the delivery line for spray discharge therefrom in heat exchange relation with the coil means to cool the oil therein,
(j) a return line connected between the oil cooler and the low pressure side of said system to return refrigerant to said system,
(k) the coil means having the oil therein pass in an arcuate path of decreasing radius, and
(l) the spray means disposed inwardly of the coil means to spray the refrigerant radially outwardly thereof to effect counter-flow heat exchange therewith.



3,270,522
ABSORPTION REFRIGERATION
Lowell A. McNeely, Indianapolis, Ind., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed Mar. 30, 1965, Ser. No. 443,804
2 Claims. (Cl. 62—476)

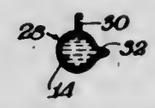
1. An absorption refrigeration system comprising:
(A) an absorber for absorbing refrigerant vapor;
(B) an evaporator for evaporating refrigerant and providing a cooling effect;
(C) a generator for concentrating weak absorbent solution by vaporizing refrigerant therefrom;
(D) a condenser for condensing refrigerant vaporized in said generator;



(E) a combined rectifier and heat exchanger comprising:
(1) first passage means connected to pass vapor formed in said generator to said condenser;
(2) second passage means connected to pass weak absorbent solution from said absorber to said generator;
(3) third passage means connected to pass strong solution from said generator to said absorber;
(4) said first, second, and third passage means being physically disposed with respect to each other so that the weak solution passing through said second passage means is in simultaneous heat transfer relation with both the vapor passing through said first passage means and the strong solution passing through said third passage means;
(F) an analyzer having surface therein for passing vapor and liquid in mass and heat transfer relation with each other;
(G) means for passing vapor from said generator to said first passage of said combined rectifier and heat exchanger through said analyzer in mass and heat transfer relation with weak solution passing through said analyzer from said second passage in said combined rectifier and heat exchanger to said generator; and
(H) means for passing condensate formed in the first passage of said combined rectifier and heat exchanger to said generator in heat exchange relation with strong absorbent solution passing from said generator to said third passage in said combined rectifier and heat exchanger, and means to pass vapor liberated from said rectifier condensate to said first passage of said combined rectifier and heat exchanger.

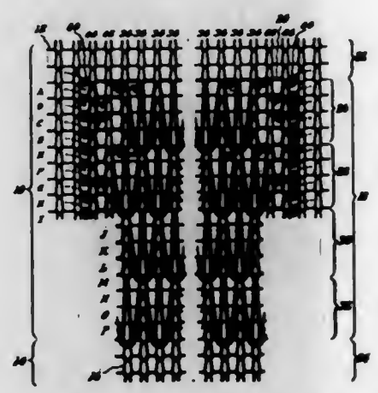
3,270,523
SOLUTION HEAT EXCHANGER ARRANGEMENT FOR ABSORPTION REFRIGERATION SYSTEM
Lowell A. McNeely, Indianapolis, Ind., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed Mar. 30, 1965, Ser. No. 443,805
1 Claim. (Cl. 62—495)

An absorption refrigeration system comprising:
(A) an absorber for absorbing refrigerant vapor;
(B) an evaporator for evaporating refrigerant and providing a cooling effect;
(C) a generator for concentrating weak absorbent solution by vaporizing refrigerant therefrom;
(D) a condenser for condensing refrigerant vaporized in said generator;
(E) a rectifier for passing vapor in heat exchange relation with relatively cool weak solution to enrich the refrigerant content of said vapor by condensing absorbent therefrom;
(F) an analyzer for passing vapor from said generator to said rectifier in mass and heat transfer relation with weak absorbent solution to enrich the refrigerant content of said vapor prior to its passage to said rectifier, said analyzer comprising:
(1) a vertically disposed tubular shell forming a vapor passage,
(2) a plurality of horizontally disposed vertically spaced plates disposed partially across said shell from alternate sides thereof,
(3) a helical heat exchange coil disposed in spaces between said plates and said vertically disposed shell, said heat exchange coil being connected to pass strong solution from said generator through said analyzer shell and toward said absorber,
(4) means to pass vapor from said generator to said analyzer,
(5) means to pass vapor from said analyzer to said rectifier, and
(6) means to pass condensate formed in said rectifier to wet the surface of the helical coil in said analyzer to provide heat exchange between strong solution passing through said heat exchanger and said condensate, thereby vaporizing refrigerant from said condensate in said analyzer and effecting mass and heat transfer between condensate wetting the surface of said coil and vapor contacting the wetted surface of said coil.



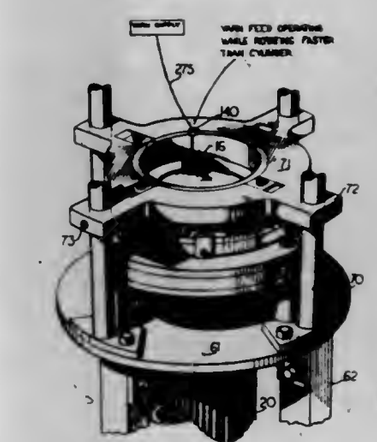
3,270,524
SOLUTION HEAT EXCHANGE ARRANGEMENT IN ABSORPTION REFRIGERATION SYSTEM
Lowell A. McNeely, Indianapolis, Ind., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed Mar. 30, 1965, Ser. No. 443,806
5 Claims. (Cl. 62—495)

1. An absorption refrigeration system comprising:
(A) an absorber for absorbing refrigerant vapor;
(B) an evaporator for evaporating refrigerant and providing a cooling effect;
(C) a generator for concentrating weak absorbent solution by vaporizing refrigerant thereform;
(D) a condenser for condensing refrigerant vaporized in said generator;
(E) a solution heat exchanger for passing strong solution from said generator to said absorber in heat exchange relation with weak solution passing from said absorber to said generator;
(F) a generator reservoir connected to receive weak absorbent solution from said solution heat exchanger and to pass said weak solution to said generator, said generator reservoir comprising:
(1) a substantially horizontal solution passage for storing weak absorbent solution passed to said reservoir from heat exchanger and passing it to said generator,
(2) a substantially horizontal vapor passage for passing vapors formed in said generator to said condenser, and



(3) a substantially horizontal heat exchanger disposed in said generator reservoir for passing strong solution from said generator in heat exchange relation with weak solution in said reservoir to boil said weak solution, said heat exchanger having a plurality of portions thereof submerged below the level of weak solution in said generator reservoir and said heat exchanger having a plurality of portions thereof above the level of weak solution in said generator reservoir and extending into said vapor passage so that boiling of weak solution in said reservoir wets the portions of said heat exchanger in said vapor passage to effect a mass and heat transfer between vapor in said vapor passage and weak solution in said reservoir.

3,270,525
PERFUME DISPENSING JEWELRY WITH FRANGIBLE PORTION
Robert S. Sellers, Huntington, N.Y., assignor to Chas. Pfizer & Co., Inc., New York, N.Y., a corporation of Delaware
Filed Jan. 28, 1964, Ser. No. 340,664
1 Claim. (Cl. 63—1)



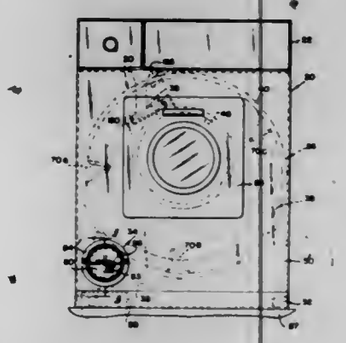
A disposable fragrance dispenser comprising a body having securing means thereon adapting said body to be worn on the person, said body comprising a small imperforate hollow container of rigid plastic containing perfume, said container having a protuberance means having a hollow interior communicating with the hollow of said container, said protuberance means being adapted to be cut off to provide a vent of from about 0.02 to 0.05 inch diameter, whereby said perfume will slowly escape in the form of vapor to permeate the air surrounding the wearer.

3,270,526
RUN-STOP BAND FOR HOSIERY
Vernon T. Stack and Thomas B. Reavis, Winston-Salem, N.C., assignors to Hanes Corporation, a corporation of North Carolina
Filed June 3, 1963, Ser. No. 284,967
1 Claim. (Cl. 66—172)

In a circular knit stocking having body yarn in connected courses forming continuous wales subject to the formation of runs, a run-stop band extending across the back of said stocking and bordering the heel thereof, said band having in each course thereof, within said band, an auxiliary yarn knit with said body yarn, said auxiliary yarn being a curl-type stretch yarn, selected wales of said band being composed of a plurality of successive plain stitches and of at least one tuck stitch, said tuck stitches in some wales being staggered with respect to the tuck stitches in other wales, the auxiliary yarn in each course of said band being knit with said body yarn in terminal plain stitches at each end of said band, the terminal plain stitches at each end of said band being disposed in the same wale, and the auxiliary yarn being trimmed close to said terminal stitches so that the trimmed ends of said auxiliary yarn curl and thereby contract toward the fabric to secure the auxiliary yarn within the run-stop band.

3,270,527
CIRCULAR KNITTING APPARATUS AND METHOD ADAPTED TO CONTINUOUS ROTATIVE KNITTING OF PARTIAL COURSES
Zephyr Monday, Mount Airy, N.C., assignor to U-Stretch Corporation, Mount Airy, N.C., a corporation of North Carolina
Filed Oct. 24, 1963, Ser. No. 318,707
32 Claims. (Cl. 66—141)

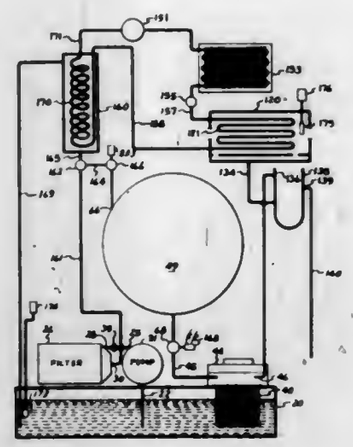
5. The method of operating a rotatable stitch cam in a circular knitting machine having a needle cylinder in continuous rotation which comprises the steps, during each revolution of the cylinder, of holding said stitch cam stationary at a fixed station while some predetermined number of needles pass through said station, then rotating said stitch cam around the axis of said cylinder at a speed exceeding the speed of said cylinder, positioning said predetermined number of needles with said stitch cam while said stitch cam is moving past such needles at such excess speed and bringing said stitch cam back to a fixed position at said station ahead of said needles.



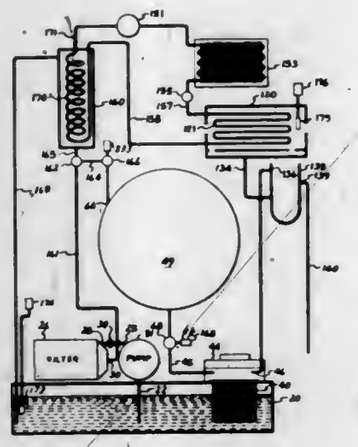
3,270,528
POCKET CIGARETTE LIGHTERS
Jerome Gevirman, 1025 5th Ave., New York, N.Y., and Lawrence T. Ward, Hester St., Portland, Pa.
Filed Dec. 4, 1964, Ser. No. 416,057
5 Claims. (Cl. 67—7.1)

1. A cigarette lighter comprising, in combination, a fuel tank, a valve housing in the tank, a spring pressed valve in the housing for normally closing the valve from passage therefrom of fuel, an internally threaded pocket

in the valve housing, an upper body member, a plug within a chamber of said body member and having a threaded outwardly projected and normally exposed end, whereby the fuel tank may be held by such plug with the tank in abutment with said body member, a hollow finger depending from the plug and adapted to depress and open the valve of the fuel tank when said tank is threaded upon the upper body member, a porous member in the plug and above its hollow finger, a second valve housing which is threaded in the plug above said porous disk, a spring pressed nozzle valve in said second valve housing, a cover for said upper body member pivoted on the latter, spring means acting upon said cover, a lift-lever carried by the cover and engaging the nozzle valve to lift the latter when the cover is raised, a friction wheel and a spring pressed flint carried by said upper body member, and manual means projected from said upper body member for rotating the valve housing to apply a compression force on said porous member and for releasing such force.



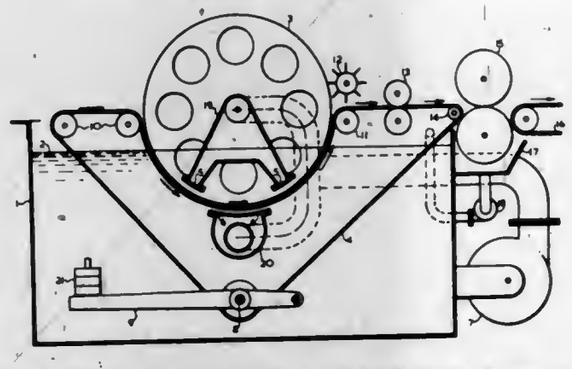
3,270,529
LAUNDRY EQUIPMENT
Lewis O. Engel, Euclid, Ohio, assignor to Hupp Corporation, Cleveland, Ohio, a corporation of Virginia
Filed Feb. 25, 1964, Ser. No. 347,296
9 Claims. (Cl. 68—18)



3. A receptacle for tumbling clothes or the like in a washer or dryer upon rotation of said receptacle in a predetermined direction, said receptacle having an essentially cylindrical wall, and baffle means for subjecting said clothes to a series of driving impulses at regularly increasing intervals including first, second and third clothes engaging baffles projecting inwardly from said wall, the circumferential spacing between said baffles in a direction opposite to said predetermined direction being such that said first and second baffles are spaced less than said second and third baffles, said second and third baffles are spaced less than said third and first baffles, said baffles extending essentially parallel to the axis of said receptacle essentially the full length of said receptacle.

3,270,530
DRY CLEANING MACHINE
Clifford F. Czech, Ripon, Wis., assignor to McGraw-Edison Company, Ripon, Wis., a corporation of Delaware
Original application July 31, 1963, Ser. No. 298,899, now Patent No. 3,250,097, dated May 10, 1966. Divided and this application June 30, 1965, Ser. No. 482,000
2 Claims. (Cl. 68—18)

1. In a clothes washing machine for use with volatile cleaning solvents, the combination comprising a clothes treating tub, a solvent reservoir for receiving solvent drained from said tub, means for circulating solvent from said reservoir, conduit means for conducting solvent from said circulating means to said tub for washing clothes in said tub, air circulating means including a solvent condenser and a heater for supplying dried heated air to said tub for drying the clothes, said air circulating means also including a blower for withdrawing air from said tub and a diverter valve for selectively directing air from said blower to exhaust and to said condenser, said condenser including a main air passage therethrough having a plurality of cooling fins therein and a by-pass channel of small cross section around said cooling fins for free passage of air upon blockage of the main air passage by the formation of ice on said cooling fins, and means for draining condensed solvent from said condenser to said reservoir.

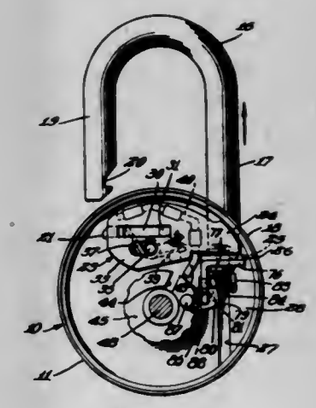


3,270,531
DRY CLEANING MACHINE
Clifford F. Czech, Ripon, Wis., assignor to McGraw-Edison Company, Ripon, Wis., a corporation of Delaware
Original application July 31, 1963, Ser. No. 298,899, now Patent No. 3,250,097, dated May 10, 1966. Divided and this application June 30, 1965, Ser. No. 482,002
2 Claims. (Cl. 68—18)

1. A clothes cleaning machine for use with volatile organic solvents comprising, in combination, a framework for supporting said machine, a clothes treating tub mounted on said framework, a solvent tank forming the base for said framework for receiving solvent drained from said tub and storing the same, pump means for circulating solvent from said tank, solvent filter means having a powdered filter material therein, a first conduit interconnecting the outlet of said pump means to said filter means, said conduit having means forming an orifice therein of smaller diameter than said conduit for reducing the formation of channels through said powdered material, a second conduit means for interconnecting said filter to an upper portion of said tub.

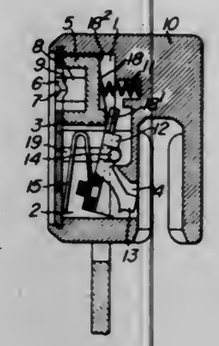
3,270,532
DEVICE FOR TREATING A MASS OF LOOSE FIBERS
Malcolm Chaikin, Maroubra, New South Wales, and Alexander Samson, Greenwich, New South Wales, Australia, assignors to Unisearch Limited, Kensington, New South Wales, Australia, a corporation of New South Wales
Original application Sept. 28, 1962, Ser. No. 226,932, now Patent No. 3,199,126, dated Aug. 10, 1965. Divided and this application Mar. 30, 1965, Ser. No. 443,795
Claims priority, application Australia, Oct. 18, 1961, 10,381/61
7 Claims. (Cl. 68—45)

1. A device for treating a mass of loose fibres, such as wool fibres and the like, comprising, in combination, a treatment liquid reservoir, an endless conveyor of a porous material permitting the passage of liquid therethrough, having an intermediate portion of its run submerged in the treatment liquid in said reservoir, and traveling along a path fixed with respect to said reservoir and the treatment liquid, and opposite end portions of its run disposed outside the treatment liquid; means, including a drum and said endless conveyor, effective initially to compress a layer of fibres on said conveyor in advance of transport of such layer through the treatment liquid; means, including said endless conveyor, effective to maintain such layer of fibres compressed on said conveyor during passage of such layer through the treatment liquid; means operable to direct a high velocity jet of treatment liquid through the layer of compressed fibres while the layer is being transported through the treatment liquid; and means, including said conveyor to maintain the fibers under a sufficient degree of compression to prevent entanglement of the fibers while they are being treated with the jet of treatment liquid and, effective only after emergence of the layer of compressed fibres from the treatment liquid on the endless conveyor, to release the pressure applied to the layer of compressed fibres.



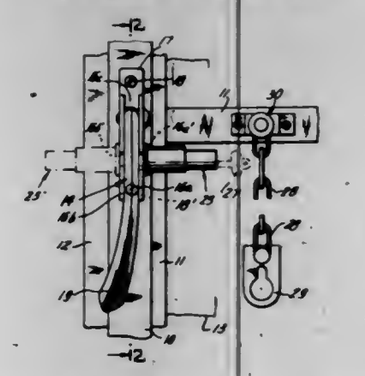
3,270,533
CONTROL FOR WRINGER ROLLS
Robert A. Brenner and Clifton A. Cobb, St. Joseph, and Carrol A. Orr, Stevensville, Mich., assignors to Whirlpool Corporation, Benton Harbor, Mich., a corporation of Michigan
Filed Sept. 11, 1964, Ser. No. 395,687
7 Claims. (Cl. 68—244)

2. In combination,
a household clothes wringer,
compression rolls in said wringer,
a motor connected to drive said rolls,
an electrical circuit including said motor,
electrically actuated motor control means in said circuit capable of reversing the operation of the motor when triggered,
a microphone in the immediate vicinity of said wringer and connected in said circuit, and



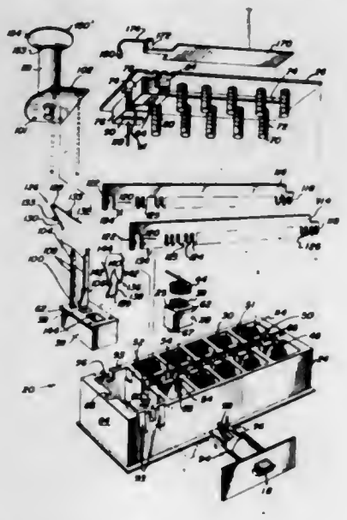
an amplifier in said circuit to trigger said motor control means in response to a sound picked up by said microphone.

3,270,534
PADLOCK
George P. Junkunc, Palos Heights, Ill., assignor to Junkunc Bros. American Lock Co., Chicago, Ill., a corporation of Illinois
Filed Oct. 26, 1964, Ser. No. 406,360
5 Claims. (Cl. 70—25)



1. In a padlock, a casing, a shackle having parallel legs of unequal length, and guided for movement with respect to said casing on the long leg thereof, a latching notch on the short leg of said shackle, a rockable latch bolt housing rockingly mounted within said casing and having a latch bolt slidably mounted therein for engagement with said latching notch, permutation mechanism comprising a plurality of rotatable tumbler disks, a tongue projecting from said latch bolt housing for engagement with the peripheries of said disks to maintain the latch bolt housing in a latching position, slots in said disks opening to the peripheries thereof for receiving said tongue and accommodating release movement of said latch bolt housing, a dial knob and dial on the outside of said casing for turning one of said disks and effecting the successive turning of the other of said disks to align the slots therein to receive said tongue and accommodate the opening of the padlock, an upsetter pawl on the long leg of the shackle engageable with one of said disks upon outward movement of the shackle to misalign said slots and hold said latch bolt casing in operative latching position, and a spinning pawl yieldably mounted on the long leg of the shackle and positioned by the upsetter pawl as the tumbler disk engaged by said upsetter pawl is upset and the shackle is moved to its outer position to engage the disk having the dial knob secured thereto for spinning the dial knob and dial off the last number of the combination as said shackle is moved within the casing to lock the padlock.

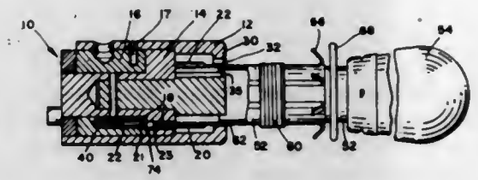
3,270,535
LOCKABLE SLIDERS FOR ZIPPER-FASTENERS
Takeo Fukuroi, Uozu-shi, Japan, assignor to Yoshida Kogyo K.K., Tokyo, Japan, a corporation of Japan
Filed Oct. 28, 1964, Ser. No. 407,199
Claims priority, application Japan, Jan. 22, 1964, 39/2,821
3 Claims. (Cl. 70—68)



1. A lockable slider for a zipper fastener, the slider comprising a slider body having, formed therein, an upwardly opening forward bore and an upwardly opening rearward recess in communication with each other, a cylindrical cam element rotatably received in said bore and having a slanted annular cam face at the inner end and a key hole in the upper portion, a cover plate closing said forward bore and provided with a key hole formed in registration with said key hole of said cam element, the cover plate closing also said rearward recess, a lever member pivotally mounted in said rearward recess with the fore end in engagement with said slanted annular cam face, a resilient means for biasing the rear end of said lever member downwardly, and a locking pawl member formed on the rear end of said lever member for cooperation with a fastener chain, known per se, of said zipper fastener, when the rear end of said lever member has been moved to the downward limit of its movement in which the fore end of said lever member is held in engagement with the lowest point of said slanted annular cam face by force of said resilient means.

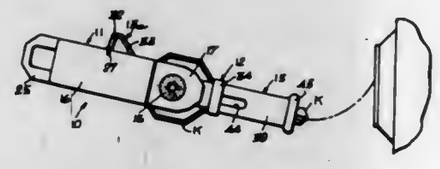
3,270,536
COMBINED CASEMENT WINDOW LATCH WITH LOCKING MEANS
Abraham Sprung, Flushing, N.Y.
(2200 Central Road, Fort Lee, N.J. 07024)
Filed June 2, 1965, Ser. No. 460,725
8 Claims. (Cl. 70—89)

1. A locking device for a hinged casement window having a sash swinging outwardly and closing against a jamb and having a striker plate mounted thereon, comprising a bracket mounted on the inside of said jamb and having a pair of spaced ears, a latch hingedly mounted between said ears and having a latching finger extending through said jamb to engage the striker plate and latch said sash, a handle carrying said finger swinging inwardly from said jamb and having a generally U-shaped portion located below said hinge, at least one of said ears being provided with an opening located adjacent said U-shaped portion, key-operated locking means on said one of said ears and having a locking element adapted to extend through said opening and into the space defined by said U-shaped portion whereby said handle is locked against movement for locking said window against said jamb.



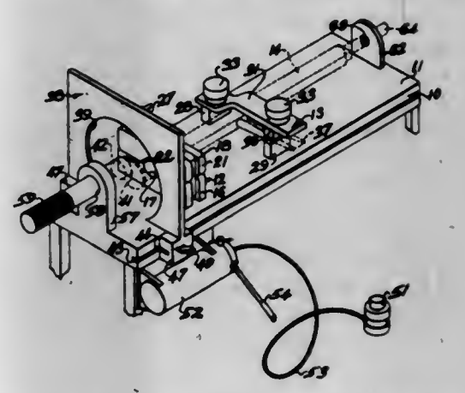
3,270,537
PUSH-BUTTON OPERATED COMBINATION LOCKS
Albert C. Sanowskis, 7321 S. South Shore Drive, Chicago, Ill.
Filed Sept. 10, 1964, Ser. No. 395,372
26 Claims. (Cl. 70—313)

1. In a button operated combination lock of the character described and having a plurality of buttons requiring the consecutive depression of a chosen sequence of said buttons to effect the change of said lock from an initial lock condition to an open condition, and including a lock controlling device coupled to said buttons and shiftable step-by-step in one direction to pass a latch controlling bolt therethrough to release the latch but only upon depression of the proper sequence of said chosen buttons and wherein depression of said buttons in other but the predetermined sequence serves to disable the lock controlling device; means for resetting the lock controlling device to the initial lock condition comprising, scissors lever means operable on the lock-controlling device, bolt-withdrawal means cooperable simultaneously with said scissors lever means to release said lock-controlling device for resetting and actuating means to operate simultaneously both the scissors lever means and said bolt-withdrawal means.



3,270,538
TAMPER-PROOF AXIAL TUMBLER LOCK
William J. Kerr, Glenview, Ill., assignor to Chicago Lock Company, Chicago, Ill., a corporation of Illinois
Filed June 11, 1965, Ser. No. 463,102
4 Claims. (Cl. 70—363)

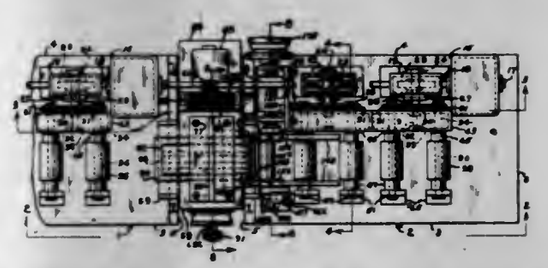
1. A tamper-proof axial tumbler lock of the character described, and comprising a lock cylinder having an open front rim for insertion of a key therethrough, a front rotatable part and an annular sleeve-like rear stationary part disposed within said cylinder and presenting relatively slidable faces which meet each other on an interfacial plane normal to the axis of the cylinder, an annular series of longitudinally extending bores formed in said stationary part, arranged in circumferentially spaced relationship therearound and no less in number than four, a corresponding annular series of longitudinally extending bores formed in said rotatable part and similarly arranged therearound, said rotatable part being movable between a position wherein the respective bores of the two parts are in alignment and the lock is in its locked condition and a position wherein such bores are out of alignment and the lock is in its unlocked condition, a split tumbler for each pair of aligned bores including a driver pin slidable in the respective bore of the rotatable part and a follower pin slidable in the respective bore of the stationary part, and a helical spring disposed in each bore of the stationary part rearwardly of the associated follower pin and serving normally to urge the latter forwardly, certain of the springs being of substantially equal spring rate and at least one other of the springs having a spring rate of no less



than twice the spring rate of each of said certain springs in order to render the lock more difficult to pick by use of a picking tool comprising a cylindrical shank shaped for insertion into the open front rim of the lock cylinder and provided in its outer periphery with an annular series of longitudinally extending open-ended grooves corresponding in number and position to the bores in the rotatable part of the lock and adapted upon insertion of the shank into said open front rim of the lock cylinder to register with the outer ends of the last mentioned bores, tumbler-engaging fingers corresponding in number to and longitudinally slidable in the grooves respectively, and means for frictionally holding the fingers in the various adjusted positions which they assume in their respective grooves in connection with normal use of the picking tool.

3,270,539
AUTOMATIC KEY REMOVER
Walter F. Hirsch, 6721 SW. 26th St., Miami, Fla.
Filed Nov. 23, 1964, Ser. No. 413,223
8 Claims. (Cl. 70—414)

1. An automatic key remover comprising, in combination, a housing member, an elongated opening in said housing member, a key guide member slidingly received in said housing opening, means constraining said key guide member to longitudinal movement with respect to said housing opening, a sliding sleeve member telescopingly received within said key guide member for in and out longitudinal movement with respect thereto, means limiting the longitudinal movement of said sliding sleeve member at inner and outer positions with respect to said housing member, means in said housing opening for yieldingly urging said sliding sleeve member to its outer limit position with respect to said key guide member, latch means for retaining said sliding sleeve member in withdrawn relation with respect to said key guide member against the urging of said urging means, said sliding sleeve member having a central slot of such width as to receive a flat key with the shank of the key projecting outwardly of the outer end of said sliding sleeve member, the outer end of said sliding sleeve member having abutment means for contact with outside portions of a key lock when the key is inserted within the lock by pushing upon said housing member, whereby said sliding sleeve member will be telescopingly received within said key guide member and said housing member opening.



3,270,540
APPARATUS FOR STRAIGHTENING BENT ARTICLES
Arthur C. West, Drawer 752, Cleveland, Miss.
Filed July 30, 1963, Ser. No. 298,665
1 Claim. (Cl. 72—31)

Apparatus for straightening a bent cam arm of a bar for holding cotton picker spindles comprising:

(a) a supporting frame,
(b) means carried by said frame for detachably securing said bar to said frame,
(c) a backing member extending generally perpendicular to and connected adjustably to said frame and having a curved inner surface disposed to surround the cam arm of said bar at selected positions,
(d) an extensible power unit disposed for one end thereof to engage said inner surface of the backing member and the other end thereof to engage a portion of said cam arm to exert a straightening force against said cam arm,
(e) an upstanding bracket carried by said frame and extending parallel to said backing member, and
(f) a movable gauge member mounted for sliding movement at right angles to said bracket and having a recess therein in position to receive the cam portion of said arm when said cam portion is in proper position.

3,270,541
ROLLING, CUTTING, AND NOTCHING MACHINE
Paul Tishken, 13000 W. Eight Mile Road, Detroit, Mich.
Filed Nov. 4, 1963, Ser. No. 321,067
8 Claims. (Cl. 72—132)

1. A machine to initiate and progressively develop one or more desired contours extending longitudinally of flat, elongated stock material, following a path of travel through said machine, and to sever said stock into desired lengths and strike notches in one or more of said con-

tours in the course of said development, said machine including,

(a) a plurality of pairs of rollers, said stock passing between the rollers of each pair, each said pair of rollers being contoured to apply such contour to said stock, said pairs being disposed to sequentially receive and pass the stock to progressively develop said desired contours,

(b) a stationary die bed disposed along said path of travel in a position corresponding to a predetermined stage of contour development,

(c) a movable die bed, similarly disposed and actuable to move to and from the stationary bed.

(d) a first die holder mounted upon said stationary bed,

(e) a second die holder carried by the movable bed,

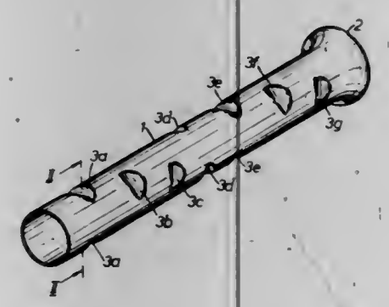
(f) an acting die carried by the second die holder,

(g) a passive die mounted on the first die holder,

(h) means to actuate the movable die bed to and from the stationary die bed to cause said dies to coact to sever and notch the stock at said predetermined stage,

(i) a first slideway formed on the stationary die bed, and said first die holder (d) being mounted on said first slideway for reciprocable sliding travel thereon,

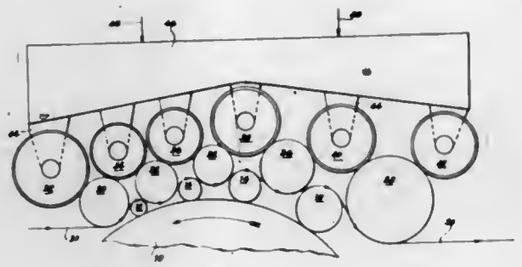
(j) a second slideway formed on the movable die bed, and said second die holder (e) being carried on said second slideway, for reciprocable sliding travel thereon,



(k) means interconnecting said die holders to afford simultaneous sliding travel thereof on said slideways,

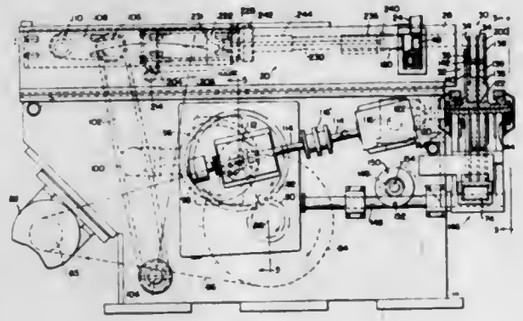
(l) drive means to advance die holders in said reciprocable sliding travel at the speed of and in the direction of stock travel concurrently with actuation of said means (h) to actuate said movable bed, and

(m) drive means to retract said die holders in said reciprocable travel,



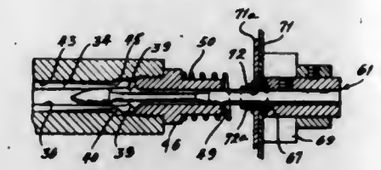
whereby said stock may be severed and notched at a suitable stage of contour development to afford minimum distortion of stock material.

3,270,542
TUBE-STRAIGHTENING TOOLS
William Horace Kennedy, 41 The Drive, Harefield Place, Uxbridge, Middlesex, England
Filed Feb. 28, 1964, Ser. No. 348,058
Claims priority, application Great Britain, Mar. 7, 1963, 9,140/63
5 Claims. (Cl. 72—160)



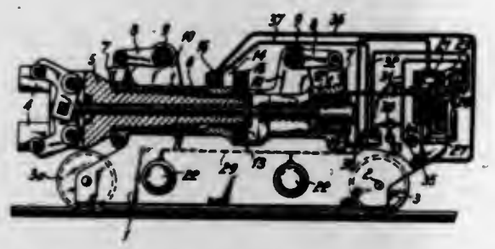
1. A tube-straightening tool comprising a hollow tubular member having an inner tubular surface, and a plurality of rounded projections on said inner surface, defined by corresponding spaced indentations of the tubular member and extending internally thereof, the crests of the said projections together defining a channel whose transverse width is substantially equal to the outer diameter of the tube to be straightened.

3,270,543
MACHINE FOR FLATTENING AND CURLING OF METAL STRIP
Natalis H. Polakowski, Wilmette, Ill., assignor to The McKay Machine Company, Youngstown, Ohio, a corporation of Ohio
Filed Aug. 17, 1964, Ser. No. 390,167
11 Claims. (Cl. 72—162)



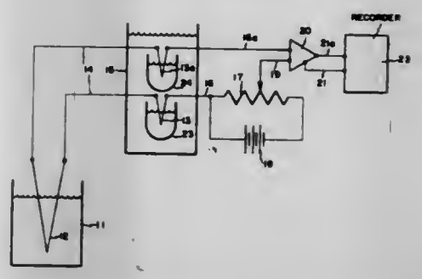
1. An apparatus for flattening and curling of metal strip comprising a set of flexing rolls, means for moving said strip through said apparatus whereby one surface of said strip passes through in engagement with said flexing rolls on one side thereof, a large back-up roll for said flexing rolls, said back-up roll engaging said flexing rolls on the opposite side thereof, a set of deflector rolls, each roll in said set of deflector rolls alternating with a roll in said set of flexing rolls, said deflector rolls engaging the opposite surface of said strip, and support rolls for engagement with said deflector rolls, and wherein the flexing rolls are mounted for free floating movement between the strip and the back-up roll.

3,270,544
CAN FORMING APPARATUS
Edward G. Maeder, Chesterfield County, and Guido Kraus, Chester, Va., assignors to Reynolds Metals Company, Richmond, Va., a corporation of Delaware
Filed June 26, 1963, Ser. No. 290,740
22 Claims. (Cl. 72—346)



1. In combination: a generally horizontal cylindraceous drawing die construction having an entrance end and a discharge end; a blank feeder adjacent said entrance end; an indexing star wheel construction adjacent said discharge end, rotatable about a horizontal axis and having a plurality of circularly arranged radially outwardly directed, channel shaped drawn can receiving star cavities each of which is temporarily stationary and aligned with said die construction adjacent the top portion of said star wheel during the indexing stops; and a punch construction reciprocable into and out of said feeder, through both ends of said die construction, and into said temporarily stationary and aligned star cavity to deposit and gravitationally maintain a drawn can in said star cavity; and stripping means to strip said drawn can off said punch construction as said punch is reciprocated out of said star cavity.

3,270,545
FASTENING APPARATUS AND METHOD
Stanley F. Jackes, University City, Salvatore Strano, St. Louis, and Raymond T. Wheeler, Bridgeton, Mo., assignors to Jackes-Evans Manufacturing Company, St. Louis, Mo., a corporation of Missouri
Filed July 16, 1963, Ser. No. 295,477
9 Claims. (Cl. 72—391)

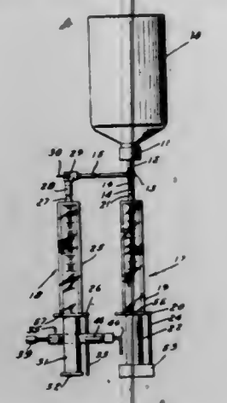


1. A tool combination for applying hollow grommets comprising a first tool including a frame, a cylinder mounted on the frame, a piston movable within said cylinder, a lever pivotally attached to the tool and movable with the piston, a fixed collet mounted on the tool, said collet having deflectable spring-like fingers on its outermost end, inwardly directed retaining means on the fingers adjacent to their outermost ends, a barrel slidably positioned on the collet in engagement with the lever and movable therewith in response to movement of the piston, said barrel having an active and an inactive position, and cooperating means on the inner surface of the barrel and the outer surface of the collet fingers to urge the fingers together as the barrel is moved over the collet toward its active positive to grasp firmly an elongated extension positioned in the collet, the collet fingers opening up and resuming their original position when the barrel is returned to its inactive position to release said elongated extension position in the collet, and a grommet positioning tool positionable on the opposite side of a work piece independently of the first tool comprising means for engaging one end of a hollow grommet, and said elongated extension being passable through a hollow gommet and an opening in a work piece, and adapted to be gripped in said collet.

3,270,546
DRIVES FOR FORGE TONGS
August Theodor Wuppermann, Leverkusen-Schlebusch, Germany, assignor to Hydraulik G.m.b.H., Duisburg, Germany
Filed Dec. 28, 1960, Ser. No. 78,901
Claims priority, application Germany, Dec. 28, 1959, H 38,265; Jan. 16, 1960, H 38,401
11 Claims. (Cl. 72—419)

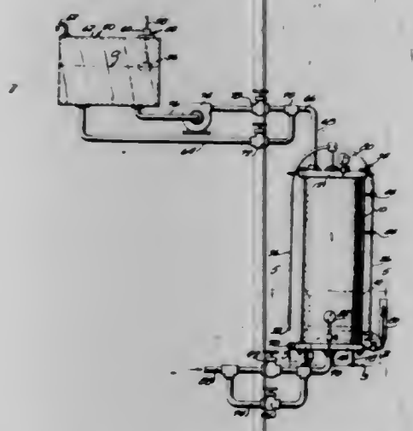
1. In a forge tongs, in combination, at least one rotary component; hydraulic motor means operatively connected to said rotary component for rotating the same; a hydraulic pressure accumulator communicating with said motor means for driving the same, said hydraulic pressure accumulator including a cylinder, a piston extending transversely through said cylinder and engaging with its peripheral surface the inner surface of said cylinder so as to be slidably guided therein, and a piston rod extending from said piston slidably through an end of said cylinder to the exterior thereof; pump means rotating only in one direction communicating with the interior of said cylinder on one side of said piston for delivering liquid under pressure to the interior of said cylinder at said one side of said piston to displace said piston in said cylinder and increase the volume in said cylinder on said one side of said piston; gas pressure means communicating with the interior of said cylinder on the other side of said piston for supplying gas under pressure to the interior of said cylinder at said other side of said piston, the volume in said cylinder at said other side of said piston decreasing during operation of said pump means to supply liquid under pressure to the interior of said cylinder on said one side of said piston; motion transmitting means carried by said piston rod at the exterior of said cylinder for movement with said piston rod; and control means located in the path of movement of said motion transmitting means and cooperating with said pump means to terminate the supply of liquid under pressure to said one side of said piston in said cylinder when the volume in said cylinder on said other side of said piston has been decreased to a predetermined extent.

3,270,547
THERMOCOUPLE CALIBRATION SYSTEM
Arthur L. MacRitchie, Morristown, and George E. Conklin, North Plainfield, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware
Filed Aug. 12, 1963, Ser. No. 301,403
2 Claims. (Cl. 73—1)



1. A method for calibrating thermocouples which comprises immersing the hot junction of a thermocouple to be tested in an accurately known temperature standard, immersing the cold junction in a second, accurately known temperature standard, thereby generating an electric potential signal corresponding to the differential temperature of the said standards; passing the said generated electrical potential signal through a potentiometric meter; introducing a reference electrical potential signal in said potentiometric meter, said reference electrical potential signal having a value corresponding to that produced under the same temperature differential by a standard thermocouple of the same type as the said thermocouple being tested; taking the electrical difference between said generated electrical potential signal and said reference electrical potential signal; amplifying the resulting electrical potential difference signal and then recording the said electrical potential difference signal.

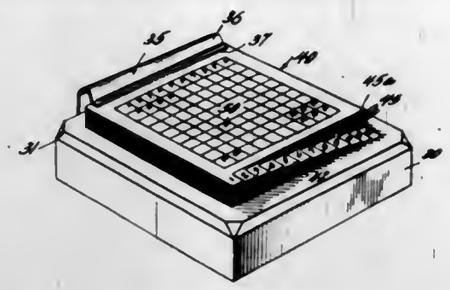
3,270,548
CALIBRATING SYSTEM FOR PROPORTIONING SYRINGE
Jacob P. Marbach, 17736 Kinzie St., Northridge, Calif.
Filed July 20, 1964, Ser. No. 383,842
6 Claims. (Cl. 73—1)



1. A method of calibrating a proportioning syringe having a plunger and a setting rod thereon from a master syringe comprising placing a predetermined precise amount of liquid in said master syringe, passing said precise amount of liquid to said proportioning syringe

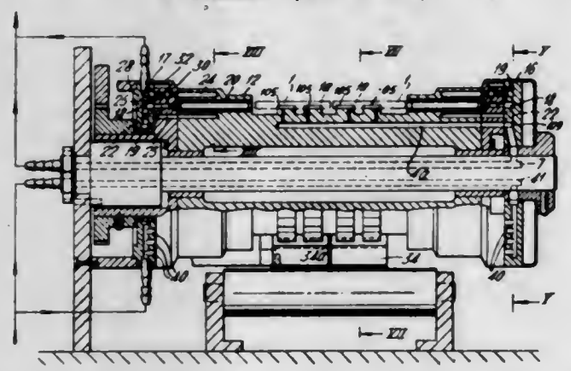
and displacing the plunger thereof by a corresponding amount, temporarily securing said plunger to said setting rod at a location wherein said setting rod is in setting engagement with said proportioning syringe, then

supporting said plunger and said setting rod in a fixed location and fastening a handle jointly to adjacent ends of said plunger and said setting rod to anchor them firmly together in calibrated relationship.



3,270,549
FLUID METER CALIBRATING DEVICE
William R. Martin, 1627 Beach Drive SE., St. Petersburg, Fla.
Filed Aug. 14, 1964, Ser. No. 389,749
7 Claims. (Cl. 73—3)

1. A device of the character described, comprising a closed cylinder having first and second ends, a piston working in said cylinder, a piston rod fixed to the piston and working through said first end of the cylinder, a vented oil reservoir, an oil transfer pipe leading from the reservoir through said first end, and providing for an oil cushion in the transfer pipe and in the cylinder between said first end and the piston, an external oil displacement gauge operatively connected to the piston rod, and a gas input pipe leading into the cylinder through said second end of the cylinder between the said second end of the cylinder and the piston, said input pipe being adapted to be connected to a meter-equipped source of gas under pressure.

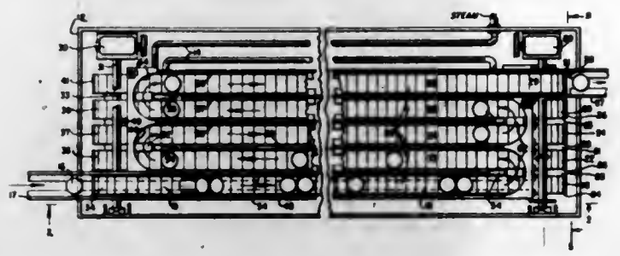


3,270,550
IMPACT TOOL TESTER
Ernst Sussman, Biery's Bridge Road, Bethlehem, Pa.
Filed May 13, 1963, Ser. No. 279,982
5 Claims. (Cl. 73—11)

1. A testing device for measuring and calibrating the intensity of a blow delivered by an impact tool, said device comprising, in combination, a heavy rigid anvil-like metal base, a pad of pressure-sensitive impression-transferring sheets disposed upon said base, clamping means for detachably securing said pad to said base, a multiplicity of similar areas on each of said sheets upon which the impact delivering head of said tool may be applied and the tool actuated to deliver the blow, indicia correspondingly designating the said areas on all of said sheets, markings thus being impressed upon the surfaces

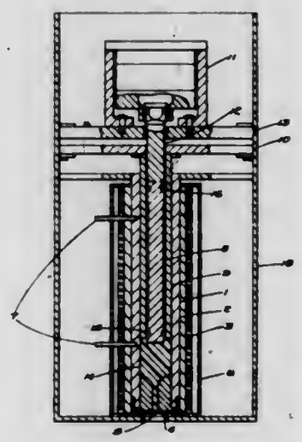
of said sheets in downward succession through the pad through such number of sheets as determined by the force of the blow, each of said sheets provided with a protruding tab, the tabs being numbered successively from top to bottom of the pad, all whereby the number of the last sheet showing an impression yields a measure of the effective impact of the tool.

3,270,551
ARTICLE TESTING DEVICES
Konrad Schmalz, Bremen-Hemelingen, Germany
Filed Apr. 7, 1964, Ser. No. 357,908
Claims priority, application Great Britain, Apr. 9, 1963, 14,117/63
8 Claims. (Cl. 73—38)



1. A device for testing articles, such as cigarettes, having a substantially air-impervious wrapper of generally tubular form enclosing an air-pervious filler, comprising a testing chamber having an open end, means for bringing an article to be tested to a loading position in alignment with said chamber and adjacent said open end thereof, and means for applying suction to said chamber so that atmospheric pressure urges any article at the loading position into said chamber, said testing chamber having restricted end portions so shaped that when an article of correct size is placed in said chamber, the wrapper engages the walls of said chamber adjacent the ends of the article, said chamber being of greater cross-section between said end portions so that an annular space surrounds the article, the suction means being connected to said space.

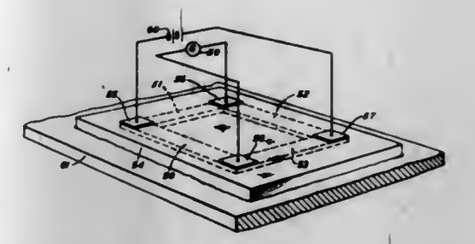
3,270,552
CONTAINER PROCESSING BATH
Hugh L. Davis, Glen Ellyn, Ill., assignor to Chase Products Company, Broadview, Ill., a corporation of Illinois
Filed Sept. 25, 1963, Ser. No. 311,564
13 Claims. (Cl. 73—41.2)



1. Container processing apparatus which comprises, a longitudinally extending, water containing tank having heating means disposed therein, first and second looped

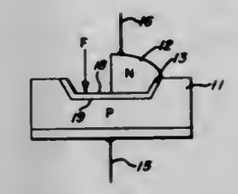
conveyer belts, each having an upper reach disposed for providing a planar transporting surface for materials disposed thereon, means for driving said belt reaches to motion in opposite directions, a planar end plate disposed above said reaches toward an extreme and thereof corresponding to the direction of motion of said first reach, said

end plate comprising a curvilinear surface concave in the direction of motion of said second reach, said concave surface embracing said reaches, and a fixed transition plate disposed between reaches, whereby material placed on said first reach is moved laterally to said second reach by said curvilinear surface upon passage of said first reach under said end plate.



3,270,553
RHEOMETER
Richard L. Ballman, Granby, and Albert W. Wotring, Springfield, Mass., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware
Filed July 13, 1964, Ser. No. 382,695
5 Claims. (Cl. 73—56)

1. A capillary extrusion rheometer which comprises: a housing defining an extrusion chamber; a capillary die disposed in one end of said chamber restricting the outlet thereof; a plunger disposed to reciprocally move in said chamber consisting of: a first member having a surface adapted to slidably engage the walls of said chamber, and a second member concentrically disposed within said first member; means for driving said first and second members in unison relationship; and force measuring means engaging said second member.

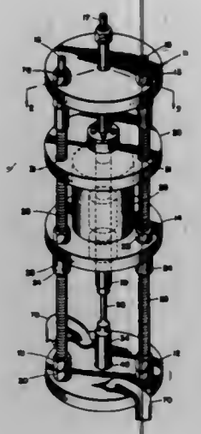


3,270,554
DIFFUSED LAYER TRANSDUCERS
William G. Pfann, Far Hills, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Jan. 4, 1961, Ser. No. 80,672
1 Claim. (Cl. 73—88.5)

A piezoresistive strain gage comprising a semiconductor base layer having a piezoresistive diffused layer formed integrally therewith, said diffused layer having a geometry in the plane of the gage of four elongated strips joined end to end to form a parallelepiped and four electrical contacts attached to said diffused layer at the ap-

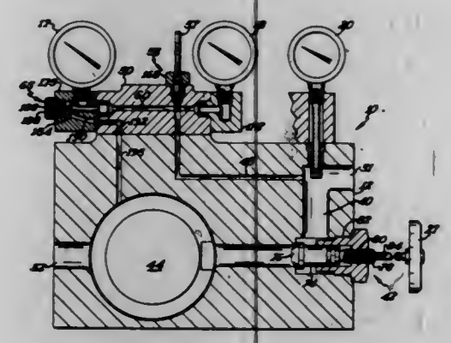
proximate intersection of the strips, said contacts connected in a Wheatstone bridge circuit such that the piezoresistive effects in opposite arms will add.

3,270,555
STRESS SENSITIVE TUNNEL DIODE TRANSDUCER
Wilhelm Rindner, Lexington, Mass., and Roger F. Nelson, Mountain View, Calif., assignors to Raytheon Company, Lexington, Mass., a corporation of Delaware
Filed Sept. 24, 1963, Ser. No. 311,013
3 Claims. (Cl. 73—88.5)



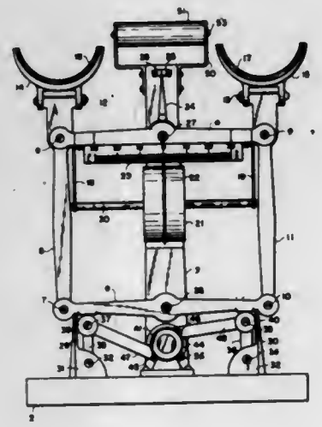
1. A tunnel diode transducer comprising a first layer of semiconductor material of a first conductivity type, a second layer of recrystallized semiconductor material of opposite conductivity type on said first layer and forming a rectifying junction therewith, a metallic alloyed dot on said second layer and of the same conductivity type as said second layer, said alloyed dot covering only a portion of said second layer so as to expose only a portion of the surface thereof, a metal base layer on said first layer, ohmic contacts on said alloyed dot and base layer, and means engaging a restricted area of said exposed surface of said second layer for applying concentrated stress to a restricted volume of the second layer and thereby altering the negative resistance characteristic of said junction.

3,270,556
EXPLOSIVELY ACTUATED TENSILE TESTING DEVICE
Erik K. Henriksen, Downey, Calif., assignor to Aerojet-General Corporation, Azusa, Calif., a corporation of Ohio
Filed Oct. 10, 1963, Ser. No. 315,142
7 Claims. (Cl. 73—95)



1. A device for testing materials under conditions encountered in explosive forming comprising frame means for securely holding an elongated specimen to be tested, said frame means having movable and stationary members, means for securing one end of the specimen to a movable member and the other end of the specimen to a stationary member to symmetrically dispose the specimen with respect to said frame means, explosive means axially disposed in said frame means intermediate said movable and stationary members, and shield means substantially

surrounding said explosive means so that upon detonation of said explosive means, said movable member will be

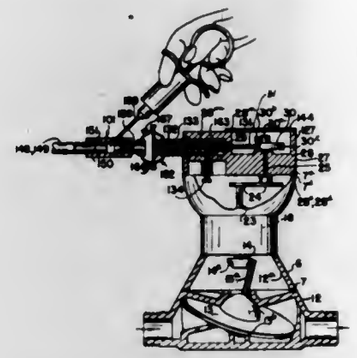


moved away from said stationary member to subject the test specimen to a selected strain rate.

3,270,557
HYDRAULIC CIRCUIT TESTER
Samuel B. McClocklin, Owatonna, Minn., assignor to The Owatonna Tool Company, Owatonna, Minn., a corporation of Minnesota
Filed Mar. 26, 1964, Ser. No. 355,049
11 Claims. (Cl. 73—168)

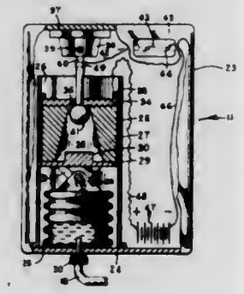
1. A portable hydraulic circuit tester comprising, a casing having a continuous passageway therethrough, a manifold mounted on said casing and having inlet and outlet ports therein connected to the ends of said continuous passageway in said casing, said ports being adapted to be connected to a hydraulic circuit to be tested whereby fluid under pressure developed in the circuit flows through the tester and back to the circuit, a chamber included within said casing as a part of said continuous passageway, a positive displacement meter positioned in said chamber including shaft means extending through said casing from said chamber and being caused to rotate with flow of a fluid through said chamber, an indicator mounted on said casing and connected to said shaft means to operate in accordance with the rotation of said shaft means and flow of the fluid through said chamber, load varying means positioned in said passageway upstream of said chamber, a second passageway included in said casing and connected to said inlet port, said second passageway having a substantially smaller fluid capacity relative to the capacity of said passageway of said continuous passageway, a high pressure gauge connected in said second passageway, an additional small capacity passageway connected to said high pressure gauge, a low pressure gauge connected to said additional low capacity passageway, pressure responsive valve means included in said additional passageway and adapted upon the presence of a high pressure in said second passageway to isolate the low pressure gauge from said second passageway, and a relief passage included in part in said pressure responsive valve and in part in said casing and adapted to connect the low pressure gauge to said chamber whenever a low pressure gauge is isolated from said second passageway.

3,270,558
CHIROPRACTIC BALANCE
William M. Barret and Clarence H. Clement, Shreveport, La., assignors to Engineering Research Corporation, Shreveport, La., a corporation of Louisana
Filed Dec. 12, 1962, Ser. No. 244,110
3 Claims. (Cl. 73—172)



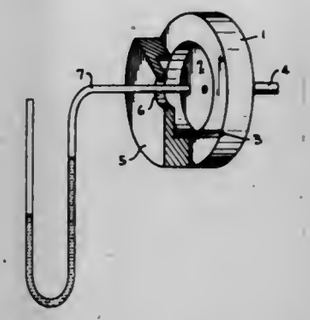
1. A pivoted beam balance for determining the presence and extent of a vertebral subluxation comprising: a horizontally disposed upper beam which is free to turn about a horizontal spindle positioned at the midpoint of said upper beam, a horizontally disposed vertically aligned, lower beam which is free to turn about a horizontal spindle positioned at the midpoint of said lower beam, two rigid rectilinear vertical links each connected by spindles to like ends of said upper beam and said lower beam, said links extending upwardly beyond said upper beam and terminating at their upper ends in ankle cups, a supporting structure to maintain said spindles associated with said beams in spaced and substantially vertical alignment, means for progressively controlling the arcs through which said beams may swing and for locking said beams in their horizontal positions, a pointer attached to one of said beams which registers with a stationary mark on said supporting structure when said beams are in their horizontal positions, a horizontally disposed member attached below one of said beams and along which a weight with index may be moved laterally, and a graduated scale for indicating the lateral position of said weight.

3,270,559
REMOTE METER READING DEVICE
Vernon E. Gleasman, 3808 Kirkwood Road, Cleveland Heights, Ohio, and Claude H. Gleasman, West Leyden, N.Y.
Filed Mar. 7, 1963, Ser. No. 263,575
17 Claims. (Cl. 73—272)



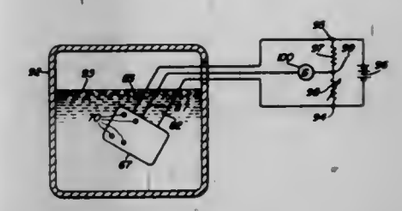
1. A remote meter reading device, comprising
(a) a transmitter unit including an actuating member movably responsive to and generally proportional to a quantity measured,
(b) a receiver unit including a counting register, and
(c) a signal transmittting element connecting the transmitter unit and the receiving unit,

(d) said transmitter unit including a signal transmission means for transmitting in response to movement of said actuating member a signal from said transmitter unit to said register for recording on said register the total quantity measured,
(e) said actuating member being a rotatable drive shaft, and
(f) a fluid meter volumetric measuring base and base connector thereon,



(g) said measuring base usually having a metering head joined thereto by a base connector and held connector respectively thereon, such as found in a water meter,
(h) said transmitter unit having a transmitter unit housing sitting on and secured to said base connector in place of said head,
(i) said transmitter unit housing having a surface located remote from said base and shape differently than said base connector.

3,270,560
CRITICAL CONDITION INDICATOR
Leonard H. Caveny, Huntsville, Ala., assignor to Thiokol Chemical Corporation, Bristol, Pa., a corporation of Delaware
Filed Feb. 19, 1964, Ser. No. 345,971
1 Claim. (Cl. 73—344)

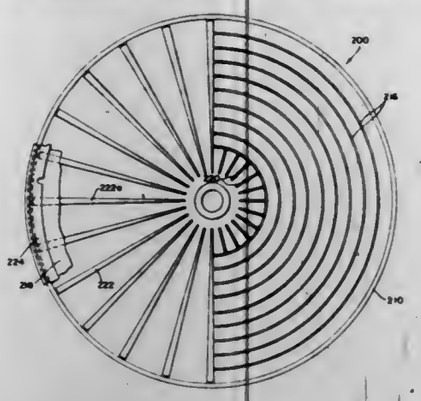


A critical condition indicator for use within a solid propellant rocket motor having a solid propellant therein provided with a central cavity comprising a temperature sensor that is positioned within the cavity within the solid propellant, an indicating assembly positioned externally of the rocket motor, fluid conducting means connecting the temperature sensor to the indicating assembly, said indicating assembly including a movable contact having a frusto-conical shaped cavity therein, a fixed contact positioned within said cavity, actuating means communicating with said fluid conducting means and connected to said movable contact and an inactive electrical circuit between said movable and fixed contacts that is activated when said movable contact is in engagement with said fixed contact.

3,270,561
FLUID PRESSURE RATIO SENSOR
Gary L. Smith, Liberal, Kans., assignor to the United States of America as represented by the Secretary of the Army
Filed Apr. 24, 1964, Ser. No. 362,534
4 Claims. (Cl. 73—388)

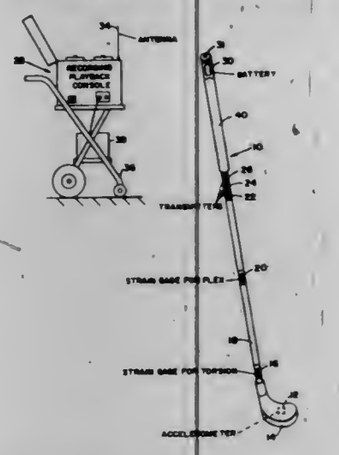
1. A device for measuring the ratio of a second pressure to a first pressure comprising:
(a) first means having no moving parts for establishing a third pressure which is inversely proportional to said first pressure,
(b) second means having no moving parts for causing said third pressure to be directly proportional to said second pressure,
(c) said first means including a body having a circular cavity therein, and
(d) fourth means for introducing a first fluid flow under said first pressure tangentially in said circular cavity.

3,270,562
SOLID STATE HYDROSTATIC PRESSURE GAUGE
Henry Ehrenreich, Arlington, Mass., and Gunther E. Fenner, Schenectady, N.Y., assignors to General Electric Company, a corporation of New York
Filed Jan. 7, 1964, Ser. No. 336,309
16 Claims. (Cl. 73—398)



1. A hydrostatic pressure sensor comprising: a body constituted essentially of a direct electron transition semiconductive material and an indirect electron transition semiconductive material, said materials being present in said body in predetermined relative concentrations by molecular weight that cause said body to exhibit first and second conduction band edges having substantially equal energy levels; and, means responsive to variations in the electrical resistivity of said body to provide an indication of changes in hydrostatic pressure exerted on said body independent of the orientation of said body.

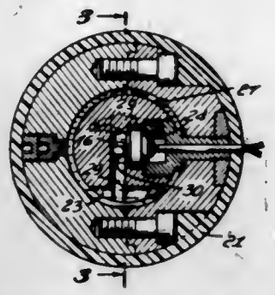
3,270,563
APPARATUS FOR ANALYZING FOR PARTICLE SIZE DISTRIBUTION
Thomas D. Sharples, Lansdale, Pa., assignor to Pennsalt Chemicals Corporation, a corporation of Pennsylvania
Filed Oct. 2, 1963, Ser. No. 313,365
12 Claims. (Cl. 73—432)



1. An apparatus for assisting in the analysis of particle size distribution comprising a spindle, means to drive said spindle, suspension-receiving chamber means mounted on

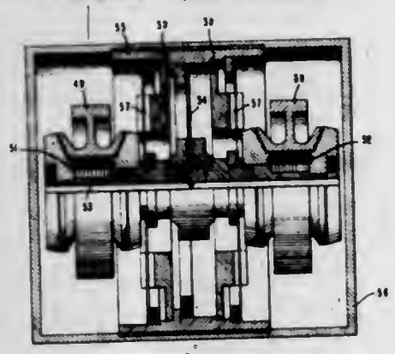
the spindle, the chamber means having fixed walls and partitions of different configuration on opposite sides of

the spindle and means to indicate the unbalance of the spindle.



3,270,564
ATHLETIC SWING MEASUREMENT SYSTEM
James W. Evans, 1718 Laverne Drive, Huntsville, Ala.
Filed May 18, 1964, Ser. No. 368,000
22 Claims. (Cl. 73—432)

1. An athletic swing measurement system comprising:
(A) A hand held athletic club having a gripping portion and further comprising:
(1) an impact region adapted to strike a playing object;
(2) A handle region intermediate said gripping portion and said impact region;
(B) movement sensing means supported by at least one of said regions and responsive to motion of said athletic club for providing at least one electrical signal which is a continuous function of an element of movement of at least a portion of said one of said regions throughout periods of said motion;
(C) indicating means responsive to an input signal for registering a plot of input signal versus time;
(D) electrical signal transmission means responsive to at least one output of said movement sensing means for providing an input signal to said indicating means.

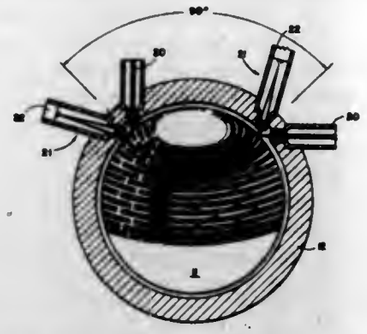


3,270,565
OMNIDIRECTIONAL ACCELERATION DEVICE
Wilbur W. Hawley, Santa Ana, David H. Geipel, Fullerton, and Willis D. Longyear, Newport Beach, Calif.; granted to National Aeronautics and Space Administration under the provisions of 42 U.S.C. 2457(d)
Filed Dec. 26, 1962, Ser. No. 247,136
3 Claims. (Cl. 73—497)

1. An accelerometer for determining the magnitude of acceleration forces from all directions comprising,
a spherical housing responsive to omnidirectional acceleration forces,
a spherical chamber within said housing filled with a liquid,
a pair of oppositely disposed pressure sensors attached to said housing and extending into said chamber for measuring the static pressure of said liquid at op-

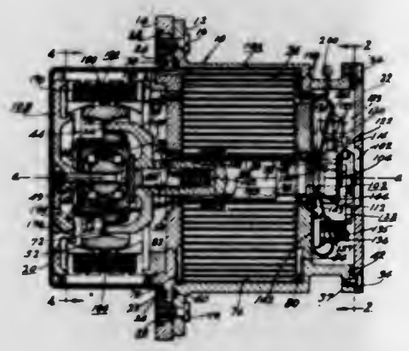
posite ends of said chamber, whereby the average pressure at said pair of pressure sensors is linearly proportional to the magnitude of said acceleration forces, and
a sphere in said chamber smaller than said chamber and attached to said housing for compensating for changes in volumetric expansion of said liquid and said housing caused by changes in temperature.

3,270,566
INERTIAL SENSOR
Eugene Cenitch and John E. Lundberg, Endwell, and Robert A. Watson, Endicott, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed May 31, 1962, Ser. No. 198,912
14 Claims. (Cl. 74—5.6)



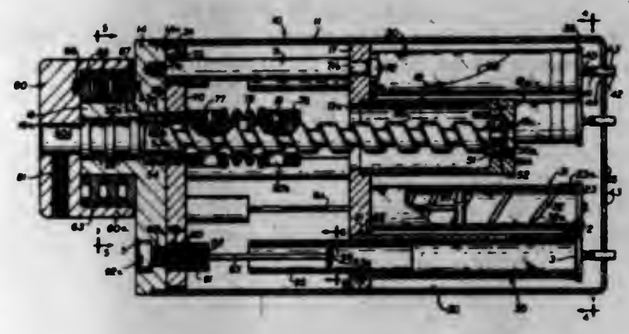
1. A gyroscopic device, comprising:
a rotor mounted for rotation about a shaft;
vibratable stressed members attached to said shaft, and extending outwardly thereof;
base reference means connected to the outer ends of said members;
drive means for maintaining the members in a vibrating state; and
means operatively related to said vibratable members for sensing and indicating the frequency of vibration of said members whereby the changes in frequency of vibration noted serve to identify corresponding changed force conditions externally imposed upon said base reference means.

3,270,567
CONTROL APPARATUS
William M. Crampton, White Bear Lake, Minn., assignor to Honeywell Inc., a corporation of Delaware
Filed Sept. 11, 1961, Ser. No. 137,288
14 Claims. (Cl. 74—5.6)



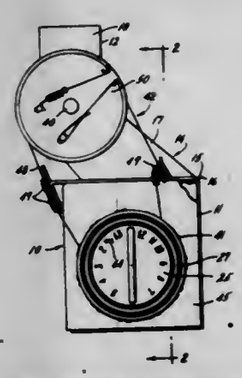
5. In apparatus of the class described: a support; a substantially spherically shaped rotor universally supported by said support and adapted to rotate about a spin axis;

and means for measuring relative rotation between said rotor and said support about an axis at an angle to said spin axis, said measuring means comprising a plurality of coded latitude lines on said rotor, said lines each hav-



ing a characteristic coding arrangement of radiative and non-radiative portions arranged about a portion of rotor periphery and a non-coded portion on the remaining rotor periphery, and the coding on one line being adjacent a non-coded portion of the adjacent lines.

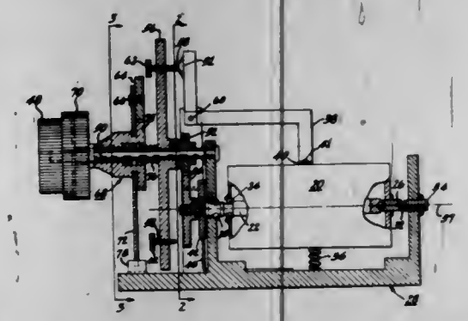
3,270,568
GYROSCOPE APPARATUS
Joseph J. Moravek, Bethpage, and Rocco N. Figalora, Plainview, N.Y., assignors to American Bosch Arma Corporation, Garden City, N.Y., a corporation of New York
Filed July 20, 1964, Ser. No. 383,774
11 Claims. (Cl. 74—5.12)



1. An impulse-driven gyroscope comprising:
a supporting frame;
a rotatable gyro element supported for rotation on said frame;
a drive shaft journalled in said frame for both rotational and axial motion with respect to said frame;
clutch means driven in rotation by rotation of said shaft and movable by axial motion of said shaft into and out of driving engagement with said gyro element, thereby to permit rotation of said gyro element by said shaft when said shaft is in a first axial position and to permit rotation of said gyro element free of said clutch means when said shaft is in a second axial position;
coil spring means comprising a coil spring around said shaft, and having its inner end releasably connected to said shaft for driving said shaft in rotation as said spring unwinds and for releasing from said shaft when said spring is spent;
release spring means urging said shaft toward said second axial position; and
stop means on said shaft abutting a portion of said coil spring means when said coil spring is tightly wound to prevent said shaft from moving from said first to said second axial position, said stop means being clear of said portion of said coil spring means when said coil spring is spent to permit said shaft to move to said second axial position in response to said release spring means, whereby said clutch means is disengaged only when said coil spring is spent.

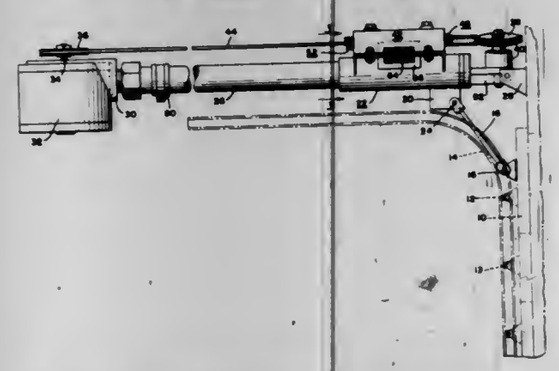
3,270,569
DRIVE DEVICE
Nelson Berman, New Hyde Park, and Hugo Seiden, Brooklyn, N.Y., and Joseph R. Roy, Wapping, Conn., assignors to JFD Electronics Corporation, Brooklyn, N.Y., an organization of New York
Original application Apr. 18, 1962, Ser. No. 188,458. Divided and this application Feb. 9, 1965, Ser. No. 441,397
6 Claims. (Cl. 74—10.2)

3. Drive shaft stop device comprising a fixed support having bearing means, a shaft turnably supported by said bearing means, a knob on said shaft, a plate on said support opposing and spaced from said knob, a plurality of discs turnably mounted on said shaft between said knob and said plate, each said disc having a part-circular groove, each said disc having circumferentially spaced pins extending perpendicularly thereto and in circumferential alignment with the ends of said slot, said discs being arranged with the pins of one disc extending into the slots of the neighboring disc, said knob and said plate respectively having a corresponding groove and corresponding pins such that such corresponding pins extend into a slot and the disc pins extend into such corresponding groove, said pins being circumferentially slidable in said slot.



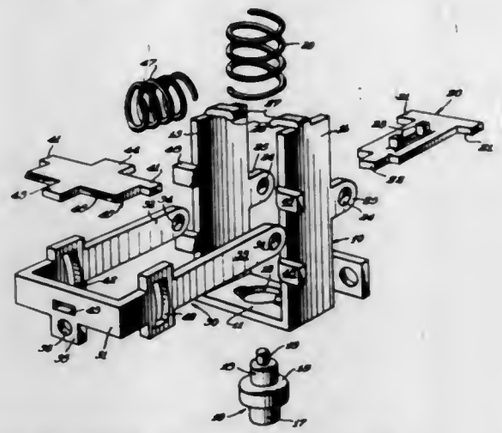
3,270,570
DRIVE SYSTEM
Donald C. Stouffer, Philadelphia, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Delaware
Filed Sept. 9, 1963, Ser. No. 307,476
14 Claims. (Cl. 74—10.5)

1. A drive system for two associated tuners, one tuner having a rotatable VHF station selector and adjustable VHF fine tuning elements carried thereby, the other tuner having a rotatable UHF tuning shaft, said system comprising a first member connected to the VHF station



selector and rotatable to drive the latter for placement in selectible operative positions including a UHF switching position, a second member drivingly connected to the UHF tuning shaft and rotatable to drive the latter for UHF coarse tuning, a third member mounted for rotation with respect to the first and second members, motion transmitting means between the third member and the VHF tuning elements to drive the latter for effecting VHF fine tuning, speed reduction means between the third member and the second member to rotate the latter and thereby drive the UHF tuning shaft for effecting UHF fine tuning, and means for disabling the motion transmitting means in response to placement of the VHF selector in the aforesaid UHF switching position.

3,270,571
TELEVISION TUNER
Marvin A. Leedom, Warminster, Pa., assignor to Radio Corporation of America, a corporation of Delaware
Filed Dec. 13, 1963, Ser. No. 330,275
9 Claims. (Cl. 74—10.41)

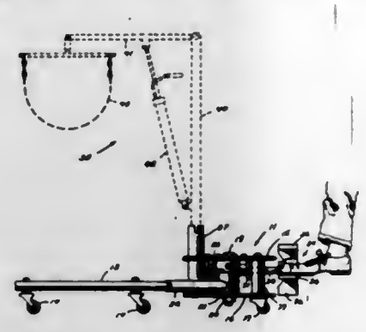


1. A television tuning mechanism comprising in combination:
a tuner including a chassis member and a control shaft:
detent means for providing a plurality of stop positions coupled to said control shaft;
means for mounting said tuner for rotation relative to the axis of rotation of said detented control shaft; and
means for rotating said tuner chassis member with respect to the detented control shaft in any of said stop positions.

3,270,572
DOOR OPERATING MECHANISM
Wilbur J. Zimmerle and James E. Whelan, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Oct. 1, 1964, Ser. No. 400,776
4 Claims. (Cl. 74—89.22)

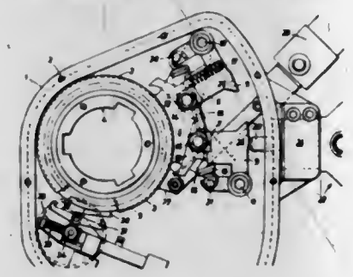
1. An operator assembly for opening and closing a garage door or the like comprising, an elongated track, drive means supported adjacent one end of said track, a driven pulley operatively associated with said drive means, garage door connectible carriage means slidably supported on said track for movement longitudinally thereof in opposite directions therealong, differential pulley means on said carriage means, a continuous belt passing over said drive pulley and said differential pulley means to be driven thereabout by said drive means, said differential pulley means rotatable upon passage of said belt therearound to effect a resultant reaction on said carriage means operative to cause relative movement of said carriage means to and fro on said track member at a reduced speed with respect to that of said drive pulley, said carriage means including a fixed base portion slidably supported on said track member, a movable base portion slidably supported on said fixed base portion, and spring members on either side of said base portions compressible upon relative movement between said base portions for damping impact between said carriage means and said track at the limits of the travel of said carriage means.

3,270,573
SNAP ACTION SWITCH
Samuel H. Schwartz, Deerfield, Ill., assignor to The Dole Valve Company, Morton Grove, Ill., a corporation of Illinois
Filed Mar. 29, 1963, Ser. No. 269,113
9 Claims. (Cl. 74—97)



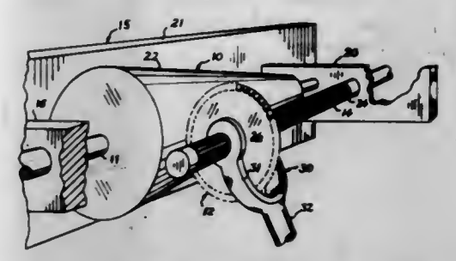
1. A motion translation device comprising:
a frame,
an actuating lever and a main lever both pivotally connected to said frame and having free ends extending outwardly from said frame,
a toggle pivotally connected to the free end of said main lever and having a free end positionable on each side of a straight line intersecting the pivotal axes of said main lever and toggle,
means limiting the degree of pivotal movement of said toggle relative to said main lever and said main lever relative to said frame,
resilient means interconnecting the free ends of said toggle and said actuating lever,
and means for positioning the free end of said actuating lever on each side of a line intersecting the spring connection point on said toggle and the pivotal axis of the toggle irrespective of the pivoted position of said toggle and irrespective of the pivoted position of said main lever.

3,270,574
ADJUSTABLE BASE UNIT FOR INVALID LIFTS
Gilbert I. Stewart and Kenneth H. Teeter, Higgins Lake, Mich.; said Stewart assignor to said Teeter
Continuation of application Ser. No. 189,602, Apr. 23, 1962. This application May 10, 1965, Ser. No. 454,268
2 Claims. (Cl. 74—98)



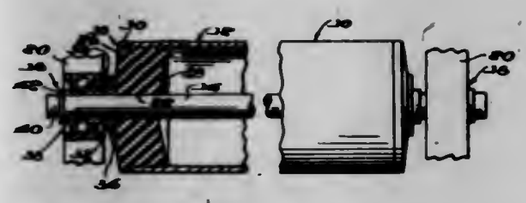
1. In an adjustable base unit for invalid lifts, the combination comprising:
(a) a base unit frame for invalid lifts;

(b) a pair of spaced-apart post pivot members provided on said base unit frame, each of said post pivot members provided with a gear segment arm extending therefrom, said gear segment arms spaced apart from but extending toward each other;
(c) an outrigger leg support member mounted on each of said post pivot members for selective pivotal movement toward and away from each other, each of said outrigger leg support members extending from said post pivot member away from said gear segment arms;



(d) worm gear assembly actuating means positioned on said frame intermediate said gear segment arms and in operative engagement therewith for selectively accomplishing corresponding and symmetrical pivotal movement of said leg support members toward and away from each other; and
(e) a vertical mast stub connector provided on said base unit frame, said stub connector adapted to supportingly engage an invalid lift assembly.

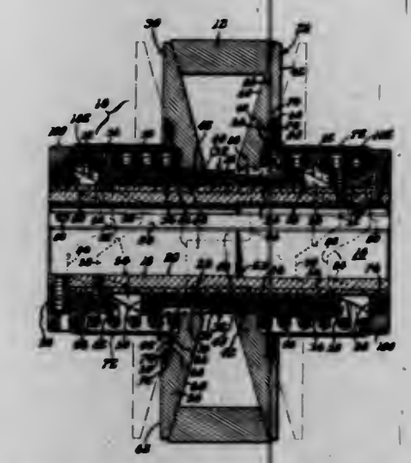
3,270,575
DEVICES FOR PERFORMING ROTATIONAL MOVEMENTS
Bror Sigurd Olsson, Mariestadsvagen 22, Johanneshov, Sweden
Filed Nov. 9, 1962, Ser. No. 236,576
Claims priority, application Sweden Nov. 14, 1961, 9,575/61; Oct. 29, 1962, 11,596/62
5 Claims. (Cl. 74—142)



1. A device for imparting to a rotatable member stepwise rotational movements between two definite end positions and for providing an increased initial torque, said device including a gear wheel operable for actuating said rotatable member, two pawl means, one for driving said gear wheel in a clockwise direction of rotation and the other for driving the same in a counter-clockwise direction of rotation, an actuating member operative for imparting different directions of rotation to said gear wheel by actuating either of said pawl means, support means mounting said pawl means tiltably about a journal point each, said support means being journalled concentrically to said gear wheel and being rotatable in opposite directions about the same axis as the latter, each of said pawl means being actuatable by said actuating member at different distances from their journal points thereby providing different torques and different velocities for said rotatable member.

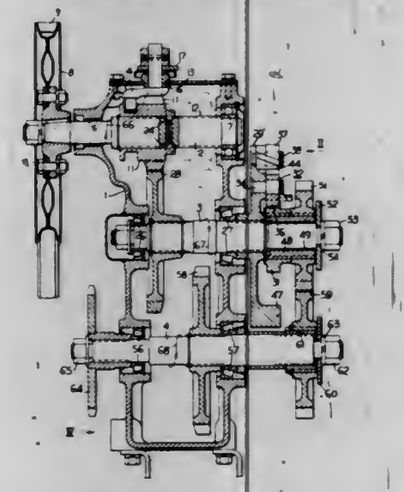
3,270,576
FRICTION DRIVE TRANSMISSION
David G. Goldwasser, 558 Orme Circle NE., Atlanta, Ga.
Filed Feb. 10, 1964, Ser. No. 343,645
5 Claims. (Cl. 74—191)

1. In a friction drive transmission having a conical driving member, a driven member allowing relative motion between the driven member and the driving member only as the driven member moves longitudinally along the driving member, said driven member comprising a central web, a plurality of support tabs extending radially outward from said central web, and a plurality of rollers, each of said rollers being rotatably mounted between adjacent tabs for rotation about an axis transverse to the said relative motion between the driven member and the driving member.



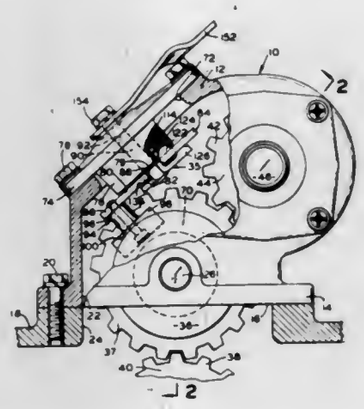
3,270,577
IDLER ROLLERS AND METHOD OF MAKING THE SAME
William N. Poundstone, Morgantown, W. Va., assignor to Consolidation Coal Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Dec. 7, 1964, Ser. No. 416,571
3 Claims. (Cl. 74—230.4)

1. An idler roller assembly comprising,
a shaft supported for rotation by bearing means located on the end of said shaft,
a tubular roller having a cylindrical external surface and first and second end portions having cylindrical internal surfaces,
a pair of annular resilient support members coaxially positioned within said tubular roller end portions and constructed and arranged to fix said tubular roller to said shaft in coaxial and nonrotatable relation therewith,
said annular support members each having in its undistorted condition a substantially frusto conical concave first end wall and a substantially frusto conical convex second end wall,
said annular support members positioned on said shaft and within said tubular roller end portions with said support member concave end walls facing each other,
stop means to limit inward axial movement of said annular resilient support members relative to said tubular roller end portions, and
retaining means secured to said shaft to retain said annular support members from moving axially outwardly on said shaft after said annular resilient support members have been distorted by axial forces applied to move said annular resilient support members axially inwardly on said shaft,



said annular resilient support members each being in axial shear between said tubular roller and said shaft.

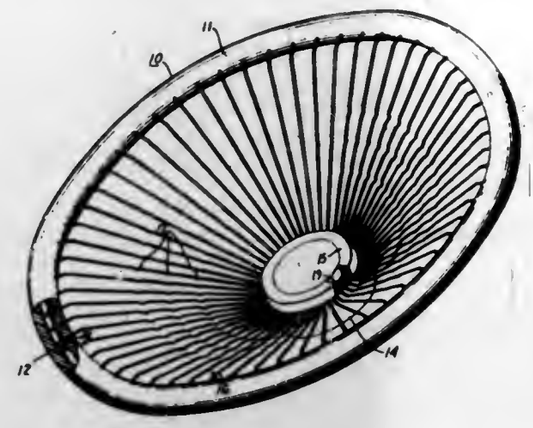
3,270,578
MOTION CONTROL SHEAVE
Howard W. Leadbeater, Glenside, Pa., assignor to Universal American Corporation, New York, N.Y., a corporation of Delaware
Filed June 1, 1964, Ser. No. 371,663
4 Claims. (Cl. 74—230.17)



1. In a motion control sheave, the combination comprising a cylindrical hub, interlocking cam members slidably fitted in series relataion over said hub, a pair of said cam members being fixed relative to each other, and another pair of said cam members being disposed between said fixed cam members and being axially shiftable relative to each other, a pair of conical sheave flanges mounted respectively upon said axially shiftable cam members facing each other to provide a V-shaped annular groove therebetween, and means yieldably biasing said flanges axially toward each other, said hub and fixed cam members on one hand and said axially shiftable cam members on the other hand being provided with engaging surfaces respectively of a plastic polymer and an oil impregnated material.

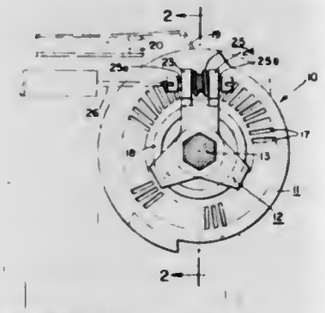
3,270,579
TRANSMISSION
Paul A. Whisler, La Porte, Ind., assignor to Allis Chalmers Manufacturing Company, Milwaukee, Wis.
Filed Feb. 6, 1964, Ser. No. 342,888
9 Claims. (Cl. 74—325)

1. In a transmission, the combination of relatively rotatable power input and output shafts, a selectively engageable and disengageable gear train and a torque limiting device operatively interposed between said shafts; and auxiliary gearing independent of said torque limiting device operable to establish and interrupt a driving connection between said shafts upon disengagement of said gear train.



3,270,580
GEAR SHIFT LOCKING DEVICE
Robert W. Wagner, Chelsea, Mich., assignor to Dana Corporation, Toledo, Ohio, a corporation of Virginia
Filed Dec. 9, 1963, Ser. No. 328,877
15 Claims. (Cl. 74—475)

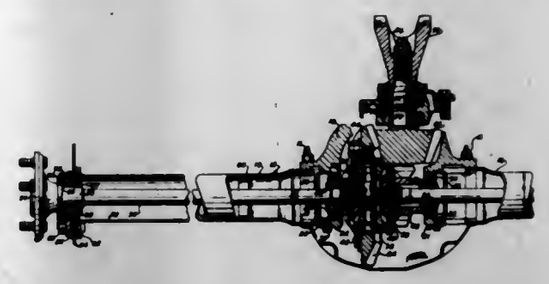
1. A shifting mechanism operative to impose a shifting force upon a shiftable member having first and second positions comprising in combination,
(a) a support means disposed in a stationary position relative to the shiftable member,
(b) a shifting element engageable with the shiftable member and operative to induce a shifting force thereto,
(c) said shifting element having first and second positions corresponding to first and second positions of said shiftable member and being rotatable between said first and second positions,
(d) locking means carried by said support means and engageable with said shifting element in its first and second positions for locking the latter alternately in said positions,
(e) an actuating means,
(1) for maintaining said locking means in locking engagement with said shifting element,
(2) for urging said locking means out of locking engagement with said shifting element,
(3) for rotating said shifting element to its first and second positions,
(f) said actuating means being engageable with said locking means and said shifting element,
(g) and means carried by said support means and mounting said shifting element and said actuating means for rotational movement relative to each other and relative to said support means.



3,270,581
STEERING WHEEL CONSTRUCTION
Rodger E. Geller, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Oct. 23, 1963, Ser. No. 318,207
7 Claims. (Cl. 74—552)

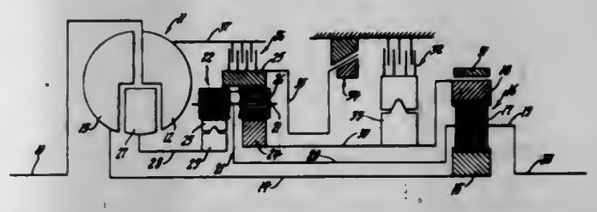
1. Steering wheel structure, comprising a rim portion, multiple wiring means extending radially and axially offset to one side from said rim portion, and a central hub portion having a covering thereon, said hub portion including a specific continuous radially serrated edging that receives inner ends of said wiring means in equally spaced

and uniformly distributed intervals rather than in isolated clusters subject to fitting of said covering thereto.



3,270,582
MECHANICAL DEVICE
Lewis Ellsworth Barth, Langhorne, Pa., assignor to Automatic Timing & Controls, Inc., King of Prussia, Pa., a corporation of Pennsylvania
Filed Jan. 3, 1964, Ser. No. 335,577
8 Claims. (Cl. 74—568)

1. A cam assembly comprising:
(a) a first member having a cam surface portion and also having a plurality of thread-engaging means formed on a substantially flat-side surface portion thereof, said other portion being substantially transverse to said cam surface portion, and
(b) a second member which includes gear means disposed so that only a small portion of its threads are pressed forcefully against said thread-engaging means at any time, said second member being constructed to cause rotation of said first member when said gear means are rotated.

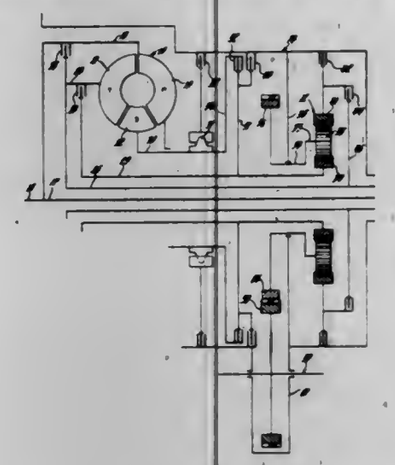


3,270,583
AXLE HOUSING ASSEMBLY
William E. Rudnicki, Detroit, and James M. Benson, Warren, Mich., assignors to The Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed July 23, 1962, Ser. No. 211,816
3 Claims. (Cl. 74—607)

1. An axle shaft and housing assembly comprising an axle shaft, a drive flange on one end of said shaft, said drive flange being adapted to accommodate a connection with a wheel drum, an axle shaft housing, said axle shaft being received within said housing, a rigid flange plate secured to the end of said housing, a wheel brake mounting plate, said flange plate being secured to one side of said mounting plate, a bearing adapter, said bearing adapter, said mounting plate and said flange plate being bolted together with the bearing adapter on the other side of said mounting plate whereby bearing loads in a direction transverse to the axis of said axle shaft are transmitted through

said flange plate to said axle shaft housing, a bearing recess formed in said bearing adapter, and bearing means within said adapter for journaling the outboard end of said axle shaft.

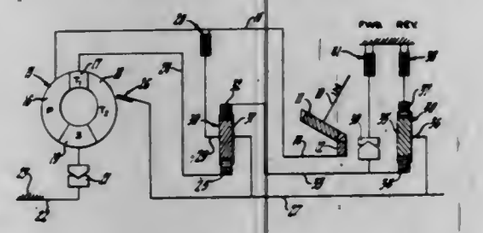
3,270,584
TRANSMISSION
Jack W. Qualman, Ann Arbor, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 27, 1963, Ser. No. 312,192
5 Claims. (Cl. 74—677)



1. In a transmission of the type having a hydrodynamic torque transmitting device and first and second planetary gearing units, said hydrodynamic device including an engine driven impeller and a first turbine and a reaction member, said first planetary gearing unit including a planet carrier supporting a planet pinion gear in mesh with a ring gear and a sun gear, said second planetary gearing unit including a planet carrier supporting a planet pinion gear in mesh with a ring gear and first and second sun gears, respectively, means connecting said turbine to said first gear unit sun gear for driving the same, a power delivery shaft, means connecting the carriers of both gear units to said power delivery shaft for rotation therewith, means connecting the ring gear of said first gear unit to one sun gear of said second gear unit for rotation therewith, means operatively connecting said reaction member of said hydrodynamic device to a sun gear of said second gear unit whereby said last-mentioned sun gear provides a reaction point for said reaction member and brake means effective when engaged for preventing rotation of one of said second gear unit sun gears in at least one direction of rotation.

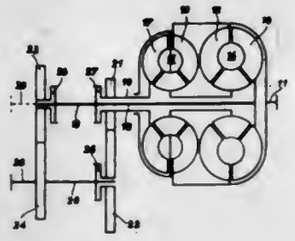
3,270,585
TRANSMISSION
William G. Livezey, Indianapolis, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Apr. 15, 1964, Ser. No. 359,894
20 Claims. (Cl. 74—677)

5. In a transmission the combination of
(a) an input member, an output member, a hydrodynamic torque converter comprising a pump connected to said input member, a turbine and a stator, a planetary gear set comprising a sun gear, a ring gear and a planet carrier rotatably supporting planetary pinions in mesh with said sun gear and said ring gear,



(b) an input power take-off shaft connected to said input member and extending centrally through said hydrodynamic torque converter and said planetary gear set, a first sleeve shaft connected to said turbine, said first sleeve shaft being received on said input power take-off shaft and extending through said planetary gear set to provide a turbine power take-off, a second sleeve shaft received on said first sleeve shaft and connected to said sun gear,

(c) a one-way brake connected to said stator, a first brake effective when engaged to ground said one-way brake, a first clutch effective when engaged to connect said turbine to said second sleeve shaft, a second brake effective when engaged to ground said ring gear,

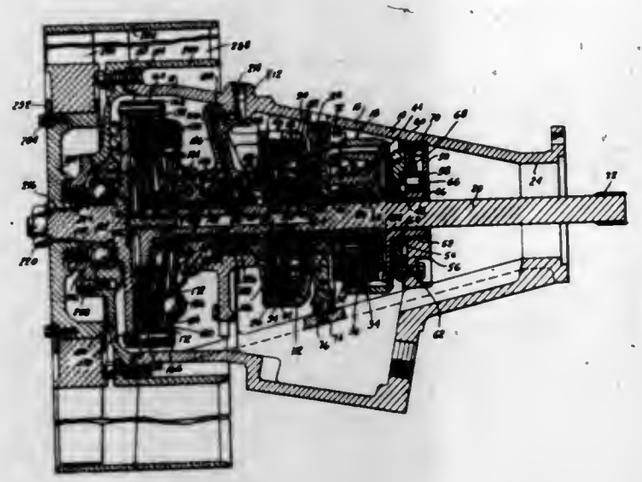


(d) and drive means operatively connecting said output member to said planet carrier.

3,270,586
TRANSMISSION
Robert M. Tuck and James J. Mooney, Jr., Indianapolis, and James A. Mitchner, Martinsville, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Continuation of application Ser. No. 55,895, Sept. 14, 1960. This application May 13, 1965, Ser. No. 455,441
70 Claims. (Cl. 74—677)

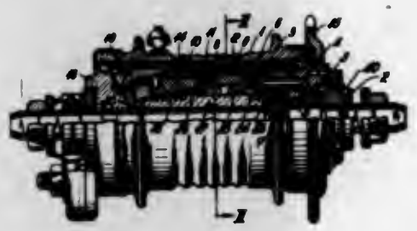
1. In a transmission; a stationary housing; input means; output means; a torque converter having a pump driven by said input means, a first turbine, a second turbine and a stator; means connecting said stator to said housing to limit rotation in one direction to provide a reaction; a reduction and a reverse planetary gear set each having a carrier member with planetary pinions meshing with a sun gear member and a ring gear member; first drive connecting means for drive connecting said first turbine to said sun gear member of said reduction gear set; second drive connecting means for drive connecting said second turbine to said output means; both of said carrier members being connected to said output means; drive connection means between said ring gear member of said reduction gear set and said sun gear member of said reverse gear set; brake means to prevent reverse rotation of said ring gear member of said reduction gear set engaged for forward drive; reverse brake means for holding said ring gear member of said reverse gear set for reverse drive; and a drive clutch directly connecting said input means to one of said members of said reduction gear set.

3,270,587
FOUR-SPEED HYDROMECHANICAL COMPOUND TRANSMISSION
Franz Geray, Friedrichshafen, Germany, assignor to Maybach Motorenbau G.m.b.H., Friedrichshafen, Germany, a firm of Germany
Filed Oct. 26, 1964, Ser. No. 406,972
Claims priority, application Germany, Nov. 6, 1963, M 58,798
5 Claims. (Cl. 74—732)



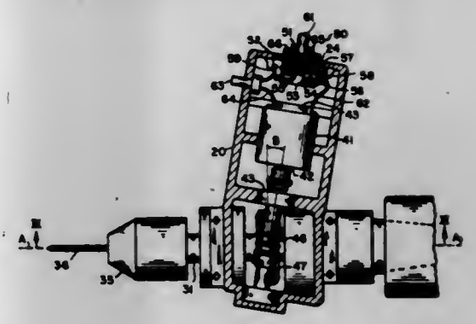
1. A four-speed hydromechanical compound transmission for vehicles, including:
two juxtaposed coaxially placed controllable hydrodynamic torque converters,
each of said converters having an impeller,
means for jointly driving said impellers,
two concentric shafts,
each of said converters having a turbine wheel, the turbine wheel of one of said converter being mounted on one of said shafts, the turbine wheel of the second converter being mounted on the second of said shafts,
one of said converters being capable of high-torque conversion for starting, the second converter having a high efficiency over a broad range at high speeds,
a countershaft,
a first spur gear pair having a gearwheel mounted on one of said concentric shafts, said first spur gear pair having a second gearwheel mounted on said countershaft,
a second spur gear pair having one gearwheel mounted on the second concentric shaft, said second spur gear pair having a second gearwheel mounted on said countershaft,
one gear wheel of each of said spur gear pairs being rotatable on the respective shaft and the other gearwheel of each of said spur gear pairs being made fast on the respective shaft,
a clutch operatively interposed between each of said gearwheels which are rotatable on the respective shafts, and the respective shaft for selectively clutching said gearwheels to the respective shafts, and
clutch means operatively interposed between said concentric shafts for clutching and declutching said concentric shafts.

3,270,588
MULTIPLE SPEED COOLING FAN DRIVE MECHANISM
Glen L. Bowen, Detroit, and Robert W. Lemon, Farmington, Mich., assignors to G. L. Bowen & Co., Oak Park, Mich., a corporation of Michigan
Filed Nov. 4, 1963, Ser. No. 321,183
14 Claims. (Cl. 74—750)



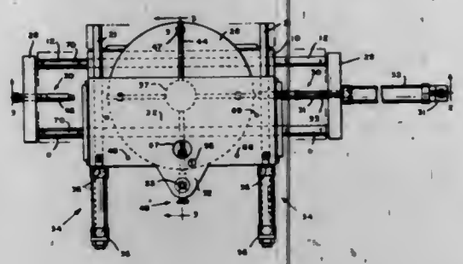
1. In a multiple speed drive mechanism for an engine cooling fan, a power input shaft, a power output shaft adapted to be connected to a bladed fan, a planetary gear unit comprising a sun gear element, a carrier element, a

ring gear element and planet pinions rotatably mounted on said carrier element in meshing engagement with said sun gear element and said ring gear element, said power input shaft being connected to one element of said planetary gear unit, a second element of said planetary gear unit being connected to relatively stationary portions of said mechanism, a direct drive clutch structure comprising a rotary drum connected to said power output shaft, means including a selectively engageable low speed clutch



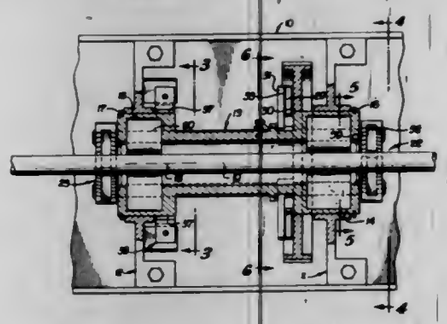
for drivably connecting a third element of said planetary gear unit to said drum, spring means carried by said drum for engaging said direct drive clutch structure, fluid pressure operated servo means disposed within said drum for overruling the action of said spring means in response to a pressure build-up therein whereby said direct drive clutch is released.

3,270,589
DUAL SPEED HUB WITH AUTOMATIC SPEED SHIFT
Hans Joachim Schwerdhöfer, Schweinfurt (Main), Germany, assignor to Fichtel & Sachs A.G., Schweinfurt (Main), Germany, a corporation of Germany
Filed Apr. 16, 1963, Ser. No. 273,329
Claims priority, application Germany, Apr. 19, 1962, F 36,604
10 Claims. (Cl. 74—750)



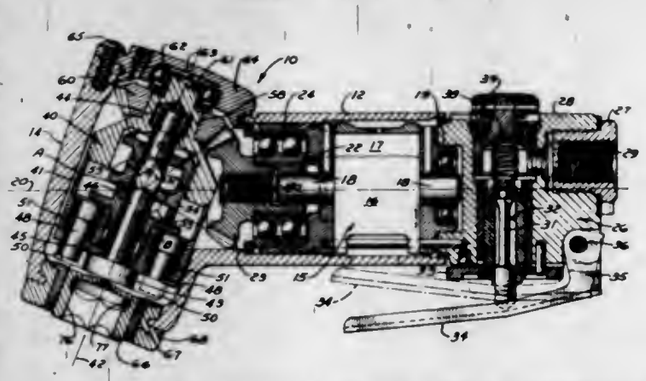
1. In a multiple speed hub, in combination:
(a) a stationary shaft, having an axis;
(b) hub shell means supported on said shaft for rotation about said axis in a forward direction and a backward direction, said hub shell means defining a cavity therein;
(c) driver means supported on said shaft for rotation about said axis is said directions;
(d) a multiple speed transmission connected to said driver means for rotation therewith, said transmission including first and second transmission members operatively connected for rotation, said first transmission member rotating at a lower speed than said second transmission member;
(e) first ratchet coupling means interposed between said first transmission member and said hub shell means, and second ratchet coupling means interposed between said second transmission member and said hub shell means, said first and second ratchet coupling means being mounted in said cavity for selectively transmitting the rotation of said transmission members to said hub shell means when the corresponding tranmsission member rotates in said forward direction at a speed equal to the speed of said hub shell means,
(1) said second ratchet coupling means including a pawl member and a ratchet member engageable by said pawl member, the members of said second ratchet coupling means being respectively connected to said second transmission member and to said hub shell means;
(f) a control member mounted in said cavity for rotation about said axis said pawl member being movable relative to said control member between a blocking position in which said control member holds said pawl member out of engagement with said ratchet member, and an unblocking position in which said control member permits engagement of said pawl member with said ratchet member;
(g) first connecting means interposed between said pawl member and said control member for jointly rotating said control member with said pawl member when said driver means rotates in said forward direction; and
(h) second connecting means interposed between said shaft and said control member for impeding movement of said control member and thereby shifting said pawl member between said positions thereof when said driver means rotates in said backward direction.

3,270,590
LATHE DRILL ATTACHMENT
William H. Schneider, 3217 Mount Troy Road, Pittsburgh, Pa.
Filed Mar. 30, 1964, Ser. No. 355,544
9 Claims. (Cl. 77—6)



1. A lathe drill apparatus comprising: a housing, bearing means mounted within said housing and defining an axis of rotation, a shank member shaped to be cooperatively received by a socketed tool holding part of a conventional machine lathe, said shank member being securely attached to said housing and extending outwardly therefrom coaxially with said axis of rotation, for mounting said housing on a lathe, an output shaft supported by said bearing means, drill holding mechanism operatively mounted on said output shaft for supporting a drill coaxially with said shank member, a motor totally supported by said housing, said motor having a motor shaft, and speed reduction gear transmission means operatively connected between said motor shaft and said output shaft.

3,270,591
SPACING TABLE
Alpheus Winter IV, Fairfield, Conn., assignor to Winter Products, Inc., Fairfield, Conn., a corporation of Connecticut
Filed July 9, 1963, Ser. No. 293,702
10 Claims. (Cl. 77—64)



1. In a spacing table, a base plate; an intermediate plate mounted on said base plate for longitudinal movement; a top plate mounted on said intermediate plate for transverse movement along a path at right angles to the path of movement of said intermediate plate; turret means removably mounted for rotation on said intermediate plate beneath said top plate; rods containing adjustable stop means extending radially from said turret means in spaced transverse planes; and separate abutment means fixed to said base plate and said top plate for cooperation with the adjustable stop means in said spaced planes.

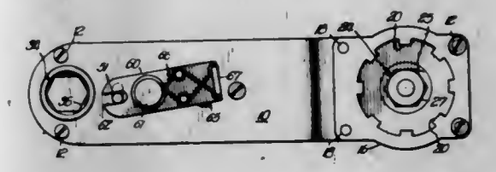
3,270,592
UNIVERSAL SUPPORTING AND DRIVING APPARATUS FOR PIPE SUBJECTED TO THREADING
Howard N. Behnke, South San Gabriel, Calif., assignor to Collins Machinery Corporation, Monterey Park, Calif., a corporation of California
Filed Jan. 3, 1964, Ser. No. 335,587
5 Claims. (Cl. 77—73)

1. In apparatus of the character described, the combination comprising
(a) a centrally hollow carrier having a horizontal central axis of rotation and a first bearing structure by which the carrier is supported for rotation;
(b) a series of elongated pivot members defining pivot axes circularly spaced about said central axis and extending parallel thereto, the carrier supporting the members to pivot relative thereto and about said pivot axes;
(c) a first set of work gripping jaws having driven connection with the pivot members at one end of the carrier;
(d) a second bearing structure supporting the carrier for rotation and at a location axially spaced from said first bearing structure, and a second set of work gripping jaws having driven connection with said pivot members adjacent the opposite end of said carrier;
(e) levers extending in the space between said first and second bearing structures and operatively connected with the pivot members so as to simultaneously pivot the members and both sets of jaws, the jaws of both sets being located to simultaneously grip work projecting through the hollow carrier as the pivot members are rotated by said levers;
(f) a drive rotor rotatable clockwise and counterclockwise about said central axis;
(g) and links operatively connected with the rotor and levers to transmit rotary drive from the rotor to said levers so as first to pivot the pivot members relative to the carrier to carry the both sets of jaws into rotary driving engagement with work projecting axially from within the carrier hollow, and thereafter to rotate the carrier about said central axis.

3,270,593
POWER OPERATED HAND TOOL OF THE ROTARY IMPACT TYPE
Frank A. Kaman, Prospect Heights, Ill., assignor to Skil Corporation, Chicago, Ill., a corporation of Delaware
Filed Oct. 28, 1963, Ser. No. 319,449
2 Claims. (Cl. 81—52.3)

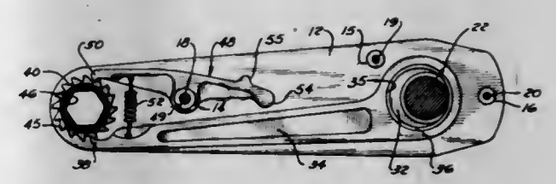
1. A power operated hand tool of the rotary impact type comprising, a housing including a handle portion having a longitudinal central axis and a head portion having a longitudinal central axis, rotary motor means in said handle portion extending longitudinally of the latter, a first bevel gear driven by said motor means at one end thereof and being disposed adjacent one end of said handle portion, which bevel gear has its axis of rotation co-axial with said axis of the handle portion and has its maximum diameter no greater than the diameter of the rotary motor means, the apex of the cone containing the pitch surface of said first bevel gear being disposed outwardly of said one end of the handle portion, rotary impact clutch means including a cylindrical hammer in said head portion extending longitudinally of the latter, which impact clutch means has an input end and an output end, a second bevel gear defining said input end and being disposed adjacent one end of said head portion, which second bevel gear has its axis of rotation co-axial with said axis of the head portion and has its maximum diameter no greater than the diameter of said impact clutch means, the apex of the cone containing the pitch surface of said second bevel gear being disposed intermediate said input and output ends and being coincident with said first mentioned apex, said first and second bevel gears being in meshing engagement with their respective axes of rotation intersecting at the point defined by both of said apexes, the portions of the last mentioned axes between the intersection thereof and respective gears defining an angle in the range of 68°, said output end being defined by a driving member having a socket opening at the other end of said head portion and being substantially contained within the latter, said handle portion being in close confining relation with said motor means and first bevel gear and said head portion being in close confining relation with said impact clutch and second bevel gear, said handle portion being elongated along the longitudinal central axis thereof and being of a size such that a substantial portion of the same can be received between the

fingers and palm of a human hand, said head portion being elongated along the longitudinal central axis thereof and being of a size such that said output end is in general alignment with the extremities of the knuckles of a human hand grasping the tool in the manner set forth.



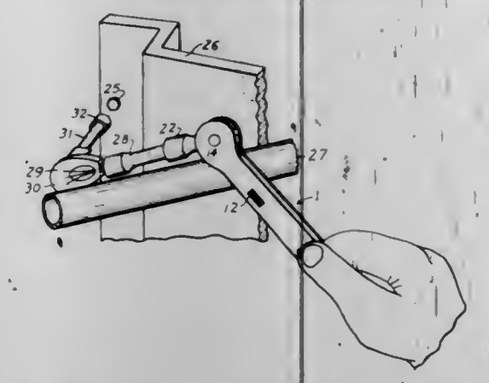
3,270,594
PREDETERMINED TORQUE RELEASE WRENCH
Bosko Grabovac, Altadena, Calif., assignor to Torque Controls, Inc., El Monte, Calif., a corporation of California
Filed July 29, 1964, Ser. No. 385,850
5 Claims. (Cl. 81—52.5)

1. In a torque wrench having a hollow body and having a work-engaging member rotatably mounted on the body, said work-engaging member being operatively connected to a swingable arm inside the body extending longitudinally of the body, means cooperative with the swingable arm for predetermined resistance to swinging movement of the arm away from a normal position, said cooperative means comprising:
a pressure member mounted inside the body with a leading end directed towards the arm and freely movable axially of the body towards and away from the swinging end of the arm, said leading end having a central projection;
spring means urging the pressure member towards the arm; and
a shoe having a transverse face in abutment with both said leading end and said projection thereof the pressure member to receive pressure therefrom,
the shoe being pivotally connected to the arm at the swinging end thereof to constitute therewith a toggle linkage in endwise abutment against the pressure member, the linkage being movable with knee action for longitudinal extension of the linkage to retract the pressure member in response to a load of a predetermined magnitude on the work-engaging member,
the hollow body confining the knee action of the linkage to limit the tilting of the shoe in response to the load,
the shoe being bistable with two opposite normal starting tilt positions depending on the direction of the initial load on the arm when the wrench applies a torque through the work-engaging member, said two opposite starting tilting positions being symmetrical with respect to the longitudinal axis of the hollow body,
said shoe being tiltable from a normal tilt position to a position of greater tilt in response to the load of predetermined magnitude with consequent retraction of the pressure member.



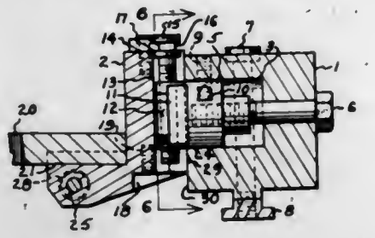
3,270,595
OFFSET DRIVE ATTACHMENT WITH REVERSING MEANS
Emery L. Hall, Hinsdale, and John A. Blachowski, Park Ridge, Ill., assignors to Skil Corporation, Chicago, Ill., a corporation of Delaware
Filed Oct. 14, 1964, Ser. No. 403,835
8 Claims. (Cl. 81—54)

3. In an offset drive attachment of the type having an elongated body with a driven member rotatably mounted in one end thereof and a cylindrical output member rotatably mounted in the other end thereof, which output member includes an exterior annular series of teeth, the improvement which comprises a pair of drive pawls each connected to said driven member by cam means so that both pawls are oscillated upon rotation of the driven member, said drive pawls being arranged and adapted for engagement with said teeth so that upon their oscillation one of the drive pawls is operable to rotate the output member in one direction and the other drive pawl is operable to rotate the output member in the opposite direction, resilient means urging both drive pawls into engagement with the teeth, a dual action stop pawl movably



mounted on said body between said drive pawls, said stop pawl being movable to one position in which it engages said other pawl for holding the latter out of engagement with the teeth and the same time engages said teeth to cooperate with said first drive pawl to rotate the output member in said one direction, and said stop pawl being movable to a second position in which it engages said one drive pawl to hold the latter out of engagement with the teeth and at the same time engages the ratchet teeth for cooprating with said other drive pawl to rotate the output member in said opposite direction.

3,270,596
OFFSET DRIVE ATTACHMENT FOR TOOLS HAVING ROTARY DRIVING MEMBERS
Emery L. Hall, Hinsdale, and Richard H. Kocian, Rolling Meadows, Ill., assignors to Skil Corporation, Chicago, Ill., a corporation of Delaware
Filed Feb. 24, 1964, Ser. No. 346,773
8 Claims. (Cl. 81—54)

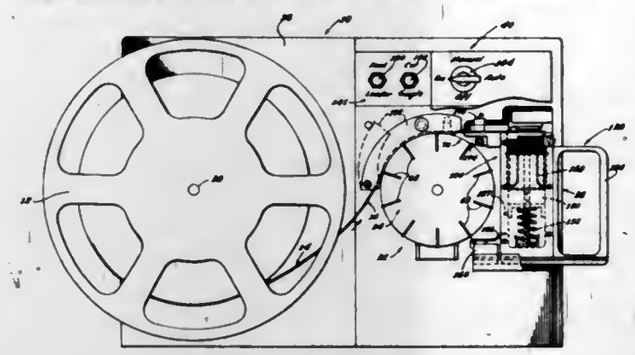


1. An offset drive attachment for a tool of the type having a rotary driving member, said attachment comprising, an elongated body, a driven member rotatably mounted in one end of the body and adapted to be driven by said driving member, said driven member including a cam surface eccentric with respect to the axis of rotation of the driven member, an arm carried by said body for movement in a plane perpendicular to said axis, said arm having drive pawl means associated with one end thereof and having the other end thereof engaged with said cam surface so that rotation of said driven member brings about oscillating movement of the drive pawl means, a ratchet wheel adapted to engage a rotary member for driving the same, which ratchet wheel is rotatably mounted in the other end of said body and has teeth engaged by said pawl means, stop pawl means carried by the body and engaged with the ratchet wheel teeth to prevent rotation of the ratchet wheel in one direction, and means carried by the body for holding said drive pawl means in engagement with the teeth on the ratchet wheel so that upon rotation of the driven member the ratchet wheel is rotated in a direction opposite said one direction.

3,270,597
MULTI-ANGLE RATCHETING WRENCHES
Ted Neff, 20975 Shamrock, San Bernardino, Calif., and Cyrus L. Wing, Rte. 3, Greenfield, Ohio
Filed Sept. 14, 1965, Ser. No. 487,209
1 Claim. (Cl. 81—177.9)

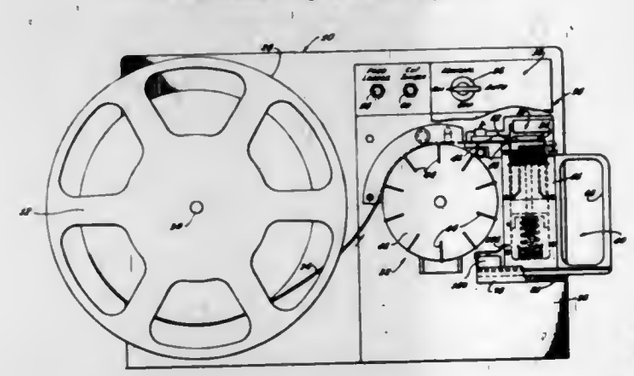
A tool comprising in combination, an elongated handle, a revolving turret member on the handle, means for latching the turret member in a fixed position, a square female connector means integral with said turret member, and a ratchet attachment having two square male connector means; said handle having one end in the form of a bifurcated head and formed by three laminated sections held together by four rivets, a pair of the outer laminae being longer than the central lamina to form the bifurcation, said turret member being multiple-slotted around a section of its outer periphery and journalled in a cavity formed by said bifurcation, a rectangular slot in the central lamina opening into said cavity, a cross slot in each outer lamina that opens into the rectangular slot of the central lamina, said latch means comprising a shiftable rectangular pin in the slot of the central lamina having one end to engage any one of the multiple slots in the turret member for the purpose of holding the turret member in a selected position, said pin engaging a spring which constantly urges the pin into engagement with one of the turret slots, said pin having laterally extending arms which extend through said cross slots on both sides of the handle and wherein their outer ends protrude to form finger tabs for shifting said pin out of engagement with said turret member against the urging of said spring, said female connector means comprising a square-shaped recessed cavity at the outer end of a short arm extending integrally from one side of the turret member, the longitudinal axis of which is in alignment with the longitudinal axis of said handle when the turret member is latched in the central slot, said female connector means being for the purpose of cooperating with and receiving one of the two male connector means on the ratchet attachment in any one of four facing directions, said female connector means also being for the purpose of receiving a similar male connector means on an extension bar as an alternate choice, in which case the first male connector means on the ratchet head may be attached to the opposite end of said extension bar instead of directly to the female connector on the turret member and in any one of four different facing directions in the same manner as it may be connected directly to the turret member, the second square male connector means on the ratchet attachment extending outwardly from one side of said ratchet attachment at a 90° angle in relation to the first male connector means, said second male connector being for the purpose of receiving directly a socket tool, or for receiving an extension bar having a female connector means of complementary cross section, in which case the socket tool may be attached to the opposite end of the extension bar instead of directly to the ratchet attachment, thereby providing in the combination tool a facility for reaching and turning a work piece or fastener from many selectable single or double-angles of variable lengths that otherwise would be inaccessible to ordinary tools.

3,270,598
SKIVING TOOL HOLDER
Lawrence J. Mailloux, Detroit, Mich., assignor to Screw Machine Tool Company, Detroit, Mich.
Filed July 13, 1964, Ser. No. 382,127
3 Claims. (Cl. 82—36)



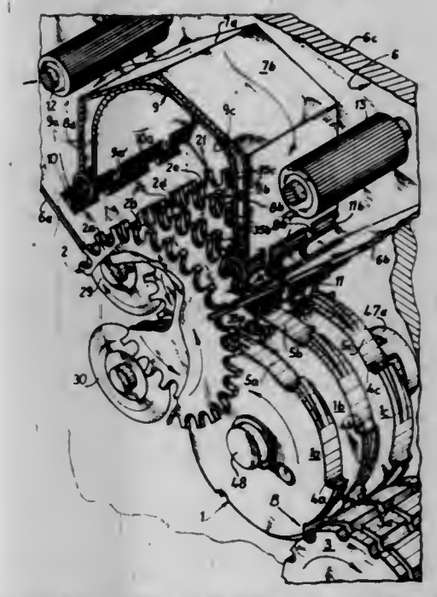
1. A tool holder including,
(a) a block to mount a tool carrier, and adapted to mount upon a tool machine, said block having at least one plane face, and being formed with
(b) a recess opening in said face,
(c) a nut having a portion rotatably received in said recess, and having a portion protruding from the recess,
(d) a slide formed on said protruding portion
(e) a tool carrier mounting a cutting tool and having at least one plane face, and being formed with
(f) an elongated slideway, extending along said face and recessed therein to slidably interlock with said slide (d) and mount the carrier thereon, said slideway being open at each end thereof,
(g) locking means interengaging the nut and the block, and actuable to draw said nut inwardly of said recess, and thus draw said carrier into rigid metal-to-metal engagement with said block, abutting said plane faces, said locking means being actuable to release said elements from said rigid engagement to afford sliding travel of the carrier on said slide, and rotative actuation of said nut in said recess,
(h) a screw extending into and along said slideway, and threadedly engaging said slide (d)
(i) restraining means removably secured to said carrier, to engage an end portion of said screw (h) and resist movement of said screw along its longitudinal axis relative to said carrier, whereby rotation of said screw effects travel of said screw through said nut, and travel of said carrier on said slide to dispose said carrier to position a cutting tool in desired relation to a workpiece,
(j) means carried by said block and actuable to effect said rotation of said nut (c) and associated carrier to dispose a cutting edge of said tool in a desired relation to the axis of rotation of a workpiece.

3,270,599
FILM CUTTER WITH PHOTOCELL INSPECTION AND STOP MEANS
Leroy C. Kleist, Ogden, Ill., assignor to The Magnavox Company, Fort Wayne, Ind., a corporation of Delaware
Filed Sept. 24, 1963, Ser. No. 311,020
16 Claims. (Cl. 83—63)



1. In combination for cutting a strip of film into a plurality of film cards,
means for advancing the film strip,
stop means operatively coupled to the advancing means for momentarily interrupting the advance of the film strip each time it has been advanced through a predetermined increment,

cutting means operatively coupled to the film strip and positioned for engaging and cutting the film into film cards,
means disposed adjacent said film strip for inspecting said film strip for defects, said last means being operatively interconnected with said stop means for

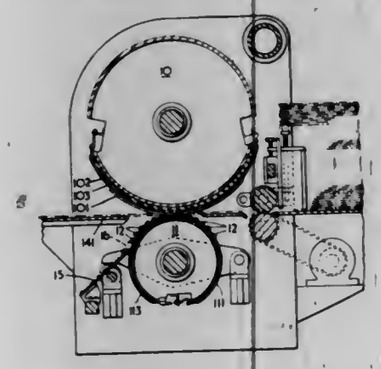


stopping the advance of said film strip whenever it is defective,
and means operatively coupled to said film-advancing and stop means for obtaining the effective operation of said film-inspecting means only when the advance of the film strip has been momentarily interrupted by the stop means.

3,270,600
FILM CUTTER
Kenneth H. Love, Urbana, Ill., assignor to The Magnavox Company, Fort Wayne, Ind., a corporation of Delaware
Filed Sept. 27, 1963, Ser. No. 312,199
24 Claims. (Cl. 83—94)

24. In combination for cutting a strip of film into a plurality of film cards and for stacking the cards in a stacked relationship,
means for intermittently advancing the film strip,
means operatively coupled to the advancing means for obtaining an interruption in the advance of the film strip after the film strip has been advanced through each successive increment,
cutting means operatively coupled to the film strip and responsive to each interruption in the advance of the film strip for engaging and cutting the film into film cards,
a capsule including an opening in one end for receiving said cards,
retaining means on the capsule adjacent said opening, the retaining means being constructed and positioned to retain a stack of cards in said capsule, the retaining means being normally disposed in a first position to retain the cards in the capsule and being movable to a second position to provide for a passage of cards into and out of the capsule,
means for securing said capsule adjacent said cutting means, said securing means including means movable between first and second positions and operative in the first position to move said retaining means to the second position to permit cards to pass through the opening in the capsule and being movable to the second position to provide for a removal of the capsule from the securing means, and
means on said cutting means for inserting the resultant cards through the opening in said retaining means and into the capsule simultaneously with the engagement of the film by the cutting means for the purpose of performing the cutting operation.

3,270,601
APPARATUS FOR MANIPULATING ROD-LIKE MATERIAL
Bernhard Schubert, Hamburg-Lohbrugge, Germany, assignor to Hauni Werke Korber & Co., KG, Hamburg, Germany
Original application Nov. 14, 1963, Ser. No. 323,694. Divided and this application Oct. 6, 1965, Ser. No. 493,319
Claims priority, application Germany, Nov. 17, 1962, H 47,424
11 Claims. (Cl. 83—102)



1. An apparatus for staggering an array of rod-like sections wherein the sections are disposed in rows and wherein each section of one row is in substantial axial alignment with one section of each other row, comprising a feed conveyor having a plurality of equidistant holding means each arranged to receive a plurality of axially aligned sections; a receiving conveyor having a plurality of equidistant holding means each arranged to receive a single section; drive means for moving said conveyors at different speeds and in directions substantially at right angles to the axes of said sections; a transfer conveyor disposed between said first mentioned conveyors and comprising a plurality of transfer elements, one for each section in a holding means of said feed conveyor and each comprising a plurality of holding means, the holding means of said transfer elements being staggered with reference to each other and said transfer elements having portions of different length extending from a first transfer station at which the holding means of said transfer elements receive seriatim the foremost axially aligned sections from consecutive holding means of said feed conveyor to a second transfer station at which the holding means of said receiving conveyor receive sections seriatim from the holding means of said transfer elements; and drive means for moving said transfer elements substantially at right angles to the axes of said sections at such

a speed that all axially aligned sections are transferred from a holding means of said feed conveyor into the holding means of said transfer elements while a section moves with said feed conveyor through a distance which is less than the distance between the centers of two consecutive holding means on said feed conveyor.

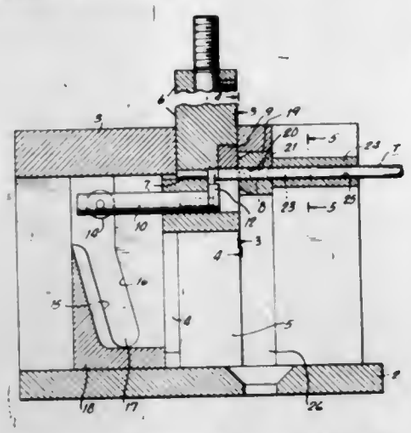
9. As a novel article of manufacture, a transfer conveyor for rod-like articles comprising a pair of rotary disks having fixed parallel axes; coupling means comprising a bolt secured to one of said disks and a substantially radially extending slot provided in the other disk and receiving a portion of said bolt; drive means for rotating one of said disks whereby the other disk rotates with said one disk; and peripheral holding means provided on said disks.

3,270,602
APPARATUS FOR CUTTING CARDBOARD AND ANALOGOUS FLEXIBLE MATERIAL
Kenneth Kirby, Keith Roland Tallett Kirby, and Colin Walter Kirby, Walsall, England, assignors to Kirby's (Engineers) Limited, Walsall, England, a corporation of Great Britain and Northern Ireland
Filed Jan. 21, 1965, Ser. No. 426,813
Claims priority, application Great Britain, Jan. 28, 1964, 3,520/64; Oct. 20, 1964, 42,656/64
7 Claims. (Cl. 83—102)

1. Rotary apparatus for cutting cardboard and analogous flexible sheet material incorporating a positively driven die carrying roller, cutting rule attached to the periphery of the roller in the pattern of the cutting desired to be effected, an impression roller, in the nip between which and the die carrying roller the sheet material to be cut is passed and protuberant arcuate members with intermediate upstanding knife edged portions fixed on one of the said rollers at those places on the periphery which will correspond with the location of the waste resulting from the performance of a cutting operation so that during the performance of a cutting operation the protuberant elements will bite into the waste with a resilient progressive rolling action as cutting proceeds and carry away the waste material impaled thereon as the die carrying and impression rollers recede in the course of a cutting operation.

3,270,603
TUBE CUTTING MECHANISM
Thane E. Hawkins and Donald J. Castor, Meadville, Pa., assignors to Talon, Inc., a corporation of Pennsylvania
Filed Feb. 18, 1964, Ser. No. 345,622
12 Claims. (Cl. 83—127)

1. Mechanism for cutting tubing, including in combination,

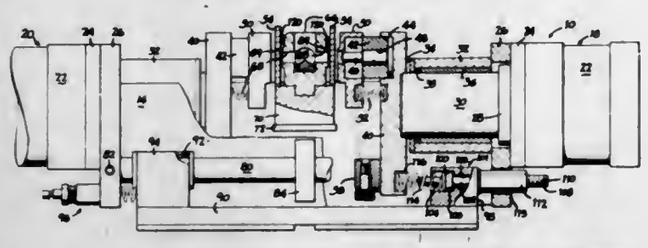


a stationary mandrel over and around which the end of a continuous length of tubing to be cut is adapted to be disposed and which acts as an internal cutter,

an external cutter arranged circumferentially around the tubing to be cut and said stationary mandrel,

means movable relative to said mandrel for stripping a cut length of tubing therefrom,

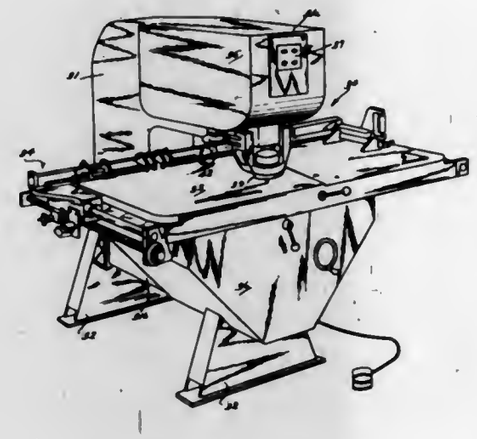
a floating mandrel arranged directly opposite said stationary mandrel and in alignment therewith which is also adapted to be disposed in the tubing to be cut, and which is adapted to act as an internal cutter,



means arranged within the tubing to be cut reardwardly of said floating mandrel which cooperates with the interior wall of said tubing for urging and positioning the floating mandrel toward and against the end of said stationary mandrel,

an external cutter arranged circumferentially around the tubing to be cut and the floating mandrel therein, and

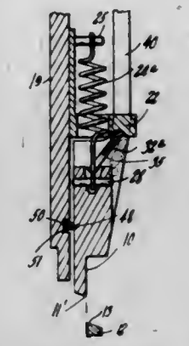
means for actuating said first external cutter together with said stationary mandrel and the stripping means transversely to the axis of the tubing to be cut whereby a predetermined length of tubing is cut from the end of the continuous length tubing due to the cooperation of the first external cutter and the end of the stationary mandrel with the second external cutter and floating mandrel.



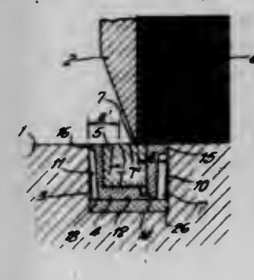
3,270,604
FORCE APPLYING FABRICATING DEVICES
Edward J. Waltonen, Southfield, Mich., assignor to Wes Industries, Inc., Royal Oak, Mich., a corporation of Michigan
Filed July 1, 1964, Ser. No. 379,541
9 Claims. (Cl. 83—140)

1. In a force applying fabricating device, frame means, workpiece fabricating means carried by said frame means and including force applying means and force resisting means spaced from said force applying means for cooperation therewith to fabricate a workpiece; spaced shaft means unitarily supporting said frame means and said workpiece fabricating means; suspension means upon which the combination of said spaced shaft means, said frame means and said workpiece fabricating means are suspended for relative movement thereto; resilient biasing means interposed between said suspension means and the combination of said workpiece fabricating means, said frame means and said spaced shaft means urging said force resisting means in a direction opposite to the direction of movement of said force applying means upon actuation thereof; whereby upon actuation of said force applying means to forcibly engage the workpiece between said force resisting means and said force applying means, the combination of said workpiece fabricating means, said

frame means and said shaft means move responsive to said resilient biasing means in substantial unison relative to said suspension means in a pressure balancing manner to contact the workpiece first by said force resisting means and second by said force applying means to thereby manufacture a finished workpiece of improved precision.



3,270,605
PUNCHING MACHINE WITH DETACHABLE TOOL HOLDER
Arthur K. Schott, Clarence, Kenneth J. Bartha, Tonawanda, and Charles Lee Rovoldt, Getzville, N.Y., assignors to Houdaille Industries, Inc., Buffalo, N.Y., a corporation of Michigan
Original application Nov. 1, 1960, Ser. No. 66,639, now Patent No. 3,225,636. Divided and this application Apr. 19, 1965, Ser. No. 449,253
19 Claims. (Cl. 83—522)

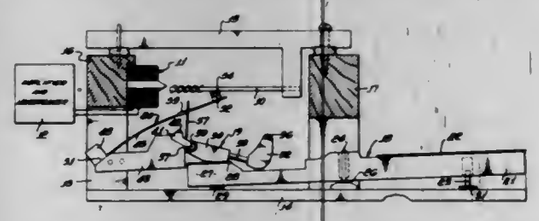


1. A punching machine including a stationary frame having a bed, a movable ram carried by said frame and adapted to be selectively driven toward and from said bed, and a single upper tool support, said bed and said tool support being adapted to support selectively replaceable relatively-reciprocable cooperating punch and die tool means both in the direction of reciprocation and in accurate alignment, a pair of connections having separate axes fixedly securing said tool support to said frame, at least one of said connections including means by which the same is readily individually detachable, and said means being operative when reattached to guide the tool support into the position where said accurate alignment of said tool means is present.

3,270,606
CUTTING BLADE ASSEMBLY
Charles M. Schott, Jr., Gloucester, Mass., assignor to Gloucester Engineering Co., Inc., Gloucester, Mass., a corporation of Massachusetts
Filed Feb. 19, 1965, Ser. No. 433,960
13 Claims. (Cl. 83—579)

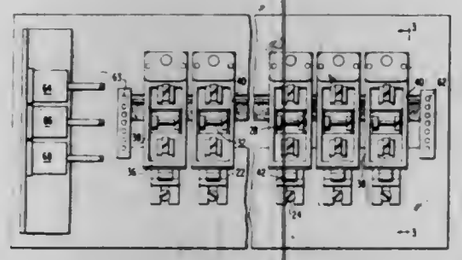
1. A knife assembly including first and second substantially edge-aligned blades mounted by mounting means on supports to move relative to each other along a first path to cut material lying across said path, said mounting means for said first blade constructed and positioned relative to the edges of said blades so that cutting resistance force in the direction of said path, exerted on the edge of said first blade by the material being cut, will produce a turning moment on said first blade tending to rotate its edge toward the edge of said second blade, said mounting means constructed and arranged to permit rotation of the body of said blade in response to said turning moment to thereby increase the lateral force exerted by the edge of said first blade toward the edge of said second blade in proportion to the cutting resistance encountered by said first blade, said mounting means including positioning means adapted to maintain said blade substantially in a given position under non-cutting conditions.

3,270,607
HOLDER FOR A STICK FOR A GUILLOTINE-TYPE PAPER-CUTTER MACHINE
Ignaz Oesterreicher, VII. Schottenfeldg. 85/8, Vienna, Austria
Filed Sept. 30, 1963, Ser. No. 312,788
Claims priority, application Austria, June 25, 1963, A 5,106/63
6 Claims. (Cl. 83—658)



1. A stickholder comprising a member having a base wall and a pair of opposing side walls which define within said member a hollow recess for a rectangular stick, said recess being open opposite said base wall, one of said side walls being thicker than the other of said side walls to provide unequal distances between the vertical center line of a stick disposed in said recess and the outer surfaces of said side walls, the outer surfaces of said side walls sloping downwardly toward said bottom wall, and a bending recess defined in the upper surface of said base wall adjacent to said one side wall.

3,270,608
PIANO ACTION
Harold B. Rhodes, Anaheim, Calif., assignor of one-half to R. H. Osbrink
Continuation of application Ser. No. 225,917, Sept. 24, 1962. This application Oct. 21, 1965, Ser. No. 506,431
35 Claims. (Cl. 84—237)



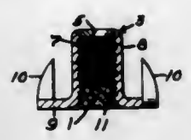
1. A musical instrument of the piano type, which comprises support means, a vibratory tone generator mounted on said support means, an elongated piano key, fulcrum means on said support means and operably associated with an intermediate part of said key to mount said key for pivotal movement about a first horizontal axis, said fulcrum means dividing said key into an outer portion adapted to be struck by a pianist and an inner portion adapted to move upwardly upon striking of said outer portion, a hammer having a first portion adapted to strike said tone generator to set the same into vibration, said hammer also having a second portion, and means to pivotally connect said hammer to said support means for

pivotal movement of said hammer about a second horizon axis generally parallel to said first horizontal axis, said second horizontal axis being so located that said second portion of said hammer is operably engaged by said inner portion of said key, said second hammer portion and said inner key portion being shaped to effect pivotal movement of said first hammer portion into engagement with said tone generator upon said upward movement of said inner key portion, said second hammer portion and inner key portion being so shaped relative to each other that upon said upward movement of said inner key portion the distance between said second horizontal axis and engaged areas of said second hammer portion and inner

key portion becomes progressively smaller only until said first hammer portion is spaced a predetermined small escapement distance from said tone generator, said second hammer portion and inner key portion also being so shaped relative to each other that said distance between said second horizontal axis and engaged areas of said second hammer portion and inner key portion does not diminish substantially during movement of said first hammer portion through said escapement distance into engagement with said tone generator whereby a braking action occurs at said engaged areas during movement of said first hammer portion in both directions through said predetermined small distance.

3,270,609
STRING ACTUATED COMBINATION ACTION
Paul A. Klann, P.O. Box 2398, Waynesboro, Va.
Filed Nov. 24, 1965, Ser. No. 509,516
4 Claims. (Cl. 84—370)

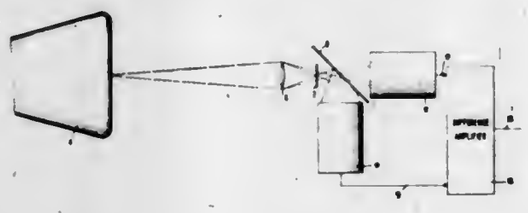
1. A string actuated combination action for an organ comprising;



(a) a plurality of stop tablets, each tablet being pivotally mounted on a support means for movement from one position to another position,

(b) string guide means on each movable stop tablet and on the support means adjacent the stop tablet,

(c) a plurality of strings, the strings being secured at one of their ends to the support means and selectively threaded in engagement with the string guide means for each stop, and



(d) pulling means attached to the other end of each string to pull selected ones of the strings and thereby actuate selected stops in accordance to the position of the string on the guide means of the stop tablets.

3,270,610
SEALED HOLLOW FASTENER MEMBERS
Edward A. Knowlton, Winchester, Mass., assignor to United-Carr Incorporated, a corporation of Delaware
Filed Aug. 20, 1963, Ser. No. 303,256
2 Claims. (Cl. 85—32)

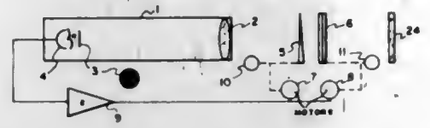
1. A sealed fastener member comprised of a tubular extension having an aperture throughout and internal walls formed by said aperture which are threaded and primer coated and a cured thermally-expanded foam vinyl pellet seated within and bonded to the internal walls of said tubular extension sealing said fastener member.

3,270,611
APPARATUS FOR MONITORING RELATIVE CONTRAST
Herbert L. Gelernter, Briarcliff Manor, Louis A. Kamentsky, Katonah, and Robert J. Potter, Ossining, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Aug. 24, 1961, Ser. No. 133,678
7 Claims. (Cl. 88—14)

2. An apparatus for monitoring the relative contrast between data on a data-bearing document and the area surrounding the data comprising, in combination:

a source emitting radiant energy in two different and non-coextensive wave length bands;

a lens element utilizing its varied refraction character to coaxially focus the energy in the first of said wave length bands at a point on the document and defocus the energy in the second of said wave length bands in an area on the document surrounding said point;



a beam splitting element directing substantially all of the energy in said first wave length band and substantially none of the energy in said second wave length band along a first path after passage through the document, and directing substantially all of the energy in said second wave length band and substantially none of the energy in said first wavelength band along a second path after passage through the document;

means in said first path receiving the energy passing through said document in said first wave length band and producing a first electrical signal proportional thereto;

means in said second path receiving the energy passing through said document in said second wave length band and producing a second electrical signal proportional thereto; and

means comparing said first and second signals to provide a signal indicative of the relative contrast between said point and the area surrounding said point.

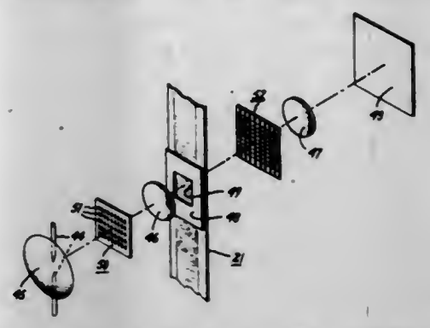
3,270,612
SERVO NULLED AUTOCOLLIMATOR HAVING A PAIR OF ROTATABLE WEDGES
Philip Wardham Collyer, Stamford, Conn., assignor to Barnes Engineering Company, Stamford, Conn., a corporation of Delaware
Filed Nov. 7, 1962, Ser. No. 236,024
3 Claims. (Cl. 88—14)

1. In a polarized light autocollimating system for monitoring rotations of a reflecting surface about two orthogonal axes which system includes means for producing at least one beam of polarized light, the plane of polarization of which rotates, means for collimating said beam and the beam being aimable at the reflecting surface and being reflected back therefrom in a beam striking the said means for producing collimation, the improvement which comprises

(a) polarizing analyzing means having polarizations totaling four and comprising pairs of polarizing means polarized at right angles to each other in each pair and at 45° to each other between pairs,

(b) said means for collimating said beam further causing the reflected beam from the reflecting surface to be imaged on the analyzing means,

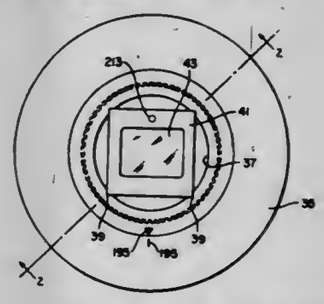
(c) radiation detecting means transforming radiation into four electrical signals in phases at 90° to each other, a pair of the signals, 180° to each other, being derived from the reflected beam through one pair of said polarizing analyzing means and the other pair derived from the other pair of polarizing analyzing means,



(d) two transparent wedges, the respective tapers of said wedges being initially substantially at right angles to each other and positioned transverse to the collimated beam so that the beam, before and after reflection from the reflecting surface, passes therethrough,

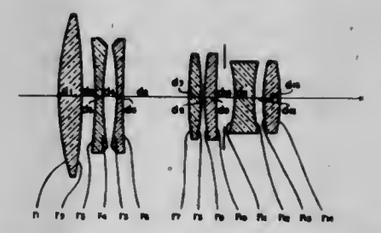
(e) means for rotating the wedges independently through limited arcs θ_1 and θ_2 respectively, the axes of rotation being parallel to the collimated beam and the arcs being less than about 30°, each means being actuated by one of said pairs of signals from the detecting means, and

(f) electronic resolving means connected to move through the same angles as the two wedges and provided with input A.C. voltages and output circuits, one giving a signal proportional to $\sin \theta_1 + \cos \theta_2 - 1$ and the other an output signal proportional to $\sin \theta_2 + \cos \theta_1 - 1$, whereby the outputs from the resolving means indicate the amount of rotation of the reflecting surface about the two axes.



3,270,613
COLORED LIGHT PROJECTION SYSTEM
William E. Glenn, Jr., Scotia, N.Y., assignor to General Electric Company, a corporation of New York
Filed Nov. 1, 1963, Ser. No. 320,894
12 Claims. (Cl. 88—24)

1. An optical system for projecting colored light representative point-by-point of the color information contained in a light modulating medium in the form of deformations which diffract light corresponding to one color to be projected in a given direction and diffract light corresponding to the remaining colored light to be projected in a direction normal to said given direction comprising a filter color mask interposed in the path of light controlled by the medium and comprising a first plurality of spaced parallel filter strips of said one color and extending in the direction of diffraction of said one color and a plurality of spaced filter strips of the color of said remaining colored light and extending in the direction of diffraction of said remaining colored light and optically overlying

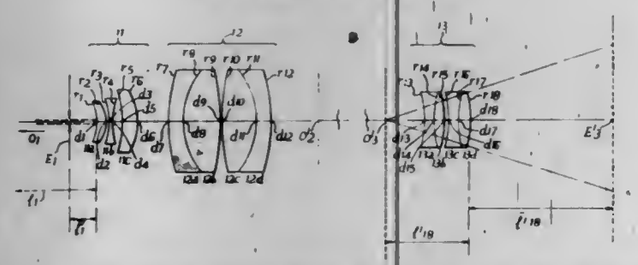


said first plurality of filter strips, the overlying areas of said filter strips forming opaque areas, said system providing light source and focusing means for focusing undiffracted light impinging on said medium on said opaque areas.

3,270,614
SOUND SYSTEM FOR PICTURE SLIDES
Morris Paull, Rochester, N.Y., assignor to Atron Corp., Rochester, N.Y., a corporation of New York
Original application May 4, 1962, Ser. No. 192,479. Divided and this application Feb. 15, 1965, Ser. No. 432,739
9 Claims. (Cl. 88—28)

1. A hub for holding a picture slide and an annular sound record in predetermined relation to each other, characterized by the fact that said hub is of generally circular shape and has a central opening with notches in the periphery thereof for making a tight press fit with and frictionally retaining the corners of a picture slide mount, and that said hub also has a circumferentially extending groove for receiving the inner marginal edge of an annular sound record engaged in and guided for rotation by said groove.

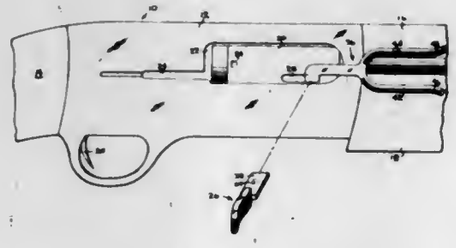
3,270,615
THREE COMPONENT ZOOM LENS FOR PHOTOGRAPHIC MINIATURE CAMERAS
Takashi Higuchi, Hodogaya-ku, Yokohama-shi, Japan, assignor to Nippon Kogaku, K.K., Tokyo, Japan, a corporation of Japan
Filed July 11, 1962, Ser. No. 209,024
Claims priority, application Japan, Aug. 15, 1961, 36/28,904
3 Claims. (Cl. 88—57)



1. A zoom lens comprising three components of which the first is a positive movable component of focal length

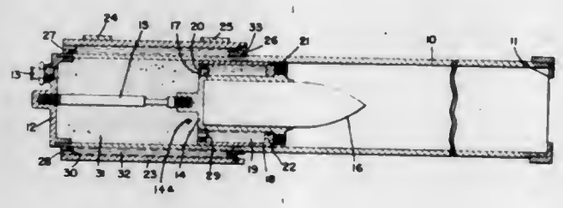
f_1, the second is an immovable negative component consisting of a plurality N up to three biconcave airspaced negative lens elements, the second component having a focal length of f_2, and the third is a positive movable component of focal length f^3, and consisting of two positive lens elements, a negative lens element and a positive lens element air spaced in that order, the second component is spatially fixed between the first and third mechanically movable components, the lens array satisfying the following conditions:

$$0.5f_1 \leq r_1 \leq 1.1f_1$$
$$0.2f_1 \leq f_2 \leq 0.5f_1$$
$$0.9|f_3| \leq f_3 \leq 1.8|f_2|$$
$$1.2Nf_3 \leq r_3 \leq \infty$$
$$0.4N|f_2| \leq r_4 \leq 1.5N|f_2|$$
$$0.9f_3 \leq |r_{11}| \leq 1.8f_3$$
$$0.5f_3 \leq r_{12} \leq 1.3f_3$$
$$l = d_{3S} - d_{1L}$$
$$m = f_1 - d_{1S} + \frac{f_2(d_{2S}-l)(b_{3S}+l-f_3) - f_2f_3(b_{3S}+l)}{(d_{2S}-l)(b_{3S}+l-f_3) - f_3(b_{3S}+l) - f_3(b_{3S}+l-f_3}$$



where $r_{subscript}$ is the radius of curvature of the successive surfaces of the lens elements, the subscripts increasing in the order of location of the respective surface from the object to the image side of the zoom array, m is the distance through which the first component is movable, l is the distance through which the third component is movable, d_{1S} the air spacing between the principal planes of the first and second components, d_{2S} the air spacing between the principal planes of the second and third components, both d_{1S} and d_{2S} being taken at the component positions at which the overall focal length of the zoom array is the shortest, d_{1L} and d_{2L} the air spacings between such principal planes when the third component has moved the distance l and the first component the distance m, and b_{3S} is the distance between the third component and the image point formed by the object point at infinity by the first, second and third components when each is at its position for the minimum overall focal length of the zoom lens array.

3,270,616
THREE COMPONENT LENS SYSTEM HAVING EXTERNAL ENTRANCE AND EXIT PUPILS
Harold Horace Hopkins, Barnet, England, assignor to Communications Patents Limited, London, England
Filed Oct. 4, 1962, Ser. No. 228,370
Claims priority, application Great Britain, Oct. 12, 1961, 36,612/61
3 Claims. (Cl. 88—57)

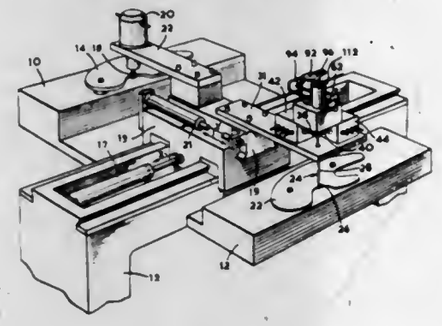


1. An optical lens system in which both the entrance pupil and the exit pupil are external to the system, comprising first, second and third lens components arranged in sequence along the optical path through the lens system from object viewed to image plane, and said first and second lens components being spaced apart by a distance less than said second and third lens components are spaced apart, the first lens component having a positive equivalent focal length, the second lens component having a positive equivalent focal length, the third lens component having a negative equivalent focal length, the lens system as a whole having an equivalent focal length which is positive and numerically smaller than the equivalent focal length of each of the three lens components individually, a real image being formed between the second and third lens components, a virtual image of this real image being formed by the third lens component between the real image and the third lens component, the said first, second and third lens components in their relative spacings are together such that the distance of the said real image, formed between the second and third lens components, from the principal plane of the second lens component is less than the distance of said real image from the principal plane of the third lens component, the separation between the principal planes of the second and third lens components being at least three times as great as the separation between the principal planes of the first and second lens components, said entrance pupil being spaced from said first lens component by a distance greater than one half said equivalent focal length of the lens system.

3,270,617
SHELL CATCHER ATTACHED TO THE RECIPROCABLE BOLT OF A FIREARM
Ralph V. Seymour, 110 Birch Road, Springfield, Ohio, and Carl E. Bullard, Rte. 1, Mechanicsburg, Ohio
Filed Mar. 22, 1965, Ser. No. 441,433
15 Claims. (Cl. 89—33)

1. In combination; a firearm having an opening through which a spent shell is ejected and also having a reciprocable bolt therein operable for ejecting the spent shell upon the rearward movement of the bolt, and a shell catcher mounted on said bolt so as to travel with said bolt and positioned on said bolt so as to be adjacent said opening when said bolt is moved rearwardly and operable to catch and retain said spent shell as it is ejected from said opening.

3,270,618
CONTROLLED RECOIL WEAPON
Albert M. Stott, Southampton, Pa., assignor to the United States of America as represented by the Secretary of the Army
Filed June 30, 1964, Ser. No. 380,119
4 Claims. (Cl. 89—43)



1. In a weapon having a slidable carrier therein for supporting a projectile,

a barrel supporting said carrier and having at its muzzle end a shoulder for stripping said carrier from said projectile and ignition means at its breech end,

said carrier comprising a movable housing and a projectile supporting member having an outwardly extending flange engaging said housing, said housing having inwardly extending flange means engaging said member and longitudinally spaced from said flange to define a chamber between said housing and member, one of said flange and flange means having orifice means extending therethrough and normally closed by blow-out disk means and buffer fluid in said chamber for dissipating energy in the moving carrier when said carrier strikes said shoulder at the end of its travel.

3,270,619
CONTROL SYSTEM
Lincoln S. Magor, Galt, Ontario, Canada, assignor to Mimik Limited, Galt, Ontario, Canada
Filed June 2, 1965, Ser. No. 460,682
9 Claims. (Cl. 90—13.5)

1. In a control for hydraulically operated machines wherein the relative movements between a tool and a workpiece correspond to relative movement between a tracer and a pattern to be reproduced, comprising:

means for controlling such relative movements;

a stylus mounted to form the operative part of said tracer and arranged to contact and be deflected by said pattern;

said stylus being connected to said means for controlling relative movements so that when deflected, said relative movements are controlled so that the resultant relative movement between said tracer and the pattern, is substantially in the direction of said deflection;

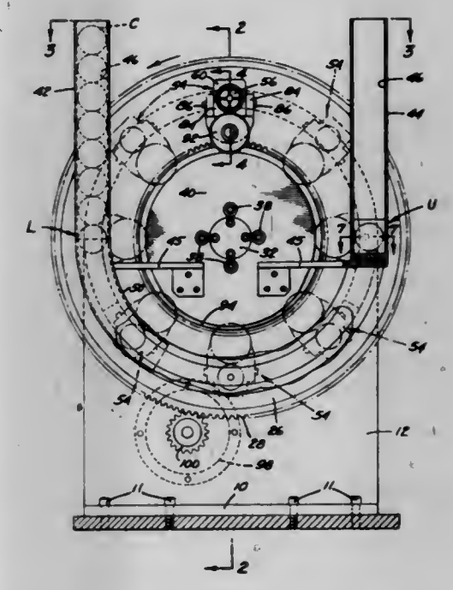
means rotatably mounted on said tracer head for biasing said stylus in a predetermined direction, relative to said means;

orientation control for said biasing means;

means responsive to the amount of deflection of such stylus from a neutral position operable:

in response to said deflection exceeding a predetermined amount for causing said orientation control to rotate said biasing means in one direction; and

in response to said deflection being less than a predetermined amount for causing said orientation control to rotate said biasing means in the other direction;



wherein a spool valve is mounted adjacent said stylus; said spool valve having a spool relatively slidable in a sleeve in a range of movement on each side of a median location therein;

means are provided responsive to movement of said spool on one side of said median location, for moving said orientation control in one direction, and responsive to movement of said spool on the other side of said median location for moving said orientation control in the other direction;

and means are provided mechanically coupling said stylus to said valve designed and constructed so that:

movement of said stylus to greater than a predetermined deflection causes said spool to move to said one side of said median location, and movement of said stylus to less than a predetermined deflection causes said spool to move to said other side of said median location.

3,270,620
MACHINE FOR SHAVING EMBOSSED LETTERS ON BOTTLE CLOSURES
Herman E. Wegner, Riverside, Calif., assignor, by mesne assignments, to Alcan Aluminum Corporation, New York, N.Y., a corporation of New York
Filed Apr. 20, 1965, Ser. No. 449,573
11 Claims. (Cl. 90—15)

1. A machine for shaving a thin layer from the surface of raised lettering embossed on the sides of a bottle closure, comprising:

a continuously rotating spindle carrier having at least one spindle journaled thereon, said spindle having an expanding chuck to receive and hold a bottle closure;

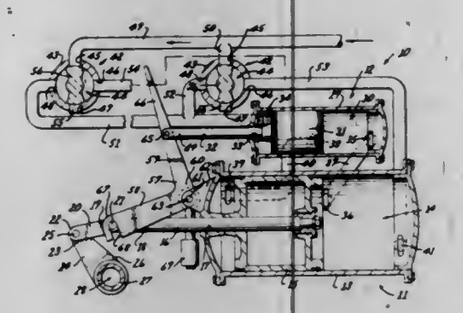
a loading station, including means for loading closures onto said chuck;

an unloading station spaced an angular distance from said loading station;

means for driving said spindle carrier;

a rotatable milling cutter mounted adjacent said spindle and movable therewith as the spindle revolves with said carrier;

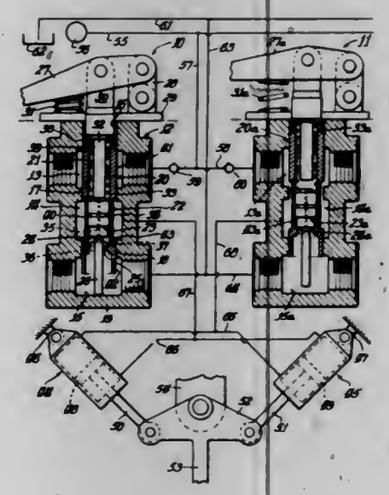
said milling cutter being movable toward and away from said chuck between a first position wherein the cutter is spaced radially outwardly from a closure mounted on the chuck, so as to clear the same, and



a second position wherein the cutter takes a light shaving cut on the surface of said lettering as said closure rotates with said spindle;

said milling cutter being normally held at said first position as said spindle and chuck pass said loading and unloading stations;

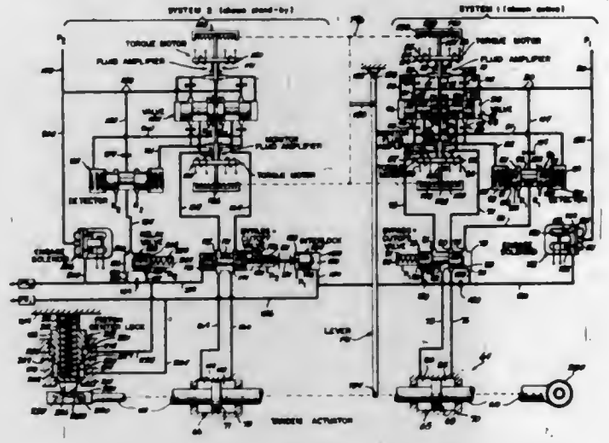
means for moving said milling cutter from said first position to said second position and then back to said first position as the spindle revolves from said loading station to said unloading station; and



means for removing the shaved closures from said chuck as the latter passes said unloading station.

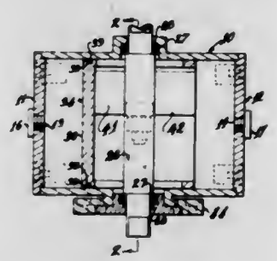
3,270,621
HYDRAULIC ACTUATOR AND LOCKING MECHANISM
Ernst J. De Ridder, Henrico County, Va., assignor to Reynolds Metals Company, Richmond, Va., a corporation of Delaware
Continuation of application Ser. No. 272,687, Apr. 12, 1963. This application Apr. 30, 1964, Ser. No. 363,744
16 Claims. (Cl. 91—44)

1. In combination, a first piston and cylinder arrangement, said first piston being movable to one position thereof, a second piston and cylinder arrangement, said second piston being movable to one position thereof, said first piston when moved to a said one position thereof locking said second piston from movement when said second piston is in said one position thereof, and fluid pressure means for moving said pistons, said fluid pressure means first moving said second piston one position thereof before it is adapted to move said first piston to said one position thereof.



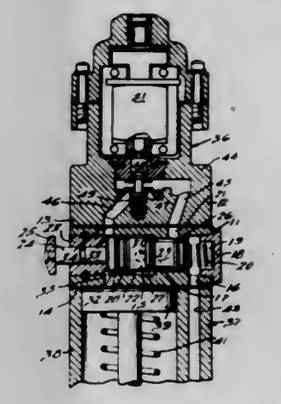
3,270,622
CONTROL VALVE FOR SWINGING A BOOM
William T. Stephens, Auburn, Ind., assignor to Borg-Warner Corporation, a corporation of Illinois
Filed Mar. 23, 1964, Ser. No. 353,735
8 Claims. (Cl. 91—186)

1. A hydraulic mechanism provided with a source of constant fluid pressure and a sump for the operation of a work member, the combination of:
(a) a first control valve, comprising a housing having first, second and third fluid chambers therein, said first and second fluid chambers normally being in fluid communication with each other and port means operably communicable between said second and third fluid chambers; a combination outmetering and relief valve operable in said housing comprising: a spool valve adapted to provide a valve head at its lower end, a valve seat operably associated with said valve head, a spring urging said valve head into engagement with said valve seat, a reaction surface at the lower end of said spool valve serving as a means for unseating said valve head when the pressure buildup exceeds the predetermined value of said spring,
(b) a second control valve having the same components as said first control valve,
(c) first and second cylinders provided with first and second pistons, respectively, operably connected with respect to said work member,
(d) a first fluid conduit interconnecting the piston side and the rod side of the said first and second cylinders respectively,
(e) a second fluid conduit interconnecting the rod side and the piston side of the said first and second cylinders respectively,
(f) a third fluid conduit interconnecting said third annular chambers of the said first and second control valves,
(g) a fourth fluid conduit interconnecting said first fluid chambers of the said first and second control valves,
(h) a pair of check valves in said fourth fluid conduit one each for each of said first fluid chambers,
(i) a fifth fluid conduit interconnecting the said source of constant fluid pressure and the said fourth fluid conduit,
(j) a sixth fluid conduit interconnecting the said sump and the said third fluid conduit,
(k) a seventh fluid conduit interconnecting said second fluid chamber of the said second control valve and the said first fluid conduit,
(l) an eighth fluid conduit interconnecting said second fluid chamber of the said first control valve and the said second fluid conduit,
(m) a manual means pivotally connected with respect to said first control valve for reciprocal operation of said combination outmetering and relief valve therein, whereby when said manual means is depressed to a certain degree the said valve head is unseated and fluid communication between said first and second annular chambers of the said first control valve is closed and fluid communication is established between the said second and third fluid chambers of the said first control valve, and fluid by way of said second fluid conduit is free to drain from the rod side and the piston side of the said first and second cylinders, respectively, by way of: the said eighth fluid conduit, the said second and third annular chambers of the said first control valve by means of the said port, and thence by way of the said third and sixth fluid conduits into the said sump whereby the said source of constant fluid pressure is exerted at the piston side and the rod side of the said first and second cylinders, respectively, which thereby causes said work member to swing in one direction; the flow of fluid from the said source of constant fluid pressure being by way of the said fifth and fourth fluid conduits, the said first and second fluid chambers of the said second control valve, and the said eighth and first fluid conduits; and
(n) a manual means pivotally connected with respect to said second control valve for reciprocal operation of the said combination outmetering and relief valve therein whereby when said manual means of said second control valve is depressed to a certain degree, the same sequence of events occur as those with respect to the operation of the said first control valve, except in reverse thereof, whereby the said work member is caused to swing in the other direction.



3,270,623
FLUID POWERED SERVOMECHANISM OF A REDUNDANT, MONITOR TYPE
Kenneth D. Garnjost, Buffalo, N.Y., and Herbert A. Whitney, Clifton, N.J., assignors to Moog Inc., East Aurora, N.Y., a corporation of New York
Filed Apr. 13, 1964, Ser. No. 359,120
10 Claims. (Cl. 91—387)

1. In a fluid powered servomechanism, the combination comprising means arranged to create a first pressure in response to a command input signal, a movable valve member driven by said first pressure, means for producing a force responsive to the position of said valve member, and monitor means including a motor for receiving

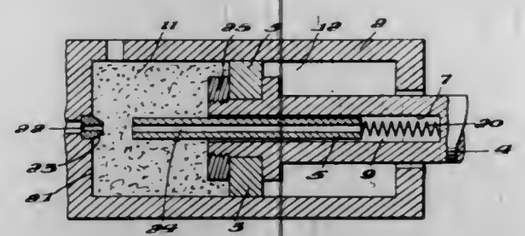


the same signal and arranged to create a monitoring pressure as a measure of the difference between said force and the output of said motor.

3,270,624
OSCILLATORY ACTUATOR
Franklin J. Blaney, Pittsburgh, Pa., assignor to Golden Anderson Valve Specialty Company, Inc., a corporation of Pennsylvania
Filed Sept. 25, 1964, Ser. No. 399,318
5 Claims. (Cl. 91—418)

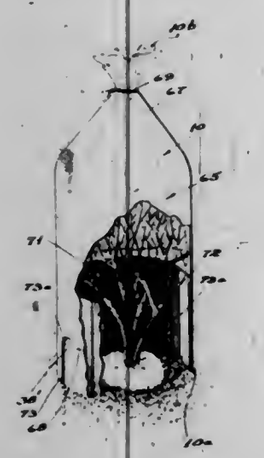
1. An actuator for converting fluid pressure to oscillatory motion comprising:
(a) a cylinder,
(b) an actuator shaft extending transversely through said cylinder and disposed for oscillation relative thereto,
(c) a piston mounted for longitudinal movement within said cylinder,
(d) there being at least one elongated opening through said piston extending longitudinally of said cylinder in position to receive said shaft whereby said piston is adapted for movement relative to said shaft,
(e) means to introduce and exhaust fluid selectively adjacent opposite ends of said cylinder to move said piston selectively in opposite directions,
(f) angularly spaced arms extending outwardly from said shaft, and
(g) longitudinally spaced detents carried by said piston in position to engage outer portions of said arms and limit relative movement of said piston and said outer portions of said arms whereby said outer portions of the arms move with said piston to impart oscillatory motion to said shaft.

3,270,625
FLUID MOTOR AND PRESSURE RESPONSIVE VALVE
Andrew B. Huntington, Royal Oak, Daniel B. Abbott, Clawson, and Edwin P. Brinkel, Royal Oak, Mich., assignors to Ross Operating Valve Company, Detroit, Mich., a corporation of Michigan
Original application Sept. 12, 1963, Ser. No. 308,546. Divided and this application Sept. 7, 1965, Ser. No. 505,201
5 Claims. (Cl. 91—426)



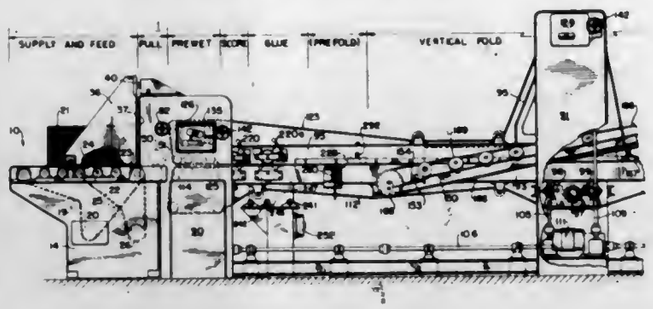
1. In combination with a system having a fluid motor, a supply port, and a control valve having inlet and working ports and movable between positions connecting and disconnecting said supply port and fluid motor, a lockout valve comprising a housing, a spool slidably mounted in said housing between open and lockout positions, first and second ports in said housing connected respectively to said supply port and control valve inlet port, an exhaust port in the lockout valve housing, the valve spool when in its lockout position disconnecting said first and second ports and connecting said second port and exhaust port, means biasing said spool toward its lockout position, pressure-responsive means connected to said control valve working port for overcoming said biasing means and holding said spool to its open position, the spool when in its open position connecting said first and second ports, and means on said spool for selectively shifting said spool to its open position.

3,270,626
FLUID-POWERED LINEAR ACTUATORS
Farel Bradbury, Square Root, 32 Church St., Hampton, England
Filed June 29, 1964, Ser. No. 378,911
Claims priority, application Great Britain, July 1, 1963, 26,088/63
4 Claims. (Cl. 92—113)



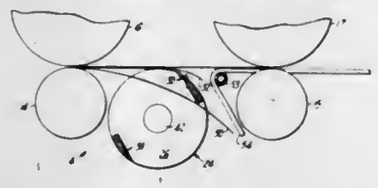
1. A linear actuator of the displacement type comprising a cylinder member and a coacting piston-and-rod member defining a hydraulic fluid chamber therebetween, means in one end face of said chamber defining at least one bore opening through said end face into said chamber and extending longitudinally in a direction parallel to the actuator axis, an open-ended generally-tubular probe freely-slidably mounted in said bore and capable of being substantially fully received therein, the end of said bore and said probe defining a probe pocket therebetween means for admitting pressurized hydraulic fluid

into said chamber disposed in the opposite chamber end face through which hydraulic fluid can be fed into and through said open-ended probe, and means for admitting hydraulic fluid to said chamber and for exhausting it therefrom on advance and withdrawal of the actuator re-



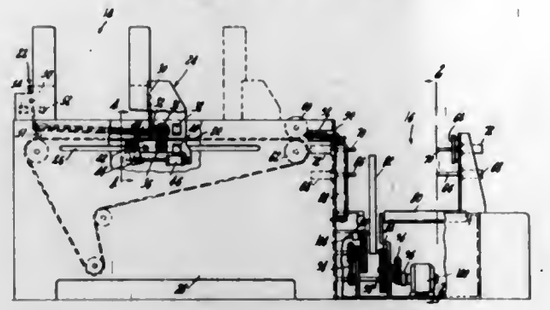
spectively, so that in operation the kinetic energy of admitted pressurised fluid is transmitted through the generally-tubular probe to said pocket there to create a pressure which tends to force said probe from said bore to encircle said pressurised fluid admission means and bear upon the opposed chamber end face.

3,270,627
METHOD OF MANUFACTURE OF PLANT SHIPPER AND SHELTER
Larry J. Budd, Elmhurst, Ill., assignor to Pallet Devices, Inc., Des Plaines, Ill., a corporation of Illinois
Filed Sept. 22, 1965, Ser. No. 489,368
11 Claims. (Cl. 93—1)



1. In a method of manufacturing a plant container comprising the steps of
cutting a shelter wall blank from corrugated paperboard material and providing transversely extending score lines at spaced intervals along the length of the wall blank,
folding the wall blank and disposing opposite ends in lapped relationship,
securing the opposite ends to form a generally flat-shaped corrugated tube,
providing a blank of waterproof paper and folding the blank disposing and securing the opposite ends of the paper blank in lapped relation to form a flat-shaped paper tube having a length greater than the length of the corrugated tube,
telescoping the generally flat-shaped corrugated tube inside of the flat-shaped paper tube and securing the tubes in assembly together, and
wrapping unsupported areas of the paper tube around the corrugated tube to compact the container for shipment and for storage.

3,270,628
UNIVERSAL BOX FOLDING MACHINE
Everett W. Clem, Shrewsbury, Mass., assignor to Specialty Equipment Corporation, Worcester, Mass., a corporation of Massachusetts
Filed Sept. 20, 1962, Ser. No. 224,951
56 Claims. (Cl. 93—52)

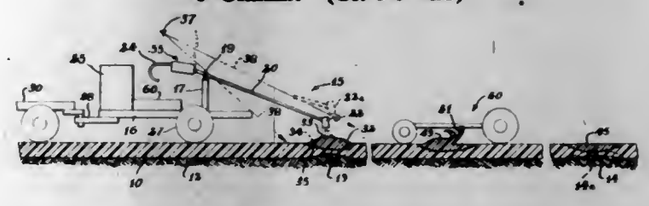


1. In a feed control system for a universal box folding machine of the type having a feed means for box blanks, a conveying and folding section arranged to receive box blanks from said feed means, and drive means for said feed means and said conveying and folding section, the improvement characterized by
(a) said drive means comprising a single, coupled drive system for said feed means and said conveying and folding section, and
(b) said drive means including a selectively engageable clutch means coupled to said feed means, whereby
(c) operation of said feed means may selectively be discontinued independently of operation of said conveying and folding sections to accommodate one-at-a-time conveyance of blanks through the machine during set-up, adjusting and like operations.

3,270,629
ENVELOPE ATTACHING MACHINES
Archibald H. Welch, Banford, Conn., assignor to converters, Incorporated, West Hartford, Conn., a corporation of Connecticut
Filed Feb. 14, 1964, Ser. No. 345,024
10 Claims. (Cl. 93—61)

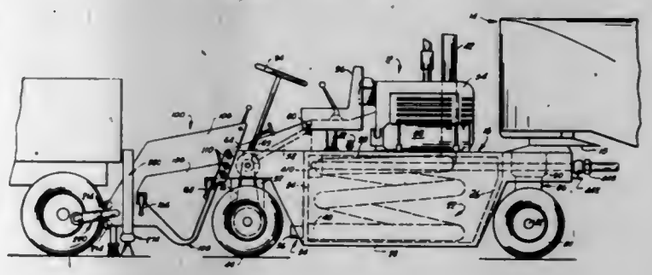
1. In a machine for conveying envelopes forwardly in succession along an elongated path with the envelope panels extending transversely of the path and the envelope flaps folded forwardly from adjacent the trailing edges of the envelopes into contiguous relationship with the envelope panels, an apparatus for successively unfolding the flaps as the envelopes are conveyed along the path comprising; a rotor mounted adjacent the envelope path with its axis extending transversely thereof and having at least one transversely extending blade radially spaced from its axis; and drive means for rotating the rotor so that the tangential velocity of the blade as it rotates through a position adjacent the path will have the same direction as but less magnitude than the velocity of the envelopes, said drive means being synchronized with the movement of the envelopes such that as the blade rotates through said position an envelope closure flap will overtake the blade for insertion of the blade between the envelope panel and flap and upon continued movement of said envelope and rotor the flap will be unfolded by the blade from the envelope panel.

3,270,630
MATERIAL HANDLING APPARATUS
Robert H. Frappier, East Greenwich, and John F. O'Rourke, Jr., Cranston, R.I., assignors to Bostitch, Incorporated, East Greenwich, R.I., a corporation of Rhode Island
Filed Aug. 21, 1963, Ser. No. 303,558
1 Claim. (Cl. 93—93)



Stacking apparatus for handling sheet-like articles comprising a hopper,
feed means for transferring articles to said hopper serially for assembly in a stack,
ejection means including first and second endless drive elements disposed below said hopper and offset from one another in vertical and horizontal directions,
each said drive element having an upper run and a lower run,
a vertical disposed pusher element secured between said drive elements at similar run positions so that operation of said drive elements moves said pusher element through said hopper along a first path at one level and returns said pusher element to its starting point along a second path at a lower level,
and means to operate said drive elements to advance said pusher element through said hopper to transfer an entire stack of articles from said hopper,
first and second auxiliary support structures movable into and out of said hopper for providing auxiliary support for articles being fed into said hopper,
said first auxiliary support structure being disposable in spaced relation to the base of the hopper so that the movement of said ejection means in said hopper does not interfere with said first auxiliary support structure and said second auxiliary support structure being disposable at a point between said first auxiliary support structure and the base of said hopper,
and means to control the positions of said first and second auxiliary support structures.

3,270,631
METHOD OF APPLYING SEAL COAT PAVING MIXTURES
Harry C. Bower, Annapolis, Md., assignor to Chevron Research Company, a corporation of Delaware
No Drawing. Filed Apr. 18, 1963, Ser. No. 273,858
3 Claims. (Cl. 94—23)



1. The method of repairing worn and eroded road surfaces which comprises
(A) heating a densely-graded siliceous aggregate to a temperature from about 325 to about 375° F.;
(B) intimately mixing the heated aggregate with a cationic emulsion of from about 70 to about 75% by weight of an asphalt, characterized by a viscosity in the range from about 600 to about 6000 poises at 140° F. and emulsified in water with the aid of a cation-active emulsifier thermally stable up to about 350° F., sand emulsion, having dispersed therein from about 1.0 to about 10.0% by weight thereof, of a light petroleum hydrocarbon distillate boiling between about 300 and about 600° F. (ASTM D–86);
(C) spreading the resulting mixture at a temperature of about 200° F. over the surface to be repaired; and
(D) compacting the spread mixture at temperatures between about 190 and 130° F.

3,270,632
METHOD FOR FLUXING ASPHALT SURFACES
Donald L. Schultz, 18150 Violet Road, Lansing, Ill.
Filed May 20, 1963, Ser. No. 281,705
6 Claims. (Cl. 94—23)

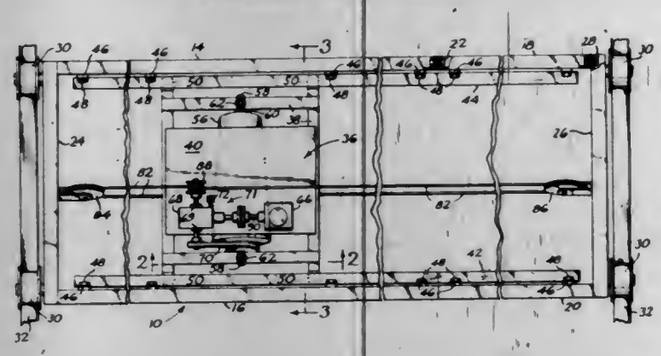
1. The method of removing humps from asphalt pavement comprising, positioning high capacity burner means in visually observable close proximity to the pavement, directly a flame from the burner means onto the pavement portion to be removed, said burner means being unshielded whereby an operator remote from the high heat zone observes discoloration in the surface to control the application of heat in accordance with predetermined color change until a portion of one of the constituents of the pavement portion to be removed ignites, removing the burner means from close proximity to the pavement, and scraping the heated area to remove the hump from the pavement.

3,270,633
UNIVERSAL BITUMINOUS PAVING MACHINE
John H. Holland, Norman, Okla., assignor to J. H. Holland Company, Norman, Okla., a corporation of Oklahoma
Filed Jan. 14, 1963, Ser. No. 251,169
7 Claims. (Cl. 94—44)

1. An asphaltic paving machine for spraying a coat of asphalt on a prepared roadbed, spreading a layer of aggregate over the coat of asphalt and compacting the aggregate in to the asphalt, the machine comprising, in combination:
chassis means having a front end and a rear end defining the longitudinal length thereof;
an asphalt supply tank carried by the chassis;
front support roller means connected to and supporting the front end of the chassis means, rear support roller means connected to and supporting the rear end of the chassis means, the support roller means constituting a transversely extending, compacting roller means for uniformly compacting the roadbed as the machine passes thereover, at least one of the support roller means being pivotally connected to the chassis means such as to be steerable for guiding the movement of the machine;
steering means operatively conected to the steerable roller means for guiding the machine over a desired path;

a prime mover mounted on the chassis means and operatively connected to at least one of the support roller means for driving the roller means and propelling the machine;

an aggregate receiving and spreading hopper means connected to the front end of the chassis means, the hopper means having a large opening in the top for receiving aggregate from a dump truck and an elongated, relatively narrow opening in the bottom extending transversely of the chassis for spreading a layer of aggregate on the ground in advance of the front support roller means;



asphalt spraybar means for coating the ground with asphalt connected to the machine and disposed transversely of the chassis and in front of the elongated, relatively narrow opening;

pump and conduit system means operatively interconnecting the asphalt supply tank and the asphalt spraybar means for supplying asphalt under pressure to the spraybar means; and,

means connected to the front of the hopper means for engaging and pushing a dump truck as the truck dumps its load of aggregate into the hopper,

whereby as the machine is driven forward, aggregate can be supplied to the hopper, the ground will be coated by asphalt from the spraybar means, a layer of aggregate will be deposited from the hopper onto the fresh asphalt, and the compacting support roller means will immediately press the aggregate into the asphalt due to the weight of the machine and the weight of the asphalt and aggregate transported thereby.

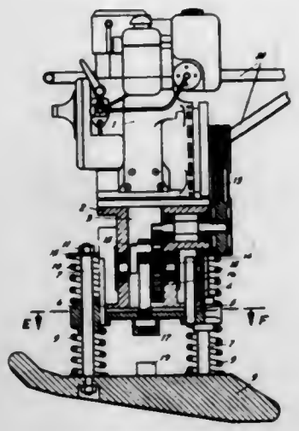
3,270,634
FINISHING MACHINE
John A. Borges, Oregon City, Oreg., assignor of one-third to Henry Walder and one-third to Walter W. Kenworthy
Filed Dec. 31, 1962, Ser. No. 248,448
4 Claims. (Cl. 94—45)

1. In apparatus for finishing an elongated concrete deck comprising:

an elongated framework proportioned to be positioned over a deck and extending transversely thereof,

means whereby the framework may be advanced over the deck by moving the framework laterally, and

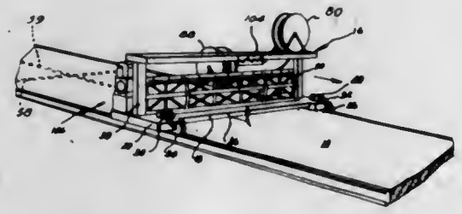
elongated track means extending longitudinally of and supported on said framework, the improvement comprising:



a rotatable finishing member of frustoconic form,

rotatable means journaling said finishing member with the member rotatable about its axis and with said axis disposed above said deck and extending transversely of said track means,

said means journaling the finishing member being supported on said track means for movement in either of opposite directions along a path paralleling said track means, and



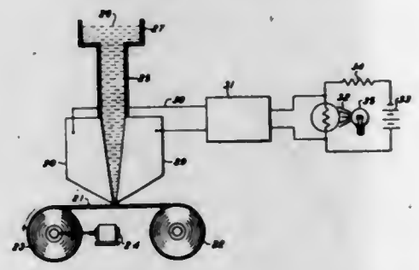
power means for rotating said finishing member in either of opposite directions.

3,270,635
MANUALLY GUIDED, MOTOR DRIVEN TAMPING DEVICES
Heinrich Kestel, Munich, Germany, assignor to Hermann Wacker and Peter Wacker, both of Munich, Germany
Filed Sept. 15, 1964, Ser. No. 396,495
Claims priority, application Germany, Nov. 15, 1963, W 35,641
5 Claims. (Cl. 94—49)

1. A manually guided, motor driven tamping device for compacting earth, concrete and the like, said device comprising a motor, a guided cylinder defining a housing, said motor being supported upon said housing, a gear transmission and a crank disposed in said housing and operatively connected to said motor, a reciprocating system comprising a guiding cylinder open at the top and slidingly receiving said guided cylinder and a connecting rod having one end linked to said crank and having its other end pivotally connected to said guiding cylinder by means of a wrist pin, a plurality of sleeves arranged circumferentially around the lower end of said guiding cylinder, a tamping foot disposed below said guiding cylinder and having a plurality of guide pins extending upwardly therefrom, one through each of said sleeves for sliding movement therein, and biasing springs associated in pairs with said guide pins, one above and one below each said sleeve, each spring of a pair having one end biased against one said sleeve, the other ends of the springs above said sleeves being biased against the upper ends of said guide pins, and the other ends of said springs below said sleeves being biased against said tamping foot.

3,270,636
METHOD AND APPARATUS FOR FORMING JOINTS IN CONCRETE
Lee Worson, Long Beach, Calif., assignor to Edoco Technical Products, Inc., Long Beach, Calif., a corporation of California
Filed Dec. 8, 1961, Ser. No. 158,003
3 Claims. (Cl. 94—51)

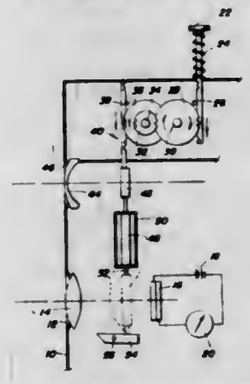
1. Apparatus for embedding lateral joint forming means in an elongated section of uncured concrete comprising:



a frame movable longitudinally with respect to said concrete;

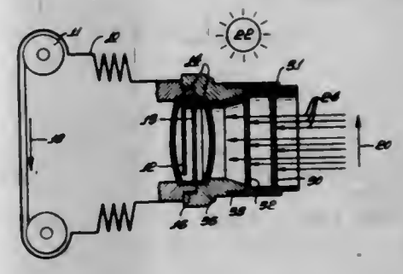
an elongated, rotatable transversely oriented tool having a groove forming portion operable to form a lateral groove through the aggregate of said concrete, said tool further having an insertion portion operable to hold and insert joint forming means into said concrete along said lateral groove;

a pair of support means vertically slidably carried by said frame at opposite ends of said tool and mounting said opposite ends of said tool thereto; and



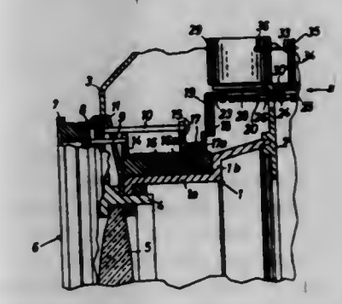
a pair of fluid actuated means carried by said frame and alternately operative upon said pair of support means to effect end-to-end rocking of said tool to thereby facilitate formation of said groove and insertion of lateral joint forming means by said tool.

3,270,637
ELECTROVISCOUS RECORDING
Harold E. Clark, Penfield, N.Y., assignor to Xerox Corporation, Rochester, N.Y., a corporation of New York
Filed Oct. 3, 1963, Ser. No. 313,675
13 Claims. (Cl. 95—1)



1. Image reproducing apparatus comprising liquid containing means adapted to contain electroviscous liquid and having an aperture therein, means to move an image recording member past said aperture, means to maintain liquid under pressure within said containing means for inducing liquid flow through said aperture onto said recording member, at least one pair of electrodes at said aperture, and circuit means to selectively apply a voltage between said electrodes to overcome said maintained pressure and inhibit the flow of said electroviscous liquid therethrough thereby forming a liquid pattern on said image recording member.

3,270,638
PHOTOMETRIC SYSTEM
Robert D. Anwyl and Dean M. Peterson, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed July 22, 1963, Ser. No. 296,806
9 Claims. (Cl. 95—10)



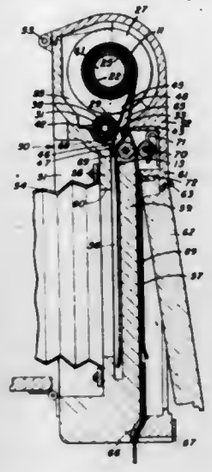
1. In a camera of the type having means including a photocell for sensing scene brightness and means for controlling the exposure in accordance with the output of said photocell, a phototropic element being movably mounted to a position covering at least a part of said photocell, said phototropic element being sensitive mainly to energy of a particular wavelength, so that in operation the camera will give greater exposure to scenes which are highly illuminated by said particular wave length, than it will to scenes which are illuminated by radiation of other wave lengths.

3,270,639
LIGHT INTENSITY CONTROL SYSTEM
Maurice W. Windsor, Redondo Beach, Calif., assignor, by mesne assignments, to Thompson Ramo Wooldridge Inc., Cleveland, Ohio, a corporation of Ohio
Continuation of application Ser. No. 17,976, Mar. 28, 1960. This application Aug. 6, 1963, Ser. No. 301,935
4 Claims. (Cl. 95—10)

1. In combination with a photographic camera having a lens and normally accommodating a photographic film, means supported by the camera and being free of mechanically moving parts for automatically regulating the intensity of light impinging on the photographic film, said means comprising a photochromic means that is progressively responsive to the intensity of certain wavelengths of light received by the camera to automatically regulate the intensity of certain other wavelengths of light lying within the spectral sensitivity range of the film, that are applied to the film, and means carried by the camera for absorbing light energy transmitted through said photochromic means which is of wavelengths different from said certain other wavelengths and lying within the spectral sensitivity range of the film.

3,270,640
MANUALLY SETTABLE CAMERA WITH LIGHT-RESPONSIVE MEANS FOR AIDING IN THE SETTING OF THE CAMERA
Wilfried Hofmann and Alfred Winkler, Munich, Germany, assignors to Agfa Aktiengesellschaft, Leverkusen, Germany
Filed Mar. 5, 1964, Ser. No. 349,566
Claims priority, application Germany, Mar. 9, 1963, A 42,551
15 Claims. (Cl. 95—10)

13. In a camera, in combination, a pair of manually operable means for respectively setting the aperture and exposure time of the camera; totalizing screw means including a pair of plastic rings in threaded engagement with each other; support means supporting said rings for rotation about the optical axis and restraining one of

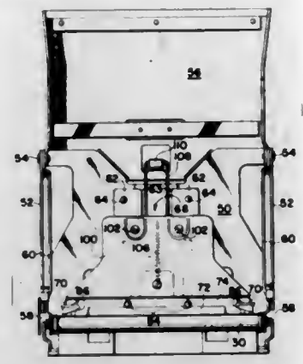


said rings against axial movement while freeing the other of said rings for axial movement; a pair of motion transmitting means respectively connecting said pair of manually operable means with said pair of rings for turning the latter in response to actuation of said pair of manually operable means, said totalizing means automatically positioning said axially movable ring in an axial position determined by the combination of the settings provided by said pair of manually operable means; light-responsive means for indicating to the operator when the camera has been properly set according to the lighting conditions; and third motion transmitting means cooperating with said axially movable ring and said light-responsive means for actuating the latter in response to axial movement of said axially movable ring for indicating to the operator when the camera has been properly set according to the lighting conditions.

3,270,641
REMOTE INSPECTION DEVICE AND THREADED MEMBER USED THEREIN
Norman R. Gosselin, Marblehead, Mass., assignor to Iota-Cam Corporation, Lynn, Mass., a corporation of Massachusetts
Filed July 1, 1963, Ser. No. 291,777
19 Claims. (Cl. 95—11)

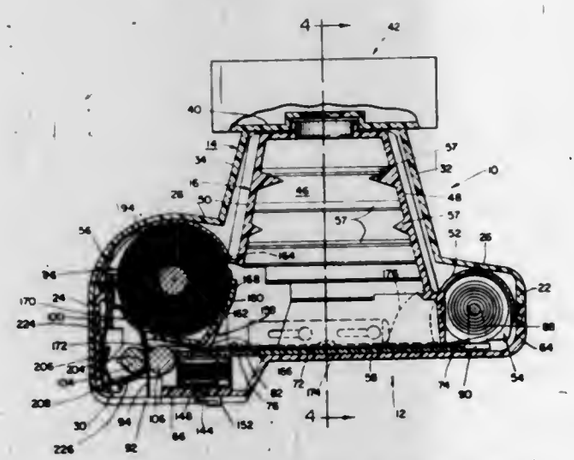
1. An inspection device comprising an elongated snake-like member which has a distal end for inspecting a remote area and a proximal end at which the device is controlled, the snake-like member incorporating at least one flexible bundle of elongated light-conducting fibers extending between said two ends, an adjustment mechanism supported by said snake-like member at a point spaced from said proximal end, said adjustment mechanism having at least one component adapted to move relative to the body of said snake-like member to control said inspection, an elongated, flexible, torque-transmitting cable extending from said proximal end to said mechanism along said flexible bundle of fibers and supported by said snake-like member, a reaction block means located near said mechanism and fixed longitudinally to the body of said snake-like member, said reaction block means threadably engaged with cooperating means on said flexible cable to enable the latter to apply an adjustment force to said movable component, the portion of said torque-transmitting cable engaged with said block means being restrained by said block means from longitudinal movement in the absence of rotation of said cable, connector means drivingly connecting the respective end of said flexible cable and said movable component of said adjustment mechanism, and means at the proximal end of said device adapted to rotate said flexible cable.

3,270,642
PHOTOGRAPHIC PRODUCT AND APPARATUS
Hubert Nerwin, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Sept. 13, 1963, Ser. No. 308,902
9 Claims. (Cl. 95—13)



1. A composite product for use in image-transfer photography, comprising:
an elongated strip having a leading end portion,
at least predetermined spaced areas on one face of said strip being image receptive,
a plurality of sheets, one corresponding to each of said image-receptive areas,
each sheet being individually hingedly secured to said face of said strip adjacent the leading edge of the corresponding image-receptive area and extending therefrom toward said leading end portion of said strip,
each said sheet being provided with an image-receptive area facing outwardly from said strip and arranged upon inversion of said sheet about its hinge connection with the strip for conjoint processing in substantially face-to-face relationship with its associated image-receptive area on the strip,
one of each associated pair of image-receptive areas being photosensitive,
said strip being wound upon itself in the form of a hollow, multi-layer coil with said leading end portion outermost,
a fluid container at least a portion of which is housed within the hollow interior of said coil,
and fluid applicator means connected to and in fluid communication with said container and located radially outwardly from the periphery of said coil in position to apply fluid from said container to selected portions of said strip and sheet assembly upon unwinding of the latter from said coil.

3,270,643
PHOTOGRAPHIC APPARATUS
Burleigh Fernald, Stratham, N.H., assignor to Polaroid Corporation, Cambridge, Mass., a corporation of Delaware
Filed Apr. 20, 1964, Ser. No. 360,861
13 Claims. (Cl. 95—13)

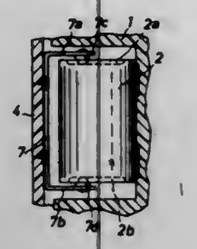


1. Processing apparatus for use with a film unit of the type including a photosensitive sheet, a second sheet and a contained processing liquid adapted to be released under pressure and spread between said sheets as the latter are advanced through pressure-applying means, said apparatus comprising, in combination:
(a) a pair of elongated, pressure-applying members having an entrance area into which said film unit is advanced with said sheets in superposed relation and lying substantially in a first plane defined by said entrance area;

(b) an elongated guide member positioned closely adjacent said entrance area and including end portions having first surfaces adapted to be positioned in said first plane; and
(c) edge-engaging means extending angularly across said first plane on each side of said guide member and urged toward engagement with outer lateral edge portions thereof;

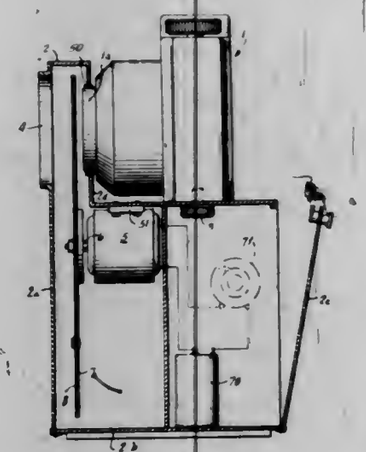
(d) the distance between the intersections of said edge-engaging means with said first plane being less than the width of said film unit, whereby marginal edge portions of said film unit are deformed out of said first plane by said edge-engaging means while the central portion is maintained in said first plane by said first surfaces of said end portions and said entrance area of said pressure-applying members.

3,270,644
CAMERA STRUCTURE
Patrick L. Finelli, Sudbury, Mass., assignor to Polaroid Corporation, Cambridge, Mass., a corporation of Delaware
Filed July 16, 1964, Ser. No. 383,197
5 Claims. (Cl. 95—13)



1. A camera means comprising, in combination:
a housing including forward and rear sections joined to one another for movement with respect to one another between open and closed positions;
said forward housing section including forward, side, end and intermediate walls defining a first recess at one end of said housing open at the rear for receiving and holding a coil of a photosensitive sheet and a second recess open at the rear and separated from said first recess by said intermediate wall, said second recess including a first portion substantially deeper than said first recess adjacent said intermediate wall and a second portion shallower than said first portion located to the side thereof opposite said first recess for holding a coil of a second sheet;
exposure means mounted on said forward housing section at the forward end of said first portion of said second recess;
guide means mounted on said forward housing section at the rear of said first portion of said second recess for engaging the lateral edges of a section of said photosensitive sheet to support said section of said photosensitive sheet in position for exposure to light transmitted by said exposure means through said first portion of said second recess;
said rear housing section cooperating with said forward housing section in the closed position of said housing sections to define first and second chambers separated by said intermediate wall and a passage between said chambers at the rear of said intermediate wall for allowing movement of said photosensitive sheet from said first chamber into exposure position within said second chamber;
means on said rear housing section for supporting said photosensitive sheet against said guide means in position for exposure in the closed position of said housing sections;
said housing sections including portions cooperating in said closed position to define an opening in the rear of said housing communicating with said second portion of said second recess and through which said photosensitive sheet and said second sheet can be withdrawn in superposition from said housing; and
means mounted on said forward housing section for movement with respect to said forward housing section between operative and inoperative positions, the last-mentioned means including means cooperating with said housing sections for holding said last-mentioned means in said operative position thereof when said housing sections are in said closed position and being movable into said operative position when said housing sections are in said open position;
said last-mentioned means in said operative position cooperating with said housing sections to divide said second chamber into first and second subchambers comprising, respectively, said first and second portions of said second recess and joined by a passage through which said photosensitive sheet is movable from exposure position within said first subchamber into superposition with said second sheet within said second subchamber;
said last-mentioned means being constructed, when in said operative position, to retain said coil of said second sheet within said second subchamber and prevent admission of light into said first subchamber from said second subchamber and, when in said inoperative position, to permit loading of a coil of said second sheet into said second portion of said second recess.

3,270,645
CAMERA STRUCTURE FOR HANDLING FILM CARTRIDGES
Dieter Engelsmann and Siegfried Zobel, Munich, Germany, assignors to Agfa Aktiengesellschaft, Leverkusen, Germany
Filed Oct. 21, 1964, Ser. No. 405,543
Claims priority, application Germany, Oct. 31, 1963, A 44,440
8 Claims. (Cl. 95—31)



1. In a camera, in combination, a film cartridge, a camera housing formed in its interior with a cartridge chamber for receiving said film cartridge, said housing including a wall movable in a predetermined direction into engagement with the remainder of said housing for closing said chamber thereof and displaceable in opposite direction away from the remainder of said housing for giving access to said cartridge chamber, and a pair of

means respectively carried by said wall and said film cartridge, one of said means including a springy engaging member movable into engagement with the other of said means in a direction transverse to said predetermined direction for releasably connecting said film cartridge to said wall when said wall is moved into engagement with

the remainder of said housing, said pair of means maintaining said releasable connection while said wall is displaced away from the remainder of said camera housing in said opposite direction so that said film cartridge is displaced out of said chamber when said wall is displaced in said opposite direction.

3,270,646
CAMERA ATTACHMENT AND CAMERA
Albert W. Wilson, Hout Bay, Cape Province, Republic of South Africa, assignor to Trenel Finance Corporation, Panama, Panama, a corporation of Panama
Filed Apr. 14, 1964, Ser. No. 359,799
13 Claims. (Cl. 95—36)

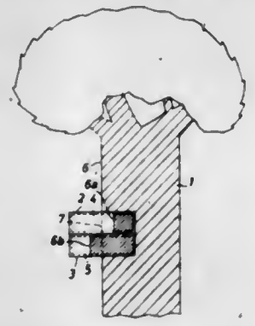
1. A camera for taking high speed exposures comprising:

(a) a housing;

(b) a compound lens system disposed within the housing;

(c) a motor secured to the housing and having a motor shaft;

(d) front plate mounting means disposed on the motor shaft;

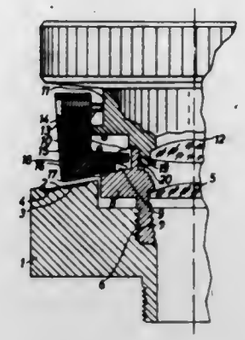


(e) rear plate mounting means disposed on the motor shaft; and

(f) an opaque rotatable disc having at least one radial slot mountable on the mounting means and movable between the front plate mounting means and the rear plate mounting means;

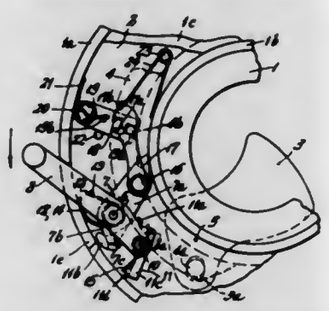
said front plate mounting means being disposed so that when the disc is mounted thereon it is disposed between the lenses of the compound lens system and said slot of the disc is optically aligned with the lenses and the light sensitive film of the camera once during each rotation of the disc, the opaque disc interrupting passage of light from the lenses to the light sensitive film during the remainder of each rotation;

said rear plate mounting means being disposed so that when the disc is mounted thereon, it is disposed approximately at the focal plane of the camera, and said slot of the disc is optically aligned with the lenses and the light sensitive film of the camera once during each rotation of the disc, the opaque disc interrupting passage of light from the lenses to the light sensitive film during the remainder of each rotation.



3,270,647
OBJECTIVE-FOCUSING APPARATUS
Franz Jakob, Unterhaching, Munich, and Joachim Spatz, Munich, Germany, assignors to Agfa Aktiengesellschaft, Leverkusen, Germany
Filed June 10, 1964, Ser. No. 374,115
Claims priority, application Germany, June 21, 1963, A 43,383
17 Claims. (Cl. 95—44)

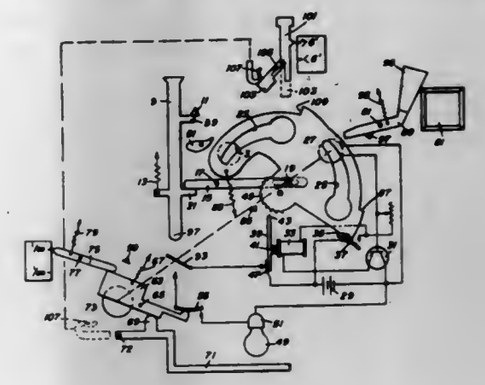
1. In an objective-focusing apparatus, in combination, a pair of identical crossed prisms located adjacent each other but on opposite sides of an optical axis of the apparatus and situated approximately in a plane which is the equivalent of the focal plane of the objective which is to be focused, so that when the contour of a given subject is seen through the crossed prisms, the contour will only appear to be uninterrupted when the prisms are precisely situated in the focal plane of the objective for the subject; and a pair of photosensitive transducers respectively situated behind said crossed prisms and respectively being identical insofar as their electrical properties and sizes and positions relative to said prisms are concerned and the outline of said pair of transducers in a plane normal to said optical axis being substantially identical in size and shape to the outline of said pair of crossed prisms in a plane normal to said optical axis.



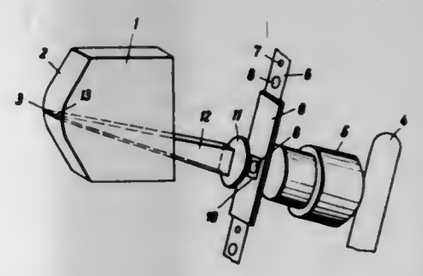
3,270,648
OBJECTIVE ASSEMBLY FOR PHOTOGRAPHING DEVICES
Dieter Engelsmann, Unterhaching, Munich, Germany, assignor to Agfa Aktiengesellschaft, Leverkusen, Germany
Filed June 10, 1964, Ser. No. 374,092
Claims priority, application Germany, June 14, 1963, A 20,131
10 Claims. (Cl. 95—45)

1. An objective assembly for a photographic device comprising, in combination; a camera body; main objective means; first mounting means mounting said main objective means on said camera body movable along a helical path coaxial with the optical axis of said main objective means so that the focal distance of said main objective means may be adjusted by turning of said main objective means; first indicator means located partly on said camera body and partly on said main objective means for indicating the focusing position of said main objective means; auxiliary objective means; second mounting means detachably mounting said auxiliary objective means on said main objective means movable along a path coaxial with said optical axis, said auxiliary objective means when mounted on said main objective means moving together with the same; auxiliary focusing means turnable relative to said auxiliary objective means and having a coupling portion engaging said main objective means in a predetermined angular position relative thereto for rotation together therewith, whereby turning of said auxiliary focusing means will result in movement of said main objective

means together with the auxiliary objective means attached thereto along said helical path, focusing the objective assembly composed of said main and auxiliary objective means; and second indicator means located partly on said camera body and partly on said auxiliary focusing means for indicating the focusing position of the combined objective assembly.



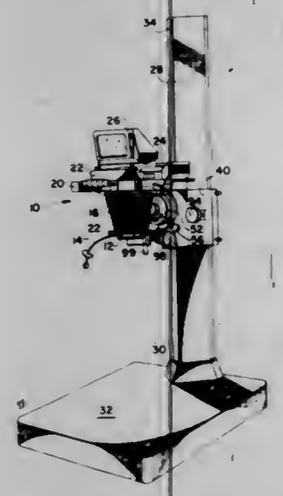
3,270,649
PHOTOGRAPHIC SELF-COCKING SHUTTER
Franz W. R. Starp, Calmbach (Enz), Germany, assignor to Alfred Gauthier G.m.b.H., Calmbach (Enz), Germany, a corporation of Germany
Filed July 12, 1963, Ser. No. 294,678
Claims priority, application Germany, July 19, 1962, G 35,510
8 Claims. (Cl. 95—63)



1. A photographic self-cocking shutter comprising a cocking and release lever pivotally mounted to pivot about an axis; a driving member pivotally mounted to pivot about the same axis; a pivotally mounted engagement pawl connected to said lever and engaging said driving member to move the same during the cocking movement of said lever, first means engageable with said engagement pawl for automatically releasing said driving member when said lever reaches a predetermined point in its cocking movement; shutter blades and second means connected thereto to move the same between an opened position and a closed position; and a crank connected to said driving member and to said second means to actuate said second means.

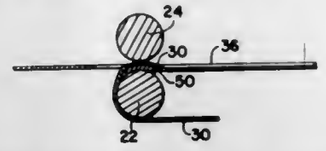
3,270,650
AUTOMATIC EXPOSURE CONTROL SYSTEM
Paul J. Ernisse, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Aug. 20, 1963, Ser. No. 303,320
6 Claims. (Cl. 95—64)

1. In a camera having a film-exposing aperture, a manually operable camera actuating device, and light-sensitive means including a photo-responsive cell for producing an output varying in accordance with scene brightness, the improvement comprising: a diaphragm blade means normally maintained in a first position and released for movement in one direction only toward a second position by the operation of said actuating device, said blade means having therein a pair of elongated slits of continuously varying width, said slits being positioned, respectively, in covering relation to said aperture and said photo-responsive cell to form proportionally varying exposure masks for said aperture and said cell at all times during the movement of said blade means; and threshold means responsive to said output and movable to a position engaging said blade means for stopping the movement of said blade means intermediate said first and second positions, the movement of said blade means toward said second position varying the exposure of said photocell until such time as the output of the photocell reaches a predetermined value.



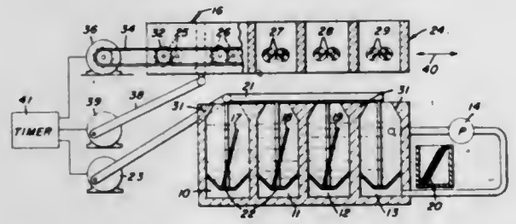
3,270,651
METHOD OF COPYING CINEMATOGRAPH FILMS IN COLOUR OR BLACK AND WHITE
Günter Wetzel, Berlin-Steglitz, and Günter Feller, Berlin-Lankwitz, Germany, assignors to Union Tonfilmmaschinenbau-Gesellschaft mit beschrankter Haftung, Berlin, Germany
Filed Aug. 7, 1962, Ser. No. 215,395
Claims priority, application Germany, Aug. 11, 1961, U 8,252
1 Claim. (Cl. 95—75)

A method of copying a continuous strip of film having image-bearing frames separated from each other by a small space comprising concentrating light from a constant light source into an area not wider than the space between frames, continuously moving the film and photosensitive copy material past the area for copying the image of the film on photosensitive copy material, directing a substantially opaque control tape, having a plurality of apertures of varying size defined at spaced locations along the length thereof through a path intersecting the light from the light source, and shifting said control tape for varying the aperture size aligned with the light source and thus the light to said area in accordance with the scene on the film to be copied in timed relationship to the film advance in a manner to provide a continuous beam of



light to the area through a selected aperture at times when the image-bearing film is adjacent the area and to intercept the light with the opaque portion of the control tape only when the space between frames of the film is aligned with the area.

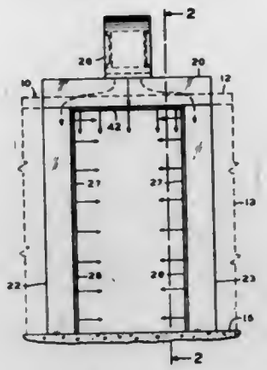
3,270,652
PHOTOGRAPHIC APPARATUS SUPPORT
Paul B. Mason, Magnolia, and Leon Rubinstein, Natick, Mass., and Arthur J. Sable, Saratoga, Calif., assignors to Polaroid Corporation, Cambridge, Mass., a corporation of Delaware
Original application Nov. 24, 1961, Ser. No. 154,655, now Patent No. 3,143,941, dated Aug. 11, 1964. Divided and this application June 3, 1964, Ser. No. 372,222
3 Claims. (Cl. 95—86)



1. A support structure for adjustably holding photographic apparatus in a selected vertical position, said structure comprising, in combination:
(a) a unitary, one-piece support column extending vertically from an anchored position at its lower end and having a substantially V-shaped horizontal cross section, whereby said column has a forwardly disposed vertical edge at the vertex of the V, and two rearwardly disposed vertical edges;
(b) a mounting bracket including a plate-like section positioned adjacent a portion of the forwardly disposed surfaces of said column, whereby said bracket has a rearwardly disposed surface facing said column and a forwardly disposed surface facing away from said column, and having a pair of flanges extending rearwardly past said rearwardly disposed edges;
(c) first and second wheels mounted one upon each of said flanges for rotation about first horizontal axes;
(d) a third wheel mounted upon a forwardly disposed portion of said mounting bracket for rotation about a second horizontal axis;
(e) said second axis being parallel to and lower than said first axes;
(f) said first, second and third wheels being in rolling engagement with each of said rearwardly disposed edges and said forwardly disposed edge, respectively, during vertical movement of said mounting bracket with respect to said column; and
(g) means for rigidly securing said photographic apparatus to said forwardly disposed surface of said mounting bracket, to extend horizontally therefrom above said second axis, whereby the weight of said apparatus exerts a turning moment on said mounting bracket urging said first and second wheels against said rearwardly disposed edges and said third wheel against said forwardly disposed edge.

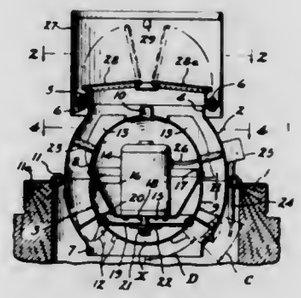
3,270,653
COMPOSITE PHOTOGRAPHIC FILM ROLL
Albert J. Bachelder, Lexington, Mass., assignor to Polaroid Corporation, Cambridge, Mass., a corporation of Delaware
Filed Nov. 14, 1963, Ser. No. 323,686
10 Claims. (Cl. 95—89)

1. A composite photographic product adapted to be employed in photographic apparatus having a pair of pressure-applying members, said product comprising, in combination, first and second strips of flexible sheet materials, means for advancing said first and second strips between said pressure-applying members in superposition, said strips being urged by said pressure-applying members into frictional engagement with one another, and means associated with at least one of said strips and movable therewith to a position between said members, and effective to separate the latter in such manner as to release said frictional engagement during a preselected portion of the advancement of said strips, the release of said frictional engagement allowing one of said strips to be advanced independently of at least a portion of the other of said strips.



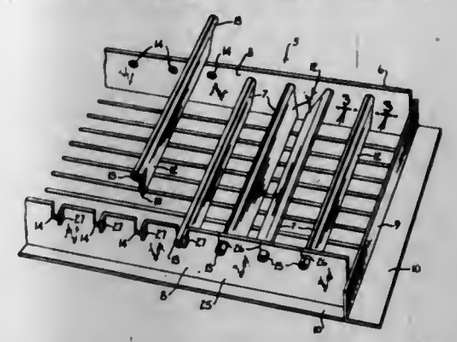
3,270,654
ROLLER TRANSFER PROCESSING MECHANISM
Harold D. Russell and Charles F. Amering, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Feb. 6, 1964, Ser. No. 342,991
12 Claims. (Cl. 95—89)

1. A roller transfer mechanism useable in a photographic film sheet developing processor, comprising:
a series of adjacent tanks for containing processing fluids;
a plurality of pairs of rollers in a frame moveably positioned over said tanks, said pairs collectively being selectively driveable to present film sheets to each of said tanks and receive film sheets from each of said tanks;
means for sequentially moving the frame to position said pairs of rollers to deliver a film sheet received from one tank to an adjacent downstream tank and for returning the frame to a receiving position; and
means for timing the motion of the frame in accordance with the process timing requirements.



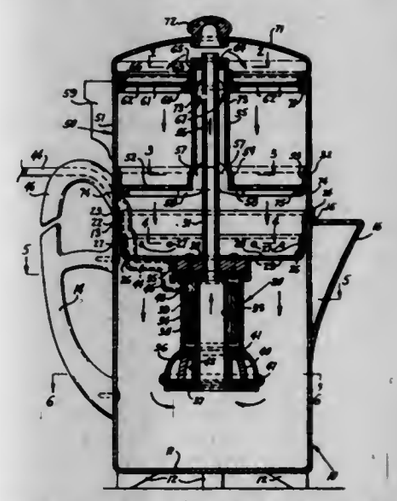
3,270,655
AIR CURTAIN DOOR SEAL
Howard P. Guirl and James N. Guirl, both of 911 Craig Drive, Kirkwood 22, Mo.
Filed Mar. 25, 1964, Ser. No. 354,607
4 Claims. (Cl. 98—36)

1. In an air curtain seal for an oven:
(a) a compartment having an opening,
(b) means at opposite sides of the opening directing an air flow into and generally across the opening at the top part of the opening, and directing an air flow outwardly of and generally across the opening at the lower part of the opening, and
(c) blower means supplying air to the air-directing means,



(d) the air-directing means being adjusted to vary the amount of air so that the air flow is the greatest at the top and bottom of the opening and diminishes regularly therebetween.

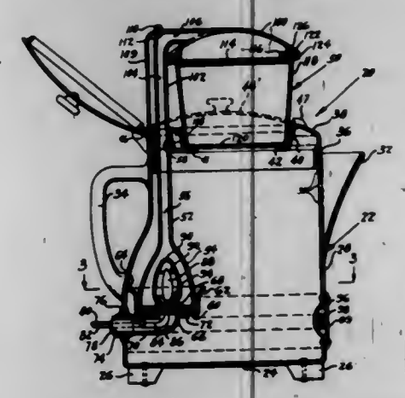
3,270,656
VENTILATOR WITH AIR DISCHARGE MEANS
Loren Cook, Berea, Ohio, assignor to Loren Cook Company, a corporation of Ohio
Filed Apr. 27, 1964, Ser. No. 362,682
10 Claims. (Cl. 98—43)



1. A ventilator comprising first and second semispherically-shaped parts, the first part of which terminates in an outlet opening and the second part of which terminates in an inlet opening, means for connecting the enlarged end portions of said parts together to form an outer casing, a stationary inner casing having a substantially semispherically-shaped portion which is spaced from the outer casing and an end portion which is arranged in substantially axial alignment with the outlet end of the first part of the outer casing, a motor, means associated with the inner casing for supporting said motor, an impeller having a central portion and an outwardly inclined body portion, a plurality of air driving blades having their root portions secured to the outwardly inclined portions of said impeller and leading edges arranged in close proximity to the inlet portion of the second part of the outer casing, a plurality of air turning vanes arranged between and connected to the outer casing and to the inner casing and arranged at a substantial distance from the air driving blades to form a plenum chamber between the inner and outer casings and the air driving blades and the air turning vanes, a shaft driven by said motor which is operatively associated with said impeller, a support, and fastening means secured to the connecting means for the enlarged parts of the outer casing and said support for holding the ventilator in place.

3,270,657
AIR OUTLET HAVING ANGULARLY ADJUSTABLE LOUVERS
Richard C. Jaye, 1025 Richards St., Watertown, Wis.
Filed Mar. 10, 1965, Ser. No. 438,526
5 Claims. (Cl. 98—110)

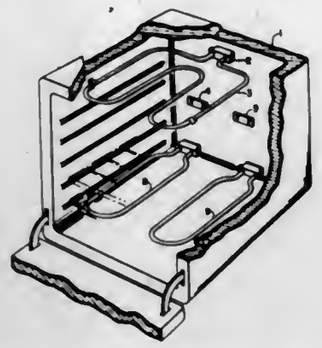
3. A one-piece vane for a louvered air outlet or the like, of the type having an elongated blade portion and coaxial trunnions projecting lengthwise from the ends of the blade portion and receivable in apertures in a pair of opposite frame members to mount the vane for angular adjustment, said vane being characterized by:
(A) the blade portion of the vane being hollow and comprising a pair of flatwise adjacent sheet metal wall elements integrally connected with one another around a substantially sharp bend which extends along one longitudinal edge of the blade, said wall elements having free marginal edge portions at the opposite longitudinal edge of the blade that are resiliently flexible toward and from one another; and
(B) each of said trunnions comprising an endwise projecting integral protuberance on each of said wall elements laterally spaced from the first designated longitudinal edge of the blade, the two protuberances at each end of the blade being opposite one another and having complementary substantially arcuate curvatures in transverse section, the resilience of the wall elements permitting the opposite protuberances to be converged so that the trunnion that they cooperate to provide can be inserted into an aperture and can dilate under resilient bias into a snug fit in the aperture whereby the vane is frictionally held in any position of angular adjustment.



3,270,658
COFFEE MAKER
Antonio Tavera, Rte. 1, Box 1386, Elk Grove, Calif.
Filed Oct. 9, 1963, Ser. No. 315,019
8 Claims. (Cl. 99—295)

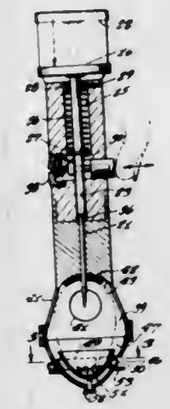
1. In a coffee maker the combination of a pot having an annular top rim, a heating unit comprised of an open topped circular casing having a perforated bottom and

a flange seating on said rim, an insulating plate secured to said bottom, a depending tube secured to said plate and extending into said pot, said plate and bottom having openings therein, a stem in communication with said tube extending to the top of said casing, a first heating coil surrounding said tube, insulating means mounting said first coil, a shell surrounding said coil to protect the same from fluid in the pot, an outwardly flared lower portion on said shell, an insulating member including a bottom insulating plate in said flared portion, a second heating coil in said insulating member, sealed conductive means for supplying electric current to said first and second coils, a coffee containing cartridge having openings communicating with said pot, water in said pot being circulated through said cartridge, tube, and stem, and a cover for said pot and casing.



3,270,659
PREPACKED COFFEE CONTAINING CARTRIDGE
Antonio Tavera, Rte. 1, Box 1386, Elk Grove, Calif.
Filed May 20, 1964, Ser. No. 368,888
19 Claims. (Cl. 99—295)

1. In combination, a percolator including a bottom, an upstanding side and an open top, a lid closing said open top of said percolator, said lid having an opening therein, a tubular percolator stem means having a flared lower end and including portions defining a longitudinal bore having an open upper end, a plate underlying said flared lower end of said percolator stem means, said plate having at least one perforation therein, a heating coil disposed within said flared lower end of said percolator stem means, and a washer member overlying said plate and movable between a first position wherein it rests on said plate and seals said perforations therein and a second position wherein it is spaced above said plate, a cartridge including a receptacle having an imperforate dome-shaped top, means carried by said dome-shaped top for supporting a quantity of coffee therewithin, said last-mentioned means including portions defining at least one opening in communication with said opening in said lid of said percolator, a tubular cartridge stem means including portions defining a longitudinal bore having an open upper end communicating with said receptacle above said quantity of coffee and an open lower end aligned with, and in communication with, said open upper end of said bore in said percolator stem means, and breather means including portions defining a vent communicating with the interior of said receptacle above said quantity of coffee.

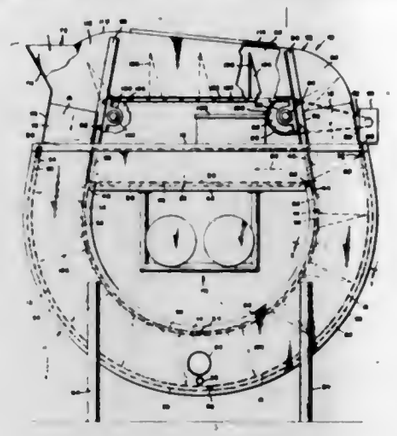


3,270,660
COOKING OVEN
Edmund H. Filipak, Lexington, Ohio, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed July 23, 1964, Ser. No. 384,657
8 Claims. (Cl. 99—340)

1. In an oven, a plurality of heating elements including top and bottom heaters, said bottom heater being constructed and arranged to be changed in location in said oven, the bottom heater comprising a plurality of open work heating elements widespread in location when moved to its lowest level in said oven and closely grouped and lying parallel to and directly below said top heater when moved upwardly nearer to said top heater, the spac-

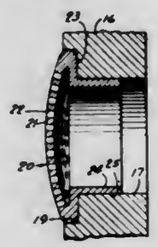
ing between said top heater and said bottom heater in its upper position being sufficiently small that a food article sandwiched between said heaters has both surfaces simultaneously broiled when said heaters are energized and means for holding an article of food substantially equidistantly between said top and said bottom heaters.

3,270,661
EGG COOKING DEVICE
Alois Juvan, 5953 Madison St., Brooklyn, N.Y.
Filed June 7, 1965, Ser. No. 461,784
3 Claims. (Cl. 99—343)



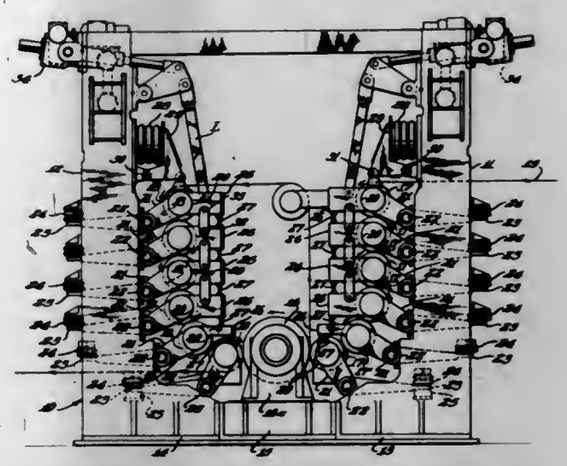
1. In an egg cooking device the combination of a cylindrical main body element and an end cap element, a longitudinal central opening through said main body element, said end cap element being removably mounted on one end of said main body element, an enlarged cavity formed within said end of said main body element and said end cap mounted thereon for receiving an egg therein, a prong slidable within said central opening, a temperature gauge at one end of said prong, the opposite end of said prong being slidable into and out of said cavity, and openings in the wall around said cavity to allow entry of water therein.

3,270,662
CRAB COOKING APPARATUS
John F. Flodin and Allan T. Flodin, Sunnyside, Wash., assignors to Flodin, Inc., Sunnyside, Wash., a corporation of Washington
Filed Apr. 26, 1965, Ser. No. 450,935
6 Claims. (Cl. 99—404)



1. A continuous cooking apparatus, comprising: (a) a lower section having generally semi-circular, spaced apart inside and outside walls and also having side walls

to define a generally U-shaped cooking tank; (b) a generally horizontally disposed circulating flume interconnecting and opening into the upper portions of said cooking tank; said circulating flume having a bottom wall connected to said inside wall of said cooking tank (c) an upper section including frame members and conveyor sprocket means supported on said frame members above said cooking tank; (d) a continuous conveyor means sup-

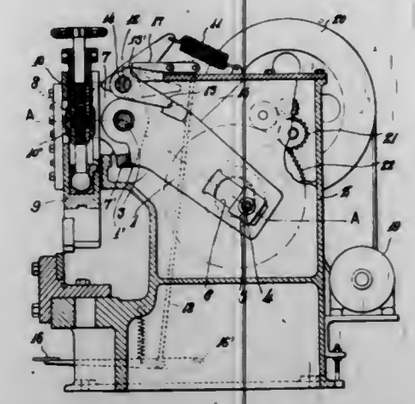


ported on and driven by said sprocket means and extending through said cooking tank, said conveyor having spaced apart continuous chain means with unobstructed space therebetween which contact and move on said inside wall and also having upstanding flight panels attached to and generally equispaced on said chain means; and (e) heating oil jacket means adjacent to said inside and outside walls and also adjacent the bottom wall of said circulating flume.

3,270,663
SCREEN PLATE FOR PULP PRESS AND THE LIKE
Lester M. Koelsch, Pittsfield, Mass., assignor, by mesne assignments, to Beloit Corporation, Beloit, Wis., a corporation of Wisconsin
Filed Nov. 30, 1964, Ser. No. 414,521
7 Claims. (Cl. 100—117)

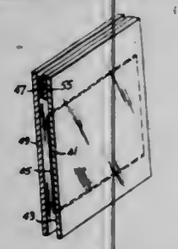
1. In a screen particularly adapted for dewatering presses,
- a screen plate in the form of a relatively thick walled cylinder having an inner peripheral wall and having a plurality of relatively large diameter perforations leading radially through the wall thereof, uniformly spaced throughout the area of said screen plate,
- a plurality of relatively thin walled screen inserts inserted in said perforations from the inner peripheral wall of said cylinder,
- each screen insert having a thin walled convex face extending inwardly of the inner peripheral wall of said cylinder having a plurality of uniformly spaced perforations leading therethrough and having a collar extending from said face fitting within a respective perforation in said screen plate from the inside thereof and positioning said convex face to extend inwardly of the inner peripheral wall of said screen plate.

3,270,664
CALENDER STACK
Dirk J. Veneman and Hugo F. Budzien, Beloit, Wis., assignors to Beloit Corporation, Beloit, Wis., a corporation of Wisconsin
Filed June 22, 1964, Ser. No. 376,694
6 Claims. (Cl. 100—162)



1. A calender roll assembly comprising in combination:
- a king roll,
- a first set of calender rolls on one side of said king roll,
- a second set of calendar rolls on the opposite side of said king roll,
- said first and second sets of calender rolls including a pair of horizontally opposed calender rolls engaging said king roll in diametrically opposed relation with respect to each other,
- a next adjacent pair of calender rolls spaced outwardly of and above said horizontally opposed calender rolls and having calendering nips therewith,
- a vertical stack of calender rolls supported on said next adjacent calender rolls,
- bearing support means mounting said first and second sets of calender rolls for movement toward and from each other,
- and pressure applying means for each set of calender rolls applying pressure to the uppermost of said calender rolls of each set of calender rolls for forcing said horizontally opposed calender rolls toward said king roll to direct diametrically opposed deflection forces thereon.

3,270,665
MACHINE PRESS
Shozo Shiokawa, 28 Sone-Nishimachi, 2-chome, Toyonaka, Osaka-fu, Japan
Filed July 10, 1964, Ser. No. 381,663
Claims priority, application Japan, July 15, 1963, 38/38,439
1 Claim. (Cl. 100—282)

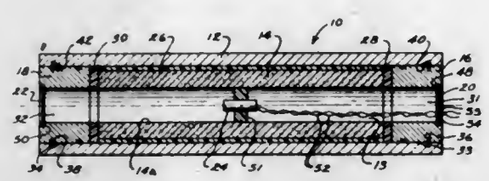


A machine press comprising a vertically movable ram member, a ram linking plate pivotally coupled to said vertically movable ram member, a main shaft mounted in a fixed position on said press and on which said ram linking plate is pivotally mounted and from which said ram plate extends in one direction toward said pivotal coupling, a lever having one end pivotally mounted on said main shaft and extending from said main shaft in substantially the opposite direction from the direction the ram linking plate extends from said main shaft, drive means coupled to the other end of said lever for pivoting said lever around said main shaft, said drive means including a gear wheel having its center positioned between the ends of said lever, said gearwheel having a shaft about which said gearwheel rotates, said lever having a

slot therein, a crank on said gearwheel shaft and sliding in said slot, said slot extending in the direction of the length of said lever and pawl means coupling said ram

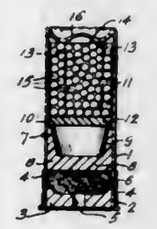
linking plate and said lever and engaging said lever at a point substantially on the opposite side of said main shaft from the coupling of said ram linking plate and said ram.

3,270,666
STENCIL WITH BARRIER LAYER BETWEEN THE STENCIL AND THE ADHESIVE
David Breverman, Los Angeles, Calif., assignor to Mark-Fast Marking System, Inc., Los Angeles, Calif., a corporation of California
Filed Sept. 8, 1964, Ser. No. 394,796
11 Claims. (Cl. 101—128.2)



1. A stencil sheet assembly comprising a single-ply sheet of stencil material which contains an oil, said stencil sheet having a carbonizing material on a first area of one face thereof constituting its back face, the sheet being adapted for striking on its front face within the confines of the area on its back face to convert it into a stencil and simultaneously make a carbon copy via said coating of carbonizing material, said sheet having a barrier layer of material at a second area of the back face and a layer of pressure-sensitive adhesive on the barrier layer spaced from the carbonizing material, and a backing sheet attached to the stencil sheet by said adhesive, the barrier layer preventing migration of oil from the stencil sheet to the adhesive.

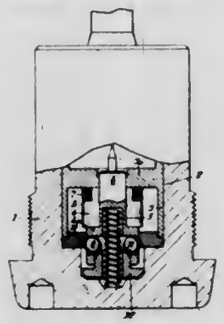
3,270,667
PLANOGRAPHIC PRINTING PLATES AND METHOD OF MAKING SAME
Glenn H. Perkins, West Peru, Main, assignor to Oxford Paper Company, Rumford, Maine, a corporation of Maine
No Drawing. Continuation of application Ser. No. 41,800, July 11, 1960. This application May 14, 1963, Ser. No. 280,440
12 Claims. (Cl. 101—149.2)



4. A planographic printing plate comprising a base and a coating thereon, said coating consisting essentially of the insoluble reaction product of a composition consisting essentially of deacetylated chitin, a cross-linking agent capable of reacting with at least one of the group of reactive —OH and —NH_2 of the deacetylated chitin molecule, and an inorganic pigment, said coating being capable of holding both water and greasy ink and having thereon an olephilic image.

3,270,668
WELL-TREATING APPARATUS
Bernard Silver, Alexandria, Va., assignor to Atlantic Research Corporation, Fairfax County, Va., a corporation of Virginia
Filed Dec. 29, 1964, Ser. No. 421,896
5 Claims. (Cl. 102—20)

1. In combination with a well bore, a well-treating apparatus including a neutral-thrust gas generator adapted to be lowered into said bore, said gas generator comprising
(a) a tubular cylindrical casing having a combustion section therein,
(b) a solid propellant grain mounted within said combustion section,
(c) ignition means mounted within said combustion section to ignite said grain,
(d) apertured means at each end of said casing to provide flow communication between said combustion section and the external atmosphere contiguous to each end of said casing, and
(e) means to obturate each of said apertured means to effect prevention of moisture from entering said casing and to effect build-up of a predetermined pressure within said combustion section, the obturation means being ejected upon attainment of said predetermined pressure within said combustion section.

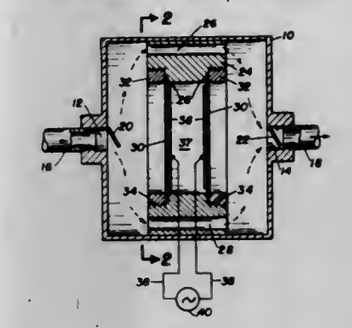


3,270,669
SHOTSHELLS
David Norman Atkins and Francis Hamnet Garland McCaffrey, Brownsburg, Quebec, and George David Taylor, Lachute, Quebec, Canada, assignors to Canadian Industries Limited, Montreal, Quebec, Canada
Filed Mar. 12, 1965, Ser. No. 439,369
Claims priority, application Canada, June 16, 1964, 905,257
6 Claims. (Cl. 102—42)

1. A shotshell comprising in combination a cup-shaped metallic head having a central aperture, a primer cap mounted in said aperture, a tubular casing securely held by the side wall of said metallic head and extending beyond said wall and, within said tubular casing, a powder charge adjacent said primer cap, an outward-facing cup-shaped resilient thermoplastic wad adjacent said powder charge and telescopically received within said casing, an outward-facing cup-shaped resilient thermoplastic shot container adjacent said wad and also telescopically received within said casing pelletized shot within said container and an end closure contiguous with said shot,

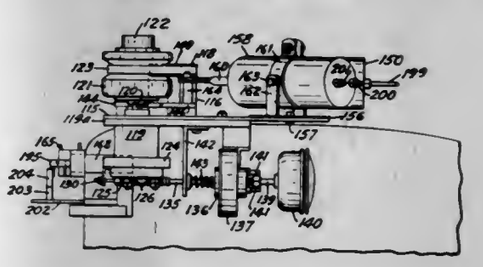
the base portion of said shot container being adapted to progressively engage with the cup portion of said wad upon initiation of said powder charge, thereby causing lateral expansion of said wad and thus forming a gas-tight seal against the inner wall of said casing.

3,270,670
IMPACT FUZES FOR SPINNING EXPLOSIVE PROJECTILES AND MORE PARTICULARLY BASE-DETONATING FUZES OF THE TYPE EQUIPPED WITH A MECHANICAL AUTO-DESTRUCTION DEVICE
William Guerne, Geneva, Switzerland, assignor to Brevets Aero-Mecaniques S.A., Geneva, Switzerland, a society of Switzerland
Filed Feb. 18, 1964, Ser. No. 346,061
4 Claims. (Cl. 102—79)



1. An impact fuze for a spinning propectile which comprises, in combination, a fuze case fixed with respect to said propectile and having a longitudinal axis of rotation, a firing pin slidable longitudinally in said case in the direction corresponding to firing in response to the stopping of said projectile by an obstacle, spring means in said fuze case operatively connected with said firing pin for urging it longitudinally with respect to said case in said direction, locking means for yieldingly preventing said firing pin from moving in said direction as long as the speed of revolution of said projectile is above a given value, said locking means comprising, on the one hand, a surface of said fuze case of revolution about said axis, said surface having generatrices oblique to said axis and converging in said direction, and, on the other hand, adapted to cooperate with said surface by sliding engagement therewith, rounded centrifugal members guided in said firing pin radically and transversely to said axis, whereby an inward movement of said centrifugal members toward the axis of said fuze case takes place when the speed of revolution of said fuze case about said axis drops below said given value, and an inertia part slidable longitudinally in said firing pin and having a surface thereof, of revolution about said axis and converging in the same direction as said first mentioned surface, in engagement with said centrifugal members, whereby said inertia part is pushed longitudinally in a direction opposed to the first mentioned direction with respect to said fuze case in response to a movement of said centrifugal members toward said axis.

3,270,671
CARTRIDGE WAD AND PROCESS FOR THE MANUFACTURE THEREOF
Benjamin K. Daubenspeck and Edward A. Rickey, Stratford, Conn., assignors to Remington Arms Company, Inc., Bridgeport, Conn., a corporation of Delaware
No Drawing. Filed Apr. 29, 1965, Ser. No. 452,007
7 Claims. (Cl. 102—95)



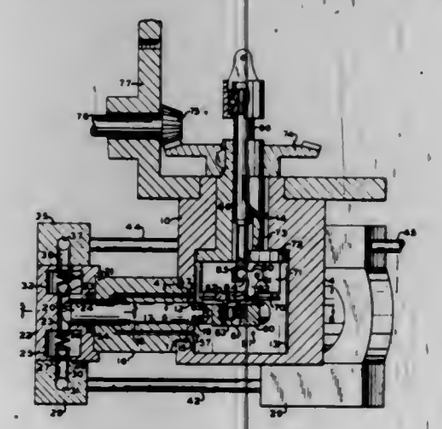
1. In a shotshell cartridge wherein a basewad is positioned at the rear end thereof, said basewad comprising an individually molded structure coherent under firing conditions and consisting essentially of a mixture of 30–60% of asbestos fibers and 70–40% of wood fibers held together by a wax binder means to form a compact mass of sufficient density and strength to prevent gas leakage and rupture upon firing.

3,270,672
PUMP APPARATUS
Robert M. Haines, Crystal Lake, Donald L. Klass, Barrington, and Thomas W. Martinek, Crystal Lake, Ill., assignors, by mesne assignments, to Union Oil Company of California, Los Angeles, Calif, a corporation of California
Filed Dec. 23, 1963, Ser. No. 332,485
13 Claims. (Cl. 103—1)

1. A pump comprising a vessel having communicating inlet and outlet openings, a flexible diaphragm exposed to the interior of said vessel, an electrostrictive transducer, comprising an electrostrictive liquid confined between two spaced members having opposing surfaces, adapted to be deformed upon the application of an electric field thereto and cause movement of said diaphragm upon the deformation thereof, and means for applying a transient electric field to said electrostrictive transducer.

3,270,673
FLUID PRESSURE SYSTEM AND CONTROL MEANS THEREOF
Harry L. Peterson, 5032 34th Ave. S., Minneapolis, Minn.
Original application July 14, 1961, Ser. No. 124,095, now Patent No. 3,135,095, dated June 2, 1964. Divided and this application Aug. 12, 1963, Ser. No. 301,497
7 Claims. (Cl. 103—24)

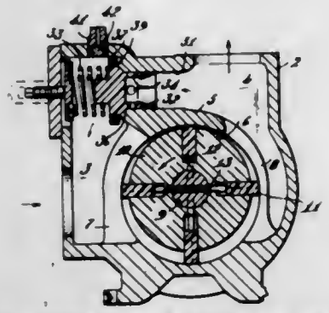
1. In a fluid pressure system for use in supplying fluid pressure to the steering system of outboard motors and the like, said fluid pressure system comprising
a fluid pump mechanism,
a longitudinally reciprocating operating member connected with said pump mechanism for operating the same,
a driven rotary shaft,
means drivingly interrelating said driven rotary shaft with said reciprocating member to reciprocate the latter,
a variable speed expansible and retractable pulley unit adjustably mounted on said driven rotary shaft for shifting movement relative thereto and for rotation therewith, said variable speed pulley being normally urged to the retracted position,



an endless belt drivingly connecting said variable speed pulley unit with a drive shaft of a rotary motor of the type having a manually operable throttle control,

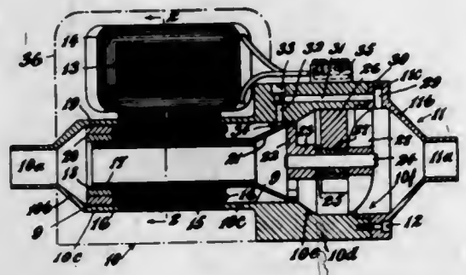
means for varying the tension of said belt comprising a shiftable idler pulley mechanism engaging said belt and being selectively shiftable to variously adjust the tension of said belt,

means for shifting said idler pulley mechanism including at least one piston and cylinder fluid pressure motor connected with said idler pulley mechanism and being operable to cause shifting movement thereof, said fluid pressure motor being connected in communicating relation with said pump mechanism and reeciving fluid under pressure therefrom,



and a valve control mechanism interposed in fluid controlling relation with respect to said fluid pressure motor and having a shiftable actuator element disposed in obstructing relation with respect to the throttle control of the rotary motor, said actuator element being shiftable by the throttle control of the rotary motor during movement of the throttle control whereby said idler pulley mechanism will be shifted to vary the tension of said belt in response to changes in speed of the rotary motor.

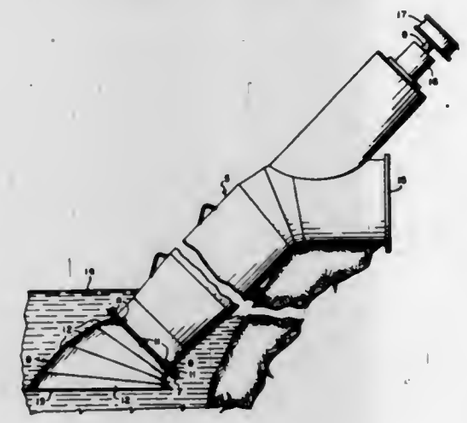
3,270,674
VARIABLE DISPLACEMENT PUMP
Robert L. Allen, Atlanta, Ga., assignor to Georgia Tech Research Institute, Atlanta, Ga., a corporation of Georgia
Continuation of application Ser. No. 703,898, Dec. 19, 1957. This application May 31, 1963, Ser. No. 284,492
2 Claims. (Cl. 103—38)



1. A variable-displacement metering pump including a hollow body defining an operating chamber containing a lubricant, a central rotary power shaft, a piston driving head in said chamber for rotation by said shaft, driving means movably mounted with respect to said head and transversely displacable with respect thereto to be moved in an orbital path of varying radius in response to rotation of said shaft, a pump piston housing mounted on said body and defining an open ended piston bore communicating at its inner end with said operating chamber, a pump casing mounted on said housing and defining a pump cavity, a piston mounted for reciprocation in said piston bore and having a pumping head extending into said pump cavity, means for reciprocating said piston commensurate with the orbital movement of said driving means and responsive to the radius of such movement, together with means to transversely displace said head during rotation of said shaft, said pump piston housing being counterbored from its outer end inwardly for a distance at least as great as the maximum stroke of the piston and providing lubrication clearance space between the piston and the pump piston housing, intercommunicating means for circulating lubricant from said operating chamber to said piston at said clearance space and thence back to said operating chamber, and sealing means about the pumping head of the piston at the juncture of said pump piston housing and said pump casing for sealing the piston and the pumping chamber against the escape of lubricant and pumped fluid along the piston.

3,270,675
ROTARY SLIDING-VANE PUMP
Mustafa J. Ajam, Amherst, N.H., assignor to Williams & Hussey Machine Corporation, Milford, N.H., a corporation of New Hampshire
Original application June 28, 1963, Ser. No. 291,478. Divided and this application Sept. 15, 1964, Ser. No. 396,697
3 Claims. (Cl. 103—42)

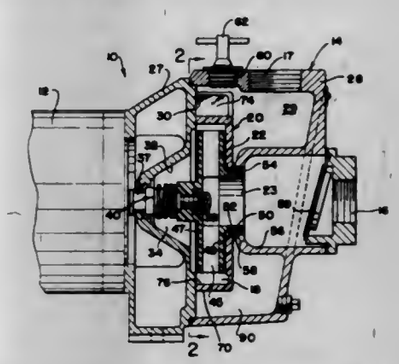
1. A pump comprising a housing having inlet and outlet chambers, means for pumping fluid from the inlet chamber to the outlet chamber, a by-pass from the outlet chamber to the inlet chamber, a relief valve in the by-pass which opens in response to pressure in the outlet chamber, an air inlet in the inlet chamber, and a closure which normally closes said inlet and which opens at a predetermined temperature so that, when the pump reaches said temperature, it is cooled by air drawn through the inlet and circulated through the pump.



3,270,676
PUMPS
Stanley John Penman, Smethwick, England, assignor to L. W. Penman Engineering Limited, Smethwick, England, a British company
Filed Mar. 27, 1964, Ser. No. 355,161
Claims priority, application Great Britain, Apr. 11, 1963, 14,488/63
3 Claims. (Cl. 103—87)

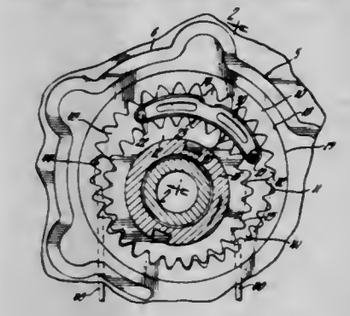
1. A pump for liquids comprising, in combination:
(a) a casing having an axis and defining an inlet, a rotor chamber, an impeller chamber, and an outlet, said inlet, said outlet, and said chambers being axially aligned and jointly constituting a straight-line flow path through said chamber;
(b) a stator winding mounted on the outside of said casing and surrounding said rotor chamber;
(c) a liner tube axially extending in said rotor chamber and having two axial end portions;
(d) a rotor winding mounted on said liner tube in said rotor chamber;

(e) a first bearing in said casing, one of the end portions of said liner tube being journaled in said bearing;
(f) a first apertured spider member on the other end portion of said liner tube;
(g) an impeller spindle coaxially fastened to said spider member and extending in said impeller chamber, said impeller spindle having two axial end portions, one of said end portions being fastened to said first spider member;
(h) impeller means mounted on said spindle in said impeller chamber for axially driving liquid along said path;
(i) a second bearing in said impeller chamber and rotatably receiving said spindle, the other end portion of said impeller spindle intermediate said end portions being received in said second bearing; and
(k) another apertured spider member radially interposed between said casing and said second bearing in said impeller chamber.



3,270,677
INTAKE BELL FOR DIAGONAL FLUID PUMPS
James Marlin Eller, P.O. Drawer E, Deerfield Beach, Fla., and James David Eller, Deerfield Beach, Fla. (3535 NW. 3rd Ave., Boca Raton, Fla.)
Filed Sept. 29, 1965, Ser. No. 491,313
3 Claims. (Cl. 103—89)

1. An angled axial flow pump having a propeller and provided with an angularly-arranged elongated cylindrical barrel, the pump having a lower intake and an upper horizontally disposed outlet end, an intake bell fixed to the lower end of the pump, the bell being downwardly tapering to a relatively wide intake side, the lower end of the bell being disposed in substantially parallel relation to the surface of the water, the bell being formed of a plurality of progressively larger segments welded together, the intake end of the bell and the body of the bell being on a true circle whereby the water being pumped by the propeller has an even velocity distribution immediately ahead of the propeller to form a uniform liquid flow to the pump.

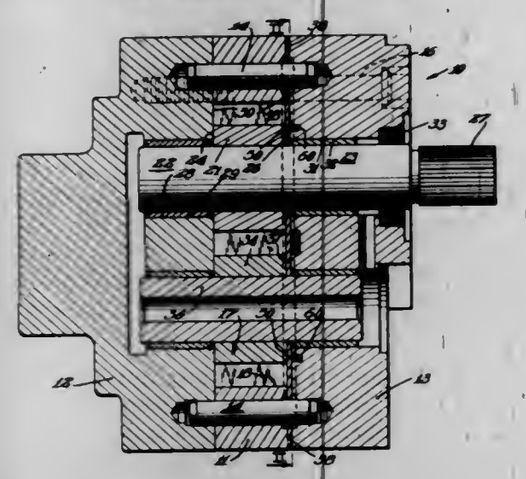


3,270,678
SELF-PRIMING CENTRIFUGAL PUMP
James A. La Monica, Salem, Ohio, assignor to Crane Co., New York, N.Y., a corporation of Illinois
Filed June 30, 1964, Ser. No. 379,121
2 Claims. (Cl. 103—113)

1. A self-priming, axial feed, centrifugal pump comprising
a casing having an axially extending fluid inlet opening and an outlet opening in the upper portion thereof,
a rotatable impeller within the casing having an intake eye at its axis connected to the inlet opening,
a single volute vane member surrounding the impeller so as to define a continuously expanding volute passageway outwardly of the periphery of the impeller which diverges increasingly radially outwardly in the direction of impeller rotation,
a cutwater at the narrowest part of said passageway and a discharge opening approximately 360° therefrom each located substantially in a vertical plane through the impeller axis,
a recirculation chamber between the vane member and casing outwardly of the volute passageway extending from the discharge opening and to about 270° in the direction of impeller rotation,

an elongated closure projecting outwardly from and integral with the vane member considerably wider circumferentially than it is radially and defining a priming passage having an inlet mouth opening axially into the recirculation chamber between 180° and 270° from said discharge opening and having,
a discharge port at the end of said priming passage opening into the volute passageway at a location closely adjacent one side of said enclosure so as to be circumferentially offset in a direction of continuously decreasing area of said volute passageway whereby an optimum relationship is achieved between suction power at the port and air-free recirculated fluid at the mouth of the priming passage.

3,270,679
PUMP ASSEMBLY
Darrel R. Sand, Plymouth, and Arlan M. Connell, Livonia, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Aug. 13, 1964, Ser. No. 389,256
8 Claims. (Cl. 103—126)



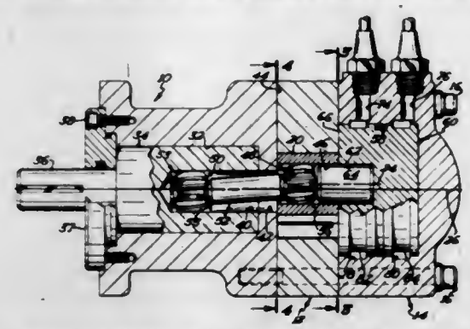
1. A pump comprising in combination a housing, an external gear meshing with an internal gear and located eccentrically within said internal gear to provide a generally crescent-shaped space between said gears, said housing enclosing said gears and defining with said gears a pumping space, a pair of spaced support members extending transversely of said pumping space, a resilient support member seated on said spaced support members, respectively, a partition carried by said resilient support member dividing said pumping space into intake and pressure delivery chambers, said resilient support member and

said partition extending transverse of said pumping space and being in contact with said housing, said partition also being in contact with the ends of the teeth of both gears and having curved extremities for providing contact surfaces with said spaced support members, respectively.

3,270,680
PRESSURE LOADED GEAR PUMP

Beldon L. Rich, Kokomo, Ind., assignor to Kingston Products Corporation, Kokomo, Ind., a corporation of Indiana

Filed Dec. 17, 1964, Ser. No. 419,064
16 Claims. (Cl. 103—126)



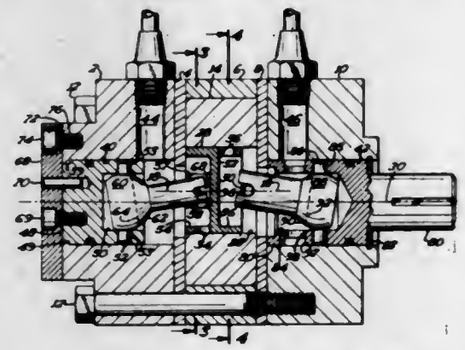
1. A gear pump comprising,
a housing having a pumping chamber including an inlet and an outlet,
rotary gears for pumping fluid from the inlet to the outlet,
said casing having a wall on one side of said chamber opposite the adjoining side faces of the gears characterized by a relief recess opposite said pumping chamber and a sealing surface outwardly of said relief recess,
an end plate interposed between said gears and said wall having a sealing face on one side thereof for engaging the side faces of the gears and a motive face on the other side thereof to form a wall of said relief recess,
said end plate having at least one opening opposite the outlet side of the pump for conducting fluid at pump generated pressure into said relief recess, and
an elongated sealing member having its opposite ends clamped between said sealing surface and said motive face at spaced apart points on the inlet side of the pump and having an intermediate section curved through said relief recess on the outlet side of the pump,
thereby to partition the relief recess into a pressure control zone communicating with said opening to load a corresponding area of said motive face with discharge pressure, and
a reduced pressure zone on the inlet side of the pump.

3,270,681
ROTARY FLUID PRESSURE DEVICE

Lynn L. Charlson, Minneapolis, Minn., assignor to Germane Corporation, Minneapolis, Minn., a corporation of Minnesota

Filed Nov. 18, 1964, Ser. No. 412,100
14 Claims. (Cl. 103—130)

1. In a fluid pressure device, fluid inlet and outlet means, an internally toothed ring member defining the outer wall of a chamber, a cooperating externally toothed star member disposed eccentrically in said chamber, one of said members being capable of orbital movement about the axis of the other of said members with the teeth of said members intermeshing in sealing engagement to form expanding cells on one side of the line of eccentricity and contracting cells on the other side of said line during relative movement between said members, one of said members being rotatable about its own axis relative to said other member at a slower speed than said orbital movement during relative rotation between said members, valve means operatively connected to the orbiting one of said members so that its rotational speed is the same as the orbiting speed of said one of said members, said valve means defining fluid passage means which com-

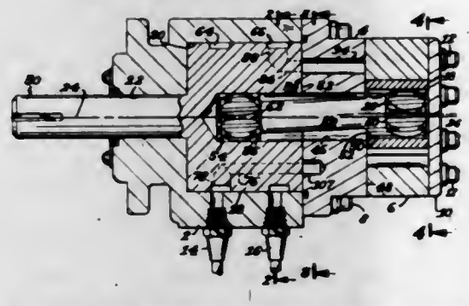


prise fluid supply means only on one side thereof in communication with said fluid inlet means and fluid exhausting means only on the other side thereof in communication with said fluid outlet means, said valve means being indexed with reference to the position of said star member relative to said ring member so that upon rotation of said valve means said fluid supply means communicate with said expanding cells, a drive shaft rotatably mounted relative to one of said members, and intermediate shaft means having one end thereof operatively secured to one of said members for common orbital and rotary movement therewith and the other end operatively connected to said drive shaft for common rotary movement with said drive shaft.

3,270,682
ROTARY FLUID PRESSURE DEVICE

Lynn L. Charlson, Minneapolis, Minn., assignor to Germane Corporation, Minneapolis, Minn., a corporation of Minnesota

Filed Jan. 22, 1965, Ser. No. 427,379
6 Claims. (Cl. 103—130)



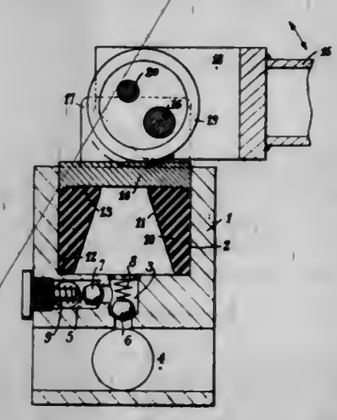
1. In a fluid pressure device, a casing, fluid inlet and outlet means, an internally toothed ring member defining the outer wall of a chamber, a cooperating externally toothed star member having fewer teeth than said ring member disposed eccentrically in said chamber and being capable of orbital movement about the axis of said ring member, the teeth of said members intermeshing in sealing engagement to form expanding cells on one side of the line of eccentricity and contracting cells on the other side of said line during relative movement between said members, said star member having a concentric bore and being rotatable about its own axis in the opposite

direction and at a slower speed than said orbital movement during relative rotation between said members, a spool member rotatably disposed in said star member bore, spool anchoring means for allowing said spool to follow said orbital movement of said star member but preventing rotational movement of said spool relative to said ring member during operation of said device, a plurality of circumferentially arranged ports in said spool member comprising a first series of circumferentially arranged fluid feeding ports communicating with said fluid inlet means and a second series of ports being arranged alternately relative to said first series of ports a fluid tight partition in said spool member separating said first series of ports from said second series of ports, a series of passages in said star member which extend from spaces between the teeth thereof to said bore thereof, said series of star passages upon relative movement between said star and spool members being sequentially communicable with each of said plurality of spool ports to effect communication between said inlet means and the expanding cells on one side of said line of eccentricity and between said outlet means and said contracting cells on the other side of said line of eccentricity.

3,270,683
PORTING ARRANGEMENT FOR BALANCING VALVE OF FLUID PRESSURE DEVICE

Hugh L. McDermott, Minneapolis, Minn., assignor to Char-Lynn Company, Minneapolis, Minn., a corporation of Minnesota

Filed Aug. 4, 1965, Ser. No. 477,207
10 Claims. (Cl. 103—130)



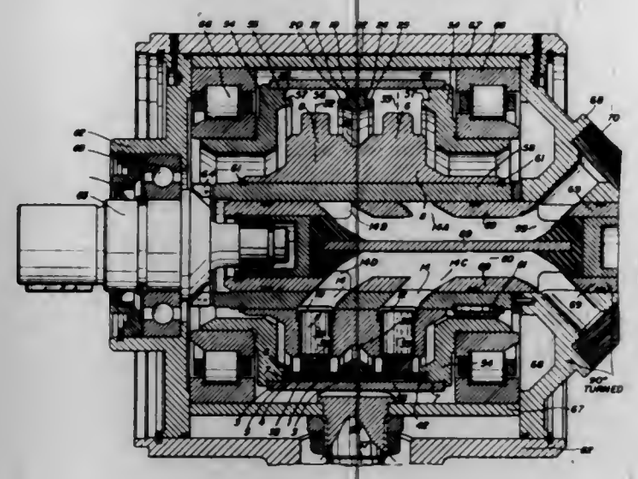
1. A rotary fluid pressure device comprising a casing, fluid inlet and outlet means, an internally toothed ring member, a cooperating externally toothed star member having fewer teeth than said ring member disposed eccentrically relative to the axis of said ring member, one of said members having rotational movement about its own axis and one of said members having orbital movement about the axis of the other of said members with the teeth of said members intermeshing in sealing engagement to form expanding cells on one side of the line of eccentricity and contracting cells on the other side of said line during relative movement between said members, first and second relatively movable valve elements having respective first and second slidably engaging surfaces with one of said valve elements being movable in synchronism with one of said movements of one of said members, said first valve element having a plurality of passages communicating with said expanding and contracting cells and having passage openings defined in said first surface arranged circumferentially relative to the axis thereof, said second valve element having ports having openings defined in said second surface arranged circumferentially relative to the axis thereof, said ports including a first group of ports having constant fluid communication with said inlet means and a second group of ports having constant fluid communication with said outlet means, said first valve element passage openings being registerable with at least a portion of said second valve element port openings during relative movement between said members to direct fluid from said fluid inlet means to said expanding cells and to direct fluid from said contracting cells to said fluid outlet means, and a plurality of circumferentially arranged fluid pressure balancing recesses in said first valve surface having openings in said first surface which are alternately and symmetrically arranged relative to said passage openings and are equal in number to said passage openings.

3,270,684
PISTON MACHINE

Jean Pasquali, 6 Rue du Square, Bois d'Arcy, France; Yvon Pranthois, 74 Ave. de la 2ème D.B., Argentan, France; and Marcel Dordain, 23 Rue des Capucins, Argentan, France

Filed Dec. 3, 1963, Ser. No. 327,618
Claims priority, application France, Dec. 11, 1962, 918,233, Patent 1,352,188; June 10, 1963, 937,553, Patent 1,352,188
3 Claims. (Cl. 103—148)

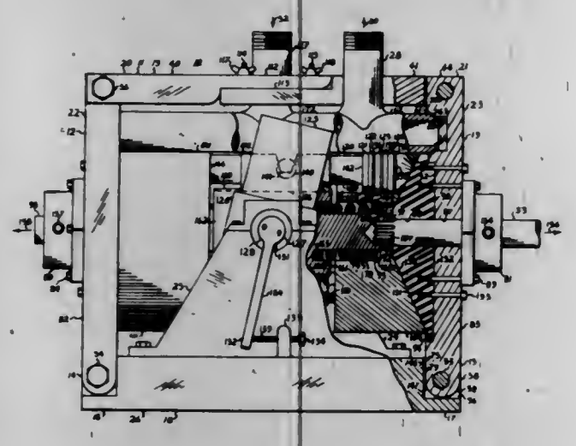
1. A piston machine comprising a cylinder provided with a bottom having suction and delivery orifices, a piston slidably mounted in said cylinder, and a pad of elastic material of relatively great thickness in which a frustoconical cavity having its large end opening toward said bottom is formed, said pad being slidably fitted in said cylinder between said piston and said bottom, wherein said cavity is also open at its small end adjacent to said piston and slightly rounded edges are provided between the frustoconical surface of said cavity and the end faces of said pad.



3,270,685
ROTARY RADIAL PISTON MACHINE

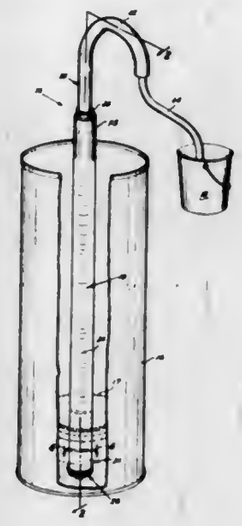
Karl Eickmann, 2420 Ishiki Hayama-machi, Kanagawa-ken, Japan

Filed July 3, 1963, Ser. No. 292,629
Claims priority, application Germany, July 4, 1962, B 67,901
15 Claims. (Cl. 103—161)



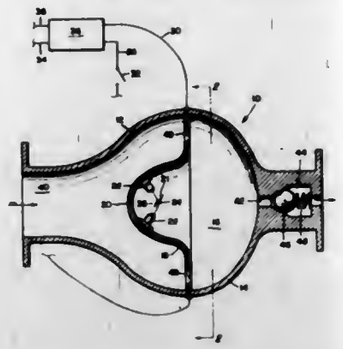
1. A rotary fluid machine comprising, in combination, a casing; at least one rotor rotatably mounted in said casing and formed with angularly spaced radial bores constituting cylinders; pistons reciprocable in each of said cylinders to vary the effective volumes of the cylinders to displace fluid relative to said cylinders; guide means surrounding said rotor and reciprocating said pistons upon rotation of said rotor; said guide means having an eccentricity relative to the rotor axis to define the piston strokes; said cylinders being arranged in at least two groups with the cylinders of each group having their axes in a respective common diametric plane through said rotor, said planes being spaced axially of said rotor; said rotor having at least two external annular radial ribs each centered axially on a respective one of said diametric planes, the axial widths of said ribs being less than the diameter of the associated bores; said guide means being formed to provide radially inwardly opening annular grooves arranged to have said ribs extend at least partially thereinto; said bores being

formed through said ribs to provide extended guide surfaces for said pistons, with resultant axial slotting of said ribs at angularly spaced locations each centered on a respective cylinder axis; the cylindrical surface of said rotor



being formed, between axially adjacent ribs, to have said guide means move at least partially close to it; whereby the effective piston stroke is increased substantially relative to the rotor diameter; and fluid inlet and outlet means communicating with said bores.

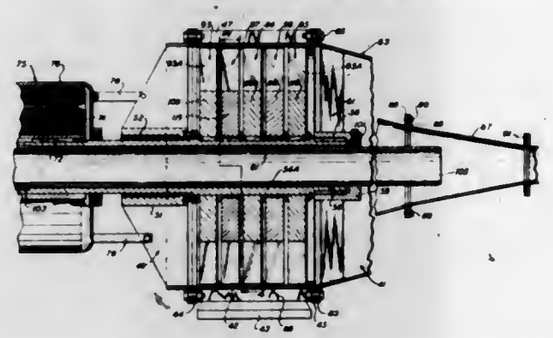
3,270,686
PUMP AND RELEASABLE HOUSING THEREFOR
Tom H. Thompson, Daytona Beach, Fla., assignor to Daytona Thompson Corporation, Daytona Beach, Fla., a corporation of Florida
Filed Feb. 13, 1964, Ser. No. 344,740
17 Claims. (Cl. 103—162)



1. In a pump, a housing comprising an elongated base having end portions, upstanding members having lower end portions, one said upstanding member being a cylinder head for the pump, pivotal connecting means for attaching said lower end portion of said one upstanding member to one said end portion of said base, connecting means for attaching said lower end portion of the other said upstanding member to the other said end portion of said base and for maintaining said other upstanding member in rigid upright spaced position, selectively releasable means attached to said one upstanding member above said lower end portion thereof for maintaining said one upstanding member in rigid upright spaced position, a shaft extending through said one upstanding member, a cylinder block rotor within said housing cooperating with said one upstanding member, said shaft including an end portion releasably connected to said rotor, said one upstanding member being adapted to pivot outwardly to expose the cylinders of said rotor upon release of said selectively releasable means and after disengagement of said shaft end portion from said rotor.

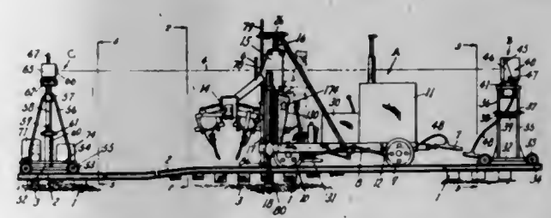
3,270,687
HAND PUMP
Siebolt Hettinga, 734 Washington, Pella, Iowa
Filed July 13, 1964, Ser. No. 382,103
4 Claims. (Cl. 103—178)

1. A hand operated pump comprising:
(a) a first tubular member having an inlet end and an opposite end connected together with a passage means,
(b) first valve means including a check valve having a movable center portion and a peripheral portion and a seat member for holding the peripheral portion of the check valve in a sealed relation with the inlet end of the first tubular member, said seat member coacting with the center portion of the check valve to permit the flow of a flowable material into said inlet end,
(c) a second tubular member having an inlet end and an outlet end connected together with a passage means, said second tubular member being slidably telescoped within the first tubular member,
(d) second valve means including a check valve having a movable center portion and a peripheral portion and a seat member for holding the peripheral portion of the check valve in a sealed relation with the inlet end of the second tubular member, said seat member coacting with the center portion of the check valve to allow the flow of the flowable material into the second tubular member, whereby on movement of the second tubular member out of the first tubular member the flowable material is moved through the first valve means into the first tubular member and on movement of the second tubular member into the first tubular member the flowable material is moved from the first tubular member through the second valve means into the second tubular member for discharge from the opposite end thereof,
(e) stop means on said second tubular means for limiting the movement of the second tubular means into the first tubular means, and
(f) hose means slidably positioned in said second tubular member, said hose means being movable relative to said second tubular member to vary the effective length of said second tubular member.



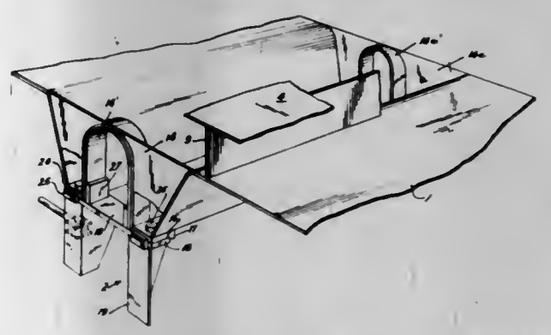
3,270,688
SPARK PUMP
Donald K. Skoog, Mountainside, N.J., assignor to Ingersoll-Rand Company, New York, N.Y., a corporation of New Jersey
Filed Nov. 3, 1964, Ser. No. 408,529
3 Claims. (Cl. 103—255)

1. A pump comprising:
a pumping chamber defined by a wall and a plate;
said plate having at least one continuously unobstructed opening therethrough for allowing fluid to be pumped to enter said chamber;
said wall having an outlet for discharging pumped fluid from said chamber;
at least two electrodes disposed in said chamber in spaced relation to one another to form a gap to be jumped by a spark for pumping;
electrical means for forming a spark across said gap to generate energy for pumping; and
means for directing said pumping energy in one direction.



2. The apparatus of claim 1 wherein said directing means is a parabolic portion of said plate with the open end of said portion facing said outlet.

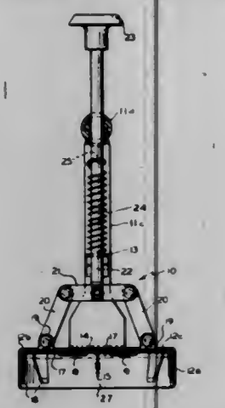
3,270,689
MATERIAL MOVING APPARATUS
Robert N. Dolphin, Vancouver, British Columbia, Canada, assignor to Mat-Mo Holdings Ltd., North Burnaby, British Columbia, Canada, a corporation of British Columbia
Filed Mar. 16, 1964, Ser. No. 352,234
1 Claim. (Cl. 103—263)



Apparatus for educing flow of solid, semi-solid and fluid materials comprising a base, a cylindrical housing on the base, bearing means supported by the housing, a tubular drive shaft extending through the housing and supported by the bearing means, an eductive tube extending through the tubular drive shaft and beyond each end of the housing, means adapted to provide relative rotation between the eductive tube and the drive shaft, a plurality of turbine rotors fixed to the drive shaft at spaced intervals thereon, a plurality of turbine stators fixed to the housing and interposed between the spaced turbine rotors, a conical shroud affixed at its large end to the cylindrical housing, said eductive tube extending through the housing and the shroud and beyond the diminished end of the shroud, a tapering venturi throat surrounding the extending end of the eductive tube, the relative diameters of the eductive tube and the venturi throat being such that air flow directed through the shroud and the throat by the turbine rotors and stators educes a flow of materials through the eductive tube to be discharged from the venturi throat.

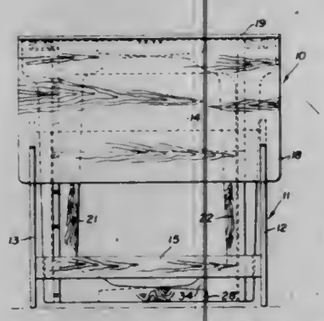
3,270,690
RAILWAY TRACK GRADING APPARATUS
Charles J. Derler, Ludington, and Merlin J. Applegate, Grand Rapids, Mich., assignors, by mesne assignments, to Jackson Vibrators, Inc., Ludington, Mich., a corporation of Illinois
Filed June 4, 1962, Ser. No. 199,720
5 Claims. (Cl. 104—7)

1. In a control system for a railroad ballast tamper having jacks and rail hooks for shifting the position of the track, the combination comprising, a first carriage having a light source visible at said tamper, a light sensor coupled to said tamper and mounted to be held at a predetermined dimension from said track, a baffle supported on said tamper between said light source and said light sensor, said baffle having a slot disposed transversely to said dimension and being mounted relative to said track so that said slot moves parallel to said dimension as the jacks shift the track, said sensor including a plurality of light responsive cells disposed parallel to said dimension and facing said light source, and a circuit coupling said cells so that a circuit output is obtained whose direction and magnitude is determined by where the light passing through said slot from said source strikes said sensor.



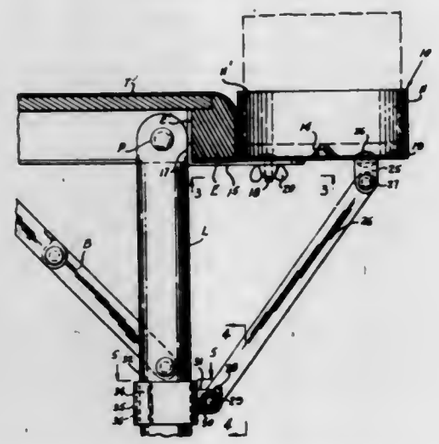
3,270,691
LOCOMOTIVE TRUCK
Fritz Zoellner, Munich-Allach, Germany, assignor to Krauss-Maffei A.G., Munich-Allach, Germany
Filed June 26, 1962, Ser. No. 205,415
13 Claims. (Cl. 105—199)

1. In a railway vehicle of the type in which the trucks are free to swivel with respect to the vehicle body without a centric connection between the body and the trucks, in combination, a vehicle body; a truck adapted to extend at least in part beneath said body; an arrangement for swivelly coupling said body to said truck, said arrangement comprising a first component rigidly secured to and extending downwardly from said body, a second component positioned in the truck beneath said first component for rotative movements with respect to the truck about a vertical axis, and means detachably securing said



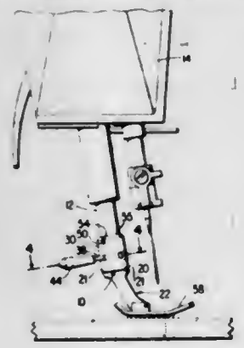
second component to said first component so that each thereof shares all rotative movements of the other, said first and second components defining between themselves a substantially horizontally extending channel open at opposite ends thereof, said first and second components including portions defining respectively upper and lower boundaries of said channel; and operating means for said vehicle mounted on said truck and including an elongated portion extending through said channel so that without interfering with said operating means said body and said first component may be lifted with respect to said truck and said second component when said components are disconnected from each other.

3,270,692
DOUGH CUTTING AND FORMING DEVICE
William F. Cummins, Sr., W. Lake Road, De Ruyter, N.Y.
Filed June 2, 1964, Ser. No. 372,036
8 Claims. (Cl. 107—68)



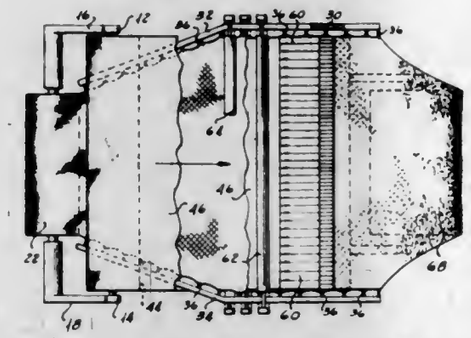
2. In a dough cutter, a shell having an open end, a knife mounted transversely in said shell with its knife edge facing the open end thereof, a wing member swingably mounted in the shell on each side of said knife and movable from a normal position substantially perpendicular to the knife to an extended position substantially parallel to the knife each wing having dough gripping means thereon, and means for moving said wings from normal to extended position.

3,270,693
FOLDING TABLE
Herman H. Lind, 1900 E. 30th St., Cleveland, Ohio
Filed Jan. 28, 1965, Ser. No. 428,809
10 Claims. (Cl. 108—16)



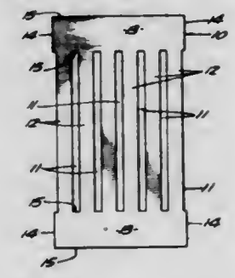
1. A folding table comprising a stationary frame assembly, a pair of legs hingedly connected to said stationary frame assembly adjacent opposite sides thereof, each of said legs being generally U-shaped and comprising a top section for supporting the top of the table and a bottom section adapted to engage the surface supporting the table, with one of said legs when folded lying flat against said stationary frame assembly and the other of said legs when folded lying flat against said one leg, a top member hingedly connected to said stationary frame assembly, said top member when unfolded being generally horizontally disposed and supported by said unfolded leg members, said table top when folded hanging downwardly over said other leg when folded thereby to provide a compact folded table, means for retaining each of said legs in their unfolded position supporting said top, said retaining means comprising a pair of flexible retaining members mounted on said top, with each of said legs being provided with an opening through which a curved leading end portion of a respective retainer member extends when said legs are moved to a support position generally normal to said stationary frame assembly and said top, said curved leading end portions of said resilient retaining members retaining said legs in such position.

3,270,694
COMBINATION ASH AND BEVERAGE TRAY FOR CARD TABLES
Hampton K. Wallace and Adele B. Wallace, both of 124 Fitzgerald Drive, Travis AFB, Calif.
Filed Jan. 12, 1965, Ser. No. 424,953
5 Claims. (Cl. 108—26)



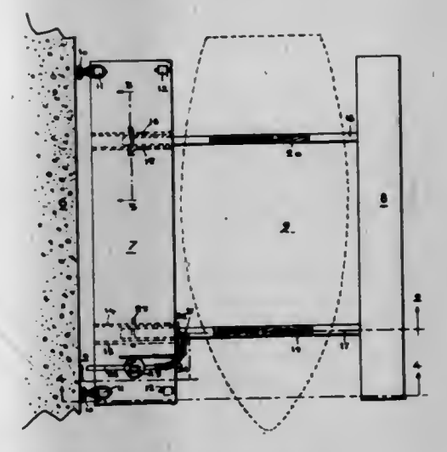
1. A combination ash and beverage tray for card tables, comprising a receptacle, a plate having an upturned end secured to the underside of said receptacle, adapted to engage the underside of the depending edge of a card table, a link pivoted at one end to the underside of said receptacle, a clamp adapted to engage the leg of a card table, and means pivotally connecting the other end of said link to said clamp.

3,270,695
SCREWLESS-TYPE PRESSER-FOOT CLAMP
Roger J. Ross, Rockaway, N.J., assignor to The Singer Company, New York, N.Y., a corporation of New Jersey
Filed Feb. 11, 1964, Ser. No. 343,977
4 Claims. (Cl. 112—240)



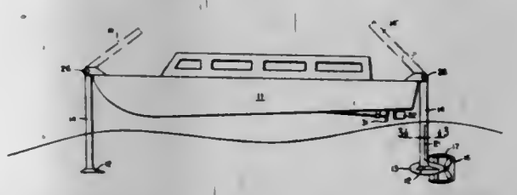
1. In a sewing machine having a presser-bar including a sleeve engaging portion and a corresponding presser-foot, means for releasably clamping the presser-foot to the presser-bar comprising a sleeve mounted upon the sleeve engaging portion of said presser-bar, said sleeve engaging portion having a vertical shank engaging slot and a clearance slot extending transversely to the vertical shank engaging slot, means connecting the sleeve to the presser-bar for biasing the sleeve for turning movement upon said sleeve engaging portion, said presser-foot including an elongated shank, said elongated shank being adapted to fit into the vertical shank engaging slot, said shank having an indent therein, said sleeve having a pair of aligned locking pin receiving bores transverse to the longitudinal axis of the sleeve, and a locking pin adapted to slip into the pin receiving bores and through the clearance slot whereby said sleeve biasing means exerts a force which urges the locking pin into engagement with said indent thereby locking the presser-foot to the presser-bar.

3,270,696
METHOD OF MAKING A PUFFED FABRIC
Alvin N. Lowenstein, Elizabeth, N.J., assignor to McGregor-Doniger Inc., New York, N.Y., a corporation of New York
Filed Oct. 11, 1963, Ser. No. 315,579
2 Claims. (Cl. 112—262)



1. A continuous method of making a puffed fabric including the steps of feeding a two-way stretchable fabric through a stitching zone, stretching said fabric in the direction of feeding in the course of said feeding operation, concomitantly stretching said fabric in a direction transverse to the direction of feeding in the course of said feeding operation as it passes through said zone, feeding a relatively inextensible face fabric through said zone together with said stretchable fabric and securing said fabrics together in said zone with stitching extending both in the direction of feeding and transversely thereto.

3,270,697
METHOD FOR FORMING A PIPE CENTERING DEVICE
James R. Solum, Los Angeles, Calif., assignor to B & W Incorporated, Torrance, Calif., a corporation of California
Filed Oct. 2, 1962, Ser. No. 227,805
4 Claims. (Cl. 113—116)



1. A method of forming a centralizer having a pair of spaced cylindrical collars and a plurality of circumferentially spaced and outwardly bowed staves extending between said collars, comprising the steps of: forming a flat blank having a pair of spaced panels and a plurality of spaced ribs extending between and integrally joined to said panels, forming each of said panels into a cylinder having abutting ends and each of whose axis is substantially aligned with the other, said ribs extending longitudinally between said cylinders, confining said panels to their cylindrical shape and urging said panels axially toward each other and forcing said ribs outwardly by means of internal dies into engagement with mating confining dies for forming the profile of the centralizer staves, and joining said abutting ends of each cylinder for forming the cylindrical collars.

3,270,698
FLOATING DRY DOCK
Marcel R. Fort, Plantation, Fla. (1600 NE. 126th St., North Miami, Fla.)
Filed Feb. 25, 1965, Ser. No. 435,251
7 Claims. (Cl. 114—45)

1. A floating dry dock comprising
(a) a first pontoon,
(b) said pontoon carrying securing means for connecting said dry dock to a dock,
(c) said pontoon also providing docking means for a boat,
(d) a second pontoon spaced from said first pontoon by a plurality of arms,
(e) said arms hingedly connected to the first pontoon,
(f) said arms rigidly connected to said second pontoon, and
(g) means for filling and emptying said second pontoon.

3,270,699
HYDROFOIL CRAFT
Vannevar Bush, 304 Marsh St., Belmont, Mass.
Filed Mar. 4, 1965, Ser. No. 437,146
24 Claims. (Cl. 114—66.5)

1. In a submerged hydrofoil craft, the combination including completely submerged depth sensing means and means to sense vertical accelerations of at least one foil, means to supply fluid under pressures determined by depth and by vertical accelerations of said one foil, control mechanisms to vary the lift coefficients of said one foil, means to actuate said mechanisms in response to

fluid pressure variations resulting from depth variations and vertical accelerations of said one foil, and means to cause outward fluid flow through the depth sensing means to prevent fouling thereof.

3,270,700
SHIPBOARD INSTALLATION OF ELONGATED PRESSURE VESSELS
Harold B. Kohn, Yonkers, and Morgan Chuan-Yuan Sze, Garden City, N.Y., Harold L. Cook, Jr., Bellaire, Tex., Herbert C. Secord, Little Cheverells, Markyate, Herts, England, and Øystein Arvesen, Haslum, Norway, assignors to Vehoc Corporation, a corporation of Delaware
Filed July 13, 1964, Ser. No. 382,179
8 Claims. (Cl. 114—74)

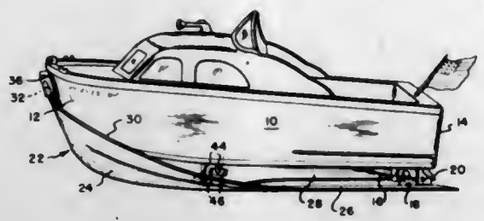
8. In the shipboard installation of elongated substantially cylindrical vessels containing refrigerated pressurized natural gas, each vessel being disposed vertically in a hold on a deck structure and being rounded at its lower end, underlying installation means comprising

(a) a flat annular balsa pad on the deck structure under each vessel;

(b) a cylindrical wooden shear plug located on the deck structure and extending closely through and eccentrically up from each pad in slideable rotatable engagement therewith;

(c) a secondary barrier comprising

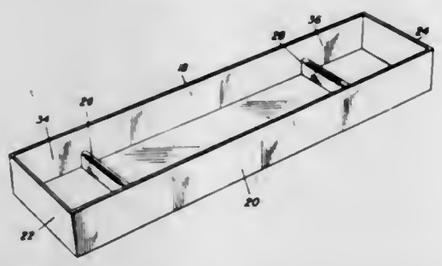
(i) a first foamed insulating layer covering the deck structure between the pads,



(ii) a double ply wooden wall covering the first foamed insulating layer and the pads between the upper portion of the shear plugs, and

(iii) a continuous film of polytetrafluoroethylene extending between the plies of said wall and closely capping the upper portion of each shear plug, and

(d) an annular wooden support bowl disposed on the secondary barrier closely about the capped portion of each shear plug and formed with a concave seat receiving the rounded lower end of the associated vessel in mating ball-and-socket engagement.

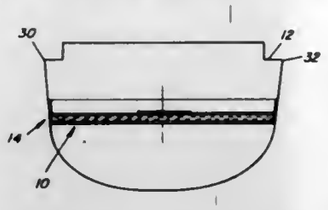


3,270,701
STABILIZED WATERCRAFT AND STABILIZER FOR MINIMIZING PITCHING AND WAVE SHOCK OF SMALL CRAFT
Joseph Kubas, 514 Eskridge Way, Olympia, Wash.
Filed Oct. 9, 1964, Ser. No. 402,781
7 Claims. (Cl. 114—121)

1. In a boat including a hull having a bow, a bottom and a propeller at the stern, a stabilizer for stabilizing the boat against pitching, side dipping and for minimizing wave shock action during the running of the boat, said stabilizer comprising a rigid sheet structural member fitting the bow and bottom of the boat and extending from the upper portion of the bow to the stern of the boat, means for securing the upper forward portion of the stabilizer member to the bow of the boat, resilient means

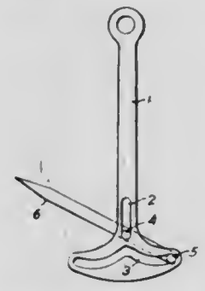
for securing the stabilizer member to the hull at approximately the mid-portion of the bottom of the boat, said last mentioned means being adapted to hold the stabilizer member in spaced relation to the bottom of the boat in one position of said means and to permit the nesting of the stabilizer member against the bottom of the boat in another position of said resilient means.

3,270,702
SHIP STABILIZER COMPRISING WEIRS
Sheldon B. Field, Floral Park, N.Y., assignor to John J. McMullen Associates, Incorporated, New York, N.Y., a corporation of New York
Filed July 30, 1964, Ser. No. 386,187
5 Claims. (Cl. 114—125)



1. A ship stabilizer comprising an elongated containing means partially filled with a liquid body, the top surface of which is in a free surface condition, said containing means having a bottom, sides and a longitudinal axis, said containing means including two upstanding weir means each mounted off-center toward opposite ends within said containing means, said weir means having a height less than that of said sides, said weir means disposed substantially perpendicular to said longitudinal axis and contacting said sides and said bottom of said containing means, and that portion of said containing means between said two weir means comprising a substantially unobstructed flume.

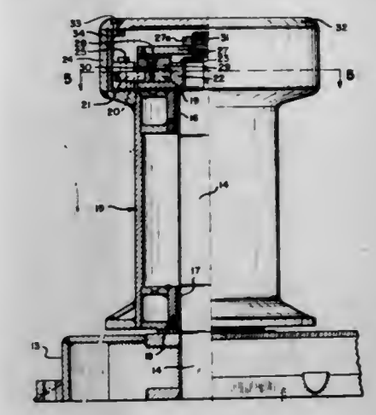
3,270,703
SHIP STABILIZER COMPRISING SURFACE COVERING MEANS
Sheldon B. Field, Floral Park, N.Y., assignor to John J. McMullen Associates, Incorporated, New York, N.Y., a corporation of New York
Filed July 30, 1964, Ser. No. 386,285
5 Claims. (Cl. 114—125)



1. A stabilization system for a vessel comprising an elongated tank having its longitudinal axis arranged perpendicular to the roll axis of the vessel, a first liquid body partially filling said tank to a predetermined level which is spaced below the top of said tank, said tank being substantially free of liquid transfer damping structure, said first liquid body having a distributed mass which when alone in said tank oscillates at a natural fundamental

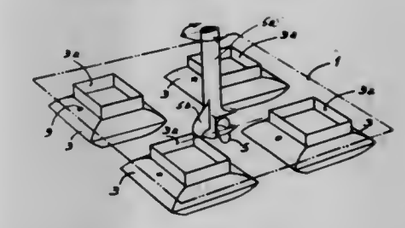
frequency substantially removed from a 90° phase lag of the vessel rolling frequency, a second liquid body which is immiscible with said first liquid body floating on the top, exposed surface thereof, the upper surface of said second liquid body being spaced below said top of said tank, said second liquid body being viscous and having a mass sufficient to dampen the fundamental transfer of said first liquid body so that the first and second liquid

body combination collectively transfers in oscillation with a fundamental frequency equal to the fundamental frequency of said ship roll and the phase oscillation of said first and second liquid body combination being such that there is as successive accumulation of liquid at that end region of said tank which is rising, each accumulation being sufficient to oppose the rise so that the vessel is stabilized.



3,270,704
ANCHOR
Stig Johan Bruno Ekberg, Hasselbyvagen 78, Spanga, Sweden
Filed Dec. 7, 1964, Ser. No. 416,392
Claims priority, application Sweden, Dec. 9, 1963, 13,612/63
4 Claims. (Cl. 114—208)

1. An anchor comprising a shank, a pair of movable flukes located one on each side of the shank, the lower part of said shank having a first slot extending along the symmetry axis of the shank and a second slot located below said first slot and having two branches located one on each side of said symmetry axis, each of said branches making an angle with said axis in the proximity thereof, a first pin movable in said first slot, and a second pin movable in said second slot, said pins being rigidly connected to both flukes.



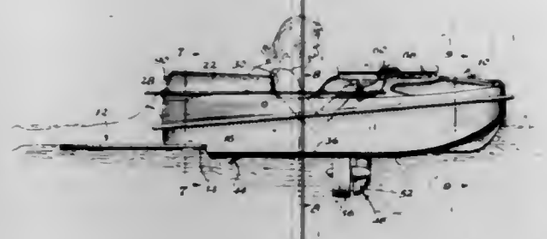
3,270,705
BOLLARDS
Karl A. Roeggen, Omagaten 47B, Kristiansund N., Norway
Filed Oct. 22, 1965, Ser. No. 501,072
8 Claims. (Cl. 114—218)

1. In a bollard for a ship including a stationary member and a post member rotatably mounted thereon round which a line, hawser or rope may be wound, in which the post is rotatable in one direction but locked against rotation in the other direction by means of a ratchet mechanism including ratchet teeth and cooperating pawls operable in such a manner that they engage the ratchet teeth and prevent relative movement between the pawls and ratchet teeth, the improvement in which the ratchet teeth are carried by one of said members and the pawls are carried by the other member, and brake means acting on a portion of the ratchet mechanism to normally prevent rotation of the post member in said other direction but

adapted to permit its rotation in that direction on the application of a predetermined force tending to rotate the post member of the bollard when held by the ratchet mechanism.

3,270,706
SELF-PROPELLING BARGE
Jacques Muller, La Garenne-Colombes, France, assignor to Rellumit, Inter, S.a.r.L., La Garenne-Colombes, France, a corporation of France
Filed Oct. 9, 1964, Ser. No. 402,896
Claims priority, application France, Oct. 18, 1963, 951,002
1 Claim. (Cl. 115—35)

A barge comprising a rigid rectangular platform, a plurality of square floats secured to the undersurface of the platform at each of the corners thereof respectively, corresponding sides of said floats extending parallel to each other, each of the side walls of each float being substantially elliptical in contour tapering outwardly from the top and bottom edge of each side wall to the center line of each side wall, said center line extending parallel to the major axes of the ellipse, a propeller shaft extending vertically through said platform and centrally located between said floats, a propeller mounted at the lower end of said shaft on an axis at right angles thereto, a rudder secured to the lower end of the propeller shaft and movable therewith and means to rotate said shaft through an angle of 360°.

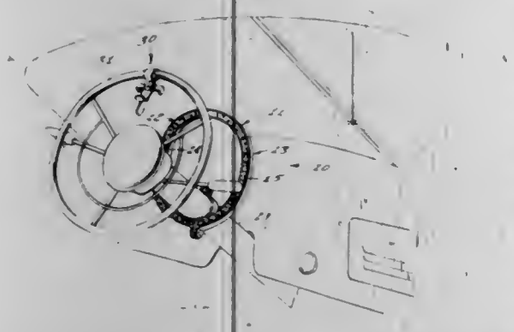


3,270,707
AQUATIC DEVICE
Frank G. Rozanski, Perry, N.Y., assignor to Aqua-Dart, Inc., Perry, N.Y.
Filed Nov. 6, 1963, Ser. No. 321,791
5 Claims. (Cl. 115—70)

1. An aquatic vehicle comprising, in combination,

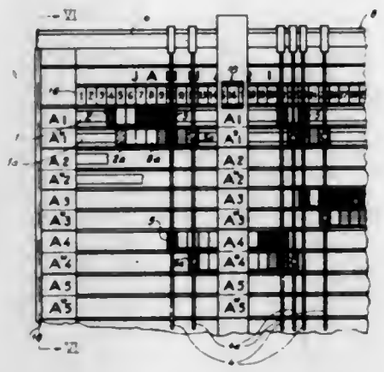
a hull having a rearwardly disposed, generally horizontal deck and a generally horizontal bottom, a pair of vertical fin members extending forwardly at the rear of said hull along the opposite sides of said deck and presenting forwardly facing abutment surfaces adjacent their forward ends,

a control board hingedly secured to the rearward end of said hull,



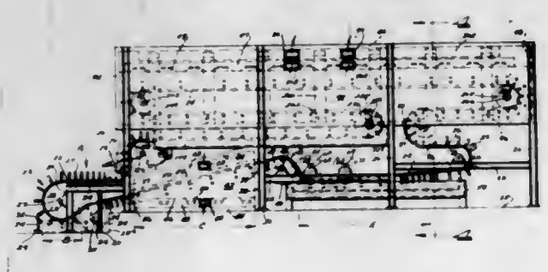
said fins projecting rearwardly of said hull in overlying relation to the forward end of said control board to

limit upward pivotal movement thereof to a position disposed generally parallel to and substantially coplanar with said bottom of hull,



and propulsion means carried by said hull.

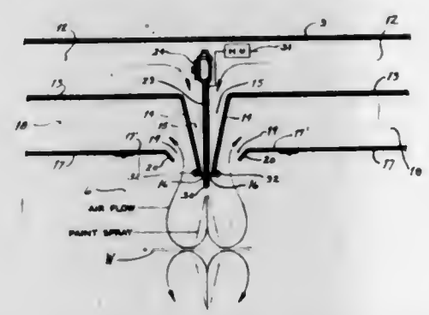
3,270,708
STEERING WHEEL TURN INDICATOR
Joseph A. Freed, 849 Beck St., Bronx, N.Y. 10459
Filed Aug. 23, 1965, Ser. No. 481,461
2 Claims. (Cl. 116—31)



1. In a steering wheel turn indicator the combination of a transparent main body of ellipsoidal configuration comprised of a right and left body element, each of said body elements having a semi-ellipsoidal bowed portion between opposite ends, each of said body elements having one of their said ends pivotally secured together, a semi-circular ring component adjacent the other of said ends on each said body element, said semi-circular ring components together forming a ring when said body elements are assembled together to form said main body; said ring having a central opening for receiving an automobile steering post therethrough, each said ring component comprising a semi-circular portion between opposite ends formed into lugs supporting nut and bolt means for frictional securement of said ring around said automobile steering post, and radial indication means on said main body, said radial indication means comprising a pair of side walls, a bottom wall and an upper wall between an intermediate part of said side walls, said walls forming each said semi-ellipsoidal bowed portions, said walls enclosing a semi-ellipsoidal pocket, a removable semi-ellipsoidal dial within each of said pockets, numerical designations on said dials, an opening through said upper walls over each said numerical designation, and an associate member secured to an automobile steering wheel, said member comprising a clamp, a slide lever and turn lever, said clamp having an extension with an arrow imprinted thereupon for radially aligning said member with one of said numerical designations to indicate to a driver the directional angle of the automobile front wheels.

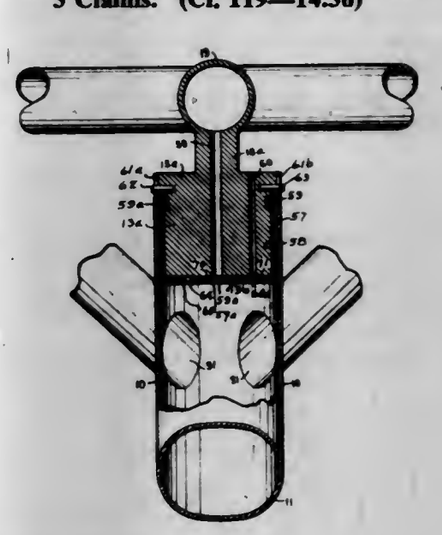
3,270,709
DEVICE FOR ORGANIZING AND PLANNING VARIOUS ACTIVITIES
Arthur Berge, Wennerbergsgatan, Stockholm 6, Sweden
Filed Jan. 23, 1964, Ser. No. 339,713
Claims priority, application Sweden, Feb. 1, 1963, 1,106/63; May 29, 1963, 5,980/63
8 Claims. (Cl. 116—135)

1. A device for indicating and displaying the coordination of different types of operations comprising, a support structure, a plurality of linearly arranged first display means supported on said structure defining a first axis, each of said display means representing one of said operations, a second plurality of linearly arranged display means supported on said structure defining a second axis representing a time scale perpendicular to said first axis, a plurality of runner means supported on said support structure in alignment with each of said first display means for movement parallel to said second axis, means carried by certain of said runner means for imparting distinguishing visual characteristics thereto, a plurality of indicator rod means supported on said support structure for movement parallel to said second axis and extending perpendicularly thereto, and pointer means supported on said rod means for movement axially of said rod means and pointing in a direction parallel to said first axis.



3,270,710
DIP-COATING MACHINE
John R. Johnson and Robert M. Smith, Toledo, Ohio, assignors to Owens-Illinois, Inc., a corporation of Ohio
Continuation of application Ser. No. 835,360, Aug. 21, 1959. This application Sept. 5, 1962, Ser. No. 224,591
4 Claims. (Cl. 118—56)

1. A machine for coating glass bottles with a plastic material, comprising in combination a bottle loading station, a first dipping tank for containing a bath of a liquid primer material, a first oven chamber, a radiant heater defining a tunnel-like heating zone, a second dipping tank for containing a bath of a liquid plastic coating material, a detearing device, a second oven chamber, a cooling chamber, a bottle unloading station, a pair of parallel



endless carriage chains, a plurality of rotatable bottle-carrying chucks, means for mounting said chucks for carriage intermediate said carriage chains, means, including a plurality of pairs of sprockets, defining an endless path for movement of said carriage chains, said defined endless path extending through the machine for carrying said chucks in succession past said first dipping tank for dipping bottles on said chucks in said bath of primer material, through said first oven for preheating the primed bottles, through said radiant heater zone for externally heating bottles on said chucks, past said second dipping tank including an initial, downwardly inclined travel for dipping bottles on said chucks into the said coating material by introducing them into said plastic material with their axes inclined to the surface of the bath and then gradually uprighting the articles to a vertical full dip position in the bath, and a subsequently, upwardly inclined travel for gradually removing dipped bottles from said coating fluid and including a span of travel above said body of coating fluid sufficient to allow excess coating material to drain from the bottles, past said detearing device while continuously moving the articles from an inclined upright position to an inverted position and coincident with said inverting movement said detearing device drivably engaging said chucks thereby continuously rotating the bottles axially for smoothing the coating on the dipped bottles during their said inverting movement heating means mounted at the terminal end of said inverting movement for applying heat to the coatings on the bottles as they complete their said inverting movement, said path then extending through said second oven for fusing the applied coating on the bottles, and through said cooling chamber, and drive means operatively connected for continuously driving one of said pairs of sprockets for continuously moving said carriage chains.

3,270,711
ELECTROSTATIC COATING SYSTEM
Charles Leach, St. Louis, Mo., assignor, by mesne assignments, to Glasser Products Corporation, a corporation of Delaware
Filed July 1, 1963, Ser. No. 291,899
13 Claims. (Cl. 118—627)

10. In an electrostatic coating system having an enclosure with a top wall, side walls and end walls, and means for conducting therethrough an article to be coated, the improvement comprising air-circulating means for removal from said system of dust, foreign matter, undeposited coating materials, and the like, comprising means provided on opposite sides of, and within, said encolsure in opposed, transversely aligned relationship for defining nozzle-like openings, means for directing air through said nozzle-like openings for collision of the air masses emitted by aligned nozzle-like openings whereby through the impact of collision the air will be returned in the general direction of the emitting nozzle-like opening, and passage-forming means provided laterally of said nozzle-like openings for receiving the returning air for discharge.

3,270,712
MILKING MACHINE CLAW
Paul R. George, Sr., Cambridge City, Ind., assignor to Golay & Co., Inc., Cambridge City, Ind.
Filed July 29, 1964, Ser. No. 385,960
3 Claims. (Cl. 119—14.36)

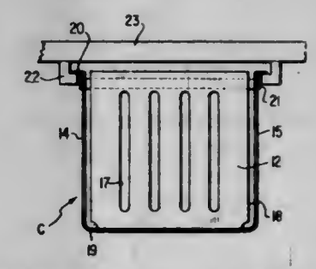
1. For a milking machine,

a member receiving milk and having an approximately constant internal vacuum pressure;

a milk discharge line leading from said member;

tube means within which pressure cyclicly varies between atmospheric and vacuum;

means providing a surface within said member through which a passageway leading from said tube means opens;

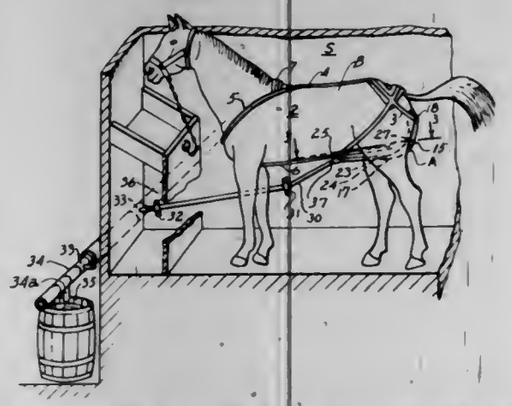


a passageway leading from the atmosphere and opening through said surface;

a flexible diaphragm disposed across said surface and covering the openings of both of said passageways; and

said diaphragm being carried toward and away from said passageways, alternately closing off and opening them under differential pressures set up on opposite sides of the diaphragm, providing an admittance of atmospheric air to said member in accordance with milk flow into said discharge line;

said diaphragm having an opening to one side of said passageways to transmit said atmospheric air therethrough.



3,270,713
SMALL ANIMAL CAGE
Jeanette L. Rubricius, 85—35 Midland Parkway, Jamaica, N.Y.
Filed Sept. 17, 1964, Ser. No. 397,107
2 Claims. (Cl. 119—17)

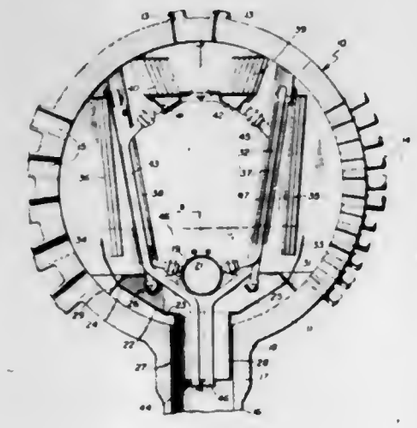
2. A small animal cage comprising a unitary body of relatively rigid sheet material having an apertured quadrangular bottom wall panel through which animal wastes are adapted to pass and apertured side wall panels integral with said bottom panel and rising therefrom at approximately right angles, said bottom wall panel joining each of said side wall panels in a smoothly contoured curve, the length of each of said side walls being shorter

than the corresponding edges of said bottom, whereby adjacent edges of said side wall panels are spaced from each other to provide elongate slots, said sheet material being adapted to maintain the cage in a box-like form, when said side walls are positioned generally normal to the plane of said bottom wall panel, said slots terminating at their lower ends in openings in said bottom wall panel; flanges on the upper ends of a pair of opposed side wall panels extending outwardly therefrom and adapted to rest upon L-shaped supporting rails for suspension therefrom.

3,270,714
SYSTEM FOR COLLECTING URINE FROM PREGNANT MARES
John C. C. Gandier, Dorval, Quebec, Canada, assignor to American Home Products Corporation, New York, N.Y., a corporation of Delaware
Filed Mar. 2, 1965, Ser. No. 436,594
4 Claims. (Cl. 119—95)

1. An apparatus for automatically collecting feces-free urine from a plurality of female quadrupeds which comprises a conducting receptacle mounted on each quadruped, said receptacle having a body including a receiving mouth and a delivery end remote therefrom, means for retaining said receptacle in collecting position on the quadruped, a flexible and elastic pipe connected to said delivery end thereof, a fixture to one side of the place normally occupied by the quadruped to guide said pipe in a downward direction therefrom, a common pipe leading in a downward direction to a common receptacle, and a connection between said flexible and elastic pipe and the common pipe.

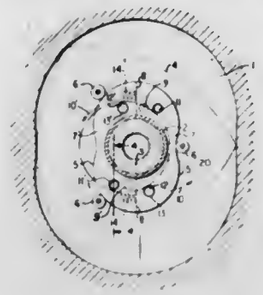
3,270,715
NON-SLIP TEMPLATES
Donald F. Dreher, P.O. Box 56, East Brookfield, Mass.
Filed Dec. 1, 1964, Ser. No. 416,961
4 Claims. (Cl. 120—41)



1. A template comprising a planar-formed body section of durable material, shaped and apertured in the manner dictated by its purpose, and having each of its surfaces specializedly modified in its affinity for a contacting element, such modification consisting of one of those described respectively as being made

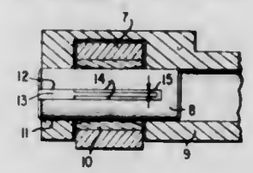
(a) frictionally affinitatious by means of attachment of an elastomeric composition to said surface,
(b) relatively nonaffinitatious frictionally, but pressurably keyable, to a contacting element by means of roughening said surface, or
(c) inherently nonaffinitatious by means of a surface coating comprising a chemical complex containing an inorganic radical,

said complex being of the order identifiable as silicone or Teflon, said coating means (c) being limited to one surface of said template, and said modifications oppositely disposed so as to permit conjunctive utilization when said elements are opposedly in contact respectively therewith, thereby permitting said template to be held reliably in the desired position with minimal application of holding force.



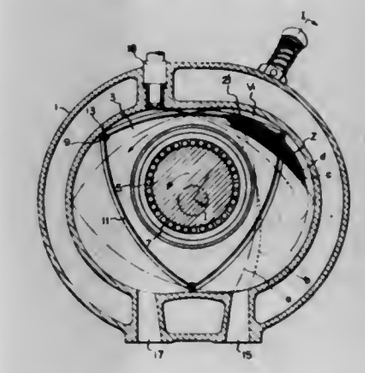
3,270,716
STEAM GENERATING UNIT
Max H. Kuhner, Oakham, Mass., assignor to Riley Stoker Corporation, Worcester, Mass., a corporation of Massachusetts
Filed Apr. 12, 1965, Ser. No. 449,683
1 Claim. (Cl. 122—459)

A steam generating unit, comprising



(a) a steam-and-water drum containing steam-separating apparatus, including a number of steam condensers receiving cold feed water and bringing it into heat exchange relationship with steam,
(b) a feed water pipe extending through the drum in the lower portion thereof and connected to the condensers,
(c) a plurality of downcomers extending from the bottom of the drum,
(d) a tray residing in the lower portion of the drum and spaced from the inner surface of the drum under the discharge end of the condensers, the tray being of substantial capacity to receive cold feed water as it leaves the said ends of the condensers and to prevent it from contacting the drum in the area of its junction with the downcomer and having an upper edge normally above the water level in the drum, and
(e) a sleeve extending downwardly from the bottom of the tray a substantial distance into each downcomer concentrically thereof, the said sleeve being spaced from the associated downcomer to form an annular space between the inner surface of each downcomer and the outer surface of its sleeve, so that relatively hot water flows from the drum through the space and mixes with relatively cold feed water flowing from the tray and the sleeve, the mixing taking place in the downcomer a substantial distance from the junction of the downcomer and the drum, the said steam separating apparatus including a drier carton having an underlying tray from which extends a downwardly extending pipe, the lower end of the said pipe extending through said sleeve a substantial distance into the said downcomer.

3,270,717
ROTARY-PISTON INTERNAL COMBUSTION ENGINE OF TROCHOIDAL CONSTRUCTION
Johannes Gassmann, Altbach, near Esslingen (Neckar), and Richard Ehrhardt, Stuttgart-Unterturkheim, Germany, assignors to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Filed Oct. 9, 1961, Ser. No. 143,843
Claims priority, application Germany, Oct. 13, 1960, D 34,498
19 Claims. (Cl. 123—8)

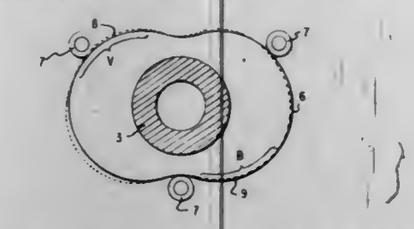


1. A rotary piston internal combustion engine of trochoidal construction comprising drive shaft means including eccentric means, polygonal piston means carrying out a rotary movement about said eccentric means as internal envelope form within an epitrochoidally-shaped housing, and means for imparting to said piston means a rotary movement about said eccentric means including a plurality of guide parts, cam means arranged at said guide parts and guide roller means, said guide parts being movably arranged at one of the two parts consisting of said piston means and said engine housing and said guide roller means being disposed at the other of said two parts, and pressure means elastically yieldingly pressing said guide parts with the cam means thereof against said guide roller means.

3,270,718
ROTARY-PISTON INTERNAL COMBUSTION ENGINE
Johannes Gassmann, Altbach, near Esslingen (Neckar), Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Filed Nov. 21, 1961, Ser. No. 154,009
Claims priority, application Germany, Mar. 28, 1961, D 35,757
20 Claims. (Cl. 123—8)

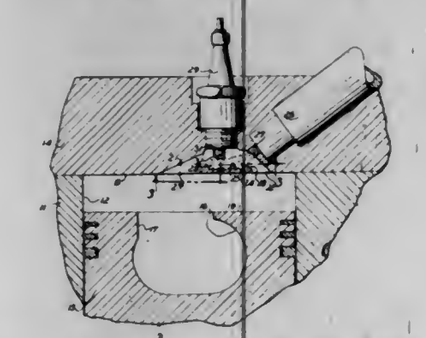
1. A rotary-piston internal combustion engine of trochoidal construction having a housing with an internal epitrochoidally shaped surface, comprising output shaft means including eccentric means, polygonal piston means adapted to carry out rotary movements about said eccentric means with the outer contour thereof approximating the internal envelope of the epitrochoidally-shaped surface of said housing, and means for imparting to said piston means said rotary movements including at least one trochoidally-shaped cam track rigid with one of the two parts consisting of said housing and piston means and bearing a predetermined relationship to the epitrochoidally shaped surface of said housing, and guide roller means for guiding the other part along said cam track, and guide roller means effectively providing an elastic yieldingness in the radial direction thereof and including bearing bolt means, bushing means for supporting said guide roller means on said bearing bolt means, said bearing bolt means being constructed as spring means provided with means limiting the spring path thereof.

3,270,719
PRESSURE REDUCING DEVICE FOR DIESEL TYPE ROTARY ENGINES
Yoshitsugu Hamada, Nishinomiya-shi, Japan, assignor to Yanmar Diesel Engine Co., Ltd., Osaka, Japan, a corporation of Japan
Filed June 5, 1962, Ser. No. 200,170
Claims priority, application Japan, July 25, 1961, 36/37,512
1 Claim. (Cl. 123—8)



A decompression device for providing decompression control in a diesel type rotary internal combustion engine comprising a housing having axially spaced end walls and a peripheral wall interconnecting said end walls to define between said walls a cavity with the inner surface of said peripheral wall having a two-lobed epitrochoidal profile, a rotor received in said cavity and supported for rotation with respect to said housing, said rotor having axially spaced end faces provided with end seal means for sealing engagement with said end walls and an outer surface with three circumferentially spaced apex portions provided with edge seal means for sealing engagement with the peripheral wall inner surface of the housing to divide the space between said inner surface and the outer surface of the rotor into three working chambers, and corner pins at the apex corners of the end faces of the rotor for holding said end face seal means and edge seal means, a suction port and an exhaust port each formed in said peripheral wall; said decompression device comprising a bore in one of said end walls, a normally closed control valve mounted within said bore and which, when actuated, provides communication between atmosphere and said cavity, said bore being located in an area of said end wall surface which is defined by three curved lines, namely, the line of rotor profile at the instant when the suction port in the engine housing has been closed by the rotor, the line of rotor profile at the instant when the volume of said working chamber under compression has been reduced during compression stroke to preferably one quarter of its maximum value, and the locus of the axis of the corner pin of the rotor.

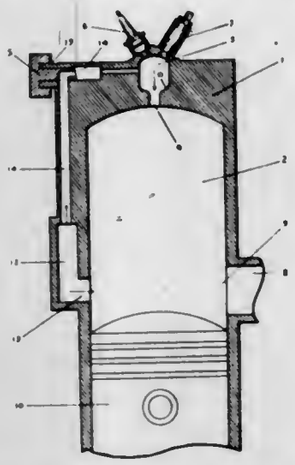
3,270,720
ROTARY PISTON INTERNAL COMBUSTION ENGINE
Richard Ehrhardt, Stuttgart-Unterturkheim, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Filed Mar. 2, 1964, Ser. No. 348,730
Claims priority, application Germany, Mar. 9, 1963, D 41,086
12 Claims. (Cl. 123—8)



11. In a rotary piston internal combustion engine of trochoidal construction having an envelope provided with an internal cam surface which together with the lateral

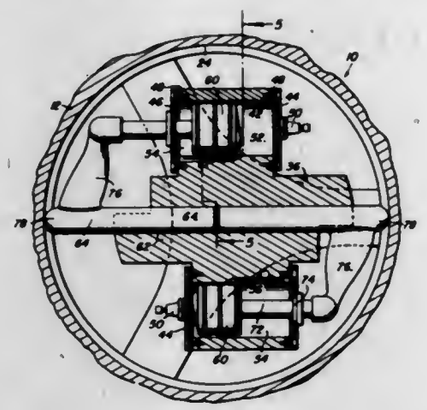
parts thereof defines an interior space through which extends an eccentric shaft on the eccentric of which is rotatably supported a polygonal piston the rotational speed of which held at predetermined ratio to the rotational

speed of the eccentric shaft by means of a transmission, the improvement essentially consisting of means in said transmission for equalizing non-uniformities in the piston mass to improve the uniformity in angular velocity of the piston.



3,270,721
INTERNAL COMBUSTION ENGINE COMBUSTION CHAMBERS
Laszlo Hideg, Dearborn Heights, Thomas M. Sebestyen, Taylor, and Aladar O. Simko, Detroit, Mich., assignors to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Jan. 2, 1964, Ser. No. 335,321
20 Claims. (Cl. 123—32)

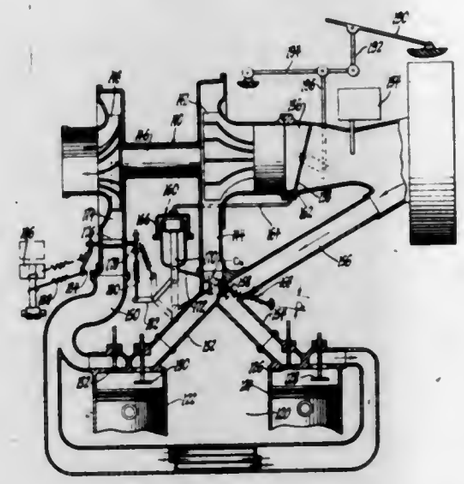
1. An internal combustion engine comprising, a cylinder, a piston member reciprocating in said cylinder, a cylinder head member enclosing said cylinder to form a combustion chamber, a cavity formed in one of said members, said cavity opening through a throat into the squish area between said piston and said cylinder head members, said cavity having sufficient volume to promote a squish induced air transfer from said squish area into said cavity as the piston member approaches its top dead center position, a fuel impingement surface in said combustion chamber communicating at one side with said squish area and at another side with said throat for causing a portion of the squish induced air transfer to traverse said fuel impingement surface, a fuel injection nozzle having at least one discharge orifice disposed to deposit a substantial portion of its fuel spray upon said fuel impingement surface during injection, the squish induced air transfer across said fuel impingement surface being adapted to sweep the deposited liquid fuel into said cavity, and an ignition device positioned in the path of the swept fuel particles and contiguous to said fuel impingement surface for igniting the fuel particles.



3,270,722
METHOD OF CONDITIONING LIQUID FUELS
John Springer Bernard, 2060 East 4800 South St., Salt Lake City, Utah
Filed Apr. 22, 1964, Ser. No. 363,059
3 Claims. (Cl. 123—32)

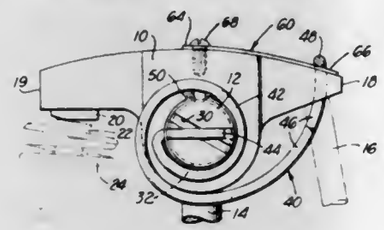
1. The method of conditioning and igniting fuel for combustion in a cylinder of an internal combustion engine, comprising the sequential steps of introducing free-oxygen bearing gas directly into a conditioning zone within said cylinder; passing a portion of said gas from said conditioning zone through a restricted orifice and into the combustion zone of said engine; increasing the pressure of said gas by compression while concomitantly spraying into said conditioning zone liquid fuel in an amount stoichiometrically in excess of the pressured free-oxygen bearing gas within said conditioning zone; completing said spraying action and detaining said sprayed fuel within said conditioning zone during the compres-

sion period, thereby allowing a portion of said sprayed fuel to transform from the liquid into the vapor state; igniting said fuel vapor within said conditioning zone after said spraying action, said ignition occurring in the presence of insufficient free-oxygen bearing gas to permit a complete combustion within said conditioning zone thereby leaving residual liquid fuel droplets therein; and flowing said residual liquid fuel droplets laterally into the gas stream ejected from said conditioning zone as said gases are forced through said restricted orifice by the increased pressure caused by the ignition.



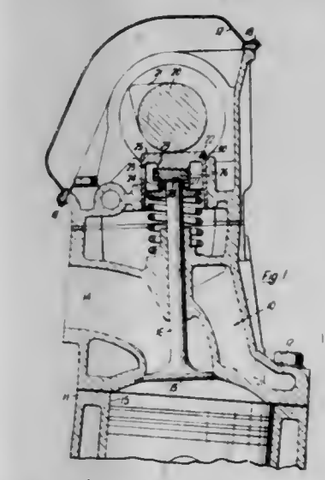
3,270,723
SELF-SUPERCHARGING ROTARY ENGINE
Peter Maroney, 133 Boulder Road, Solvay, N.Y.
Filed Dec. 18, 1963, Ser. No. 331,488
8 Claims. (Cl. 123—43)

1. A rotary engine comprising a stator, a circular cam track stationarily mounted in said stator, a rotor disposed in said stator and eccentrically in said cam track and mounted for rotation about a rotor axis parallel to the cam track axis, a pair of cylinders carried by said rotor on opposite sides of said rotor axis, said cylinders being parallel, the axes of said cylinders being displaced from the axis of rotation of said rotor, guide means in said rotor having a slide axis intersecting said rotor axis parallel to said cylinders, a piston assembly for each cylinder, said piston assembly including a piston and a



guide member fixedly secured thereto, said piston and guide members being parallel and being respectively slidably received in said cylinder and in said guide means, and a cam follower on said guide member movably engaging said cam track where intersected by said slide axis.

3,270,724
SPLIT ENGINE WITH TURBOCHARGER
John Dolza, Fenton, Mich., assignor to Fiat S.p.A., Turin, Italy, a corporation of Italy
Filed July 19, 1963, Ser. No. 296,211
7 Claims. (Cl. 123—59)



1. An internal combustion engine comprising first and second sets of cylinders, first passage means for supplying a combustible mixture to all of said cylinders under high engine output conditions and for supplying only air to said second set of cylinders under low engine output conditions whereby in said latter instance only said first set of cylinders is operative to supply power, common exhaust passage means for both sets of cylinders, a turbocharger including a compressor disposed in said first passage means and a turbine disposed in said exhaust passage means, and a valve in said exhaust passage anteriorly of said turbine for controlling the energy of the gases impinging upon said turbine.

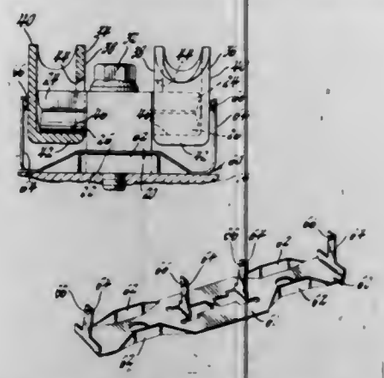
3,270,725
SPRING FOR BIASING A ROCKER ARM AND MOUNTING THEREFOR
Marion Lee Thompson, 2734 Eastvale, Rolling Hills, Calif.
Filed Dec. 2, 1964, Ser. No. 415,392
6 Claims. (Cl. 123—90)

1. In combination, an engine rocker arm assembly, a push rod, and a spring for torque biasing the rocker arm into substantially continuous engagement with the push rod, which combination comprises: a shaft; a rocker arm pivotally mounted on the shaft, the ends of the shaft protruding beyond the rocker arm; aligned, transverse slots formed in the axially outwardly facing surfaces of the protruding ends of the shaft; a reciprocally movable push rod abutting on the underside of the rocker arm adjacent one end of the rocker arm and adapted to pivot the rocker arm on the shaft; a spring having a pair of parallel coils spaced apart from each other and adapted to produce a torque; a first, substantially straight leg extending from each of the coils, each of said legs being adapted to be received in a transverse slot in an opposite end of the shaft; a second leg extending from each of said coils, said second legs being disposed substantially parallel to each other; and a transverse yoke interconnecting the second legs and adapted to overlie and abut on the rocker arm above the abutment of the push rod thereon, said yoke being in torque biasing engagement with the rocker arm so as to cause the rocker arm to follow the push rod in its reciprocal movement.

3,270,726
VALVE TAPPET
John Lee Cotton, Flitwick, England, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Oct. 20, 1965, Ser. No. 498,953
Claims priority, application Great Britain, Nov. 14, 1964, 46,479/64
6 Claims. (Cl. 123—90)

1. A valve tappet comprising a cup member adapted to fit over the end of a valve stem and having a transverse threaded bore, a threaded plug carried for screw adjusting movement in said bore and having a flat surface along one side adapted to contact the end of the valve stem, said surface lying at an angle with respect to said bore, whereby axial adjustment of said plug in said bore to any of a plurality of positions wherein said flat surface may contact said valve stem, adjusts the effective length of said valve tappet.

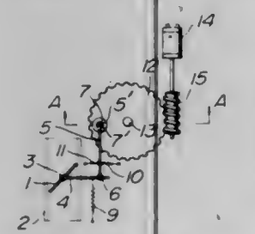
3,270,727
VALVE ROCKER ARM MOUNTING
Robert L. Nance, Oak Park, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Nov. 29, 1965, Ser. No. 510,228
10 Claims. (Cl. 123—90)



1. Valve gear for an internal combustion engine and comprising

a plurality of T-shaped supports secured to said engine in linearly spaced relation, each said support including a leg portion and a pair of oppositely extending arms,

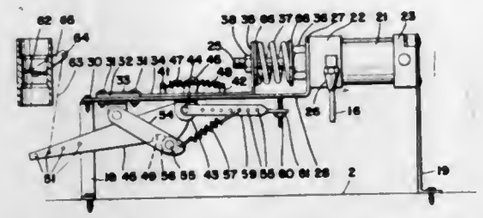
a pair of rocker arms retained on the extending arms of each support for rocking motion in separate planes and



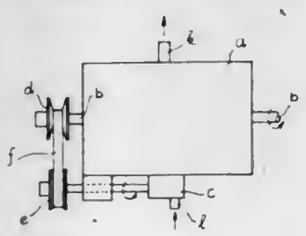
a unitary retainer means extending between and engaging at least two of said supports to at least par-

tially position them, said retainer means including a plurality of resilient fingers engaging said rocker

arms at their outer ends to retain said rocker arms in position on said supports.



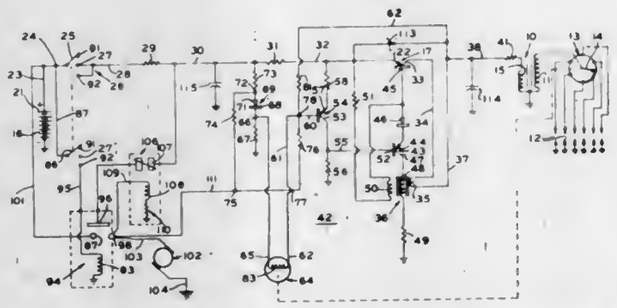
3,270,728
DEVICE FOR DRIVING AUTOMOTIVE VEHICLES AT CONSTANT SPEED
Akira Mizuno, 60 Shinmeicho, 7-chome, Kariya-shi, Aichi-ken, Japan
Filed Dec. 17, 1963, Ser. No. 331,304
Claims priority, application Japan, Dec. 26, 1962, 37/58,885
7 Claims. (Cl. 123—102)



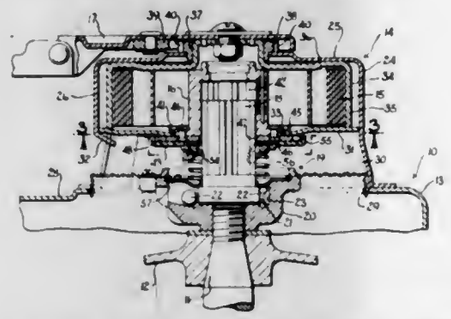
1. Apparatus for driving an automobile vehicle at a selected speed, which comprises a throttle valve for controlling the speed of said automotive vehicle, an electromagnet, means to selectively energize said electromagnet, a plate of ferromagnetic material having a rest position when the electromagnet is deenergized adjacent to and out of contact with said electromagnet and mounted for displacement in either of two opposite directions, said electromagnetic being mounted for displacement from said rest position to a position of contact with said plate when said electromagnet is energized and from said position of contact back to said rest position when said electromagnet is deenergized, said electromagnet being held in fixed relation to said plate when said electromagnet is in an energized state, a linkage directly and continuously connecting said electromagnet both when in said energized state and when in a deenergized state to said throttle valve, and means to selectively displace said plate together with said electromagnet when said electromagnet is in said energized state to move said plate together with said electromagnet to operate said linkage and thereby change the opening of said throttle valve.

3,270,729
AUTOMATIC THROTTLE CONTROL FOR AIR COMPRESSORS AND THE LIKE
Edward J. Swatek, Jr., 14 Mapleton Drive, Bedford, Ohio, and Norman J. Polcyn, 7112 Alice Ave., Cleveland 5, Ohio
Filed Mar. 11, 1964, Ser. No. 351,133
6 Claims. (Cl. 123—103)

1. An automatic throttle control for internal combustion engines, said control comprising an air cylinder, a piston in said cylinder, a piston rod extending from said cylinder, a frame member secured to one end of said cylinder, a slide operatively connected to said piston rod and movable along said frame member, a compression coil spring interposed between said frame member and said slide, a lever operatively connected to said slide and mounted for pivotal movement on said frame member, and means for resiliently maintaining said lever in at least two different pre-selected positions, said means comprising a member mounted for pivotal movement relatively to said frame member and having a cam follower thereon, said lever being provided with recesses defining the pre-selected positions of the lever, and into which said cam follower is adapted to snap.



3,270,730
INTERNAL COMBUSTION ENGINES
Seamus Gearoid Timoney, 9 Hume St., Dublin, Ireland
Filed Nov. 3, 1964, Ser. No. 408,617
Claims priority, application Great Britain, Nov. 14, 1963, 45,025/63
7 Claims. (Cl. 123—119)



1. An internal combustion engine comprising in combination, an engine power shaft driven by the engine cylinder air charging means driven from the engine power shaft through a variable speed drive unit permitting controllable alteration of the speed of the air charging means while output power is being delivered by the engine, and means for automatic variation of the engine cylinder compression ratio in response to the engine load condition or the engine cylinder pressure, or both.

3,270,731
IGNITION SYSTEM
Laurence F. Mieras, Livonia, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Aug. 3, 1964, Ser. No. 387,002
8 Claims. (Cl. 123—148)

1. An ignition system for an internal combustion engine comprising, an ignition coil having a primary winding, an electrical storage battery, a solid state switching device coupled to said electrical storage battery and said primary winding of said ignition coil for controlling the energization of said primary winding, a current limiting resistor in circuit with said solid state switching device for limiting current through said solid state switching device, and means coupled to said electrical storage battery and said current limiting resistor for disabling said current limiting resistor from its current limiting function during engine starting operations only when the electrical load coupled to said electrical storage battery during starting operations reduces the terminal voltage of said battery below a predetermined value and for retaining said current limiting resistor in circuit to perform its current limiting function if the terminal voltage of said battery during starting operations is above said predetermined value.

3,270,732
SPRING STARTER FOR INTERNAL COMBUSTION ENGINE
Joseph R. Harkness, Germantown, Wis., assignor to Briggs & Stratton Corporation, Milwaukee, Wis., a corporation of Delaware
Filed Aug. 12, 1964, Ser. No. 389,025
6 Claims. (Cl. 123—179)

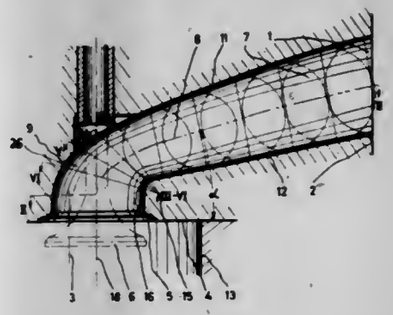
1. In a spring starter for an internal combustion engine of the type wherein one end of a starter spring is attached to a rotatable torque applying member that must be held against rotation in one direction while the spring is wound up, and the released energy of the wound up spring imparts starting torque to the crankshaft of the engine through a drive train including said torque applying member and the rotatable driving element of a unidirectional clutch which has a driven element connected with the engine crankshaft, and wherein engagement of the clutch entails some rotation of its driving element in said direction relative to the driven element of the clutch, the improvement which comprises:

(A) holding means operable to prevent rotation of the torque applying member while the spring is wound up;

(B) lockout means for said holding means to normally maintain the latter inoperative, said lockout means comprising

(1) a lockout member which is loosely mounted on the driving element of the clutch for free axial sliding movement to and from an operative lockout position with respect to said holding means,

(2) and yieldable biasing means acting upon the lockout member to yieldingly hold it in its lockout position;



(C) means providing a lost motion but positive driving connection between the driving element of the clutch and the torque applying member by which the latter can be rotated in non-driving relation to the driving element a limited extent in said direction by the starter spring as winding thereof is commenced;

(D) and means defining an impositive torque transmitting connection between the driving element of the clutch and the torque applying member through which said non-driving rotation of the latter by the starter spring is translated into rotary movement of the driving element of the clutch to engage the clutch before the lost motion is taken up in the connection between the torque applying member and the driving element of the clutch, said last named means including

(1) a drive plate connecting the lockout member in driving relation with the driving element of the clutch,

(2) and interengaging cam means on the torque applying member and the lockout member cooperating with said drive plate to translate said initial non-driving rotary movement of the torque applying member by the starter spring into clutch engaging rotary movement of the driving element of the clutch, said cam means being operable after such engagement of the clutch but before all of the lost motion is taken up in the driving connection between the torque applying member and the driving element of the clutch to move the lockout member to its inoperative position to thus render the holding means operative to prevent further rotary movement of the torque applying member by the starter spring while the latter is wound up.

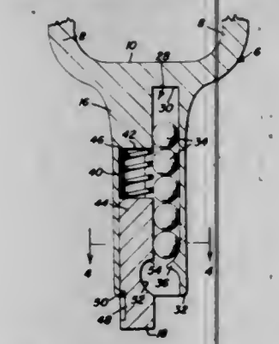
3,270,733
CYLINDER FOR AN INTERNAL COMBUSTION ENGINE
Walter Steidler, Mannheim-Feudenheim, Germany, assignor to Motoren-Werke Mannheim AG Vorm Benz ABT. Stat. Motorenbau, Mannheim, Germany
Filed Dec. 17, 1965, Ser. No. 514,520
Claims priority, application Germany, Jan. 5, 1965, M 63,700
2 Claims. (Cl. 123—188)

1. A cylinder for an internal combustion engine, comprising a cylinder body, inside surface portions of said body defining a substantially cylindrical working space therein, a cylinder head closing said working space at one axial end, first portions of said cylinder head defining a lateral surface thereof directed outwardly, second portions of said cylinder head defining an inside surface thereof bounding said end of said working space, third portions of said cylinder head defining an inlet duct portion extending towards said working space from said lateral surface, fourth portions of said cylinder head defining a valve chamber to which leads said inlet duct, and fifth portions of said cylinder head defining an annular valve seat and a circular valve port encircled by said valve seat, opening into said working space at said inside surface, and in communication with said valve chamber, said valve seat and said valve port being disposed eccentrically with respect to the axis of said working space, and the cylinder having the following features:

mish, symmetrical body tapering towards said working space,

(b) when viewed in an axial direction of said working space, the centre line of said inlet duct portion is of bent form and a first surface portion of said valve chamber, which surface portion is radially outer with respect to the axis of said working space, extends tangentially of the inner periphery of said valve seat,

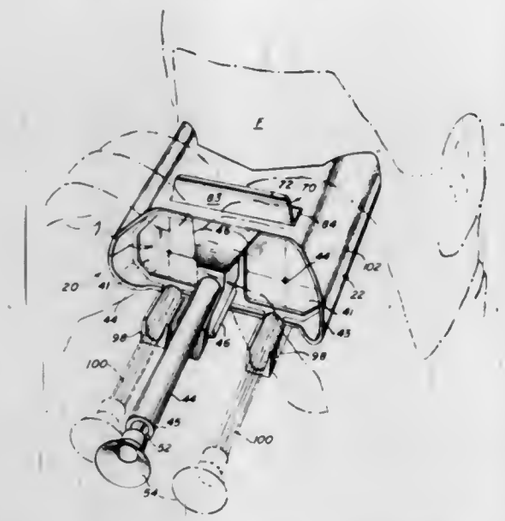
(c) when viewed in a radial direction of said working space transversely of said duct, the centre line of said inlet duct portion is approximately a straight line and extends at an angle of about 15° with respect to said inside surface,



(d) when viewed in said axial direction, the width of said inlet duct portion in the vicinity of said valve chamber is less than the internal diameter of said valve seat,

(e) second and third surface portions of said valve chamber, of which said second surface portion faces said valve port and said third surface portion is disposed opposite to said second surface portion, extend arcuately from said inlet duct portion to said valve port, merge with surface portions of said valve port, and become increasingly spaced apart as they approach said valve port,

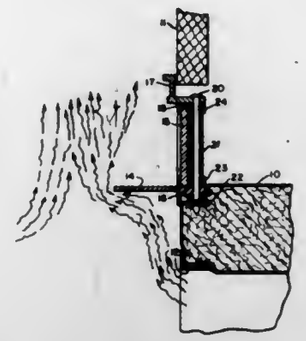
(f) sections taken through said valve chamber and on planes passing through a common point in the region of the centre of an arc of said third surface portion and containing lines which extend perpendicularly to the centre line of said valve chamber and parallelly to said inside surface, have approximately elliptical contours of which the major axes extend substantially perpendicularly to the working space axis, and



(g) when viewed in said axial direction, a tangent to the centre line of said inlet duct portion at a first location in the vicinity of said valve chamber extends through a second location between the inner periphery of said cylinder body and the axis of said valve port.

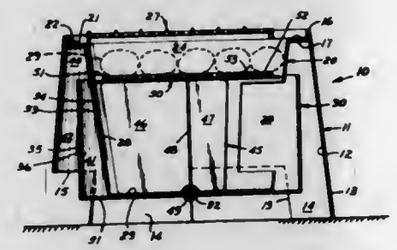
3,270,734
TOY CATAPULT WITH PELLET MAGAZINE
Ira A. Clements, P.O. Box 376, Hamlin, Tex.
Filed July 18, 1963, Ser. No. 295,993
4 Claims. (Cl. 124—20)

1. A toy slingshot comprising, in combination, a fork equipped with a pellet casting sling and having a handle, said handle being hollow, said hollow portion closed at the upper end and open at the lower end, a portion of the wall adjacent the open lower end being provided with an enclosed inwardly projecting V-shaped projection, said projection being rigid and constituting first a pellet detent and secondly a deflector, one lengthwise portion of the hollow in the handle defining an elongated storing and dispensing magazine for pellets, a cooperating opposed parallel lengthwise portion of said hollow portion being substantially circular in cross-section and defining a plunger-accommodating cylinder, a plunger slidable in said cylinder, a coil spring confined in said cylinder, engaging a closed end of said cylinder and also a cooperating end of the plunger and normally projecting a manually actuable end of the plunger to a ready-to-use position, said plunger and a cooperating portion of the handle having coacting elements to limit the outward projection of the operable end of the plunger, and the peripheral surface portion of the plunger which normally opposite said detent having a notch defining and providing clearance pocket.



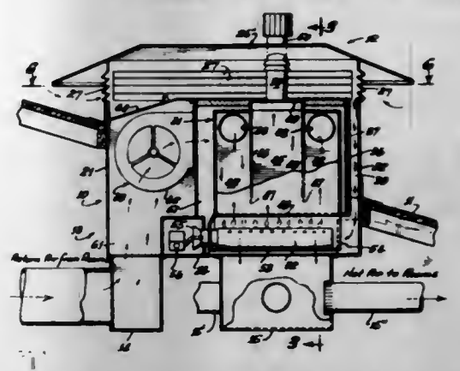
3,270,735
SIMULATED BINOCULARS WITH A PROJECTING DEVICE
Victor Petrusek, 14611 Halsted St., Harvey, Ill.
Filed Aug. 6, 1964, Ser. No. 387,662
3 Claims. (Cl. 124—26)

2. A toy gun of binocular-style configuration comprising, a plastic housing having a pair of fixed sighting tube formations arranged side by side, each tube having an eyepiece end and an objective lens end, a gun barrel rigid on the housing and projecting forwardly from between said objective lens ends, said barrel having an inner end opening into said housing, for receiving the inner end of a shaft therein from said barrel, a shaft having an enlarged inner end, spring means carried in said housing aligned with said barrel and adapted to be compressed by said inner end of the shaft for cocking the gun, and trigger means operable from exterior of the housing, for releasably latching the shaft in the barrel with said spring means compressed, said trigger means movable to release the shaft whereupon the potential energy of the compressed spring can propel the shaft from the barrel, each of said objective lens ends having like aiming means for target sighting through the eyepiece ends of the tubes by merging of said aiming means into a single such means visible to the viewer for aiming.



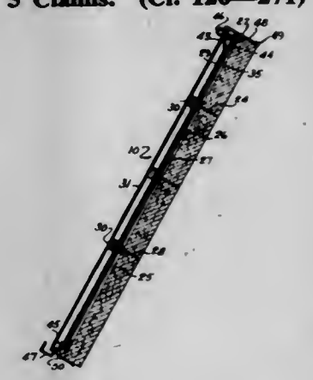
3,270,736
BUILT-IN OVEN
Eugene J. Barnett, Mansfield, Ohio, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed May 28, 1964, Ser. No. 371,051
3 Claims. (Cl. 126—19)

1. An oven construction adapted to be built into a surrounding cabinet structure having a front wall surface and comprising, an oven compartment liner adapted to be countersunk in said cabinet with an oven door opening in a plane substantially in alignment with said front wall surface, said door opening having an upper edge surface, a planar heat deflector ledge having upper and lower planar surfaces and positioned along the upper edge surface of said door opening with its planar surfaces extending outward from said door opening, a spacer panel of material having a relatively low thermal conductivity and comprising upper and lower edge surfaces and positioned with its lower edge surface above the upper planar surface of the ledge and coextensive there-



with, and a trim member extending along the upper edge surface of said panel and adapted to be in contact with the front wall surface of the surrounding cabinet.

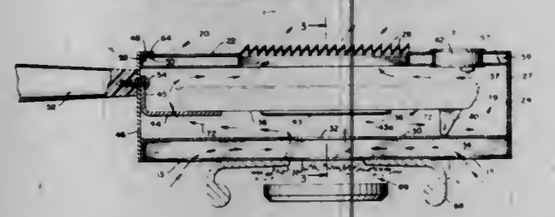
3,270,737
COOKING STOVE
Conrad S. Horine, 629 Echo St., Anaheim, Calif.
Filed Apr. 1, 1964, Ser. No. 356,522
4 Claims. (Cl. 126—25)



1. A generally circular cooking stove having a central axis of symmetry, and comprising: an outer shell having an interior peripheral wall; an inner guide having an outer and an interior peripheral wall, its interior peripheral wall forming an upwardly opening cooking region, the outer shell and the inner guide being joined at a joint which is substantially fluid-tight, the inner guide also having a plurality of inlet ports therethrough; an outer guide extending upwardly between the outer shell and the inner guide, and spaced therefrom so as to leave a clearance for air flow; the shell, guides, and walls being surfaces of revolution concentric on said axis, the interior peripheral wall of the outer shell and the outer peripheral wall of the inner guide forming on each side of and with the outer guide a passage which is a volume of revolution concentric on said axis which is open at its two lower ends and closed at its upper extreme, and which opens into said cooking region through the inlet ports; a fuel support grid in said cooking region above the inlet ports, said grid being adapted to support fuel to be burned for cooking, using air from the inlet ports for combustion, the inner guide and grid being exposed to each other, whereby radiation from fuel on the grid heats said inner guide, and the inner guide radiates energy to heat the outer guide, both guides thereby serving to heat air which passes through the inverted passage and inlet ports to the cooking region, said inlet ports lying between the grid and the outer guide whereby radiated energy from fuel on the grid passes through the inlet ports and impinges on the outer guide to heat the same and thereby to heat air flowing through said inverted passage.

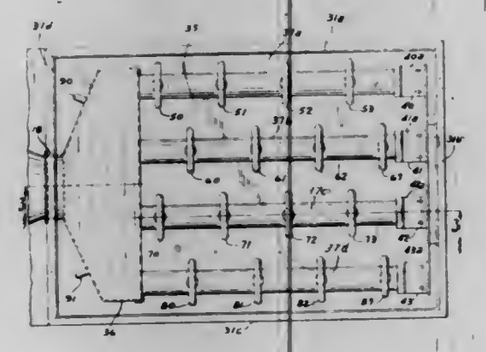
3,270,738
RECESSED ROOF-MOUNTED HEATER
Rodney A. Nielsen, 3007 Green Lane, Redondo Beach, Calif.
Filed Feb. 4, 1963, Ser. No. 255,965
5 Claims. (Cl. 126—110)

4. In an air-conditioning apparatus, in combination: a building including a roof having an opening therein; a main housing including lateral upright walls extending through said opening, fitted to the margins thereof, and sealed to said roof, said housing having an upper portion projecting above said roof and provided with apertures for intake and discharge of external air from atmosphere outside said building into said upper housing portion, said housing having a lower portion projecting beneath said roof into an upper area within said building; an air-conditioning means within said housing and extending into said lower portion thereof; means within said housing for directing said external air to said air-conditioning means for affecting the operation thereof and for then returning it to external atmosphere; air distribution and intake ducts communicating with said lower housing portion, for circulating in heat-transfer relation to said air-conditioning component, a body of air which thereby becomes conditioned; and means within said housing for directing said body of air past said air-conditioning means in a circulation path separate from that of said external air, said apparatus including an insulating jacket surrounding at least three sides of said air-conditioning means and spaced from the side walls and an end wall of said housing, thereby defining air passages communicating at their upper ends with said atmosphere intake apertures, and communicating at their lower ends with said air-conditioning means.



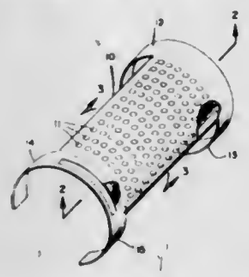
3,270,739
SOLAR HEATER
Harry E. Thomason, District Heights, Md.
(7354 Walker Mill Road SE., Washington, D.C. 20027)
Original application July 29, 1960, Ser. No. 46,213.
Divided and this application Aug. 31, 1965, Ser. No. 484,132
5 Claims. (Cl. 126—271)

1. A solar heat collector mounted in an inclined position and comprising a frame including an insulating base, a heat collecting sheet attached to the base in



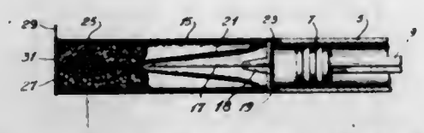
spaced relation thereabove, a first transparent sheet attached to said frame and suspended above said heat collecting sheet, means attached to the upper end of said frame for introducing small streams of liquid onto the inner surface of said heat collecting sheet to gravitate along the inner surface of said sheet, and collection means attached to the lower end of said frame to collect said liquid.

3,270,740
OVEN
Milton Koos, Jr., New York, N.Y., assignor to Arthur Tamaroff, Forest Hills, N.Y.
Filed Oct. 27, 1964, Ser. No. 406,743
7 Claims. (Cl. 126—275)



1. A portable-type oven for use above a gas flame to rapidly heat food products, comprising a housing including a base plate, said base plate including a central gas inlet aperture and air inlet holes, a baffle plate supported in said housing above said base plate, said baffle plate being attached at its periphery to the interior of said housing and including an aperture in registration with said gas inlet aperture, a tray for supporting said food products supported above said baffle plate, gas outlet means in the top of said housing, said tray and baffle plate being positioned within said housing with respect to said base plate whereby all of the gas and air entering through said base plate flows through said baffle aperture and around substantially the entire periphery of said tray and over the top thereof prior to exit through said gas outlet means.

3,270,741
SNOW MELTER
Joseph J. Petlak, 3 Lincoln Drive, Wallingford, Conn.
Filed Sept. 30, 1964, Ser. No. 400,519
3 Claims. (Cl. 126—343.5)



1. In a snow and ice melting machine, a chamber having side and bottom surfaces, a plurality of manifold ducts supported near the bottom surface of the chamber, said ducts being arranged substantially parallel to each other, means positioned within said chamber for distributing gases to each of said ducts, a plurality of gas-expelling pipes coupled to each of said ducts, each of said pipes being constructed in a T configuration with the vertical portion of the T coupled to respective duct and the cross-bar portion of the T having open ends, said cross-bar portion further being bent downward at regions in proximity to the respective open ends to point said open ends toward said bottom surface, at least one fluid outlet in said side surface, a portion of the outlet being located in the chamber at a level between the open ends of the last-mentioned pipe and the bent regions thereof for inhibiting any fluid in said chamber from entering the corresponding duct, and pressure-relief ducts coupled to said manifold ducts, said relief ducts extending at least partially up to the height of said side surface and having weighted covers hinged to provide flap valves.

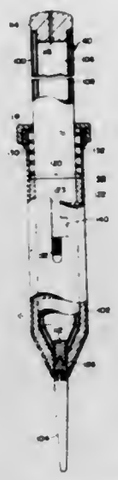
3,270,742
BANDAGE HOLDER
Abraham F. Costa, 1139 Roy Ave., San Jose, Calif.
Filed Nov. 17, 1964, Ser. No. 411,936
3 Claims. (Cl. 128—171)

1. In a bandage holder of the class described, the combination of a body member, said body member having inwardly turned side flanges, a bandage positioned against said body member having the side portions thereof compressed and inserted under said flanges, said body member having a plurality of perforations therethrough facing the side of said bandage that is against said body member to provide ventilation to said bandage and supporting means attached to the end portions of said member for holding said body member and said bandage against the wounded limb of the wearer.

3,270,743
HYPODERMIC INJECTION SYRINGE
Pierre Gingras, Pierrefond, Quebec, Canada assignor to Leeming-Miles Pharmaceuticals Inc., Montreal, Quebec, Canada
Filed May 29, 1963, Ser. No. 284,139
3 Claims. (Cl. 128—215)

1. A protective assembly for the needle of a hypodermic syringe having a piston cylinder, made of plastic material, adapted to contain the substance to be injected and from one end of which said needle projects, said assembly comprising:

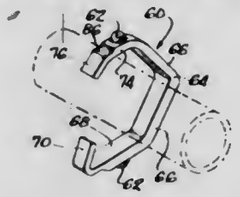
(a) a plastic cylindrical envelope having an open end adapted to snugly fit over the end of said cylinder from which said needle projects;



(b) a protective substantially conical plastic inner cover within said envelope housing said needle and having the wide end thereof integrally joined to said open end of said envelope;

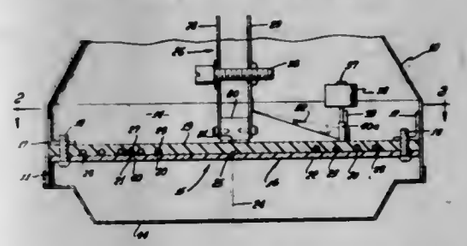
(c) a wad of absorbent material filled with antiseptic liquid disposed at the other end of said envelope;

(d) cord means for pulling said wad out of said envelope, and



(e) removable cap means closing said other end of said envelope comprising a circular flat disc of plastic material fitting over and heat-sealed to said other end of said envelope; said disc having a finger grip member radially projecting therefrom whereby it may be peeled off said envelope by pulling on said member.

3,270,744
CRYOGENIC SURGICAL PROBE
Kurt Katz, Pittsburgh, and Edward F. Federmann and Anthony J. Venturino, Penn Hills, Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Nov. 27, 1963, Ser. No. 326,550
3 Claims. (Cl. 128—303.1)



1. A surgical probe comprising a vessel having a chamber for containing coolant means, a sleeve member having an extended tip portion, said sleeve member telescoped over said vessel in sliding engagement, spring means, said spring means being disposed between said sleeve member and said vessel, urging said vessel into thermal communication with said extended tip portion, said extended tip portion being cooled to a predetermined temperature when coolant is added to said chamber, and means for sliding said vessel relative to said sleeve member, to overcome the urging effect of said spring means and cause thermal communication between said vessel and said extended tip portion to be interrupted when it is desired to raise the temperature of said extended tip portion.

3,270,745
HEMOSTATIC CLIP CONSTRUCTIONS
Ernest Charle Wood, Los Angeles, Calif., assignor of one-third to Rene G. Le Vaux and one-third to Peter B. Samuels
Filed June 11, 1963, Ser. No. 287,133
4 Claims. (Cl. 128—325)

1. A hemostatic clip comprising a strip of nontoxic material, said strip defining arm portions having opposed faces, a single protuberance formed on the outer surface of each of said arm portions at intermediate points along the lengths of the respective arm portions, one arm portion being longer than the other arm portion, said strip defining a V-shaped configuration which includes a central fold, said arm portions extending angularly from said fold and then bending into an approximately parallel relationship with said protuberances being formed on the parallel portions of said arms, an end member formed on each of said arm portions, said end members being bent toward each other and being parallel to each other, one of said end members formed on said one arm portion being directed inwardly toward the central fold of said V-shaped portion thereby defining a recess with said one arm portion, and the other end member comprising an outwardly directed end member formed on the other of said arm portions adapted to be received in said recess when said arm portions are clamped together, and wherein said end members are bent when said arm portions are clamped together with the end members being thereby pressed against each other.

3,270,746
HIGH-PERFORMANCE ELECTROTHERAPEUTIC TREATMENT HEAD
William Denis Kendall, Los Angeles, and Frank A. Yarger, Sylmar, Calif., assignors to Dynapower Systems Corporation, Los Angeles, Calif., a corporation of Delaware
Filed Aug. 26, 1963, Ser. No. 304,468
1 Claim. (Cl. 128—404)

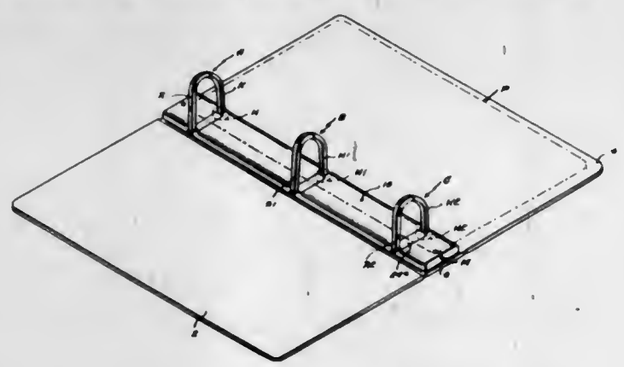
In electrotherapeutic treatment head structure, a metallic shell having a longitudinal axis, spaced apart primary and secondary coils, the primary coil having a high voltage input connection, insulative tubular sheathing about the primary coil, dielectric means carried by said shell and supporting both coils to extend about said axis, and a capacitor carried by said dielectric means generally rearwardly of said coils within the shell and electrically connected across the secondary coil, the capacitor having two generally parallel plates with edge portions attached to said dielectric means to prevent their relative displacement, major portions of the plates extending freely away from said edge portions to flex toward and away from each other, and a non-conductive fastener carried by said major portions of the plates in spaced relation to said plate edge portions to hold said major portions of the plates at adjusted separation, said fastener extending between the plates for attachment thereto, the secondary coil having more turns than the primary coil and both primary and secondary coils comprising circular cross section wire.

3,270,747
FOUNDATION GARMENT
Concetta Cuozzi, 443 Granite Springs Road, Yorktown Heights, N.Y.
Filed June 11, 1964, Ser. No. 374,305
6 Claims. (Cl. 128—528)

1. A foundation garment, such as a girdle, panty-girdle, and the like, comprising in combination a torso-encircling panel for encompassing that portion of the female torso known as the hips, and at least a portion of the waist and the thighs, said torso-encircling panel extending to the rear of the garment, and being of such dimensions thereat to enable said panel to encompass at least a portion of that part of the torso known as the derriere;

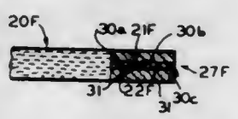
the dimensions of said torso-encircling panel being defined at least in part by an edge disposed at the rear of the garment; said edge being of curvilinear configuration, and corresponding generally with the contour of said derriere; a supporting panel disposed rearwardly of the garment to encompass a substantial portion of said derriere; said torso-encircling panel and said supporting panel being positioned in overlapping relationship with respect to one another, and said supporting panel being connected to said torso-encircling panel at least along only a portion of said edge, enabling said panels to be relatively movable with respect to one another; and support assemblies connected to said supporting panel for transmitting tensile forces substantially only thereto.

3,270,748
FOUNDATION GARMENT
Concetta Cuozzi, Yorktown Heights, N.Y., assignor to Corde de Parie, Inc., New York, N.Y.
Filed Oct. 30, 1964, Ser. No. 407,748
8 Claims. (Cl. 128—528)



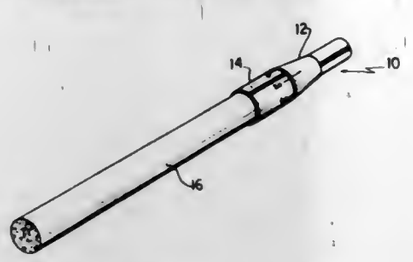
1. A foundation garment, such as a girdle, panty-girdle, and the like, comprising in combination a torso-encircling panel for encompassing those portions of the female torso known as the waist, hips and at least a portion of the thighs; the dimensions of said torso-encircling panel at the rear of the garment being chosen to enable said panel to encompass at least a portion of that part of the torso known as the derriere; the dimensions of said torso-encircling panel being defined by an edge disposed at the rear of the garment;

a supporting panel disposed rearwardly of the garment to encompass a substantial portion of said derriere; said torso-encircling panel and said supporting panel being positioned in overlapping relationship with respect to one another, and said supporting panel being connected to said torso-encircling panel at least along only a portion of said edge, enabling said panels to be relatively movable with respect to one another; a waist portion control assembly; said supporting panel being connected to said waist portion control assembly only along a portion thereof, enabling said supporting panel and said waist portion control assembly to be disposed in overlapping relatively movable relationship with respect to one another along another portion of said panel; and support assemblies connected to said supporting panel for transmitting tensile forces substantially only thereto.



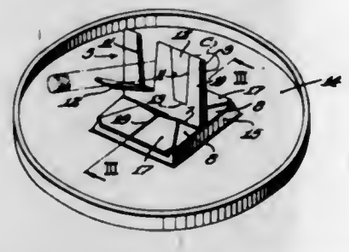
3,270,749
LOOSE LEAF BINDER AND BACKING CONSTRUCTION FOR NOTEBOOKS
James P. O'Connell, 3 Rosemont St., Malden, Mass.
Filed Oct. 23, 1965, Ser. No. 503,671
9 Claims. (Cl. 129—24)

1. A loose leaf notebook construction for loosely holding sheets of notebook paper formed with ring apertures therein, said notebook comprising front and back cover members, binding means for connecting the cover members in hinged relationship, a rigid backing structure secured at the inside of the binding means and including a slotted base and a retaining cap, a plurality of binder rings having annularly shaped tongue extremities engaged in the slotted base and adjustably supported by means of the said retaining cap and each of said rings including a pair of flexible ring sections held under tension and normally acting to move away from one another, said flexible ring sections being supported for limited flexing movement by said retaining cap and each pair of flexible ring sections including a slotted receiver ring section and a keying ring section, the slotted receiver section being formed at its underside with a conically recessed seating surface and the keying ring section being shaped with a conical surface which mates with the conical recessed surface, said keying ring section having a web portion extending



upwardly from the conical shaped surface and supporting thereon a key portion which is defined by angular surfaces coinciding with the said angular surfaces of the receiver section, said keying portion being further formed with stepped abutment surfaces which are adapted to lie within the slotted receiver portion in a fully engaged position of the ring sections, a locking insert member fixed in the receiver section and presenting an abutment surface which normally lies in locking relationship with a corresponding abutment surface of the key portion to hold the ring sections in a locked position, and said locking insert member being yieldably supported for movement downwardly into a release position for disengaging the ring sections.

3,270,750
ADJUSTABLE-FILTER CIGARETTE
Robert A. Campbell, 167 N. Ridgeland Ave., Oak Park, Ill.
Filed Sept. 16, 1960, Ser. No. 56,377
3 Claims. (Cl. 131—10)



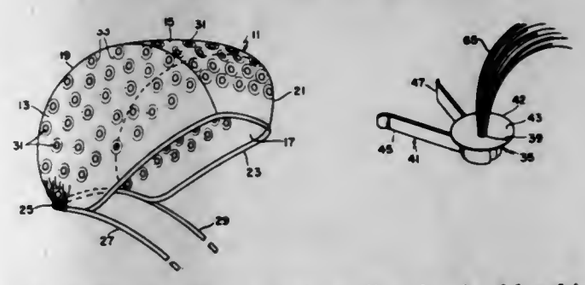
1. In a cigarette, the combination of an elongated cylindrical body filled with tobacco for the major portion of its length, a cylinder of crushable filter material at one end of said body, said cylinder having an axial bore extending the full length thereof and a removable plug of filter material normally substantially filling and closing said bore, whereby upon removal of said plug, smoke may pass from the ignited tobacco directly to the mouth of the user without filtering, the smoke being fully filtered when the cigarette is smoked with said plug in position, said bore being provided interiorly with normally inoperative, pressure sensitive self sealing adhesive means, said adhesive being non-adherent to said plug, but operative for self adhering sealing engagement upon digital crushing closure of said bore to fasten and retain opposed parts of said bore together in closed relationship, after removal of said plug, to reestablish full filtering of the smoke.

3,270,751
SMOKING DEVICE
Richard C. Tucker, Newtown, Conn., assignor, by mesne assignments, to Delcron Products, Inc., New York, N.Y., a corporation of New York
Filed Mar. 16, 1964, Ser. No. 352,285
5 Claims. (Cl. 131—198)

1. A smoking device arranged to be inserted between a source of smoke and a smoker, an end piece body forming on one end a smoke chamber which is adapted to receive smoke from said source and on the other end a peripheral wall forming a recess, a front piece having on one end a smoke withdrawal chamber from which a smoker may withdraw the smoke products and on the other end thereof a plug fitting into said recess of said end piece, said end piece having a smoke passage communicating with said smoke chamber and an air passage formed as an enlarged blind hole which reduces the thickness of said peripheral wall at said hole to provide direct communication from said blind hole to the surrounding air, said plug arranged with a plurality of pairs of orifices, each pair of which is disposed to be alignable with said two passages, and means for relatively moving said plug to align any one of said pairs with said two passages to meter a predetermined ratio of air to smoke from said passages to said withdrawal chamber.

3,270,752
DISPOSABLE HOLDER FOR SMOKER'S ARTICLES
Joseph J. Dorrance, 401 N. Wabash Ave., Chicago, Ill.
Filed Feb. 18, 1964, Ser. No. 345,635
6 Claims. (Cl. 131—240)

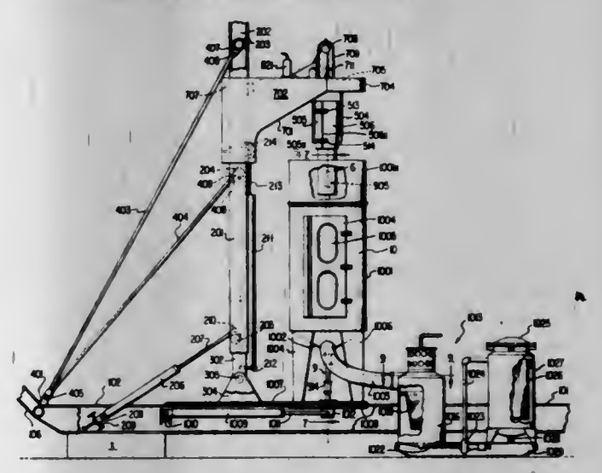
2. A disposable smoker's article blank which is adapted to be assembled with an ash tray and comprising:



a panel of generally rectangular outline;

parallel scorings adjacent opposite edges of the panel and defining marginal flanges including said edges;

a score line parallel to said scorings and centrally between the same, dividing the area between said scorings into a pair of congruent foldable body panel sections;



and said blank having at least one smoker's article notch extending across said score line and within said panel sections, said panel sections being foldable toward one another and the marginal flanges being bendable into oppositely projecting relation angularly to said sections whereby to provide a base supporting said folded body panel sections upright with the article-receiving notch at the upper end portion thereof, said blank having material partially severed therefrom in forming the notch and providing a tongue having its opposite ends hingedly connected to said sections adjacent to said scorings, said tongue having substantially the same outline dimensions as said notch and having portions foldable toward one another at said score line, to provide a tongue which is bendable out of the notch on said hinge connection to open the notch, whereby the tongue then extends laterally from the notch to provide a rest for a smoker's article engaged in the notch.

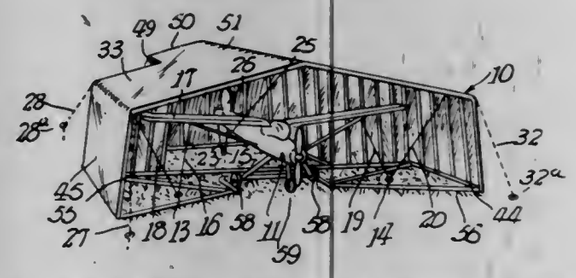
3,270,753
APPARATUS FOR SELECTIVELY TREATING HAIR
Loveda Cook, Warsaw, Ind., and Victor N. Farhi, 4124 Fairfield Ave., Fort Wayne, Ind.
Filed Mar. 4, 1963, Ser. No. 262,713
8 Claims. (Cl. 132—9)

1. A protective cap for hair styling in the bleaching and dyeing of strands of hair, comprising a pliable transparent material formed in the shape of a head covering having a series of spaced indentations which may be selectively pierced to form perforations through which strands of hair can be pulled therethrough, a reinforcing ring surrounding each indentation so that each perforation is strengthened to resist destruction of the perforation around the circumference thereof and, said indentations being formed so that they can be manually snapped out by an operator over portions of hair as required.

3,270,754
APPARATUS FOR EMPLOYING FLUID JETS TO REMOVE MATERIAL FROM ARTICLES
R. E. Moeller, Robert G. Love, and Forrest C. Pittman, Duncan, Okla., assignors to Halliburton Company, Duncan, Okla., a corporation of Delaware
Filed Sept. 22, 1964, Ser. No. 398,267
11 Claims. (Cl. 134—110)

1. A portable apparatus for removing material from the interior of open ended articles, said apparatus comprising:

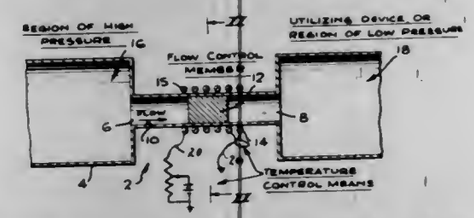
skid means;



tower means;

pivot means connecting said tower means with said skid means whereby said tower means may be pivoted toward said skid means;

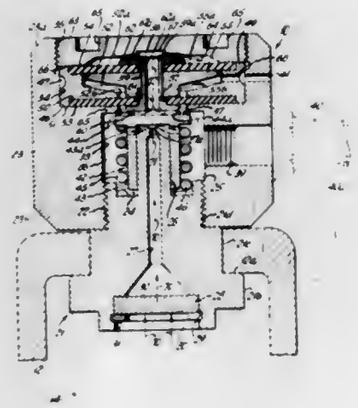
tower securing means adapted to releasably secure said tower means in a generally upright position;



holding means for supporting an article with an open end thereof facing downwardly;
elevating means carried by said tower means for raising and lowering said holding means along a generally vertical and stationary axis;
drive means for rotating said holding means about a generally vertical axis; and
fluid discharging means adapted to remain stationary while entering the open end of an article which is being lowered and direct fluid jets against material to be removed from said article.

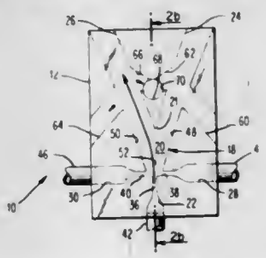
3,270,755
PORTABLE HANGAR
Louis W. Horvath, 3306 Hutchens Ave., Huntsville, Ala.
Filed July 25, 1963, Ser. No. 297,527
1 Claim. (Cl. 135—1)

A portable hangar, comprising a dismantleable frame having a general T shape in plan and arranged to enclose an aircraft, a flexible covering for said frame, and means for connecting said frame to the three spaced tie-down rings of a landing field, said frame including a base portion adapted to contact the ground, said base portion including bracing members arranged to define an aircraft wheel access space.



3,270,756
FLUID FLOW CONTROL VALVE
Hugh L. Dryden, Deputy Administrator of the National Aeronautics and Space Administration, with respect to an invention of Siegfried Hansen
Filed Apr. 9, 1963, Ser. No. 271,822
10 Claims. (Cl. 137—13)

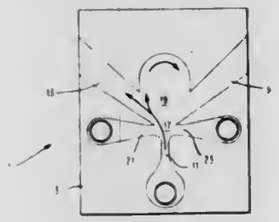
1. In a valve, the combination comprising: a flow control member positioned to block the path of flow of a selected fluid through said valve, said member being constructed of material whose crystal structure contains apertures through which molecules of said selected fluid can flow, and whose aperture size varies in response to temperature change; and means to change the temperature of said flow control member to change the size of said apertures to vary the impedance of said flow control member to the flow of molecules of said selected fluid through said apertures.



3,270,757
DUAL DIAPHRAGM PRESSURE REGULATOR
Alfred Engler, 1037 NE. 88th St., Miami, Fla.
Filed Oct. 1, 1963, Ser. No. 312,985
9 Claims. (Cl. 137—64)

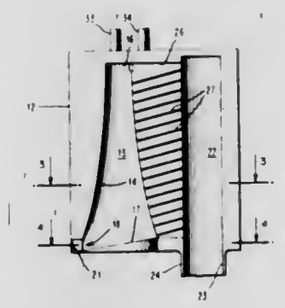
1. A device for first stage regulation of the pressure of a compressed air tank, comprising means forming a hollow housing having an axis and an inlet on said axis for connection to said tank, first and second flexible diaphragms respectively extending in spaced parallel relation across the interior of said housing transversely to said axis to divide it into a first chamber on the side of said first diaphragm adjacent said inlet, a second chamber on the side of said second diaphragm remote from said inlet, and an intermediate chamber between said diaphragms, said second flexible diaphragm being of substantially greater flexible area than said first diaphragm, said first chamber having an outlet, air communication means between said first and second chambers, said housing having a passage between said intermediate chamber and the outside of said housing, an axial piston in said intermediate chamber connected to said diaphragms so that their axial movements are in unison, said inlet comprising a post

having an axial passage therein extending perpendicularly into said first chamber from the bottom surface of said first chamber and having a nozzle outlet at the end thereof, valve means comprising a hollow lower portion slidably received on said post and a transverse head portion extending outwardly past said hollow portion to define the flange on the under side of said head and being movable between a valve opened position and a valve closed position whereby the under side of said head abuts said nozzle outlet to prevent the air from flowing out of said outlet, biasing means for biasing said valve means to the valve open position wherein the top surface of said transverse head abuts said first diaphragm, said valve means being moved to said valve closed position by the flexing action of said diaphragms in response to an increased air pressure in said second chamber.



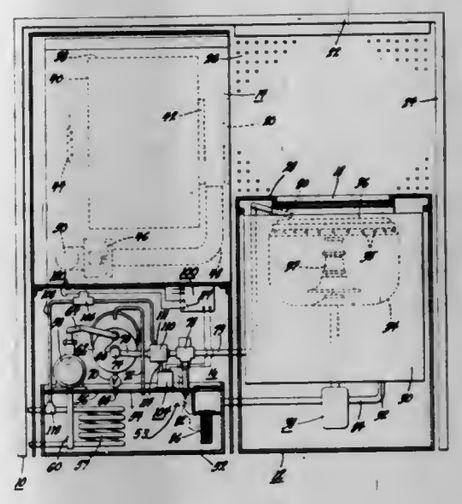
3,270,758
FLUID AMPLIFIERS
Peter Bauer, Bethesda, Md., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Apr. 22, 1963, Ser. No. 274,741
2 Claims. (Cl. 137—81.5)

1. A fluid amplifier comprising a supply orifice, two control fluid inlets and at least two output channels, a dividing element between said channels, said dividing element having an apex facing the supply orifice, conduit



means disposed in said dividing element connection with each of said two output channels downstream of said apex, said conduit means connecting said output channels with each other and in common to the ambient atmosphere for eliminating excess fluid in either one of said output channels due to pressure build-up.

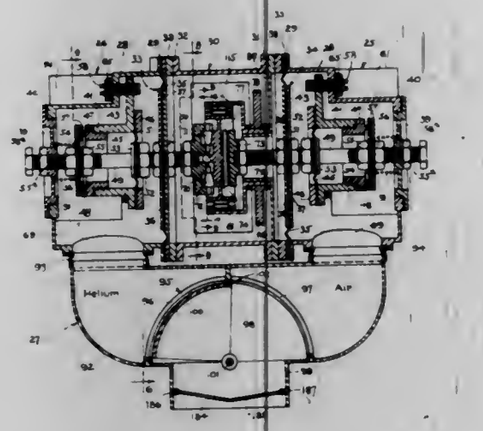
3,270,759
FLUID DEVICE
Edwin R. Phillips, Westport, Conn., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed June 7, 1963, Ser. No. 286,396
1 Claim. (Cl. 137—81.5)



A fluid device comprising an inlet for supplying power fluid, a pair of outlets, a pair of control inlets for directing said power fluid to a selected outlet, and a vortex chamber all leading from a common mixing chamber, said vortex chamber being disposed intermediate said outlets and in alignment with said inlet to receive power fluid therefrom, said vortex chamber being dimensioned to create a vortex movement of fluid therein with a portion of said fluid being directed to said selected outlet to maintain said fluid at said selected outlet after the application of fluid from said control inlets has terminated, said control inlets being disposed at substantially right angles with respect to said inlet and said vortex chamber, said outlets being angularly disposed away from said inlet on opposite sides of said vortex chamber and between said vortex chamber and said control inlets.

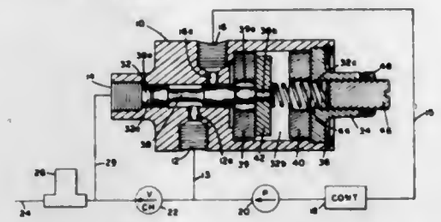
3,270,760
PNEUMATIC MULTIPLIER (VERY HIGH GAIN AMPLIFIER)
Robert G. Williamson, Norwalk, Conn., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Dec. 19, 1963, Ser. No. 331,819
7 Claims. (Cl. 137—81.5)

1. A tapered chamber, means for introducing fluid into said chamber in amounts gradually increasing from one end of said tapered chamber to the other, control means communicating with said chamber for initiating a vortex movement of said fluid at said one end of said chamber which in turn effects an increasing vortex movement of said fluid throughout said chamber.



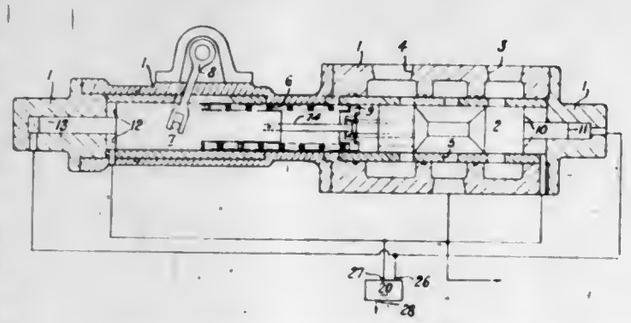
3,270,761
DRY CLEANING APPARATUS
Nelson J. Pansing, Clayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed July 31, 1963, Ser. No. 299,016
2 Claims. (Cl. 137—88)

1. In combination:
(a) means forming a container adapted to contain a dry cleaning solvent such as perchlorethylene or the like for dry cleaning clothes,
(b) means forming a substantially closed sump means containing a predetermined level of dry cleaning solvent therein and having a top wall, said top wall having first and second relative humidity sensing ports,
(c) means including a water cooling line in said sump means below said predetermined level for cooling said dry cleaning solvent,
(d) means including a solvent supply conduit connected in supply relationship to said container for effecting the circulation of dry cleaning solvent between said sump means and said container,
(e) means for supplying water to the dry cleaning solvent being supplied to said container including a mixing means in said solvent supply conduit having a water inlet and an outlet, a water supply conduit having one end connected to said water cooling line and its other end connected to the water inlet of said mixing means, and valve means in said water supply conduit openable for passing a regulated amount of water to said mixing means for entrainment into the solvent being supplied to said container,
(f) and control means for controlling said valve means, said control means including an inverted cup-like sniffer box supported on said top wall of the sump means and having a closed top and an open bottom positioned over said first and second relative humidity sensing ports, said sniffer box having a partition therein between said first and second ports for separating said sniffer box into a sensing chamber and a vapor flow inducing chamber, said partition being spaced from said closed top to form a passageway interconnecting said chambers, a standpipe in said vapor flow inducing chamber having one end connected to said first port, a relative humidity sensing element in said sensing chamber in vapor flow intercepting relationship between said second port and said passageway, and aspiration means including nozzle means in said standpipe having an inlet end connected to the outlet of said mixing means to supply a bleed sample of solvent to said standpipe whenever solvent is being circulated to said container thereby to induce a stream of vapor through said sensing chamber from above



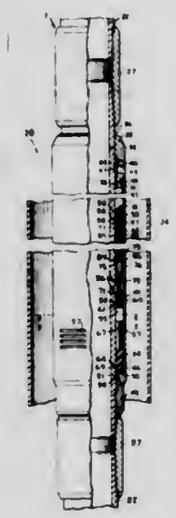
said predetermined level of dry cleaning solvent in said sump means for sampling the relative humidity of the vapor of the dry cleaning solvent in said sump means, said relative humidity sensing element effecting a control signal in response to the relative humidity sensed to open said valve means when the relative humidity of said stream of vapor is below a predetermined value.

3,270,762
MULTIPLE SUPPLY, BALANCED VALVE, PRESSURE REDUCING VALVES, AND THE LIKE
Thomas A. Banning, Jr., 5500–5520 S. Shore Drive, Apt. 1408, Chicago, Ill.
Application May 5, 1961, Ser. No. 107,948, which is a division of application Ser. No. 563,306, Feb. 3, 1956, now Patent No. 3,217,730, dated Nov. 16, 1965. Divided and this application Oct. 5, 1965, Ser. No. 493,156
7 Claims. (Cl. 137—98)



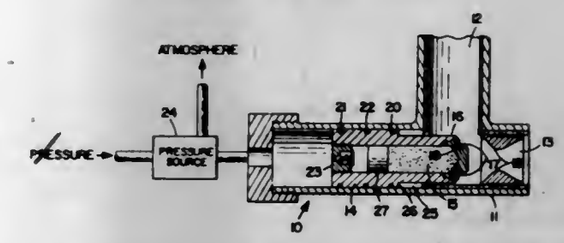
1. A multiple balanced pressure-reducing and delivering and proportion-controlling valve unit; comprising in combination a pair of pressure reducing valve units, each including a reduced-pressure gas-receiving chamber, and a control valve opening into such chamber, and including adjustable delivered-reduced-pressure regulating means, together with a common delivered-reduced-pressure control unit between the delivered-pressure, reduced-pressure regulating means of the two valve units; said control unit being constituted to cause each of the pressure reducing valve units to deliver gas into its gas-receiving chamber at the same reduced pressure as the other pressure reducing valve unit; together with a gas reduced-pressure receiving manifold in proximity to both of the valve units, and having its end portions in communication with the proximate chambers; together with a common delivered gas proportioning valve element located in the central portion of the manifold, and dividing the manifold into separated portions communicating with the respective reduced-pressure gas-receiving chambers; wherein said proportioning valve includes a mixed gas delivery opening in the manifold at the location of the proportioning valve element; and wherein said proportioning valve includes a circular arcuate partition extending across the central portion of the manifold and having its end portions connected to the manifold wall at the sides of said mixed gas delivery opening, a segmental arcuate movable valve element journalled for rotary movement about an axis coaxial with the partition, an arcuate mask plate between the proximate opposing surfaces of the partition end of the valve unit; together with means constituted to rock the movable valve element about its axis, to selected angular positions.

3,270,763
PRESSURE RESPONSIVE VALVE
Heinz Kiefer, Ulmenweg 1, Eltorf, Germany
Filed Sept. 25, 1963, Ser. No. 311,538
2 Claims. (Cl. 137—108)



1. A pressure responsive valve comprising, in combination: a body having a fluid pressure sensing aperture connectable to a source of fluid under pressure and an axial bore extending from said aperture; a fluid inlet and outlet opening in said body connecting to said bore; a piston member slidably disposed in said bore in relation to said inlet and outlet and effective to normally cover one of the openings and to preclude any fluid intercourse between said aperture and the openings, said piston member being axially movable in said bore to control fluid flow communication between said inlet and outlet; magnetic snap action means including a magnetic member secured on and movable with said piston and a pair of magnetically responsive members disposed spaced apart on opposite sides of said magnetic member; a spring member arranged in said bore and bearing, at one end, against said magnetic member and extending through one of said magnetically responsive members, said spring providing an opposing force against said piston member in opposition to the fluid under pressure; said magnetic snap action means being effective for establishing a magnetic force for facilitating an impact-like axial movement of said piston member when the fluid pressure within the bore exceeds the opposing force of the spring member and the magnetic force exerted upon said piston to establish, suddenly, fluid flow communication between said inlet and outlet and to suddenly return said piston to its normal position cutting off said fluid flow communication when the forces acting upon said piston member exceed the fluid pressure within said bore.

3,270,764
PRESSURE CONTROL VALVE FOR USE WITH MINE WINDERS
Colin McFadyen, Mufulira, Northern Rhodesia, and Bernard E. Shaw, Paisley, Scotland, assignors to Fullerton, Hodgart & Barclay Limited, Paisley, Scotland, a corporation of Great Britain and Northern Ireland
Filed Oct. 16, 1962, Ser. No. 230,956
5 Claims. (Cl. 137—116.3)

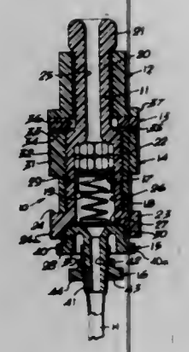


1. A control valve comprising a first casing, first port means formed in said first casing for the passage of a pressure medium through said casing, a first valve member axially movable within said casing to a position in which the flow of said pressure medium through said casing is permitted and to a position in which the flow is prevented, said valve member having one end face thereof of stepped construction, an actuating member axially movable within said casing, said actuating member having one end face thereof of stepped construction, means connecting the non-stepped end faces of said valve member and said actuating member in spaced relationship, said connecting means comprising resilient means urging said members apart and adapted to be compressed to allow said members to be moved together, force imparting means connected to said actuating member for axially moving said actuating member and said valve member within said casing, means selectively imparting said pressure medium to any number of the step faces of said stepped end faces of both of said members when said valve member is in a position permitting the flow of said pressure medium through said casing, the impinging of said pressure medium on said stepped end faces urging said members together by compressing said resilient means, said valve member thereby moving toward said actuating member to said position in which the flow of said pressure medium through said casing is prevented, the pressure necessary to move said valve member to the position in which the flow is prevented being dependent upon the number of step faces on which said pressure medium is permitted to act.

3,270,765
GAS LIFT VALVES
James D. Waters, Houma, La., assignor to Otis Engineering Corporation, Dallas, Tex., a corporation of Delaware
Filed June 8, 1962, Ser. No. 201,022
8 Claims. (Cl. 137—155)

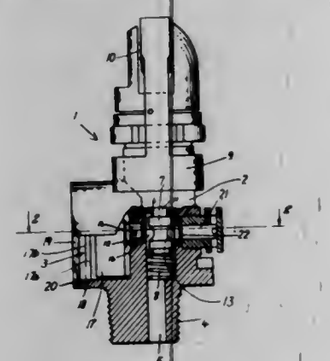
1. A gas lift valve comprising: a tubular body adapted for connection in a tubing; a sleeve disposed about said body to define a flow passage between said body and said sleeve, said body and said sleeve having ports therein communicating with said flow passage and with the interior of said body and the exterior of the sleeve respectively; annular port seat means disposed in said flow passage between the ports of said body and the ports of said sleeve and having a plurality of circumferentially spaced flow ports therein; an annular valve carrier member disposed between said body and said sleeve and having a plurality of circumferentially spaced longitudinally extending valve members thereon each engageable with one of said flow ports to prevent fluid through said passage between said ports of said body and said ports of said sleeve; and a pair of coaxially aligned annular bellows disposed in said flow passage, one end of each of said bellows being sealingly connected to one end of said flow passage, the other end of each of said bellows being sealingly connected to said annular valve carrier member, said annular valve carrier member and said bellows enclosing within the bellows a fluid pressure charge which expands the bellows and urges said annular valve carrier member toward said annular port seat means whereby said valve members on said valve carrier member are biased into engagement with said flow ports; said spaced depending valve members permitting free passage of fluid between the outer sides of the pair of bellows whereby the fluid pressure within the passage between the bellows and the annular port seat means acts on said bellows to cause movement of said valve members to open position when said fluid pressure exceeds the pressure of the charge confined within the bellows.

3,270,766
AUTOMATICALLY VISCOUS SEALED FLUID AMPLIFIER
William C. Stone, 1901 Alexander Drive SE., Huntsville, Ala.
Filed Sept. 18, 1963, Ser. No. 309,904
8 Claims. (Cl. 137—246.22)



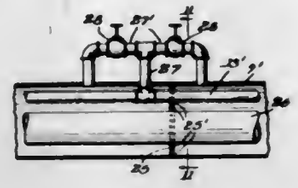
1. A value disposed for controlling the flow of hot gases therethrough comprising:
(a) a housing having a longitudinal bore therethrough including an exit portion at a first end of said bore and an inlet disposed in normal relation to and in communication with said bore;
(b) a hollow piston slideably mounted in said bore and having a male seat thereon for sealing engagement with said exit portions, said hollow piston provided with a chamber containing a viscous seal means, and said seat of said hollow piston having passage means therethrough and in communication with said piston chamber;
(c) a floating piston concentrically carried in said hollow piston chamber to effect flow of said viscous seal means through said passage means;
(d) a pressure source secured to a second end of said bore in communiaction with said hollow piston and said floating piston for causing relative movement therebetween, whereby said seat of said hollow piston is moved into sealing engagement with said exit portion of said housing and movement of said floating piston effects extrusion of said viscous seal means through said passage means for retention between said seat and said exit portion to enhance the seal therebetween for preventing flow of the hot gases through said exit portion.

3,270,767
FAUCET CONNECTOR
Walter Franz Hirsch, 6271 SW. 26th St., Miami, Fla.
Filed Jan. 2, 1964, Ser. No. 335,311
4 Claims. (Cl. 137—268)



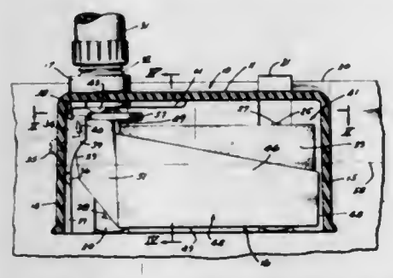
1. In a faucet connector, the combination comprising, a body member having an elongated, tubular nozzle portion at one end and an increased diameter portion at the other end, said increased diameter portion having a cylindrical inner chamber coaxial with and communicating at one end with the opening at the inner end of said tubular nozzle portion, the outer end of said nozzle having integrally formed therewith a head portion of increased external diameter, a resilient sleeve member circumjacent said nozzle portion and movable axially therealong, said

sleeve member having an internal diameter less than the outer diameter of said head portion, screw means for forcing the outer end of said sleeve member in expanded disposition over said nozzle head portion, and means for connecting a hose to said body member and in communication with the other end of said chamber, said screw means comprising an exterior screw thread formed along the outside of said increased diameter portion of said body member, an actuating thumb-nut threadedly re-



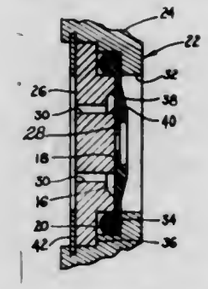
ceived on said screw thread and providing an annular shoulder facing said sleeve member, and an annular washer circumjacent said nozzle portion between said sleeve member and said annular shoulder, said annular shoulder of said thumb-nut being formed with a central, coaxial groove, and a coaxial annular projection on said washer of greater height than the depth of said groove for minimizing the frictional contact between said washer and said shoulder.

3,270,768
VALVE AND PRESSURE GAUGE ASSEMBLY
Frank G. Kamowski, East Orange, N.J., assignor, by mesne assignments, to The Fyr-Fyter Company, a corporation of Delaware
Filed Mar. 7, 1963, Ser. No. 263,457
3 Claims. (Cl. 137—327)



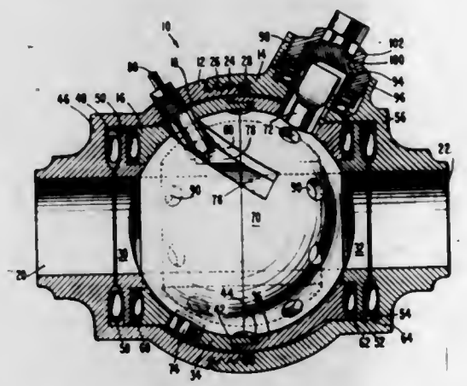
1. A valve and pressure gauge assembly comprising a valve body having a main discharge passage therethrough, means forming a cross passage intersecting said main discharge passage, means forming a pressure gauge recess in said valve body about one end of said cross passage, means forming a threaded surface in the wall of at least one end of the cross passage, a pressure gauge, a threaded inlet pipe for the pressure gauge, the pressure gauge positioned in said recess with its inlet pipe threadedly engaged in said cross passage and providing a support for the pressure gauge, means forming a tool engaging surface on the pressure gauge inlet pipe, and removable closure means for the other end of the cross passage whereby a tool may be introduced through said other end of the cross passage into contact with said tool engaging surface to turn the inlet pipe into threaded engagement with the wall of the cross passage.

3,270,769
VACUUM INSULATING SYSTEM FOR JACKETED PIPING SYSTEMS
Edward W. Kaiser and Edward B. Kaiser, both of 2114 West Lake Ave., Glenview, Ill.
Filed Mar. 30, 1965, Ser. No. 443,960
4 Claims. (Cl. 137—375)



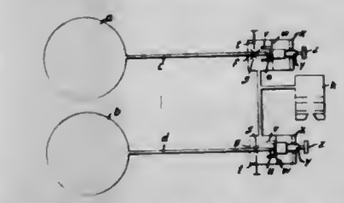
1. A jacketed piping system comprising in combination a casing line and a matter transporting pipe line supported within the casing line in spaced relation to the walls thereof forming a flow way between the casing line and the matter transporting pipe line throughout their lengths, the flow way being divided into separate compartments throughout its length:
(a) a vacuum pipe line within and disposed longitudinally of the casing line;
(b) branch pipes extended from the vacuum pipe line at intervals throughout its length connected to and selectively communicable with adjacent compartments of said flow way;
(c) vacuum creating means connected to the casing line communicating with said flow way; and
(d) means positioned between the vacuum creating means and the vacuum pipe line communicating therewith and operable to maintain a vacuum of predetermined degree in and throughout the vacuum pipe line.

3,270,770
FLOAT CONTROLLED VALVE ASSEMBLY
Robert M. Wilson, Battle Creek, Mich., assignor to Dare Products, Incorporated, Battle Creek, Mich., a corporation of Michigan
Filed Nov. 29, 1963, Ser. No. 326,787
10 Claims. (Cl. 137—434)



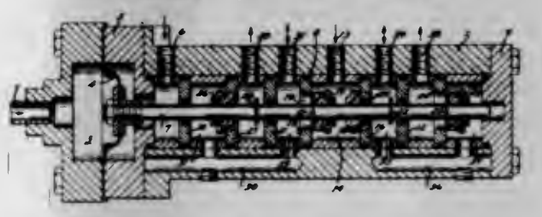
1. A float valve assembly for watering tanks and the like, comprising a box-like member having a top, sides, ends, and an exposed open bottom, with the upper portion of said box-like member being vented, said box-like member having an inlet connection into same through said top adjacent but spaced from one end of same, said inlet connection being connectable to one end of a supply line for liquid under pressure, a valve seat encircling the other end of said inlet connection inside of said box-like member, pivot means at the end of and inside said box-like member adjacent said inlet connection, a sealing valve member for sealing on said valve seat, means pivotally mounted on said pivot means at the end of said box-like member, means for mounting said sealing valve member in fixed position on said pivotally mounted means for movement in unison with same to and from said valve seat, a float, and means for mounting and supporting said float on said pivotally mounted means wholly within said box-like member, the portion of said float supporting means adjacent the open bottom of said box-like member serving as a shield for said float and having a smooth outer surface.

3,270,771
RESILIENT DISC CHECK VALVE
David Luke Morgan, Shelton, Harold F. Snider, Orange, and Frank Vincent Mingrone, Milford, Conn., assignors to Robertshaw Controls Company, Richmond, Va., a corporation of Delaware
Filed June 11, 1963, Ser. No. 287,005
8 Claims. (Cl. 137—525.3)



1. A resilient valve element comprising a disc-shaped portion having a central opening, the thickness of said portion varying inversely with the radial distance from said opening, one side of said portion presenting a flat surface; an integral flexible annular lip extending radially inward from said portion at said opening, one side of said lip being an extension of said flat surface and extending outwardly from said surface and an integral bead at the periphery of said disc-shaped portion.

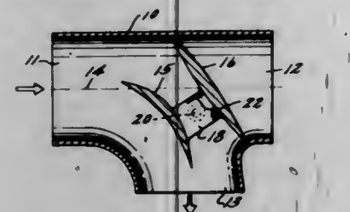
3,270,772
BALL VALVE UNIT
Jozef M. Rakus, P.O. Box 1749, Washington, D.C.
Filed Aug. 23, 1965, Ser. No. 481,503
9 Claims. (Cl. 137—553)



1. A valve unit comprising a housing, said housing being provided with an exterior wall and a spherical chamber disposed between an inlet port and an outlet port, a spherically shaped hollow valve member rotatably positioned within the spherical chamber of said housing, a rotating means attached to said valve member and extending through said housing, a tubular member extending diametrically through said hollow valve member and communicating with the inlet and outlet ports when said valve member is rotated to a first position and blocking the inlet and outlet ports when said valve member is rotated to a second position, said tubular member and said hollow valve member forming an annular chamber within the interior of said valve member, and a valve position indicating means attached to said housing and contacting said tubular member establishing a means to display the relative degree of valve opening between the first position and the second position.

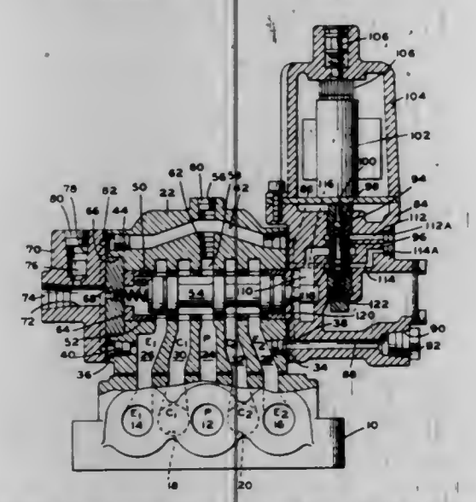
3,270,773
CLOSABLE INLET DEVICES FOR ADMITTING GAS INTO HIGH VACUUM CONTAINERS
Curt Brunnée, Bremen, Germany, assignor to Atlas Mess- und Analysentechnik G.m.b.H., Bremen, Germany, a corporation of Germany
Filed Feb. 11, 1963, Ser. No. 257,459
Claims priority, application Germany, Feb. 13, 1962, A 39,454
2 Claims. (Cl. 137—561)

1. In a mass spectrometer having a gas storage tank and a high vacuum ion source, the improvement comprising a closable inlet device interconnecting said gas storage tank and said ion source,
said closable inlet device comprising a capillary tube having a first end operatively connected with said gas storage tank,
a second end of said tube comprising an outlet means to said high vacuum ion source,
a throttle means disposed immediately adjacent and interconnected only with said second tube end of said tube without interconnection of a high vacuum pump between said throttle means and said second tube end, and
valve means operatively associated with said outlet means for movement into positions seating against and closing said outlet means.



3,270,774
MULTIPLE VALVE
Robert B. Stuart, 936 Calimesa Blvd., Calimesa, Calif.
Filed Feb. 5, 1965, Ser. No. 430,595
4 Claims. (Cl. 137—596.18)

4. A multiple valve comprising a body,
a rod within the body and positioned on the longitudinal center line of the body,
actuating means connected to said rod to move said rod lengthwise within said body,
said body having a pressure chamber therein and a pair of walls defining the ends of said chamber,
one of said walls having a fluid opening therein,
said body having a pressure inlet port extending into said chamber,
said body having a second chamber therein adjacent the first named pressure chamber and a port extending from the second chamber,
said body having a third chamber therein adjacent the second chamber and a port extending from the third chamber,
said body having a fourth chamber therein adjacent the third chamber, and a by-pass duct extending from the second to the fourth chambers,
said rod extending through each of said chambers,
spool valves slidably mounted on said rod, one of said spool valves controlling fluid flow between the first and second chambers, and another spool valve controlling fluid flow between the third and fourth chambers,

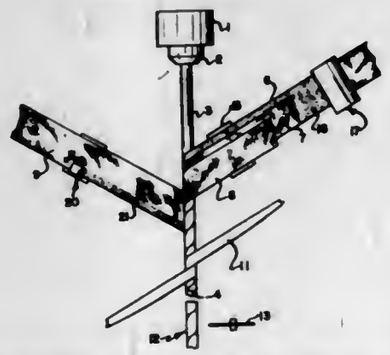


one of said spool valves being seated in the fluid opening in one of said walls,
and separate fixed pickup shoulders on said rod engageable with each of said spool valves to unseat the spool valves on longitudinal movement of said rod.

3,270,775
DIVERTER VALVE ASSEMBLY
Edgar D. Alderson, Cincinnati, Ohio, assignor to General Electric Company, a corporation of New York
Filed Apr. 9, 1963, Ser. No. 271,721
6 Claims. (Cl. 137—609)

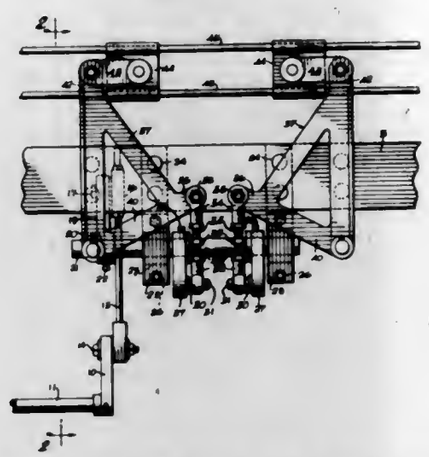
1. A diverter valve assembly comprising,
a conduct for the passage of fluid therethrough, and having an inlet,
said conduit being bifurcated to provide two outlets therefrom,
a pair of valve doors spaced from each other throughout their length to provide flow therebetween and disposed in the conduit at said bifurcation,
a separate member joining said doors to form a unitary movable structure therewith,
a fixed pivot connected to said separate member,
means to rotate said structure as a unit so rotation of said doors and member together opens and closes said outlets alternately,
said pivot connecting said member being disposed between said doors and downstream of the net pressure vector of all the forces acting on the doors,
whereby a positive torque is exerted on said doors in their respective closed positions.

3,270,776
SOLENOID VALVE CONSTRUCTION
William Carls, % Numatic Inc., Highland, Mich.
Filed June 10, 1965, Ser. No. 462,885
4 Claims. (Cl. 137—625.64)



1. For use in a multi-purpose valve of the spool and sleeve type:
(a) a main valve housing with two end faces having a main axial bore between said faces with spaced pressure, exhaust and work ports and passages extending from said ports laterally of said bore to a surface of said housing, said housing having also an axial passage extending between said end faces with a lateral passage connecting said axial passage and a pressure port at said bore, said housing having also a short axial passage from each end face extending inwardly to respective exhaust passages, and
(b) an end housing located respectively at each end face of said main valve housing, each end housing having a common passage connecting the axial passages of said main valve housing terminating respectively at each end face.

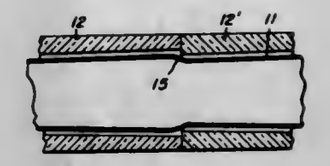
3,270,777
INCORPORATION OF CARBON BLACK IN MIXTURE OF ALPHA-METHYL STYRENE:ACRYLONITRILE RESIN AND GRAFT COPOLYMER OF STYRENE AND ACRYLONITRILE ON POLYBUTADIENE
Mortimer S. Thompson, North Woodbury, Conn., assignor to United States Rubber Company, New York, N.Y., a corporation of New Jersey
No Drawing. Original application Dec. 19, 1958, Ser. No. 781,434, now Patent No. 3,111,501, dated Nov. 19, 1963. Divided and this application July 15, 1963, Ser. No. 295,607
2 Claims. (Cl. 138—118)



1. A thermoplastic gum plastic composition comprising a separately prepared mixture of from 68% to 85% of (A) and correspondingly from 32% to 15% of (B), the said (A) being a resinous copolymer of alpha-methyl styrene and acrylonitrile, said copolymer containing from 65 to 75 parts of alpha-methyl styrene and correspondingly from 35 to 25 parts of acrylonitrile per 100 parts of said copolymer, and the said (B) being a graft copolymer made by copolymerizing from 50 to 40 parts (per 100 parts of graft copolymer) of a monomeric mixture of styrene and acrylonitrile, the ratio of styrene: acrylonitrile being from 65:35 to 75:25, in an aqueous emulsion containing correspondingly from 50 to 60 parts of polybutadiene rubber, the said polymers (A) and (B) being the sole polymers present in the said separately prepared mixture, the said mixture of (A) and (B) being further blended with a separately prepared premix of from 5 to 10 parts of butadiene-acrylonitrile copolymer rubber, containing from 12 to 40% of acrylonitrile and correspondingly from 88 to 60% of butadiene, with from 2 to 3 parts of carbon black, the amount of said premix being sufficient to provide from 2 to 3 parts of carbon black per 100 parts of the total mixture, the said percentages, parts and ratios being by weight, and the said composition being characterized by resistance to weeping and by good physical properties at elevated temperatures.
2. A pipe made from the composition of claim 1.

3,270,778
FLEXIBLE PAPER TUBE
William A. Foll, 3475 Doris Road, Cleveland, Ohio, and Albin M. Hancik, 2021 Clarence Ave., Lakewood, Ohio
Filed Aug. 14, 1963, Ser. No. 302,055
7 Claims. (Cl. 138—144)

1. A spiral wound flexible, bendable paper tube capable of absorbing oil comprising an inner ply of biaxially creped kraft paper, a coating of adhesive on the exterior surface of said inner ply, an intermediate ply of biaxially creped kraft paper, an exterior ply of biaxially creped kraft paper lap seamed to itself, and adhesive securing together the lapped portions only of said exterior ply.

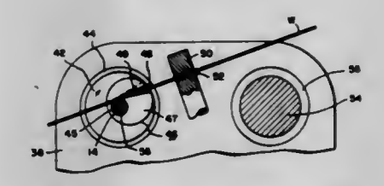


3,270,779
SHUTTLE DRIVING MECHANISM
Henry Dyer, 136 N. 15th St., Prospect Park, N.J.
Filed Apr. 15, 1965, Ser. No. 448,317
7 Claims. (Cl. 139—138)

1. A shuttle driving device for power looms of the type having a transverse batten lay beam, a shuttle batten in spaced parallel relation above the batten lay beam and a rotary drive shaft extending outwardly of one end of the loom and disposed in spaced parallel relation with respect to the batten lay beam and shuttle batten, comprising, in combination, a rocker shaft journalled in spaced parallel relation with respect to and below the batten lay beam, an elongated main lever perpendicularly fixed at one end to said rocker shaft and extending to the rear of the lay beam, a pair of relatively short elongated front levers each perpendicularly fixed at one end to said rocker shaft and extending to the front of the lay beam, a pair of picker levers, each having upper and lower and sidewardly offset pivotal bearing portions, the lower pivotal bearing portions of said picker levers each being journalled with respect to the front of said lay beam for independent transverse swinging motion with respect thereto, adjustable link means interconnecting said sidewardly offset pivotal bearing portions of said picker levers with one each of the other ends of said front levers for transmitting oscillatory motion therebetween, and adjustable crank means interconnecting said other end of said main lever with the rotary drive shaft of the loom for imparting oscillatory rocking motion to said rocker shaft.

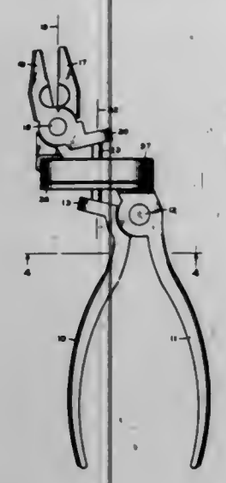
3,270,780
COMPOSITE HEAT EXCHANGER TUBE STRUCTURE
Paul H. Kydd, Scotia, N.Y., and George J. Mullaney, Seattle, Wash., assignors to General Electric Company, a corporation of New York
Filed Apr. 26, 1963, Ser. No. 275,880
10 Claims. (Cl. 138—148)

3. A composite tube construction comprising:
(a) longitudinally-extending impermeable metallic means for containing a fluid confined therein for transportation under pressure therethrough,
(1) said containing means being in the shape of a right circular cylinder and having sufficient wall thickness and strength to withstand the internal fluid pressure without additional external support at temperatures below and approaching the operating temperatures for said composite tube,
(b) ceramic means for simultaneously protecting said containing means and supporting the internal fluid pressure transmitted thereto by said containing means at operating temperatures after the expansion of the containing means thereagainst during temperature increase thereof to the operating temperatures,



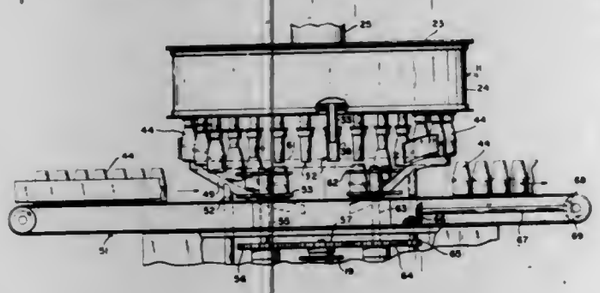
(1) said protecting and supporting means having an opening therethrough of circular cross-section encircling said containing means,
(2) said containing means and said protecting and supporting means having a total cold radial clearance therebetween at least as great as and substantially equal to the differential radial expansion of said containing means and protecting and supporting means during heating thereof to the operating temperatures.

ERRATUM



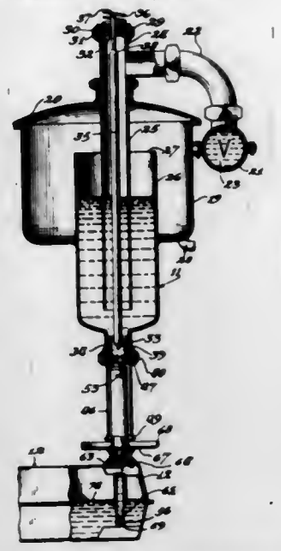
For Class 139—138 see:
Patent No. 3,270,779

3,270,781
METHOD AND APPARATUS FOR FORMING AND ATTACHING FILAMENT SUPPORT MEMBERS
William L. Brundige, West Caldwell, N.J., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed May 17, 1963, Ser. No. 281,293
8 Claims. (Cl. 140—71.5)



1. The method of forming and mounting a wire support member on an elongated incandescible filament comprising,
immobilizing at least that portion of the filament to which the support member is to be attached,
positioning a length of wire that is substantially straight and longer than that required for the support member transverse and tangent to said filament so that the latter contacts an intermediate portion of said length of wire,
wrapping a portion of said wire located adjacent to and on one side of said filament tightly around the latter and simultaneously bending the corresponding portion of said wire located on the other side of said filament into an arcuate loop to thereby form the intermediate portion of said length of wire into a support member of predetermined curvature and size that is disposed and anchored in encircling spaced-apart relationship with said filament, and then
trimming the ends of the formed support member to remove the excess end sections of said length of wire.

3,270,782
WIRE-TWISTING HAND TOOL
Leon R. Klang, Hickman Ave., and Ralph R. Twitchell, Rte. 4, both of Fulton, Mo.
Filed Mar. 25, 1964, Ser. No. 354,556
14 Claims. (Cl. 140—123)



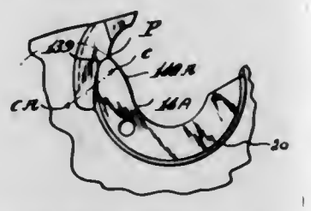
1. A hand tool comprising:
(a) a pair of pivotally interconnected handles,
(b) a pair of pivotally interconnected jaws,
(c) means interconnecting one handle with one jaw so as to open or close the jaws upon pivotal action of the handles, and
(d) swivel means offset from the longitudinal axis of the jaws and interconnecting the other handle with the other jaw so that translatory cranking movement of the handles causes rotation of the jaws.

3,270,783
CONTAINER FILLING METHOD AND APPARATUS
Harley Roland Hughes, Summit, N.J., assignor to Colgate-Palmolive Company, New York, N.Y., a corporation of Delaware
Filed Oct. 16, 1963, Ser. No. 316,668
15 Claims. (Cl. 141—1)

1. In a method of filling an open top otherwise airtight container with predetermined volume of flowable particulate product wherein a filling tube depending from and open to a reservoir of said product is inserted into the container through said open top, the steps of peripherally sealing the container substantially air tight with said filling tube by relatively axially moving said container and tube until the container rim surrounding said opening peripherally engages an annular external surface of said tube in airtight relation while introducing product from the reservoir through the tube into the container until the inserted tube is filled to a predetermined level, and then separating the container from the tube and permitting the remaining contents of the tube to discharge into the container.

3,270,784
METHOD AND APPARATUS FOR DISPENSING FOAMABLE LIQUIDS
Robert J. Mistarz, Northbrook, Ill., assignor to Chicago Stainless Equipment Corporation, a corporation of Illinois
Filed Feb. 4, 1963, Ser. No. 258,372
9 Claims. (Cl. 141—2)

1. A liquid dispensing device, comprising: a measuring receptacle for said liquid; means forming an overflow portion on said receptacle to limit the liquid contained therein to a predetermined maximum level; an exit conduit from said receptacle having a flow orifice therein; a supply conduit to said receptacle having a discharge end within said receptacle and an elevated portion above the receptacle; a vacuum breaker means in said supply conduit communicating with the atmosphere; means for flowing liquid through said supply conduit into said receptacle, the liquid level in said receptacle being beneath said overflow portion; and a member movable between two positions, in one position to restrict flow through said orifice and simultaneously open said vacuum breaker means to cause a further liquid portion to flow from said conduit into said receptacle, and in another position to permit free flow through said orifice, said further liquid portion serving to fill said receptacle substantially to said overflow portion.



3,270,785
PORTABLE MOTOR-DRIVEN SAW
Kermit A. Molitor, 712 Hemitt, Bremerton, Wash.
Filed Oct. 28, 1963, Ser. No. 319,394
10 Claims. (Cl. 143—43)

1. In a portable motor-driven saw of the character described, a portable motor housing having a rigid arbor housing projecting outwardly at a fixed attitude therefrom, an arbor extending in a fixed rotatable position through the arbor housing from the motor housing, the end of said arbor housing having a collar member rotatably keyed thereon so as to be continuously free to turn about the arbor, said collar member having means fixed thereon which define a slideway that extends along a line coincident with a radius of the arbor, a shield member which defines a guard and a planar guide for a disc blade mounted on the arbor, and which is equipped with

bracket means that are slidably engaged on the slideway, said planar guide being so positioned in relation to the arbor that its base lies in a plane extending normal to the aforementioned line, means defining limits for the slideway at points relatively remote from and relatively adjacent to the base of the planar guide, and resilient means urging the shield member to move into a position in which the bracket means abuts that slideway limit disposed relatively adjacent to the base of the guide.

3,270,786
SHANKS FOR INSERTED TOOTH SAWS AND ASSEMBLIES OF SAME
Victor A. Kolesh, Holden, and Walter E. Lamlein, Leominster, Mass., assignors to Simonds Saw and Steel Company, Fitchburg, Mass., a corporation of Massachusetts
Filed Aug. 18, 1965, Ser. No. 480,742
1 Claim. (Cl. 143—151)

An inserted tooth saw comprising a circular saw body, sockets formed about the periphery of said body, inserted tooth cutter bits for the saw, and shanks replaceably holding said bits in said peripheral sockets, each of said shanks comprising

a flat metal body of a general C-shape including rear and forward ends and an intermediate portion,

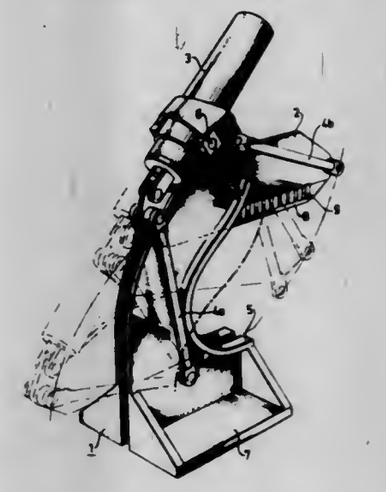
said body formed with flat swageless parallel sides affording it uniform thickness throughout, said thickness being 0.020 inch plus or minus 0.010 inch thicker than the saw body, whereby it extends not more than about 0.015 inch laterally beyond the saw body on each side, the thickness of said shank body further being dimension between the thickness of the saw body and the width of the body of said bits at the front face thereof,

the inner and outer margins of said shank body along the major intermediate portion thereof being formed as corresponding arcs respectively of an inner and relatively smaller circle and of an outer relatively larger and substantially concentric circuit, the radius of said inner margin being 45% to 60% of the outer margin radius, the smaller arc defining the gullet space in the installed position of the shank in the saw socket,

the trailing end of the shank body having a bit-engaging rear part and a gullet-entering front part, the marginal edges of said parts joining at the outermost contact point of the shank and the bit when assembled,

said rear part comprising approximately a quadrant of a circle centered within the shank body and having a radius equal to about half the difference in length of the radii of the shank outer and inner margins,

said front part of said trailing end of the shank body projecting convexly into the gullet space from said shank and bit contact point and merging reversely into the concave margin of said space as an arcuate segment of a circle, the locus of the center of which and the length of radius of which being correlatively such that the full circle of which the segment is a part is defined within the initial overall circumference of the saw plate,



said center locus further defined as ranging from a point within the shank body to a point rearwardly and inwardly from the end of the shank body and said segment radius further defined as ranging from about 50% of the difference between the inner and outer radii of the shank to a radius increased correspondingly with the rearward inward positioning of the locus but still describing a cricle within the confine of the saw plate circumference,

said rear and front part of said shank trailing end defining a chip dispersal shoulder adapted to propel chips impinging thereupon from the cutting edge of the bit in different paths relative to and outwardly into the gullet space with avoidance by said shank thickness of jamming and compacted collection thereof in the region of the bit and shank junction and with consequent prevention of friction and rotative pressure on the bit and shank by such chip collection,

the forward end of said shank extending in the installed positon thereof substantially to the front end of the corresponding saw plate socket and being shaped to conform generally with and to serve as a rearward extension of the adjacent outer edge of the saw plate portion immediately forward of the particular socket wherein the shank is installed, and

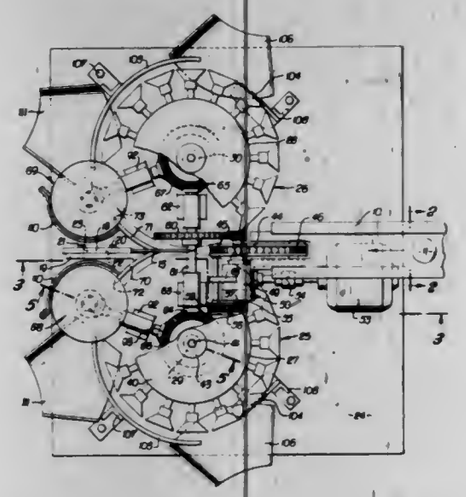
said shank having only a single transverse through aperture, in the intermediate portion of the shank body, for engagement by and coaction with an installing and removing tool.

3,270,787
HYDRAULICALLY OPERATED DEVICE FOR CUTTING TREES, LOGS AND THE LIKE
Dick Lennart Rehnström, Skelleftea, Sweden, assignor to Fabriks AB Forslund & Co., Skelleftea, Sweden
Filed May 14, 1964, Ser. No. 367,922
Claims priority, application Sweden, May 16, 1963, 5,431/63
6 Claims. (Cl. 144—34)

6. An apparatus for cutting trees, logs and similar objects comprising in combination

(a) a frame member consisting of two substantially symmetrical halves that are maintained a fixed distance apart,

(b) a cutting member that is disposed in the plane passing between the symmetrical halves of said frame member,

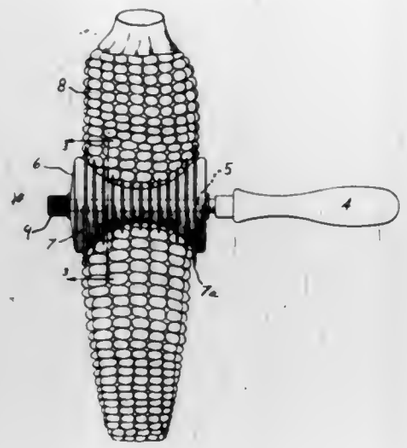


(c) a hydraulic power means comprising a cylinder portion and a piston portion that is attached to one extremity of said cutting member,

(d) the cylinder portion of said hydraulic power means being pivotally mounted on said frame member so that said cylinder portion can swing at least a limited distance in the plane passing between the symmetrical halves of said frame member,

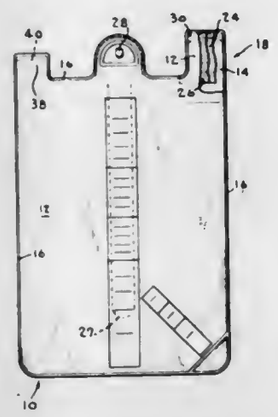
(e) a first pivotable link having one end attached adjacent to the same extremity of said cutting member to which said piston portion is attached and the other end of said link being attached to said frame member, and

(f) a second pivotable link having one end attached adjacent to the other extremity of said cutting member and the other end of said link being attached to another portion of said frame member.



3,270,788
FRUIT ORIENTING, HALVING, AND CORING MACHINE
Theodore Armstrong, Torrance, Calif., assignor, by mesne assignments, to Pacific Preserving Co., Gardena, Calif., a corporation of California
Filed Sept. 3, 1963, Ser. No. 305,991
9 Claims. (Cl. 146—52)

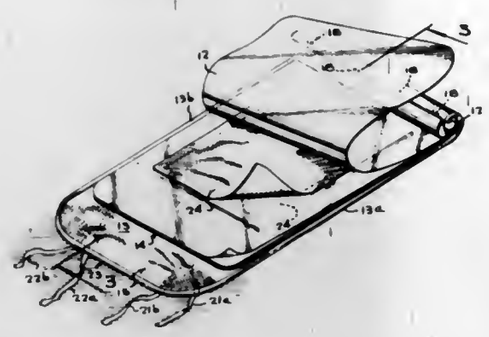
4. In apparatus for coring substantially spherical fruit having a core axis extending through its seed cell: a pair of fruit holders; means determining separate circuitous paths of movement of the holders, said paths having substantially parallel runs in which the holders are opposed to each other, said paths converging in advance of the start of said parallel runs and diverging from the end of said parallel runs; means for feeding fruit between the holders in advance of said parallel runs with the core axes perpendicular to the said paths; said holders having provisions for centering the seed cells relative to the holders; a cutting knife located between said paths at the parallel runs; a pair of rotary knife devices for the holders respectively; means for moving the knife devices in paths having runs substantially paralleling the paths of said holders respectively; said knife devices each having operative fruit cutting parts located both above and below the position of the seed cell determined by said holders.



3,270,789
CORN TENDERIZER
John Majeske, 2835 Garrett Road, Drexel Hill, Pa.
Filed Feb. 11, 1964, Ser. No. 343,971
3 Claims. (Cl. 146—203)

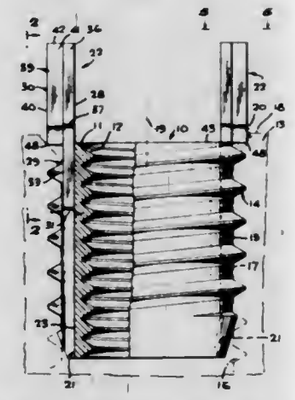
1. A device for treating corn in situ on the cob, comprising an elongated handle, an axle-like shaft extending lengthwise from said handle, an integral concave-spool-like member of varying cylindrical cross section rotatably mounted on said shaft with its axis substantially in alignment with the handle, said member having its minimum cylindrical cross section at the mid-region of its length and its maximum cylindrical cross section at its ends, whereby it is contured to embrace a portion of the curved surface of an ear of corn when the latter is held at right angles to the axis of the shaft and handle, and a plurality of radially disposed kernel-piercing teeth formed integrally on the concave surface of said spool-like member

and configured to pierce the kernels, while leaving their hulls in place, as the said member rotates when passed along an ear of corn held at right angles to the handle.



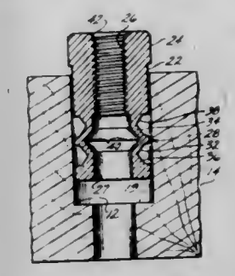
3,270,790
DETACHABLE TUBE TO BAG CONNECTOR MEANS AND METHOD OF MAKING SAME
James L. Clark, Whitefish Bay, Wis., assignor, by mesne assignments, to Plastronics, Inc., Milwaukee, Wis., a corporation of Wisconsin
Filed Mar. 9, 1964, Ser. No. 350,329
2 Claims. (Cl. 150—1)

1. Outlet means for a container, said container including sheets of synthetic resin forming opposite walls of said container, first and second relatively thin flat strips of like material forming rectangular integral extensions of said opposite walls of said container, said strips having opposite side edges and an end edge;



resilient, foam synthetic resin inserts considerably thicker than said strips positioned in an abutting face-to-face relationship between, co-extensive with and secured to said first and second strips, said pair of foam strips and said first and second plastic strips being sealed together along the outer periphery of said side edges and said end edge to form a peripherally sealed extension of said sheets, said end edge being readily severable to provide an access opening between the abutting foam plastic faces, said faces frictionally engaging a tube adapted to be inserted therein after severance of said sealed end edge.

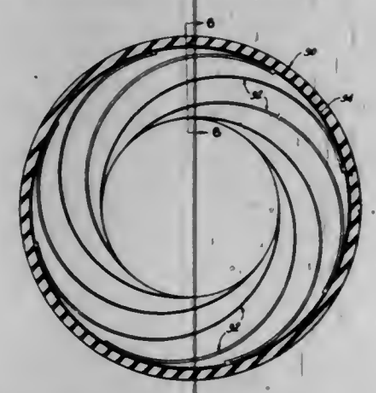
3,270,791
FABRIC STORAGE DEVICE
Nancy R. Harris, 200 Poplar Lane, Richmond, Va.
Filed Apr. 1, 1964, Ser. No. 356,399
5 Claims. (Cl. 150—52)



1. A device adapted to be rolled into a cylindrical configuration for storing fabric articles and the like comprising, an elongated cylindrical core member, a plurality of stacked superimposed co-extensive thin flexible sheets adapted to be separated for the insertion and retention of substantially flat articles therebetween, a flexible cover member superimposed with one side of the stack of sheets, the cover having a pair of marginal edges and first and second end edges, the first cover end edge being substantially co-extensive with a first edge of the sheets, the second end edge extending beyond the peripheral extent of the stack of sheets to provide an overlap, the first cover end edge having an extension underflap folded about a fold line and positioned between the stack of sheets and the cover, means fixedly securing the first edge of the co-extensive sheets and first cover end edge to the core member, the securing means comprising elongated fasteners projecting through the underflap and the stack of sheets and terminating in the core member, and tie means mounted to the overlap of the cover whereby the tie means are adapted to secure the device in a cylindrical configuration.

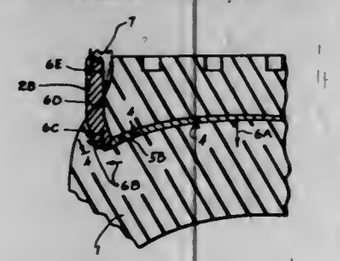
3,270,792
THREADED ELEMENT WITH CARRIER PART DEFORMING LOCKING KEY
Robert Neuschotz, Beverly Hills, and Cullen E. James, Southgate, Calif., assignors to Newton Insert Company, Los Angeles, Calif., a corporation of California
Filed Apr. 20, 1964, Ser. No. 361,085
3 Claims. (Cl. 151—23)

1. An element comprising a body having external threads disposed about an axis and adapted to be screwed into a passage in a carrier part, and having additional threads for attachment to another member, said body having a groove formed therein and extending generally axially through said external threads, a key received in said groove and adapted to be driven axially relative to said body to a locking position to lock the element in said carrier part, said key having an axially inner first portion received and frictionally retained in the groove at the location of some of said external threads and which is thin enough radially to avoid interference thereby with screwing of said element into said passage, said key having a second portion projecting axially outwardly beyond said groove and accessible for engagement by a tool to drive the key axially within the groove, said second portion forming a locking projection which extends radially outwardly farther than said first portion to cut into the material of said carrier part when the key is driven axially, said groove having an outwardly narrowing dovetail shaped radially inner portion containing and slidably retaining and confining said first portion of the key and having a radially outer portion which is located outwardly beyond and does not contain said first portion of the key, said outer portion of the groove being defined by essentially parallel approximately radially extending opposite side walls positioned to receive said locking projection circularly therebetween in said locking position thereof, said side walls being spaced apart far enough to leave clearance space circularly between said locking projection and said side walls at each point through the entire radial extent of said projection, equal to at least about one-third of the width dimension of said projection circularly about said axis at that point, said locking projection having opposite side surfaces extending substantially parallel to said side walls of the groove and being located for reception approximately midway between said side walls so that said clearance space forms two approximately equal width gaps at opposite sides of the projection, said projection having an axially inner end tapering axially to an essentially sharp cutting edge which extends essentially radially outwardly with respect to said axis, said second portion of the key having a radially inner portion which forms essentially a continuation of said first portion of the key but is slightly narrower than said first portion and wider than said projection.



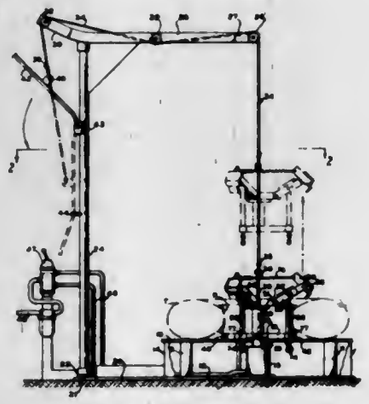
3,270,793
THREADED INSERT
Anthony P. Polmon, 126 Southwest Road, Waterbury, Conn.
Filed Oct. 5, 1964, Ser. No. 401,570
5 Claims. (Cl. 151—41.72)

1. A threaded insert adapted to be permanently installed in a member of yieldable material having a cylindrical opening which has an inner end against which said insert can abut, said insert comprising inner and outer generally cylindrical portions the diameter of which permit the insert to be slidably received in said opening, said outer portion defining a threaded segment and having a segment which has a plurality of radially protruding circumaxially spaced teeth each of which teeth extends generally parallel to the axis of said insert to permit the same to be pressed to its opening and to help prevent turning movement thereof relative to said member, a circumferentially continuous annular portion of



said insert between said inner and outer portions and having an external diameter substantially equal to that of said outer portion, said annular portion having a plurality of radially protruding circumaxially spaced teeth each of which is axially aligned with a tooth in said outer portion, inner and outer annular wall circumferentially continuous portions of frusto-conical shape integrally connected at their larger ends to said annular portion and at their smaller ends to said inner and outer portions respectively, each of said conically shaped wall portions having a thickness which permits said wall portions to be collapsed axially under a predetermined compressive stress whereby said annular portion can be urged radially outwardly into engagement with said member.

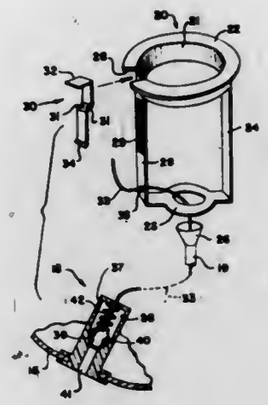
3,270,794
TIRE COOLING
Frank O. Skidmore, 2513 3rd St., Cuyahoga Falls, Ohio
Filed Dec. 15, 1964, Ser. No. 418,515
14 Claims. (Cl. 152—153)



1. In combination,
a standard one-piece drop center rim, said rim having a closed flat well and substantially horizontal bead receiving flanges extending laterally from the well and integral therewith,
tire bead retaining flanges extending substantially vertically from the edges of the bead receiving flanges and integral therewith,
a radially inwardly projecting wheel secured to the well of the rim,
a pneumatic tire having a tread and sidewalls mounted in fluid tight relation on the rim and secured by the tire bead retaining flanges, and
means operatively mounted within the fluid tight cavity defined by the tire and the rim to effectively agitate the fluid providing pressure to the tire during rotational operation thereof to transfer heat generated at the tread to the sidewalls and the rim.

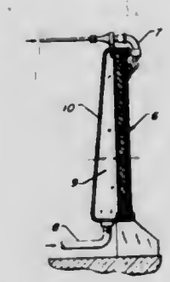
3,270,795
NON-SKID TIRES
Joel B. Guin, 148 E. 48th St., New York, N.Y.
Filed Jan. 29, 1965, Ser. No. 428,917
5 Claims. (Cl. 152—211)

1. In combination:
an automobile tire;
a series of springs around the periphery of the tire, each spring being made of a durable material, imbedded in and running diagonally across the tread and deflectable toward the center of the tire when said tread is depressed inward; and
multiple non-skid studs, one attached near each of the ends of said springs, made of strong durable material, and movable outward beyond the periphery of said tire to impinge on the road surface in proportion as the mid-portion of said springs is deflected inward by the depressing of the tread toward the tire center.



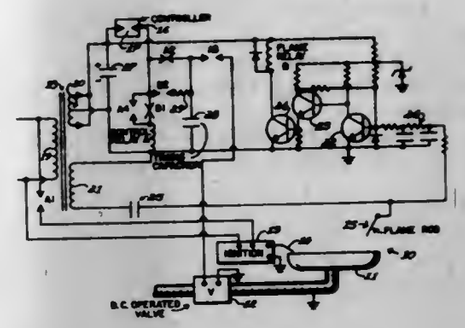
3,270,796
BEAD BREAKER FOR TIRES
Duel R. Smith, Carrollton, Ga.
Filed Mar. 4, 1965, Ser. No. 437,053
6 Claims. (Cl. 157—1.2)

1. A tire bead breaker including a tire supporting platform, a bead breaker head mounted for bodily movement to and from a position vertically over said platform, means for vertically moving said head when vertically over said platform toward said platform, power means within said supporting platform releasably engageable with said head when said head is lowered toward said platform, said head including a relatively fixed member releasably engageable with said platform and a relatively movable member releasably engageable with said power means and tire engaging arms interengaging said relatively movable member and said relatively fixed member pivotally movable in response to relative movement therebetween.



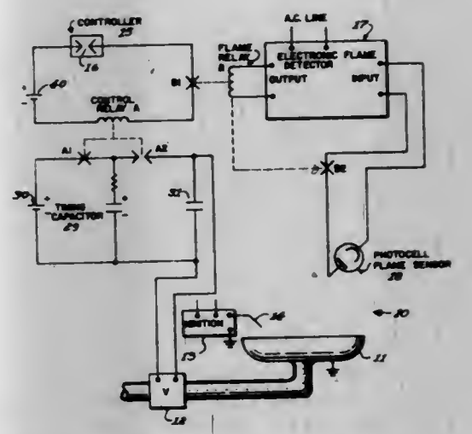
3,270,797
EMERGENCY FUEL CONTAINER FOR AUTOMOTIVE VEHICLES
John W. McLeod, 1300 Lafayette E., Detroit, Mich., and Roger L. Champoux, 31102 Schoolcraft, Livonia, Mich.
Filed Aug. 7, 1964, Ser. No. 388,239
2 Claims. (Cl. 158—46.5)

1. An emergency fuel container for a vehicle fuel tank having a narrow filler neck comprising a bag-like container, formed of a thick, flexible fuel-impervious sheet material, of a size considerably smaller than said tank but normally larger than the filler neck thereof, for insertion into said tank through said neck; a tube having a narrow end opening into said container and an upper end arranged for opening into said tank filler neck for receiving fuel when the tank is normally refueled; a bracket comprising an upper ring snugly fitted into and frictionally held within the upper end of said filler neck, a lower ring spaced below said upper end and centered in the filler neck, means rigidly interconnecting the two rings, and the upper end of said tube being connected to said lower ring in an upwardly opening position; said bracket further including a slider member, slidably secured to the bracket between the rings and having an upper end arranged at the upper ring, said slider member being arranged for sliding upwardly and downwardly relative to the filler neck; a normally closed valve formed in said container for communicating the interior of the container with the interior of the tank; and a cord connected to the valve for opening same



when the cord is pulled, the upper end of said cord being secured to the lower end of said slider member, wherein manually caused upward sliding of said slider member will pull said cord for opening said valve, thereby permitting fuel within the container to flow through the valve into said tank.

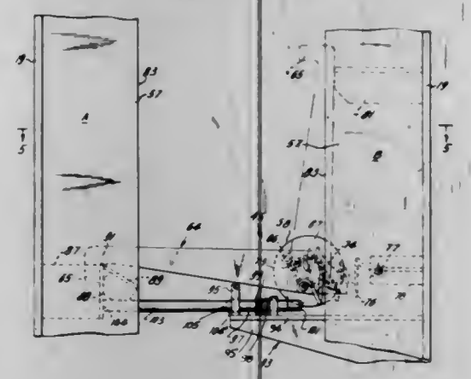
3,270,798
CATALYTIC RADIANT HEAT TREATING APPARATUS
Richard J. Ruff, deceased, late of Detroit, Mich., by National Bank of Detroit, executor, Detroit, Mich., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware
Original application Sept. 19, 1961, Ser. No. 139,226. Divided and this application Nov. 19, 1964, Ser. No. 412,869
5 Claims. (Cl. 158—99)



1. In a catalytic radiant heating apparatus adapted to provide high temperature radiant heating in the infrared range above 850° F., the combination of a thin metallic element of at least one gas permeable metal alloy gauze having a noble metal catalytic coating of substantially uniform thickness thereover, at least one pervious gas distributing and heat reflective uncoated metal alloy gauze of substantially equal mesh size as the coated gauze in direct contact with the back of and coextensive with said catalytic element without intervening media therebetween, and confined manifold means having air and fuel supply inlet means thereto encompassing the backside of said gas distributing gauze.

3,270,799
BURNER CONTROL APPARATUS
Balthasar H. Pincksers, Edina, Minn., assignor to Honeywell Inc., a corporation of Delaware
Filed Dec. 7, 1964, Ser. No. 416,280
9 Claims. (Cl. 158—128)

1. Burner control apparatus for use with a direct ignition fuel burner installation having electrically energizable fuel flow control means, comprising;
a timing capacitor,
means adapted to institute charging of said timing capacitor upon a need for operation of the burner installation,
means responsive to a given charge being accumulated on said capacitor to interrupt the charging of said capacitor and to connect said capacitor to the electrically energizable fuel flow control means as the sole source of energizing voltage therefor,
and means responsive to the establishment of flame at the burner installation to maintain the charge on said capacitor.



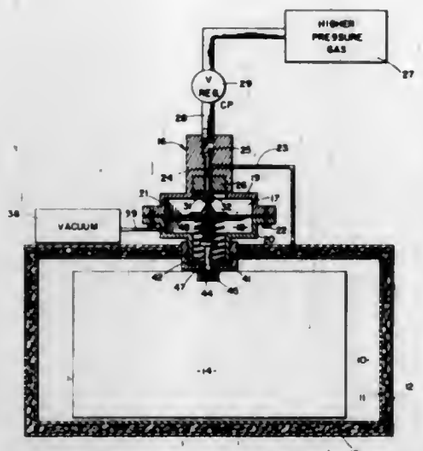
3,270,800
BURNER CONTROL APPARATUS
Fred T. Deziel, Bloomington, and Balthasar H. Pincksers, Edina, Minn., assignors to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed Dec. 7, 1964, Ser. No. 416,320
7 Claims. (Cl. 158—128)

1. A direct ignition burner control for use to control the direct ignition of a main fuel burner, comprising;
a timing capacitor adapted to accumulate a charge of electrical energy,
means responsive to a need for operation of the main fuel burner effective to connect said capacitor to electrically energizable means which is adapted to cause fuel to flow to the main burner, to thereby energize said electrically energizable means as the sole source of electrical energy and for a short trial for ignition period determined by the discharge time of said timing capacitor,

and flame detecting means effective upon the establishment of flame at the main fuel burner to maintain a charge of electrical energy at said timing capacitor and thereby maintain fuel flow.

3,270,801
AUTOMATIC HOLDBACK DEVICE
Philip Richter, Bethlehem, Lawrence B. Smith, Allentown, and Francis J. Luipersbeck, Northampton, Pa., assignors to Fuller Company, Catasauqua, Pa., a corporation of Delaware
Filed June 10, 1963, Ser. No. 286,692
10 Claims. (Cl. 160—213)

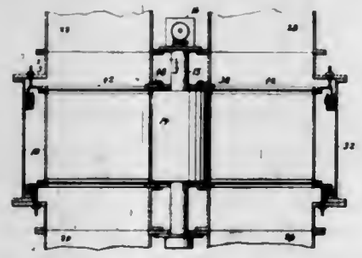
6. A latching mechanism for retaining a movable member in fixed position with respect to a second member, said latching mechanism comprising a pivoted latch arm having a hook end, carried by one of said members, a complementary retaining member carried by the other member adapted to be engaged by the hook end of the latch arm, control means carried in part by said other member and operatively engaging said latch arm when said members are moved into juxtaposition to effect pivoting movement of said latch arm for engagement of the hook end of the latch arm with said retaining member, and resilient means normally retaining said pivoted latch arm in unlocked position, one end of said resilient means being in fixed position with respect to the member carrying the latch arm, on one side of the pivotal axis of said latch arm and the other end of said resilient means being connected to said latch arm at a point, which in one pivotal position of said latch arm, will be on one side of a line between the pivotal axis of the latch arm and said fixed end of said resilient means, to react against said latch arm, to urge the latter in one rotational direction toward unlocked position during one portion of the pivotal movement of the latch arm by said control means and in the second pivotal position of said latch arm, will be on the other side of said line, to urge said latch arm in an opposite rotational direction toward locked position, during another portion of the pivotal movement of said latch arm by said control means.



3,270,802
METHOD AND APPARATUS FOR VARYING THERMAL CONDUCTIVITY
Jay G. Lindberg, Downey, Calif., granted to National Aeronautics and Space Administration under the provisions of 42 U.S.C. 2457(a)
Filed Jan. 10, 1963, Ser. No. 250,567
8 Claims. (Cl. 165—2)

4. A method for regulating heat flow comprising the steps of interposing a gas permeated insulating material between a region having relatively high temperature and a region having relatively low temperature,

transferring heat from the region having relatively high temperature to the insulating material,



transferring heat from the insulating material to the region of relatively low temperature,

sensing a quantity having a known relation to the amount of heat transferred in one of said transferring steps, and

varying the composition of the gas permeating the insulating material in response to the sensed quantity.

3,270,803
SEALING ARRANGEMENT FOR ROTARY HEAT EXCHANGER
Noel D. Hazzard, Wellsville, N.Y., assignor, by mesne assignments, to Combustion Engineering, Inc., a stock corporation of Delaware
Filed Dec. 21, 1961, Ser. No. 161,062
5 Claims. (Cl. 165—9)

1. Rotary regenerative heat exchange apparatus having a rotor including a cylindrical rotor shell and a central rotor post spaced apart to form a compartment therebetween, a mass of heat absorbent material carried in said compartment, a housing surrounding said rotor in spaced relation to provide an annular space therebetween, apertured end plates at opposite ends of said housing adapted to direct a heating fluid and a fluid to be heated through spaced portions of the rotor, said end plates comprising an annular rim aligned with the end of the rotor and formed with a diametral portion that provides spaced apertures for the flow of said fluids, an upright annular channel positioned in the annular space adjacent an end of the rotor, an annular flange carried by said annular rim adapted to extend into the space between sides of said channel member, means for adjusting said rim axially with respect to the end of the rotor, and a mass of meltable material carried in said channel solidly encasing the end of the annular flange positioned therein.

3,270,804
COMBINATION DEHUMIDIFYING, REFRIGERATION COOLING AND HEATING UNIT
Howard L. Paulus, Scottsdale, Ariz.
(3026 E. Northern Ave., Phoenix, Ariz. 85028)
Filed May 18, 1964, Ser. No. 368,056
1 Claim. (Cl. 165—48)

A combination dehumidifying, refrigeration cooling, and heating unit comprising in combination:

(A) a cabinet having,

(B) a bottom,

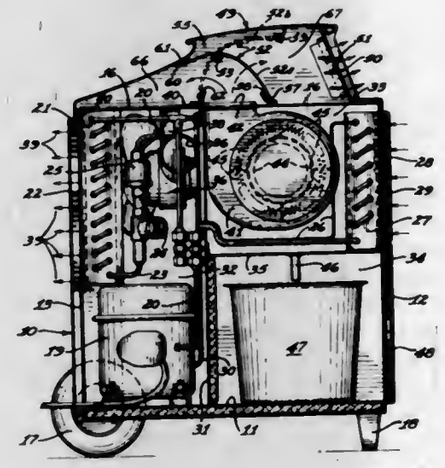
(C) a front panel,

(D) a back panel,

(E) side panels,

(F) and a top,

(G) an intermediate lateral partition extending between said sides forming,



(H) a compressor and condenser compartment at the rear of said cabinet,

(I) a cooling and heating air compartment at the front of said unit,

(J) and a condensate compartment below said cooling and heating air compartment,

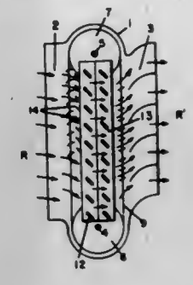
(K) a condenser in the upper rear portion of said compressor and condenser compartment having an exhaust grill in said back panel,

(L) an evaporator in the front portion of said cooling and heating air compartment having an evaporation air intake grill in the upper portion of said front panel,

(M) a bolwer in said cooling and heating compartment having a blower suction air intake adapted to draw air through said evaporator,

(N) a heating coil between said evaporator and said blower suction air intake,

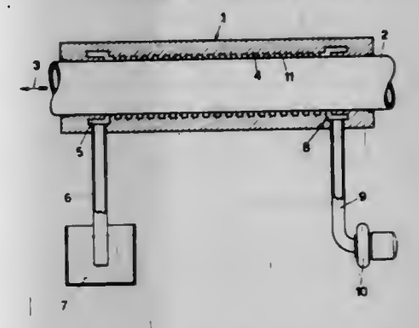
(O) a top on said unit over said compressor and condenser compartment and said evaporator compartment having a discharge outlet from said blower,



(P) an air directing cover on top of said unit,

(Q) a cooling and heating air discharge grill in the front of said air directing cover located above and behind said evaporator air intake grill,

(R) and an air flow directive valve movably mounted in said cover to one position to direct air discharged from said blower discharge outlet out through said cooling and heating discharge grill and movable to another position to direct air discharge from said blower discharge outlet into said compressor and condenser compartment out through said condenser.

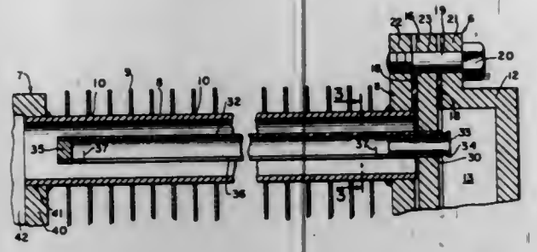


3,270,805
AIR MOVING DEVICES AND AIR CONDITIONERS
Ernst A. Glucksman, 13 Dalia Road, Haifa, Israel
Filed Dec. 11, 1964, Ser. No. 417,842
14 Claims. (Cl. 165—122)

1. A heat exchange apparatus including endless belt means supporting blades having a fixed inclination relative to the straight portions of said belt means, motor means for operating said belt means, duct means having an upstream entrance and a downstream exhaust and forming a substantially straight passageway between said entrance and said exhaust, substantially at right angles to both said straight portions of said belt means, fixed air guiding vanes inside said passageway to cause said blades to establish an air flow substantially transversely through

both said straight portions of said belt means, and heat exchange structure arranged inside said passageway between said straight portions of said belt means.

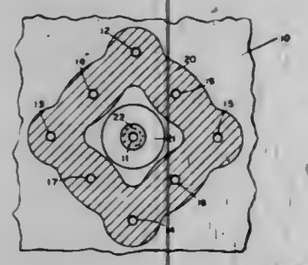
3,270,806
COOLING DEVICE FOR EXTRUDED GOODS OF THERMOPLASTIC MATERIALS
Geo Borrini, Milan, Italy, assignor to Amut S.p.A., Novara-Veveri, Italy, a company of the Italian Republic
Filed July 15, 1964, Ser. No. 382,817
Claims priority, application Italy, Oct. 4, 1963, 20,374/63
2 Claims. (Cl. 165—156)



1. A device for cooling a heated body in a plastic state comprising a member having an inner longitudinal bore, said heated body being advanced longitudinally through said bore, said member having a cavity opening into said bore and extending around said bore and longitudinally thereof, supply means for supplying a cooling fluid in liquid form to said cavity, and a vapor pump for advancing the cooling fluid through said cavity in a direction opposite to that of the advancement of the heated body while establishing a negative pressure of the fluid in said cavity, said fluid being introduced into said cavity from said supply means in a liquid state at a temperature at which the fluid will vaporize under its negative pressure and the heat of said heated body and be withdrawn from a cavity by said vapor pump in a vapor state, said bore being substantially the same size and shape as that of the heated body such that as said heated body is advanced through the bore, the heated body contacts the member at the inner bore under the influence of the negative pressure of the cooling fluid.

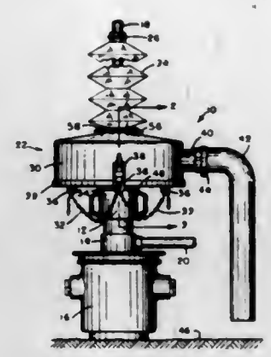
3,270,807
HEAT EXCHANGER HAVING DISTRIBUTION TUBE INTERNAL FLOW DIRECTORS
Paul E. Steadman, 10813 Woodhaven Drive, Fairfax, Va.
Filed May 1, 1964, Ser. No. 364,144
7 Claims. (Cl. 165—174)

1. In a heat exchanger, a supply header and a condensate header arranged in spaced relation, heat conduction tubes extending between said headers, a header plate in said supply header having a series of openings aligned with said heat conduction tubes, said header plate being



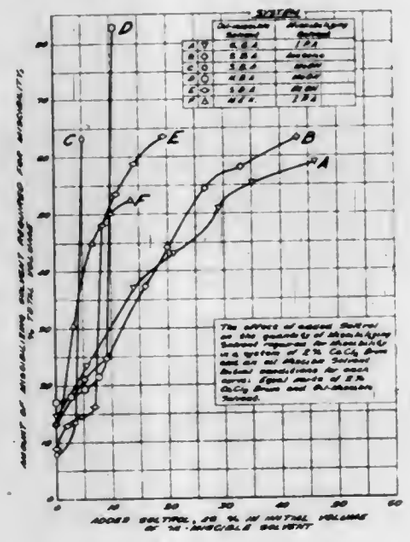
arranged in sealing engagement with said heat conduction tubes, and synthetic plastic distribution tubes each having one end mounted in said openings and provided with discharge passages to supply said heat conduction tubes uniformly throughout their length upon expansion of said synthetic plastic tubes.

3,270,808
METHOD FOR INCREASING SUBTERRANEAN FORMATION PERMEABILITY
Robert R. Harvey, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Filed Feb. 25, 1963, Ser. No. 260,864
6 Claims. (Cl. 166—9)



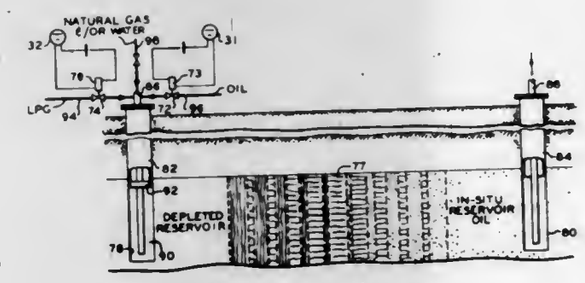
1. A process for the recovery of oil from a subterranean formation comprising injecting flood water into said formation through an input well, displacing oil in said formation, directing the displaced oil toward an output well and recovering said displaced oil from said output well, said flood water having present therein a compound selected from the group consisting of quebracho, pyrocatechol and hydroquinone in an amount sufficient to increase the water permeability of said formation.

3,270,809
MISCIBLE DISPLACEMENT PROCEDURE USING A WATER BANK
Carl Connally, Jr. and Frank R. Scauzillo, Dallas, Tex., assignors to Mobil Oil Corporation, a corporation of New York
Filed Sept. 11, 1963, Ser. No. 308,162
13 Claims. (Cl. 166—9)



1. A method for recovering oil from a subterranean reservoir penetrated by a plurality of wells comprising the steps of:
   (a) forming in the reservoir a continuous bank of water in spaced relationship about a central well by injecting water into the reservoir through a plurality of surrounding wells, and
   (b) producing oil from the reservoir through wells other than the wells being used for injecting the bank of water;
   (c) injecting a miscible displacement fluid through the central well into the reservoir behind the bank of water, and
   (d) driving the miscible displacement fluid radially outwardly through the reservoir from the central well and producing oil from the wells in the reservoir surrounding the bank of water.

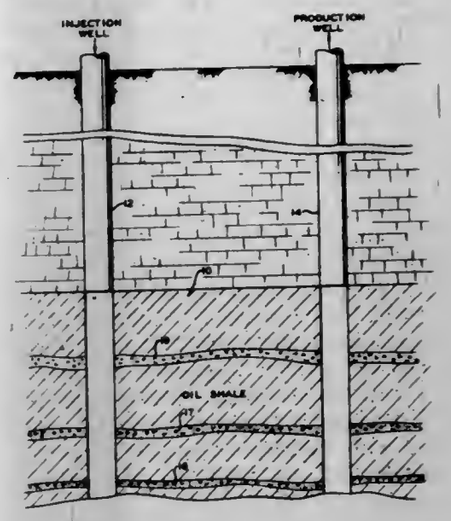
3,270,810
POLISHED ROD PROTECTOR AND BLOW DEFLECTOR
Leslie A. Johnston, 1225 E. 18th St., Tulsa, Okla.
Filed Feb. 13, 1963, Ser. No. 258,294
5 Claims. (Cl. 166—84)



1. A polished rod protector for use with an oil well pumping system having a polished rod reciprocated through a stuffing box, said stuffing box positioned a distance above the surface of the earth comprising:
   a hollow bonnet member supported to said stuffing box, said bonnet member having an opening in the top and bottom surfaces thereof to receive said polished rod, said bonnet member having an exhaust opening therein; and
   a bellows member affixed at its lower end to said bonnet member at said upper opening in said bonnet member, said bellows member receiving said polished rod therein, said bellows member affixed at its upper end to said polished rod.

3,270,811
MISCIBLE DISPLACEMENT PROCESS FOR PETROLEUM RESERVOIRS CONTAINING BRINE AND OIL
William K. Meyer, Pittsburgh, and Joseph J. Taber, Indiana Township, Allegheny County, Pa., assignors to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware
Filed July 25, 1963, Ser. No. 297,500
6 Claims. (Cl. 166—9)

2. In a method for recovery of oil from a petroleum reservoir containing brine and oil by introducing into the reservoir through an injection well a sequence of solvents and displacing the solvents through the reservoir toward a producing well by injecting water into the reservoir, said solvents being such that a first injected solvent is miscible with the reservoir oil and substantially immiscible with the reservoir brine, and a second solvent is miscible with the first solvent and with water, the improvement of injecting as first and second solvents liquids which in an aqueous mixture have a binodal peak less than 20 percent of the second solvent and which in an aqueous mixture have a binodal peak less than 55 percent of the second solvent in the total volume of liquids when the mixture contains a volume of the reservoir oil in a concentration of about 25 percent of the volume of the first injected solvent.



3,270,812
PROGRAMMING
Ralph E. Gilchrist and Richard H. Langenheim, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
Filed Feb. 16, 1962, Ser. No. 173,715
4 Claims. (Cl. 166—9)

2. A method for miscible displacement of a fluid from an underground reservoir penetrated by an injection well and a production well comprising the steps of:
   injecting a first displacement fluid into said injection well;
   alternately injecting a second displacement fluid;
   generating a plurality of constant interval electrical pulses;
   counting said pulses and actuating a switching relay once for a first predetermined number of said pulses to change from one of said displacing fluids to the other; and
   counting said pulses and actuating said relay once for a second predetermined number of said pulses to change back to said one fluid.

3,270,813
IGNITION AND COMBUSTION OF CARBONACEOUS STRATA
Ralph E. Gilchrist, Bartlesville, Okla, assignor to Phillips Petroleum Company, a corporation of Delaware
Filed June 15, 1964, Ser. No. 375,198
8 Claims. (Cl. 166—11)

1. A process for igniting a carbonaceous stratum penetrated by a well which comprises the steps of:
   (a) fracturing said stratum to extend a fracture radially outwardly from said well using a non-aqueous fracturing fluid;
   (b) injecting into said fracture a mixture of a high temperature resistant propping agent in particulate form, "Thermit" pellets, and pellets of a starter material reactive with water, using a non-aqueous injection fluid;
   (c) following step (b) injecting water into said fracture so as to energize said starter material which then heats and ignites the "Thermit" pellets; and

   (d) feeding O_2-containing gas into said fracture so as to ignite the carbonaceous material in said stratum.

3,270,814
SELECTIVE COMPLETION CEMENTING PACKER
Cecil R. Richardson, Charles D. Manson, Jr., and Eugene E. Baker, Duncan, Okla., assignors to Halliburton Company, Duncan, Okla., a corporation of Delaware
Filed Jan. 23, 1964, Ser. No. 339,744
12 Claims. (Cl. 166—21)

12. A method for isolating and producing from a formation by expanding a packer on a tubing string having a baffle below the packer comprising dropping a ball down the tubing to lodge on a seat in the packer, pumping fluid down the tubing to increase the pressure on the ball, breaking the seat to uncover a filling port for expanding the packer and to allow the ball to drop to the baffle, pumping fluid down the tubing and into the packer through the filling port, closing the filling port in response to fluid pressure in the packer when the packer is expanded, pumping fluid down the tubing to increase the pressure on the ball to break the baffle and pump the ball out of the tubing string, pumping cement down the tubing to cement the packer in the well, and opening production ports in the packer communicating between the formation and the tubing.

3,270,815
COMBINATION HYDRAULIC-EXPLOSIVE EARTH FORMATION FRACTURING PROCESS

Oliver Osborn, Lake Jackson, and Frank D. Patrick, Freeport, Tex., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Sept. 11, 1963, Ser. No. 308,057
3 Claims. (Cl. 166—36)

1. A process for producing fractures in an earth formation which comprises:

(a) introducing a hydraulic fracturing fluid into an earth formation at a pressure sufficient to initiate fractures in said earth formation, said fracturing fluid consisting of a slurry of a liquid hydrocarbon having particulate light metal admixed therewith, said light metal particles becoming lodged in the fractures initiated by the hydraulic fracturing action,

(b) introducing an oxidizer solution into the fractured formation thereby displacing the hydrocarbon fracture fluid from contact with the light metal particles, said oxidizer solution forming an explosive composition with the light metal particles in the formation,

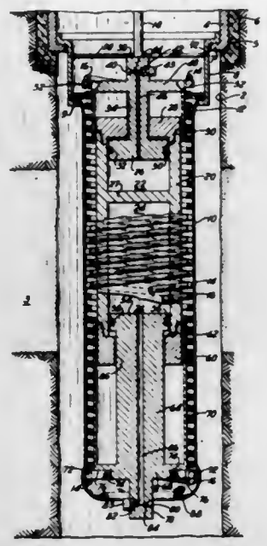
(c) introducing an explosive detonator adjacent the explosive composition, and

(d) initiating said detonator thereby to promote explosion of said explosive composition in the fractures of said formation further extending said fractures and promoting the permeability of said formation.

3,270,816
METHOD OF ESTABLISHING COMMUNICATION BETWEEN WELLS

Harold E. Staadt, Tulsa, Okla., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Filed Dec. 19, 1963, Ser. No. 331,820
12 Claims. (Cl. 166—42)

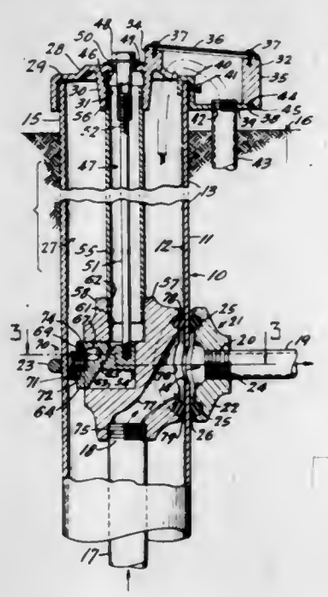


1. A method of establishing subsurface communication between first and second earth wells which are spaced apart by a predetermined distance, each of which penetrates a particular earth formation, comprising notching said formation of said first well along a predetermined depth range and in a vertically disposed plane which extends generally at an acute angle with respect to a line drawn between said first and second well and towards said second well with which communication is to be established, notching said formation of said second well in a vertically disposed plane at an acute angle with respect to said line drawn between said wells and which, if extended, would intersect an extension of the vertically disposed notch of said first well, and hydraulically fracturing said particular earth formation from both wells through said notches until said fractures meet.

3,270,817
METHOD AND APPARATUS FOR INSTALLING A PERMEABLE WELL LINER

John Papaila, Kiskiminetas Township, Armstrong County, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

Filed Mar. 26, 1964, Ser. No. 354,837
9 Claims. (Cl. 166—46)

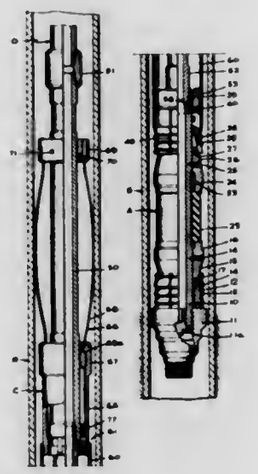


3. A method for arresting the movement of formation particles around a well bore penetrating an unconsolidated formation comprising inserting in the well bore at the level of the formation an expansible permeable tubular liner containing a helical spring subjected to both tensional and torsional forces to constrict the spring and reduce its diameter sufficiently to permit the passage of the spring and liner through the well bore, positioning the spring and liner in the well bore adjacent the formation, first gradually releasing the tensional force exerted upon the spring to shorten the spring and increase its diameter, subsequently gradually releasing the torsional force exerted upon the spring to farther expand the diameter of the spring and thereby urge the liner to forceably engage the wall of the well bore in substantial conformity with the contours of the well bore.

3,270,818
PITLESS WELL ADAPTER ASSEMBLY

Kells L. Pugh, Jr., 1306 West St., Genoa, Ohio

Filed Feb. 19, 1964, Ser. No. 345,945
10 Claims. (Cl. 166—85)

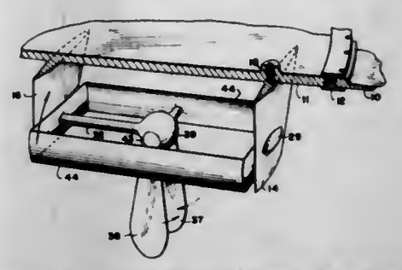


1. A pitless well adapter assembly for use in a well system including a vertical well casing having an interior surface, an exterior surface and a horizontal discharge opening, said adapter assembly comprising, in combination, a cap mountable on the upper end of such casing, support means depending from said cap, a coupler body secured to said support means, horizontal guide means on said coupler body, a vertical draw rod assembly having an uppermost end supported by said cap and a lowermost end secured to a vertical expanding block, a horizontal expanding block supported by said guide means, said vertical expanding block engaging said horizontal expanding block, and being effective upon vertical movement of said vertical expanding block to move said horizontal expanding block laterally in said guide means for engaging relationship with the interior wall of such casing, said coupler body having a conduit engaging bore in its lower portion and a discharge port positionable adjacent the horizontal discharge opening in such casing and defining a fluid passageway between such bore and such port.

3,270,819
APPARATUS FOR MECHANICALLY SETTING WELL TOOLS

Gordon E. Thrane, La Mirada, and Horace W. McZilkey, Jr., Los Angeles, Calif., assignors to Baker Oil Tools, Inc., Los Angeles, Calif., a corporation of California

Filed Mar. 9, 1964, Ser. No. 350,235
11 Claims. (Cl. 166—124)

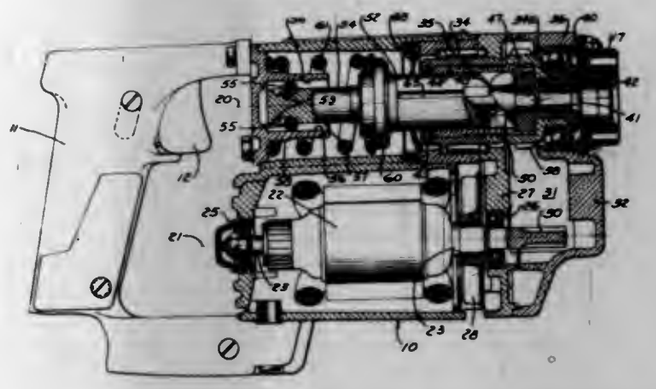


1. In well apparatus adapted to be set in a well bore: body means adapted to be secured to a running-in string for lowering the apparatus in the well bore; normally retracted means on said body means expandible laterally outwardly of said body means; spring means for shifting said normally retracted means laterally outwardly of said body means; a retainer engaging said normally retracted means to prevent expansion of said normally retracted means by said spring means; means releasably connecting said retainer to said body means to prevent relative shifting of said retainer from engagement with said normally retracted means, including a device threaded on said body means and movable upwardly on said body means and along said retainer in response to rotation of said body means to permit said body means to shift said normally retracted means longitudinally of said retainer to released position from said retainer.

3,270,820
PROPELLER FOR BOATS

Thomas J. Frazier, 2680 Ashford Road NE., Atlanta, Ga.

Filed Apr. 15, 1965, Ser. No. 448,326
4 Claims. (Cl. 170—135.21)



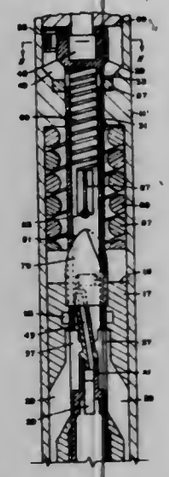
1. A boat propeller including a rotatable impeller mounting frame, means for rotating said frame, a pair of impellers, rotatably mounted on said frame for bodily rotation with said frame and for rotation on their own axes about a common axis normal to the axis of rotation of said frame and means for continuously rotating said impellers in equal and opposite directions as an incident to the continuous rotation of said frame.

3,270,821
POWER TOOL

Leon H. Bassett, Glenview, William A. Fouser, Chicago, Frank A. Kaman, Prospect Heights, and Frank C. Schrack, Chicago, Ill., assignors to Skil Corporation, Chicago, Ill., a corporation of Delaware

Filed Sept. 20, 1963, Ser. No. 310,347
13 Claims. (Cl. 173—123)

1. In a power tool, a housing, a sleeve mounted for rotation in said housing and having an actuating member fixedly mounted in the forward end thereof, a striker mounted for axial non-rotatable movement in the housing and having at least the forward portion thereof axially slidable in said sleeve toward and away from said actuating member, said striker being provided with at least one axially extending cavity communicating the space defined by said sleeve and said end of the striker with the interior of said housing, spring means for urging the striker forwardly in the housing, first cam means on the strking end of said striker, second cam means on said actuating member cooperating with said first cam means for effecting periodic rearward axial movement of the striker upon rotation of said sleeve, and said actuating member having a central opening co-axial with said striker for receiving a tool element to be struck by said end of the striker as the latter approaches its forward limit of axial movement in the housing.



3,270,822
PERCUSSIVE UNIT FOR EARTH DRILLING

James M. Cleary, Dallas, Tex., assignor to The Atlantic Refining Company, Philadelphia, Pa., a corporation of Pennsylvania

Filed Dec. 6, 1965, Ser. No. 511,870
29 Claims. (Cl. 173—137)

13. In rotary percussive earth drilling wherein a percussive unit and an earth drill are rotated and the drill is impacted against the earth by axial cyclic reciprocation of a hammer within the percussive unit, a power fluid-operated percussive unit comprising an elongated casing, an anvil surface slidably mounted in the lower

end of said casing, a piston-like hammer slidably mounted for reciprocating up and down movement in said casing above said anvil surface, said hammer having an upper surface and a first hammer passage communicating with said upper surface, said hammer having a lower surface and a second hammer passage communicating with said lower surface, a rotatable tubular valve passing longitudinally through said hammer, said tubular valve having a valve inlet passage adapted to pass fluid into said valve and a valve outlet passage adapted to pass power fluid from said valve, at least one first valve port located in said valve in a position to alternately pass said power

fluid from said valve inlet passage to said first hammer passage and to said second hammer passage as said valve is rotated, at least one second valve port located in said valve in a position to alternately pass said power fluid from said first and said second hammer passages to said valve outlet passage as said valve is rotated, and motion conversion means adapted to employ the reciprocating movement of said hammer to coordinate the axial position of said hammer with the circumferential rotative position of said first and said second valve ports during at least a portion of the reciprocating cycle of said hammer.

3,270,823
DRILL PIPE HANDLING APPARATUS
Alois A. Buehler, Easton, Pa., assignor to Ingersoll-Rand Company, New York, N.Y., a corporation of New Jersey
Filed Oct. 25, 1963, Ser. No. 318,876
6 Claims. (Cl. 175—85)

1. A drill pipe handling apparatus for a drill tower having a rotary head slidably supported thereon, comprising:

(a) an elongated tubular housing disposed wholly within the drill tower,

(b) means for movably connecting said housing to said drill tower,

(c) a first drill pipe supporting and gripping assembly connected to said housing and comprising:

(1) a pair of pivotally connected, coacting first jaws for engaging and holding a drill pipe,

(d) a second drill pipe supporting and gripping assembly connected to said housing in spaced relation to said first drill pipe supporting and gripping assembly,

(e) said second drill pipe supporting and gripping assembly comprising:

(1) a pair of spaced U-shaped plates secured to said housing,

(2) a third plate of inverted U-shape in cross section spaced below said pair of U-shaped plates,

(3) a pair of pivot pins extending through registered openings in each of said pair of plates and said third plate,

(4) tongs mounted on each of said pins between said pair of plates and connected to be pivotally moved by rotation of said pins,

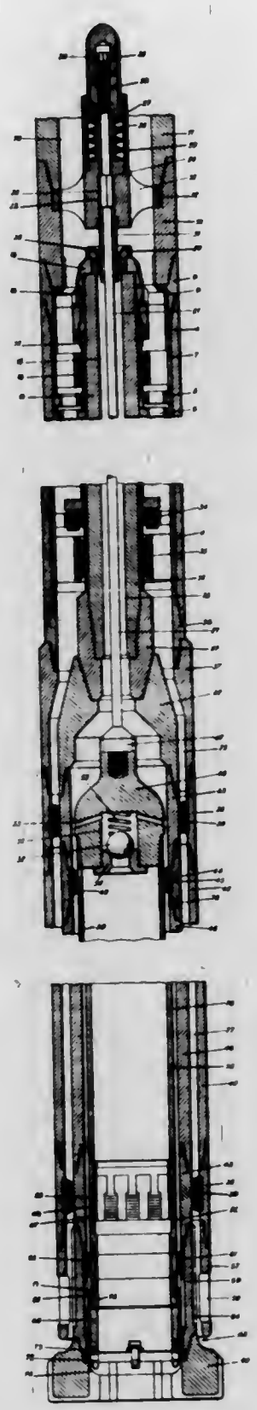
(5) said tongs being constructed and arranged to engage and prevent rotation of a drill pipe,

(6) a pair of second jaws for engaging a drill pipe, said pair of second jaws being mounted on said third plate and including a second jaw on each of said pins for conjoined rotation with said pins so as to pivot to closed and open positions,

(7) each of said second jaws having a horizontal flanged portion for receiving the end of the drill pipe and supporting the weight thereof,

(8) said third plate and said second jaws being connected to said pins for slidable movement relative to said pins and said housing,

(9) fluid motor means connected to said second jaws to actuate said second jaws to open and closed positions and thereby rotate said pins,



(f) a connecting rod disposed for slidable movement within said tubular housing,

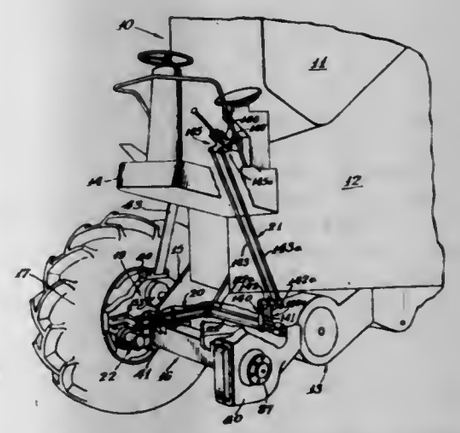
(1) said connecting rod being connected at one end to said third plate and at the opposite end to said first jaws of said first drill pipe supporting and gripping assembly so that, upon release of the weight of the drill pipe from said second jaws, the first jaws are actuated to an open position, and

(g) fluid motor means connected to said drill tower and said housing for moving said housing and a drill pipe supported by the housing out of and into the drill tower so as to position the drill pipe into alignment and out of alignment with the rotary head.

3,270,824
TURBO-COREDRILL
Wladimir Tiraspolsky, Issy-les-Moulineaux, France, assignor to Turbodrill International Corporation, Schaan, Liechtenstein
Filed July 9, 1963, Ser. No. 293,741
Claims priority, application France, July 20, 1962, 904,580, Patent No. 1,339,585
6 Claims. (Cl. 175—107)

1. A turbo-coredrill including a turbine comprising a casing body, a set of stator blades fixed inside said casing body, a hollow shaft journalled in said body, and a set of rotor blades carried by said hollow shaft and cooperating with said stator blade set, a supporting rod axially extending through said hollow shaft and axially movable therein, means for selectively securing said rod to said turbine body preventing relative rotation thereto, said means being provided above said stator and rotor blades, said securing means including a seat fixed relative to said body having a noncircular bore, a corresponding noncircular rod portion defined on said rod selectively receivable within said bore, a large diameter guiding skirt forming a downward extension of the turbine body, a tubular member forming a downward extension of the turbine shaft, a core bit fixed to said tubular member,

a core barrel suspended from said supporting rod, and guiding bearings interposed between said tubular member and said skirt and also interposed between said tubular member and the core tube.

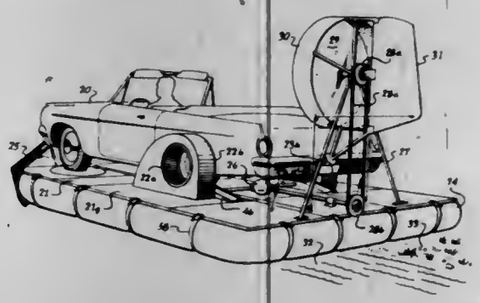


3,270,825
SPRINGLESS ADJUSTABLE SCALE STRUCTURE
Jacob L. Kleinman, Hotel Kimberly, 203 W. 74th St., New York 23, N.Y.
Filed Jan. 11, 1965, Ser. No. 424,526
18 Claims. (Cl. 177—217)

1. A scale structure comprising a casing, said casing having a base portion and a front section, said front section having a slot, a member having a pocket structure, the front portion of said pocket structure having a window opening, said member positioned normally within the said casing having its said front portion located within the said slot, a part of said front portion extending exteriorly of said slot and providing gripping means for moving the said pocket structure from its said normal position outwardly through the said slot to bring the said window opening into exposed position exteriorly of said casing, a

rotatable dial structure comprising a disk having numerals thereon, said dial structure carried by the said member having a portion of said disk located within the said pocket, said disk being rotatable on a horizontal plane parallel to the base section of said casing for bringing certain of its said numerals towards the said window opening, said pocket structure adapted to be reverted to its said normal position within the said casing, and means for holding the said pocket structure in desired position.

3,270,826
CHANGE SPEED TRANSMISSION FOR VEHICLE HYDROSTATIC DRIVE
Tommy A. Middlesworth, Hinsdale, John F. Reynolds, La Grange, and Jack B. Findlay, Downers Grove, Ill., assignors to International Harvester Company, Chicago, Ill., a corporation of Delaware
Filed Sept. 23, 1963, Ser. No. 310,593
9 Claims. (Cl. 180—6.48)



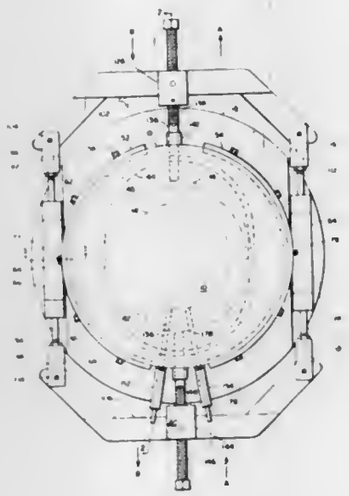
1. In a vehicle having a generally longitudinal support frame structure and a transversely extending wheel axle assembly fixedly mounted on said frame structure, the combination, comprising: a plurality of change-speed transmissions including a housing for each thereof: means detachably and non-rotatably mounting said transmission housings one each on an opposite end of said axle assembly; each of said transmissions including an input shaft, gearing mechanism operable for providing a plurality of selectable gear speed ratio drives therethrough, and an output shaft, and having said latter shaft extending therefrom on the side of the respective housing opposite that to which the proximate end of said axle assembly is mounted; a plurality of traction wheels detachably mounted one each on a respective one of said output shafts and constrained for rotation therewith; a plurality of hydraulic motors mounted one each on a respective one of said housings and being operatively connected to a respective one

of said input shafts and operative for driving said transmissions; a source of fluid pressure connected for operation of said hydraulic motors; control linkage means interconnecting said change-speed transmissions and having said linkage operative for selecting simultaneously for each of said transmissions each of the gear speed ratio drives available through each of said change-speed transmissions; and control valve means interconnected between said source of fluid pressure and said hydraulic motors and operative for individually controlling the speed and direction of drive of each traction wheel irrespective of the gear speed ratio selected by said control linkage means for the transmission connected to a respective traction wheel thereby to effect steering of the vehicle.

3,270,827
AMPHIBIOUS AUTOMOBILE GEM KIT

Peter J. Mantle, Pasadena, Calif., assignor to Vehicle Research Corporation, Pasadena, Calif.

Filed May 13, 1963, Ser. No. 279,883
4 Claims. (Cl. 180—7)



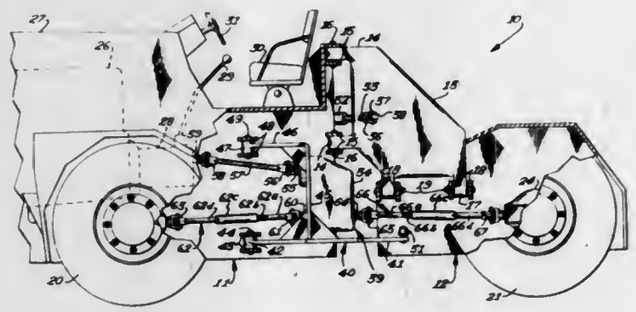
1. A kit for temporarily converting an automobile to an Amphibious Automobile Ground Effect Machine, said kit comprising one or more fans for providing a cushion of air beneath said amphibious automobile ground effect machine; means powering said fans with said automobile; an air propeller to provide thrust; means powering said air propeller with said automobile; a sectionalized platform, one section of said sectionalized platform so shaped that in combination with other sections of said sectionalized platform, said sectionalized platform, when assembled, can accommodate any make of automobile with wheels of said automobile fitting into ramps and troughs incorporated in sections of said sectionalized platform; rotatable discs in said sectionalized platform supporting said troughs; connecting means converting rotation of said rotatable discs to movement of a rudder; an inflatable tube so shaped that it conforms to the perimeter of said sectionalized platform, said inflatable tube and said sectionalized platform combining to form a plenum chamber wherein air pressurized by revolution of said fans comingles to support said amphibious automobile ground effect machine on a cushion of air; a second sectionalized platform depending from said first mentioned sectionalized platform, said second sectionalized platform so dimensioned that it forms an annular jet opening between the perimeter of said second sectionalized platform and the inner perimeter of said inflatable tube.

3,270,828
HYDRAULICALLY ACTUATED LOAD CARRYING APPARATUS

Robert J. McCracken, Port Jefferson, N.Y., assignor to the United States of America as represented by the United States Atomic Energy Commission

Filed Mar. 27, 1964, Ser. No. 355,515
7 Claims. (Cl. 180—8)

1. Compact load carrying apparatus comprising:
(a) platform means upon which said load is rested;
(b) base means for supporting said platform means;
(c) alternate means for supporting said platform means including a bottom plate, bearing means resting on said bottom plate, piston means resting on said bearing means, and a cylinder formed in said platform means in which said piston means is slidable;
(d) said bearing means being slidable with respect to each of said piston means and said bottom plate;
(e) means for pressurizing said cylinder with fluid under pressure to raise said platform means and base means thereby shifting support of said platform

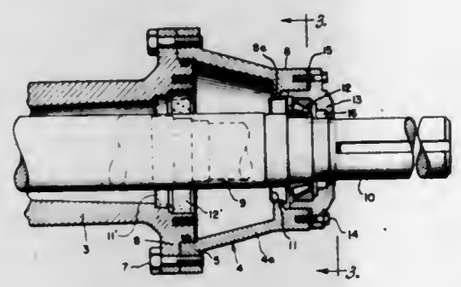


means to said alternate means including said piston means, bearing means and said bottom plate rendering the latter stationary; and
(f) means to slide said platform means and base means transversely on said bearing means when supported by said alternate means and to slide said bottom plate in the same direction when said cylinder is without fluid under pressure and said base means is stationary to move said apparatus transversely in a series of sequential short transverse steps as recited.

3,270,829
ARTICULATED VEHICLE

Douglas W. Steiger and Maurice J. Steiger, Red Lake Falls, Minn., assignors of one-half to Earl A. Christianson, Elbow Lake, Minn.

Filed Aug. 4, 1964, Ser. No. 387,391
9 Claims. (Cl. 180—51)



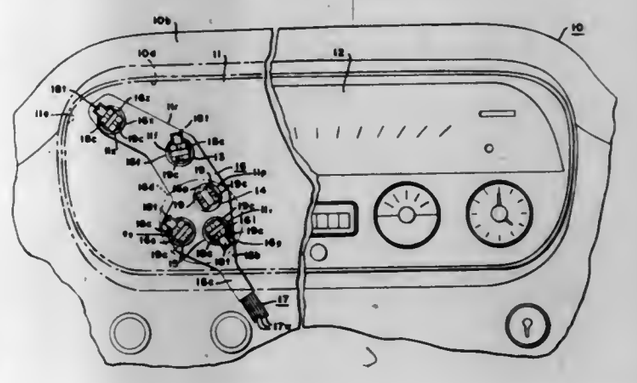
1. A power articulated vehicle comprising a front frame structure and a rear frame structure,
means pivotally connecting said frame structures together for pivoting movement therebetween about a substantially vertical axis,
each of said frame structures having driven ground engaging means for supporting the frame structures for travel over the ground,

one of the frame structures having a source of power for driving said ground engaging means,
drive transmitting means interconnected with the source of power and including a pair of elongate drive shafts each having one end thereof drivingly connected with said ground engaging means for one of said frame structures,
said drive transmitting means including an articulated drive connection between said drive shafts comprising an elongate support structure pivotally connected with said front frame structure for pivotal movement about a substantially vertical axis located forwardly of said pivotal axis between said frame structures, said support structure being pivotally connected with said rear frame structure at a point located rearwardly of said pivotal axis between said frame structures,
said articulated drive connection including a coupling mechanism mounted on said support structure and drivingly interconnecting said drive shafts,
and power means extending between and connected to said frame structures for selectively causing relative pivotal movement between said frame structures.

3,270,830
VEHICLE WIDE TREAD AXLE SUPPORT

Robert D. Barrett, Westchester, George J. Hamouz, Clarendon Hills, Lawrence I. Frisbie, La Grange, James K. Hirakawa, Chicago, and Edward C. Harnach, Jr., La Grange Highlands, Ill., assignors to International Harvester Company, Chicago, Ill., a corporation of New Jersey

Filed June 29, 1964, Ser. No. 378,905
2 Claims. (Cl. 180—88)



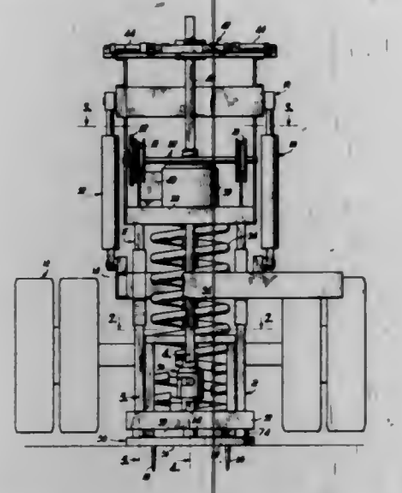
1. In a vehicle comprising a body and an axle housing projecting outwardly from said body for selective reception of axles which are relatively short and long, said housing having an outboard end portion, the combination of: housing extension mounting means on said housing outboard end portion, a first bearing assembly mounting means on said housing outboard end portion, a bearing assembly mountable on the bearing assembly mounting means to receive and journal the shorter of said axles received by the axle housing, an axle housing extension having outer and inner end portions and having an opening therethrough and fashioned with a frustoconical shape therebetween, said inner end portion being detachably secured by said housing extension mounting means to mount the housing extension on the axle housing with the outer end portion of the extension disposed outwardly from the outboard end portion of the axle housing, an axle housing cap having an axially extending aperture therethrough, said axle housing cap having an integral, circumferentially and axially inwardly extending wall for supportably mounting said bearing assembly therein to receive and journal the longer of said axles when the housing extension is mounted on the axle housing and when the longer axle is disposed in the axle housing, said axle housing cap including a radially outwardly extending flange, and means detachably securing said latter flange to the outer end portion of said housing extension.

3,270,831
DASHBOARD SUBASSEMBLY

Robert C. Woofter, Cortland, Ohio, and William C. Luscombe, Canandaigua, N.Y., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Original application July 8, 1960, Ser. No. 41,677, now Patent No. 3,174,576, dated Mar. 23, 1965. Divided and this application Apr. 9, 1964, Ser. No. 358,588
9 Claims. (Cl. 180—90)

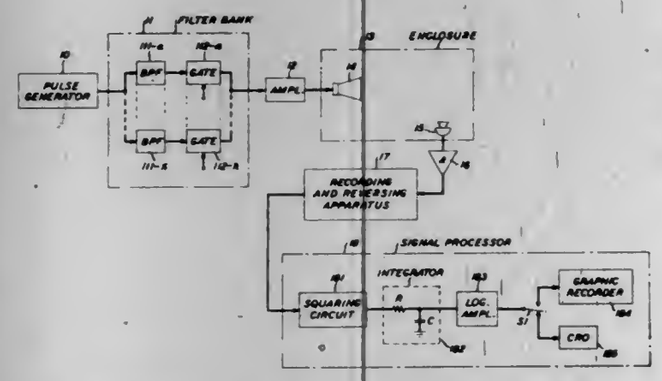
1. For a vehicle having electrical wiring means such as insulated conductors, grouped wires as a harness and the like as well as a dashboard means to carry instrumentation, accessories and the like a pre-connected combination illumination and instrumentation-accessory panel, comprising, a body portion of insulating material having an elongated predetermined configuration adapted to fit on one side of the dashboard means, a channel-like guide portion for the wiring means extending integrally and laterally on one side of said body portion, a plurality of lamp socket means also completely integral with said body portion of insulating material and having predetermined positioning thereof established by said body portion, terminal means provided in each of said lamp socket means for mounting and interconnection between energizable illuminators such as light bulbs and bare ends of the wiring means directly on said body portion prior to attachment of said body portion to the dashboard means, at least one additional socket portion integral with said body portion of insulating material, and at least one combination clip and terminal means provided in said additional socket portion which maintains both retention and establishment of electrical energization of an individual piece of instrumentation, accessories and the like.



3,270,832
APPARATUS FOR GENERATING SEISMIC IMPULSES USED IN GEOLOGICAL EXPLORATION

Charles C. Williams, Wichita, Kans., assignor to Imperial Industries, Inc., Dallas, Tex., a corporation of Kansas

Filed Dec. 9, 1963, Ser. No. 328,849
11 Claims. (Cl. 181—.5)



1. Apparatus for generating a sonic impulse employed in seismic geological exploration comprising:
a generally flat coupling plate adapted to be positioned during use with one major face thereof in substantially horizontal, flat engagement with the ground and entirely supported thereby;
an upright frame assembly;
a hammer reciprocable in said frame assembly and disposed to impactively engage the plate; and

structure carried by the frame assembly and operably coupled with the hammer for driving the hammer into impactive engagement with the plate, the mass of the frame assembly being greater than the mass of

the hammer and the mass of said hammer being substantially greater than the mass of said plate, whereby the recoil of the hammer and frame assembly after said impactive engagement is kept to a minimum.

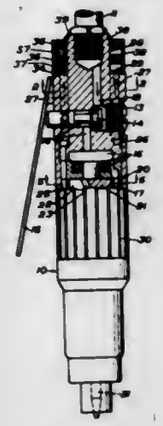
3,270,833
METHOD OF AND APPARATUS FOR MEASURING ENSEMBLE AVERAGES AND DECAY CURVES
Manfred R. Schroeder, Gillette, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Dec. 10, 1964, Ser. No. 417,364
9 Claims. (Cl. 181—.5)

1. Apparatus for measuring automatically the sound decay characteristic of an enclosure which comprises

a source of an impulse of energy having a predetermined frequency range and a relatively short time duration,

means for introducing a selected frequency sub-band of said impulse into said enclosure at a first predetermined point,

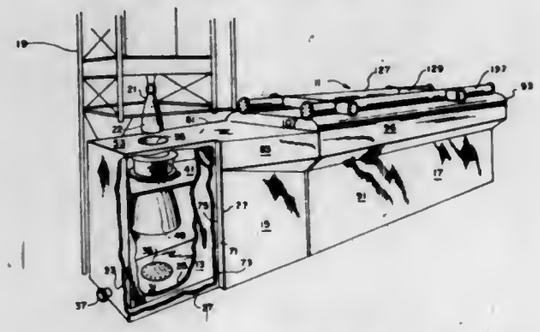
means for detecting at a second predetermined point within said enclosure the sound resulting from said radiated impulse to derive an output signal representative of the impulse response of said enclosure,



means for reversing the direction of said output signal to obtain a reversed direction signal,

means for raising said reversed direction signal to the second power to produce a squared signal,

means for integrating said squared signal, thereby to generate a decay curve signal,



and means for deriving a visual record from said decay curve signal.

3,270,834
PNEUMATIC TOOL HAVING EXHAUST NOISE REDUCING MEANS
Sven-Åke Bratt, Trollbacken, Sweden, assignor to Atlas Copco Aktiebolag, Nacka, Sweden, a corporation of Sweden
Filed Sept. 10, 1965, Ser. No. 486,317
8 Claims. (Cl. 181—36)

1. In a pneumatic tool a generally cylindrical housing, a rotary air motor mounted within said housing, a cylindrical external surface on said housing with one end thereof terminating in an annular shoulder radially outwardly of said surface, air exhaust passages longitudinally disposed within the housing connecting the outlet side of said air motor with the end of said external surface adjacent said shoulder, a sleeve extending from said shoulder in substantially parallel spaced relation to said external surface, opening means in said sleeve communicating directly with the atmosphere at the end of said sleeve opposite to said shoulder, a plurality of noise reducing rings of relatively rigid porous material mounted in axially stacked relation between said external surface and said sleeve for supporting said sleeve around said surface and for reducing the noise of the exhaust air issuing from said exhaust passages through said sleeve to the atmosphere, and means in said sleeve for keeping said rings axially spaced therein under the formation of a substantially annular expansion chamber for the exhaust air adjacent at least one of the axial faces of each ring in said sleeve for increasing the noise reduction therein.

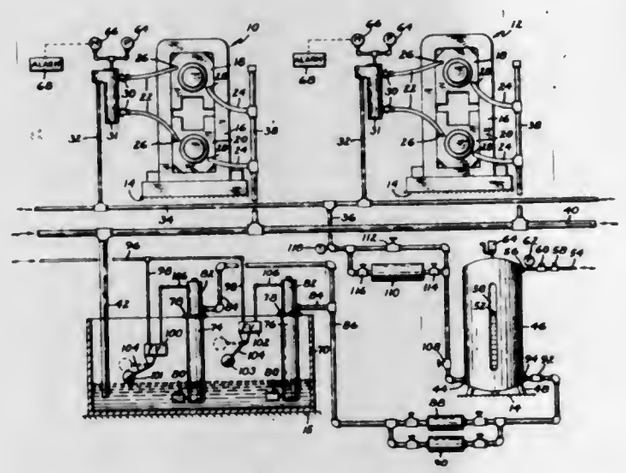
3,270,835
DEVICE FOR SUPPRESSING SOUND AND HEAT PRODUCED BY HIGH-VELOCITY EXHAUST JETS
Fritz Kramer, Huntsville, Ala., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed June 16, 1964, Ser. No. 375,674
8 Claims. (Cl. 181—52)

1. A device for suppressing sound and heat produced by the exhaust jet of reactive propulsion engines comprising:

(a) a venturi-shaped passage for receiving an engine's exhaust jet upon issuance from the engine;

(b) said passage having an entrance end and an exit end for the exhaust jet;

(c) a walled deflector section;

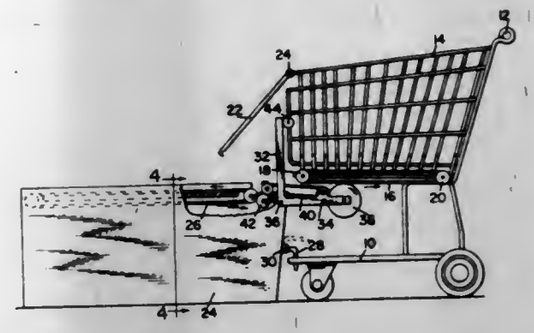


(d) the exit end of said passage opening into said deflector section;

(e) means for supporting a reservoir of water adjacent said entrance end of said passage;

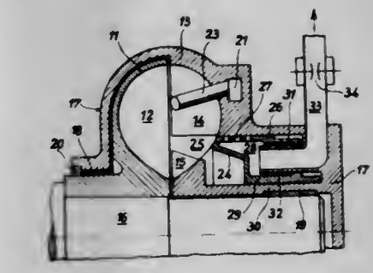
(f) said means including a container having a periphery spaced from and extending around said entrance end of said passage;

(g) a communication between said water and said entrance end of said passage whereby said water may be pumped into said passage by force exerted by the exhaust jet.



3,270,836
PRESSURIZED LUBRICATING SYSTEM
Samuel S. Rickley, West Boylston, Mass., assignor to Morgan Construction Company, Worcester, Mass., a corporation of Massachusetts
Filed Feb. 6, 1964, Ser. No. 342,966
2 Claims. (Cl. 184—6)

1. A lubricating system for forcing a lubricant continuously through a bearing comprising: a closed tank containing a supply of said lubricant; feed piping leading from said tank to said bearing; a source of pressurized gas connected to said tank, whereby the pressure in said tank will force said lubricant continuously into said bearing; a sump tank for receiving lubricant from said bearing; and, a pump operated by said source of pressurized gas for forcing lubricant from said sump tank back into said closed tank, thereby maintaining the supply of lubricant in said closed tank at a relatively constant level.



3,270,837
AUTOMATIC GROCERY CART
Armand A. Lachance, % American Metal Products Co., Southbridge St., Auburn, Mass.
Filed Sept. 9, 1964, Ser. No. 395,141
6 Claims. (Cl. 186—1)

1. The combination with a checkout counter including a power driven roll, means mounting the driven roll on a movable axis, means attached to said driven roll mounting means to move the latter and thereby the roll from an inoperative position to an operative position; of a grocery cart or the like including a lower wheeled frame, a basket mounted thereon in elevated condition with respect thereto, said basket including an openable forward wall and an endless belt comprising the bottom of the basket, and means on said cart for engaging said second-named means to move it together with the driven roll mounting means to cause the driven roll to move to operative position wherein it engages a run of said belt

to drive it in a direction to move articles placed thereon through the forward wall of said basket when open.

3,270,838
CONTROL OF THE BRAKE POWER OF A HYDRODYNAMIC BRAKE
Walter Schweizer, Friedrichshafen-Manzell, Germany, assignor to Maybach-Motorenbau G.m.b.H., Friedrichshafen, Germany, a firm of Germany
Filed Feb. 24, 1964, Ser. No. 346,981
Claims priority, application Germany, Mar. 14, 1963, M 56,105
12 Claims. (Cl. 188—90)

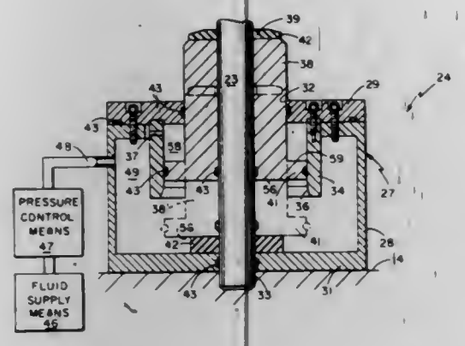
1. A core-less hydrodynamic brake comprising:

a stationary blade rim without a center guide core;

a movable blade rim to be braked without a center guide core;

said blade rims defining an annular fluid exchange gap therebetween and a fluid circuit chamber unobstructed in the direction transverse to said gap due to the absence of a center guide core;

fluid within said chamber; and



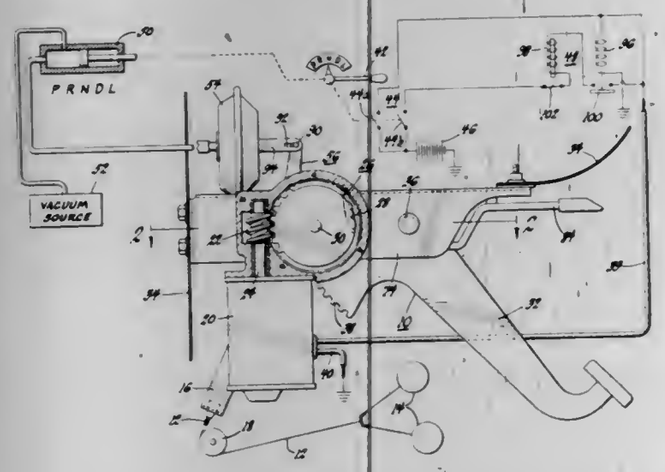
annular wall means operable to control the moment of the brake by moving into said stationary blade rim to change the profile of the circuit chamber including the location of the neutral fluid core formed by the circulation of said fluid within said chamber and to remove said fluid from the circuit.

3,270,839
DEVICE FOR PREVENTING MULTIPLE REBOUNDS OF AN IMPACTING MASS
Ralph S. Colby, Boxford, Mass., assignor to Avco Corporation, Cincinnati, Ohio, a corporation of Delaware
Original application Dec. 28, 1961, Ser. No. 162,705, now Patent No. 3,209,580. Divided and this application Mar. 16, 1965, Ser. No. 452,959
18 Claims. (Cl. 188—96)

3. In combination with a means for supplying a propelling force to a mass to impact said mass, a means for preventing a multiple rebounding of said mass comprising:

(a) means for applying a neutralizing force to said mass prior to impact and thereafter, said means including; a fluid cylinder, and means for supplying

fluid to said fluid cylinder for developing a continuous pressure of predetermined value in said cylinder; and



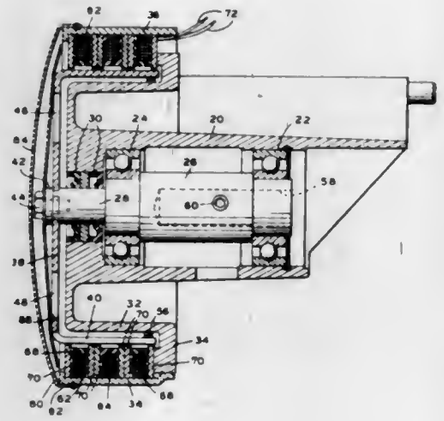
(b) damping means acting on said mass after impact for reducing the velocity thereof and bringing said mass to rest.

3,270,840

POWER OPERATED PARKING BRAKE HAVING AN AUTOMATIC TRANSMISSION CONTROL GEAR SHIFT RELEASE

James H. De Claire, East Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed Aug. 12, 1964, Ser. No. 389,047
8 Claims. (Cl. 192—4)



1. Parking brake mechanism for a vehicle having lever means for changing gears, said mechanism comprising: a pedal pendantly supported on a fixed portion of a vehicle and including a geared portion; power source means; connecting means between said pedal and a vehicle brake for transferring a force to hold the vehicle in a braked position; drive means including a pivotally supported gear connecting transferring force from said power source means to said pedal; pawl means held out of engagement with said geared portion during an actuating movement of the pedal and engaging said geared portion to maintain a relative position thereof after release of actuating movement; and brake releasing means for releasing said geared portion from an actuated position under one operating condition in response to a movement of the lever means for changing gears on the vehicle, said brake releasing means also including a pivotable lever for releasing said geared portion from an actuated position under a second operating condition.

3,270,841

MAGNETIC PARTICLE CONTROL UNIT

Richard Grau, Grand Rapids, Mich., assignor to Conductron Corporation, Ann Arbor, Mich., a corporation of Delaware

Filed Apr. 30, 1964, Ser. No. 363,931
4 Claims. (Cl. 192—21.5)

1. A coupling device for controlling the transmission of force between two relatively movable members comprising:

(a) a first housing member having a radially extending face wall terminating in an axially extending wall having a radial flange at its outer end,

(b) a cylindrical outer wall sealed on said radially extending flange to form an annular opening,

(c) a frictionally-engaged cover means peripherally engaged with said cylindrical outer wall overlying the radial face wall of said first member and said annular recess,

(d) a second member movable relative to said first member comprising a disc overlying said radially extending face wall of said first member having spaced axially extending fingers projecting into said annular opening,

(e) means forming a plurality of electromagnetic fields within said annular opening radially adjacent said fingers, and

(f) a charge of powdered magnetic material enclosed by said first member and said cover member to lie in the area of rotation of said fingers.

3,270,842

CAM OPERATED CLUTCHES FOR LAWN MOWER

Ross E. Pinto, Torrance, Calif., assignor to Roman Industries, Los Angeles, Calif., a corporation of California

Filed Mar. 27, 1964, Ser. No. 355,268
1 Claim. (Cl. 192—48)

In a dual clutch construction for a lawn mower, comprising:

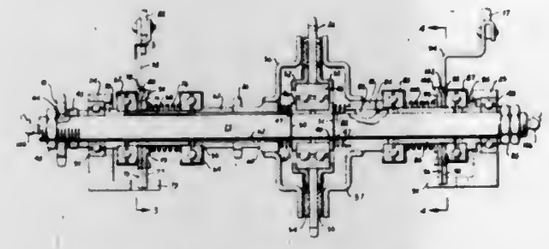
(a) a clutch shaft rotatably supported on the lawn mower and having first mower drive means fixed thereto;

(b) an annular driven element co-axially received on said shaft;

(c) main radial and thrust bearing means mounting said element on said shaft for rotation relative thereto in a plane substantially fixed and normal relative thereto;

(d) a first annular clutch element co-axially received on and keyed to said shaft to one side of said driven element for axial movement and against rotational movement relative to said shaft, said first clutch element being frictionally engageable with one side of

said driven element upon axial movement thereagainst;



(e) a second annular clutch element, having second mower drive means fixed thereto, co-axially received on said shaft to the other side of said driven element for axial and rotational movement relative to said shaft, said second clutch element being frictionally engageable with one side of said driven element upon axial movement thereagainst;

an improved means for selectively engaging either one or simultaneously engaging both of said clutch elements with said driven element, comprising:

(1) first and second annular cam disks rotatably received around said clutch shaft, respectively, to either side of said driven element for axial movement on said shaft towards and away from said driven element;

(2) first and second thrust bearing means interposed, respectively, between said first clutch element and cam disk and said second clutch element and cam disk;

(3) first and second resilient compression means interposed, respectively, between said first thrust bearing means and cam disk and said second thrust bearing means and cam disk to resiliently urge said respective thrust bearing means and cam disks apart whereby movement of said first and second cam disks towards said driven element functions, respectively, to resiliently urge said first and second clutch elements into frictional engagement with said driven element;

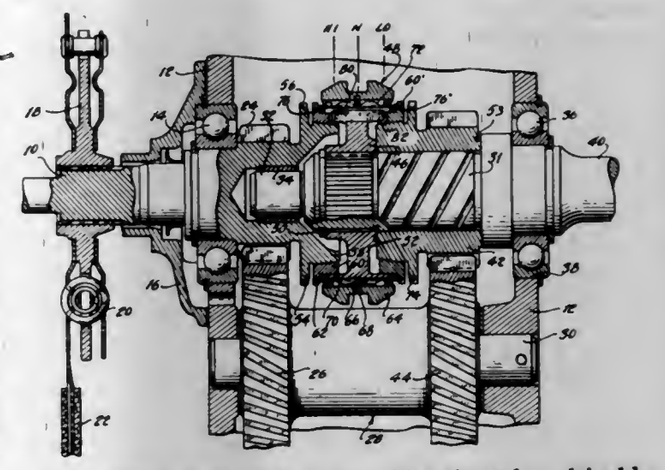
(4) first and second annular cam actuating disks rotatably received around said clutch shaft with one side thereof in juxtaposition to one side of the respective first and second cam disks exteriorly relative to said driven element;

(5) first and second abutment elements fixed to said clutch shaft to either side of said driven element exteriorly relative to said respective first and second cam actuating disks;

(6) first and second bearing means interposed, respectively, between said first cam actuating disk and abutment element and said second cam actuating disk and abutment element to provide, with said abutment elements for the rotatable receipt of said cam actuating disks on said shaft and the maintenance of said cam actuating disks against axial movement on said shaft away from said driven element;

(7) mating recesses and protrusions on the juxtaposed sides of the cam disks and cam actuating disks, said recesses being adapted to be brought into and out of mating engagement by rotation of the cam actuating disks relative to the cam disks;

(8) means to simultaneously or independently selectively impart relative rotation to the juxtaposed cam actuating and cam disks; and wherein,



(9) relative rotation of the juxtaposed cam actuating and cam disks functions to move the cam disks axially on the clutch shaft towards said driven element.

3,270,843

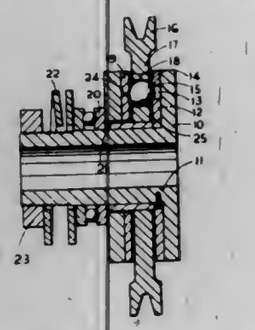
SYNCHRONIZER CLUTCH ASSEMBLY

Peter G. Ivanchich, Dearborn, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware

Filed May 4, 1964, Ser. No. 364,526
5 Claims. (Cl. 192—53)

1. A synchronizer clutch assembly adapted to drivably connect a driving member with a driven member and comprising a synchronizer hub carried by one member, clutch teeth carried by the other member, a blocker ring situated between said clutch teeth and said hub, said other member and said blocker ring having cooperating friction clutch surfaces, a synchronizer clutch sleeve having internal clutch teeth drivably carried by said clutch hub, means for establishing a driving connection between said blocker ring and said hub while accommodating a limited degree of rotary lost motion therebetween, and yieldable spring means located between said blocker ring and said sleeve including a portion engageable with the teeth of said sleeve as the latter is shifted toward said other member whereby the teeth of said blocker ring are shifted rotatably relative to said hub into the path of motion of the teeth of said sleeve, the teeth of said sleeve engaging the teeth of said blocker ring to cause clutching engagement of said clutch surfaces, the ends of the teeth of said sleeve being tapered, said spring means including a circular spring element surrounding said blocker ring and compressible radially inwardly as it engages the tapered ends of the teeth of said sleeve.

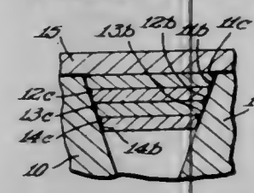
3,270,844



OVERLOAD CLUTCH OR TORQUE LIMITING DEVICE

Olaf John Barclay Orwin, Birmingham, England, assignor to Fisher & Ludlow Limited, Tipton, England, a British company

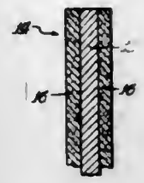
Filed July 24, 1964, Ser. No. 384,838
Claims priority, application Great Britain, July 30, 1963, 30,091/63
6 Claims. (Cl. 192—56)



1. An overload clutch comprising a torque transmitting driving element and a torque transmitting driven element, a thrust member, means mounting the driving element, the driven element and the thrust member in side by side but axially spaced apart relation for relative rotational movement about a common axis of rotation, one of said elements having two axially directed opposite faces and being disposed between the other element and the thrust member, said other element and said thrust member having axially opposed mutually parallel plane faces each directed towards an adjacent one of the faces of the one element, said other element in the face thereof adjacent said one element having a plurality of circumferentially spaced torque transmitting openings having ball engaging mouths of circular configuration, said one element having

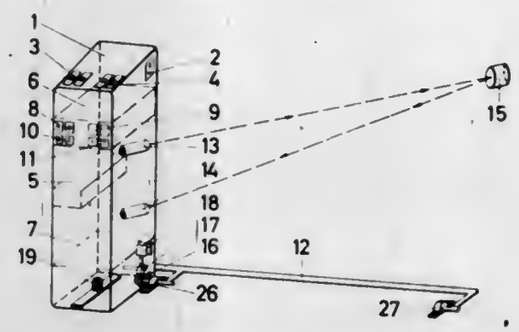
a plurality of slots extending therethrough between its axially directed opposite faces with one portion of each slot in register with one of said torque transmitting openings for one relative rotational position of said elements, a torque transmitting ball within each slot, each ball having a diameter which is greater than the diameter of the torque transmitting opening mouths and the thickness of the one element adjacent said slots so that each ball projects axially beyond each of said two axially directed faces of the one element in a position for engaging with said

opposed plane faces of the other element and the thrust member, each slot in the direction of its length being inclined to the direction of rotation of said one element so that part of each slot is out of register with the torque transmitting openings for all relative rotational positions of the elements, said other element and said thrust member being relatively axially movable on said mounting means, and spring means urging said other element and thrust member towards one another into thrust engagement with said torque transmitting balls.



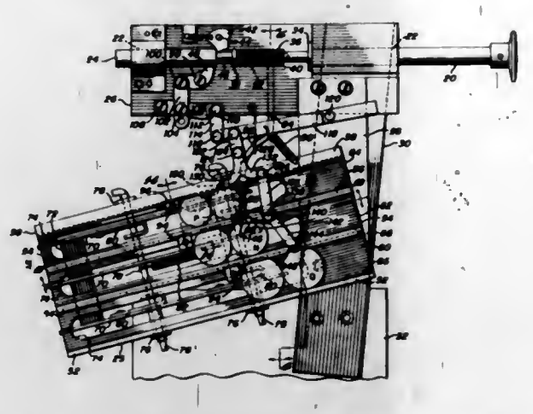
3,270,845
BAND CLUTCH
John Major Dodwell, Piedmont, Quebec, Canada (2619 N. 5th St., Niles, Mich.)
Filed July 9, 1964, Ser. No. 381,447
6 Claims. (Cl. 192—81)

1. A band for one-way V-pulley friction devices comprising an elongated thin spring metal strip, precurved into a generally flat radial spiral shape tapered in width along its length from adjacent its outer end to its inner end to provide a pair of progressively closer side edges for progressively deeper co-operation with the sidewalls of a V-pulley, securing means on the strip adjacent its outer end, said side edges being beveled at their radially innermost corners to conform to said V-pulley and being relieved at their outermost corners.



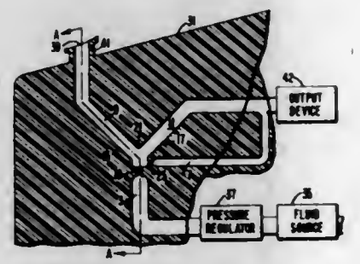
3,270,846
FRICTION MEMBER WITH FRICTION MATERIAL
Hanns F. Arledter, Ross, Ohio, and Carl R. Canfield, Jr., Decatur, and Daniel C. Gillespie, Maywood, Ill., assignors, by direct and mesne assignments, to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois, and The Mead Corporation, a corporation of Ohio
Continuation of abandoned application Ser. No. 646,349, Mar. 15, 1957. This application Apr. 10, 1961, Ser. No. 104,499
15 Claims. (Cl. 192—107)

1. A friction member for a torque control device adapted to operate in oil comprising a metallic backing member and a resilient porous friction facing adhesively secured to the backing member, said friction facing comprising an interfelted fibrous paper sheet consisting essentially of from about 30% to about 70% by weight of at least one fibrous material selected from the group consisting of natural cellulosic fibers and synthetic organic fibers capable of withstanding 200° F., from about 5% to about



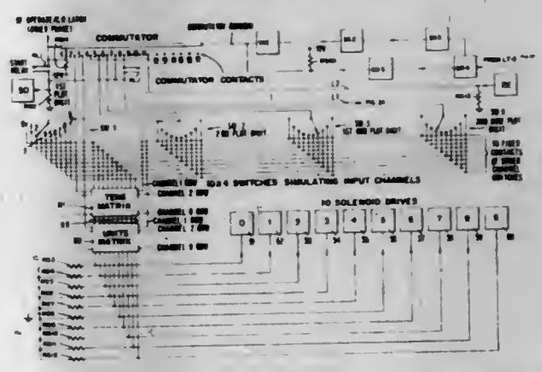
35% by weight of asbestos fibers, from about 10% to about 50% by weight of at least one inorganic filler material of a hardness of more than 3.5 mohs, and said facing further containing from about 10% to about 50% based on the weight of the paper of at least one cured thermosetting resin, said facing having a readily available air volume of at least 60%.

3,270,847
AUTOMATIC CAR PARKING-METER FOR GARAGES
Harry I. Å. Rudberg, 28 W. 44th St., Stockholm, Sweden
Filed Oct. 22, 1964, Ser. No. 405,766
Claims priority, application Sweden, Oct. 31, 1963, 11,983/63; Apr. 9, 1964, 4,365/64
3 Claims. (Cl. 194—1)



1. In an automatic parking meter for garages of the type having parking spaces each controlled by a meter and each having a closure blocking a car in the respective parking space until payment of the free registered on the associated meter: the improvement comprising a source of radiant energy associated with each parking space; a respective radiant energy responsive means operatively associated with each radiant source; the receipt of radiant energy from a source thereof by the associated responsive means being interrupted responsive to movement of a car into the associated parking space; a source of timing pulses; normally open circuit means connecting each responsive means to said source of timing pulses and operable, responsive to the interruption of radiant energy to a respective responsive means, to initiate delivery of timing pulses from said source thereof to the associated meter; first means operable periodically, for short time periods, to activate said sources of radiant energy; and second means operable periodically, during such short time periods, to close said circuit means; said first and second means operating in synchronism, and said first means, during each such short period, activating said radiant energy sources sufficiently in advance of closing of said circuit means to assure full energization of said radiant energy sources before closing of said circuit means.

3,270,848
COIN ACCUMULATOR
Mitchell A. Hall, 445 Rossford Ave., Fort Thomas, Ky.
Filed Oct. 19, 1964, Ser. No. 404,571
20 Claims. (Cl. 194—92)

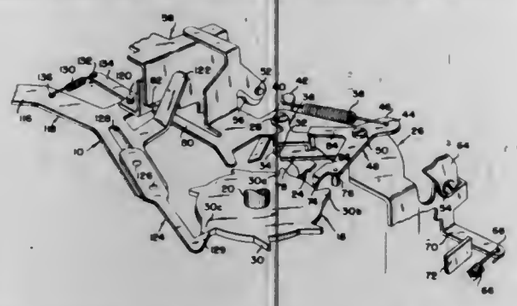


1. An accumulator of coins of different sizes, comprising in combination: an actuator movable from a normally inoperative position to an operative position; a shiftable latch member movable from an inoperative position in non-interfering relationship with movement of the actuator, to an operative position barring movement of the actuator to the operative position; a coin magazine comprising a plurality of coplanar runways, said runways each including an elongate inclined shelf to support the coins on edge in a common plane, and along which the coins may roll by gravity toward the lower ends of the shelves, the runways each having an open coin entry end receptive of coins deposited in the several runways; individually adjustable coin stops intermediate the ends of the runway; and means supported by accepted coplanar coins resting in edgewise contact upon the several inclined shelves, for holding the latch member in the inoperative position favoring unobstructed movement of the actuator to the operative position.

3,270,849
PNEUMATIC KEYBOARD INPUT DEVICES
Benjamin F. Griffin, Jr., Fairfax County, Va., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Oct. 18, 1961, Ser. No. 145,947
17 Claims. (Cl. 197—15)

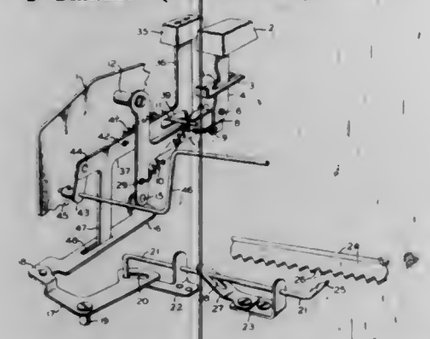
1. A keyboard mechanism comprising:
(a) a keyboard having a key thereon,
(b) a bistable pure fluid switch having an input channel, a first channel connected with said input channel and terminating at an opening in said key, and an output channel connected with said input channel,
(c) the chamber formed by the intersection of said input channel, said first channel, and said output channel having a configuration whereby a fluid stream flowing through said input channel normally flows through said chamber and said first channel and whereby upon and subsequent to closure of said opening said fluid stream flows through said output channel,
(d) and a control signal channel terminating at an orifice in said chamber for deflecting said fluid stream back to said normal path of fluid flow through said first channel.

3,270,850
RECORDING DEVICE
Kenneth L. Smith, Bassett, Southampton, Julian Bowen, Winchester, and Terrence G. Bowker, Romsey, England, assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Aug. 29, 1961, Ser. No. 134,687
2 Claims. (Cl. 197—19)



1. Apparatus operable under the control of digital signals representative of the values of a plurality of separate input variables for printing on a record medium the respective digital values of the input variables in assigned columns thereof as well as a distinctive graphical symbol for each said variable at a position on said record medium determinative of the value of the variable, comprising a first storage device storing the respective digital values of said variables; a typewriter type of printing device having a moving carriage, electrically operated numeral and symbol printing instrumentalities, and function controls including carriage space and tabulate devices; an emitter on said typewriter for emitting signals which manifest the displacement of the typewriter carriage; means under control of said first storage device and said emitter for controlling the sequential operation of said numeral printing instrumentalities and said function controls to print the respective digital values of said input variables in predetermined columns on said record medium; a second storage device; means under control of said first storage device and said emitter for entering the digital values stored in said first storage device in said second storage device; and means under control of said emitter and said second storage device for reading out the data stored in said second storage device in ascending order of magnitude and controlling the carriage tabulating and spacing controls as well as the symbol printing instrumentalities to print the graphical symbols representative of the respective variables at positions on said record medium manifestive of the values thereof.

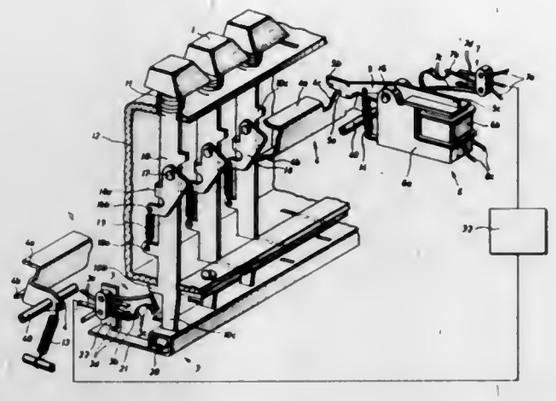
3,270,851
TYPEWRITER
Arthur C. Goldsmith, La Fayette, and Anthony N. Paone, Syracuse, N.Y., assignors to SCM Corporation, New York, N.Y., a corporation of New York
Filed Aug. 8, 1963, Ser. No. 300,823
2 Claims. (Cl. 197—84)



1. In combination in a typewriter or like machine: a carriage; a starwheel movable concomitantly with said carriage; an escapement operable to free the carriage for incremental movement in the letter space direction including a pivotally mounted dog rocker, a holding dog mounted on said rocker normally engaged by a tooth of and restraining the starwheel against movement; type key operated means for pivoting said dog rocker to disengage

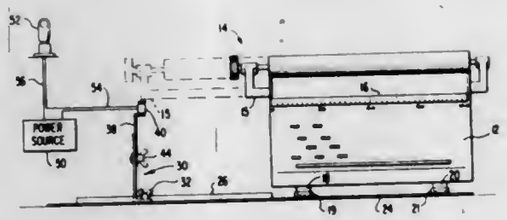
the holding dog from the starwheel tooth and free the starwheel for rotation; and independent key operated means operable to pivot said dog rocker and disengage the holding dog and simultaneously position in the path of the starwheel restraining means effective to limit the movement of the carriage to a predetermined fraction of its normal letter space increment, comprising a pivotally

mounted actuator including dog rocker pivoting cam means, a starwheel tooth engageable dog fixed to said actuator, spring means biasing said actuator in a direction effective to hold said dog out of engagement with the teeth of the starwheel, and a key operated motion transmitting linkage effective to pivot the actuator against the bias of said spring and move said dog into the path of said starwheel.



3,270,852
TYPEWRITER ERASURE MECHANISM
Robert Fondiller, 33 W. 63rd St., New York 23, N.Y.
Filed Feb. 4, 1963, Ser. No. 255,966
5 Claims. (Cl. 197—91)

1. In a typewriter, a ribbon vibrator, mechanism for shifting said vibrator, a carriage rack, mechanism for back spacing said carriage rack, a manually operable key, a first linkage coupling said shifting mechanism to said key for rendering said shifting mechanism responsive to the operation of said key, a second linkage coupling said back spacing mechanism to said key for moving said back spacing mechanism a character space interval plus an overtravel portion in response to the operation of said key, and locking means for maintaining said key operated, said locking means being arranged to permit the partial resetting of said key to relax said back spacing mechanism said overtravel portion.



3,270,853
KEYBOARD APPARATUS HAVING MEANS TO CONTROL DURATION OF ACTUATION OF CIRCUIT
Heinz Gerjets, Hans Elsner, and Siegfried Wesselhöft, Wilhelmshaven, Germany, assignors to Olympia Werke A.G., Wilhelmshaven, Germany
Filed June 22, 1965, Ser. No. 465,984
Claims priority, application Germany, June 24, 1964, O 10,214
20 Claims. (Cl. 197—98)

1. Electric operation control apparatus, comprising, in combination, a set of selector members; a set of selector switches respectively operated by said selector members; a set of electrically operable means respectively connected with said selector switches; control means operable by each actuated selector member; a start switch actuated by said control means; and an electric timing device having an output connected with said selector switches and an

input connected with said start switch, said device being energizable under the control of said start switch for producing at said output a working impulse so that any electrically operable means whose correlated selector member and selector switch are actuated, is energized independently of said selector members.

3,270,854
VISIBLE MARGIN SIGNAL APPARATUS
Henry C. Baker, P.O. Box 102, Bradley, Maine
Filed Sept. 2, 1964, Ser. No. 393,935
2 Claims. (Cl. 197—187)

1. In combination with a typewriter having a movable carriage and a copy scale for designating letter spaces between left and right margin positions of the movable carriage, apparatus which is readily coordinated with the typewriter copy scale, without modification of the typewriter, to produce a visible signal at a desired right margin position for the movable carriage comprising

elongated base bar means including means for fixing the position of the elongated base bar means with relation to the typewriter so that longitudinal movement along the elongated base bar means coincides with movement of the movable carriage,

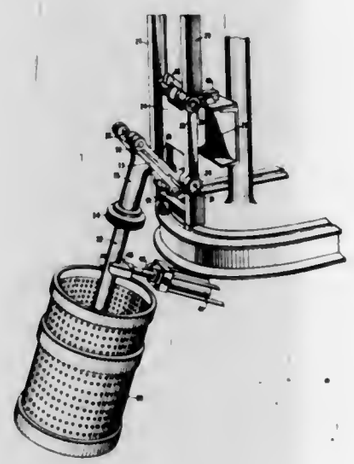
a base copy scale mounted on the elongated base bar means, the base copy scale including scale markings corresponding to the typewriter copy scale markings, with the base copy scale and typewriter copy scale being aligned longitudinally upon positioning of the elongated base bar means with relation to the typewriter,

means for coordinating scale markings of the base copy scale with the typewriter copy scale,

vertically-oriented switch support means mounted on the base bar means,

means for moving the switch support means toward and away from typewriter along the base copy scale longitudinally of the elongated base bar means to select a marking along the base copy scale corresponding to desired right margin position for the movable carriage,

indicator means attached to the switch support means for indicating the position of the switch support means along the base copy scale,



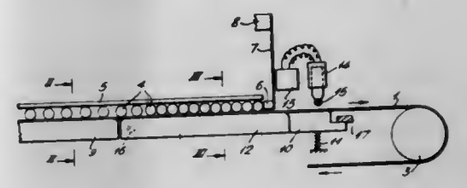
a switch held in fixed position by the switch support means, without interconnection with the movable carriage, so as to be mechanically actuated by the movable carriage at the selected marking along the base scale corresponding to the desired right margin position for the removable carriage,

means for adjusting the vertical position of the switch to contact the movable carriage upon movement of the movable carriage to the desired right margin position,

a source of electrical power, and

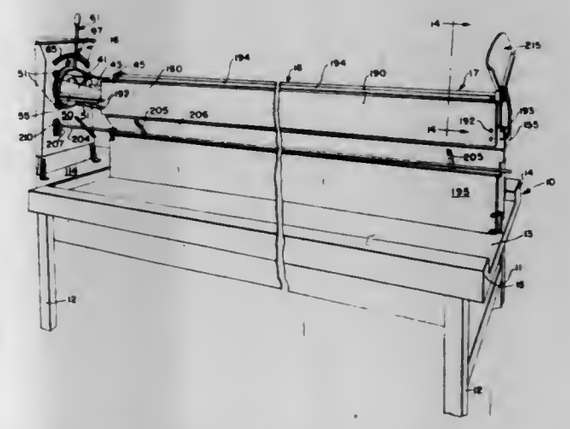
light means connected to the source of electric power through the switch so as to give a visible indication of desired right margin for the movable carriage upon mechanical contact of the movable carriage with the switch.

3,270,855
BARREL TREATMENT MACHINE FOR SMALL ARTICLES
Willard J. Harper, Colts Neck, and Paul A. Hauck, Freehold, N.J., assignors to Hanson-Van Winkle-Munning Co., Matawan, N.J., a corporation of New Jersey
Filed Apr. 8, 1964, Ser. No. 358,188
19 Claims. (Cl. 198—19)



1. In a machine for the treatment of small articles in which a barrel through its shaft and shaft bearing is carried in a normal operative attitude by a carriage which is raised and lowered by an elevating mechanism and moved around horizontally by conveying mechanism to positions over treatment tanks into which the barrel is sequentially lowered throughout a cycle of treatments, the improvement comprising

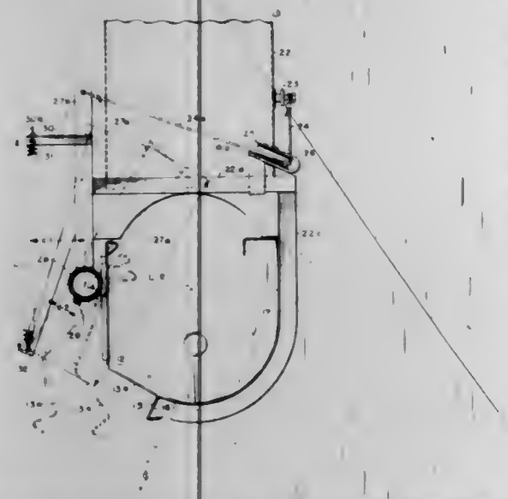
(a) support means for the barrel shaft having pivotal connection to said carriage for permitting of a lowering movement of the barrel below normal operative attitude to present the open end of the barrel upwardly for loading, and



(b) detachable means between said carriage and support means for normally retaining the barrel in normal operative position.

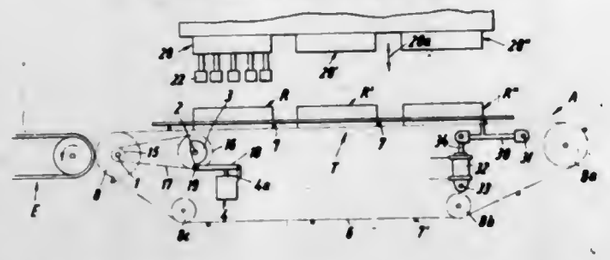
3,270,856
ARTICLE ASSEMBLING APPARATUS
George Dearsley, Richmond, Va., assignor to American Machine & Foundry Company, a corporation of New Jersey
Filed Jan. 28, 1964, Ser. No. 340,669
Claims priority, application Great Britain, Feb. 25, 1963, 7,525/63
9 Claims. (Cl. 198—31)

1. In a continuously moving conveyor, apparatus for conveying a stream of articles and for arresting at least part of the conveyed stream or articles, comprising support means pivotally mounted on a horizontal axis at one end and yieldably supported at the other end, endless movable member means for conveying a stream of articles thereon and being supported at least in part by the support means, rail means, extending along and parallel to said endless member, stop means adjacent the downstream end of the endless member means for arresting articles being conveyed, sensing means adjacent the stop means for sensing the number of conveyed articles arrested by the stop means, and actuating means responsive to the sensing means for urging the support means about its pivotally mounted end to disengage the endless member means from a number of adjacent conveyed articles upstream of the stop means.



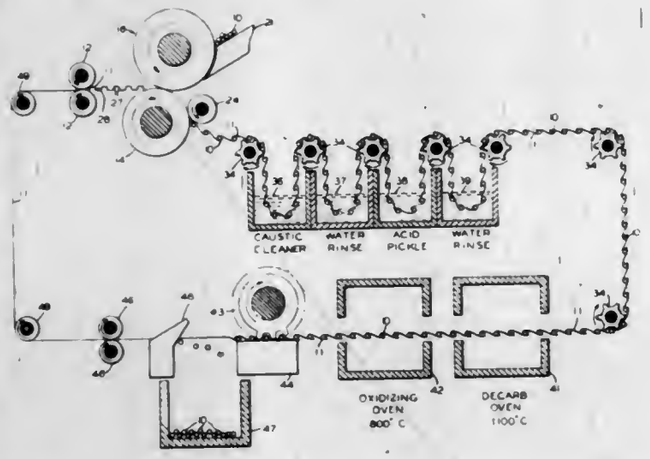
3,270,857
SCREW-CONVEYOR FEEDER
Raymond S. Wilkes and Alvin E. Klouda, Moline, and Etlar A. Henningsen, Geneseo, and Arnold B. Skromme, Moline, Ill., assignors to Deere & Company, Moline, Ill., a corporation of Delaware
Filed Feb. 24, 1964, Ser. No. 346,822
21 Claims. (Cl. 198—64)

1. A material feeding device comprising: a material container; an elongated substantially horizontal auger housing having an inner end adjacent the container and extending therefrom to an outer end, the housing further having side opening means therein; an auger in the housing; longitudinally spaced means supporting the housing for rotation thereof about its axis; adjusting means at the inner end of the housing for angularly and selectively



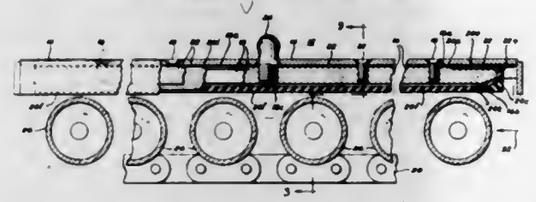
positioning the housing about its axis to effect the angular location of the side opening means; a latching device at the outer end of the housing for locking the latter end at any of a plurality of angular positions; a control element extending alongside the housing between the inner end closely adjacent the adjusting means and connected to the locking device whereby an operator may selectively lock the outer end at a selected angular position about the axis and may selectively adjust the inner end at the same or different angular positions to thereby vary the location of the side opening means at both ends; a faced member adjacent to and extending radially from the outer end and having an indicia bearing surface facing the inner end; and an indicator element operatively associated with the auger housing at the outer end and movable relative to the indicia bearing surface to thereby indicate the angular position of the outer end.

3,270,858
LATE OPENING, EARLY CLOSING GATE MECHANISM FOR BUNK FEEDER
Victor C. Fuhrwerk, Celina, and Paul A. Luthman, Maria Stein, Ohio, assignors to Avco Corporation, Coldwater, Ohio, a corporation of Delaware
Filed Aug. 31, 1964, Ser. No. 393,333
3 Claims. (Cl. 198—64)



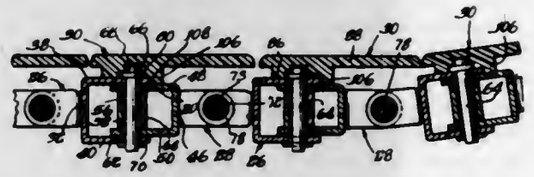
1. A cattle feeder comprising a longitudinally extending conveyor for conveying flowable feed along a series of adjacent coextensive feed bunks for depositing substantially equal amounts of feed in each bunk, said conveyor having a plurality of side gates mounted on longitudinally aligned pivots adjacent the sides thereof, a lever means for each gate fixed at one end to a respective one of said pivots, an arm extending approximately at right angles to said lever means, resilient means for each gate, each resilient means having an extensible longitudinal axis spaced from the axis of said pivots for maintaining each gate in normally closed position, each of said resilient means being connected to one end to a fixed point spaced from the axis of said pivots, the other end of each resilient means being connected to the end of a respective arm, whereby said resilient means is approximately parallel to said lever means, and means for independently actuating one of said lever means from the others of said lever means for opening said gates against the force exerted by said resilient means, said axes of said pivots and said resilient means approaching each other as each of said lever means is actuated to open said gates, said means for independently actuating one of said lever means from the other of said lever means including means for opening the first gate subsequent to the time the other gates are opened and closed prior to the time the other gates are closed.

3,270,859
APPARATUS FOR HANDLING BOTTLES AND SIMILAR CONTAINERS
Günter Bargel, Dortmund-Korne, Germany, assignor to Holstein & Kappert, Dortmund, Germany
Filed May 13, 1964, Ser. No. 366,984
12 Claims. (Cl. 198—110)



1. In an apparatus for transferring bottles and other types of containers into and out of crates and similar receptacles, in combination, a conveyor arranged to advance receptacles consecutively along an elongated path and toward a transfer station at which the receptacles receive a supply of containers or are relieved of their contents, said conveyor including motion transmitting means arranged to engage a receptacle while moving along said path and abutment means fixed to said conveyor for movement therewith along said path; drive means for continuously transmitting driving torque to said conveyor tending to continuously drive said conveyor in a predetermined direction; control means for regulating the speed of said conveyor in such a way that whenever a receptacle approaches the transfer station, the speed of the conveyor decreases; and arresting means located adjacent said path and intermittently movable into the path of said abutment means for preventing the movement of said conveyor in said predetermined direction against the action of said drive means when a receptacle reaches the transfer station.

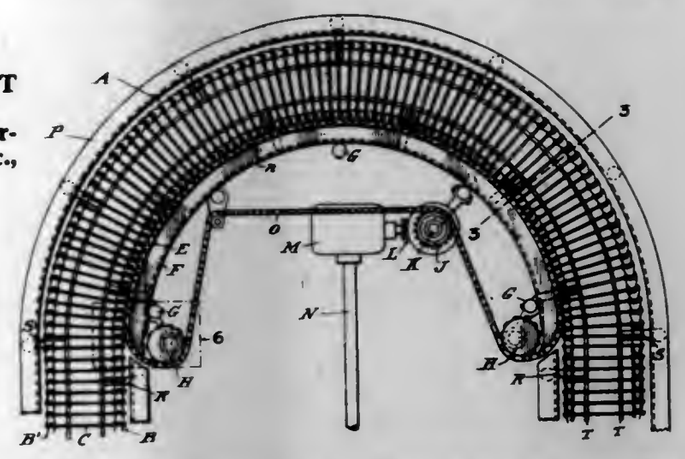
3,270,860
METHODS OF AND APPARATUS FOR PROCESSING ARTICLES
Henry R. Siebach, Reading, Pa., assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York
Filed Oct. 9, 1963, Ser. No. 314,894
8 Claims. (Cl. 198—179)



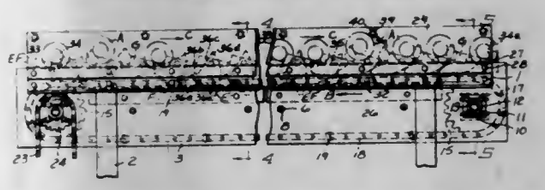
4. Apparatus for processing articles, which comprises:
means for corrugating a pliable carrier;
means for inserting articles into the corrugations of the corrugated carrier;
means for deforming the corrugations of the carrier in a manner such that each corrugation releasably secures an article therewithin;
means for advancing the carrier after insertion of the articles therein through at least one processing station; and
means for applying tension to said carrier after its emergence from said processing station to elongate the carrier and release the articles therefrom.

3,270,861
ARTICLE CONTROL DEVICE FOR ROLLER SLAT CHAIN CONVEYOR
Reginald A. Reed, Menomonee Falls, and Wilton C. Warner, Colgate, Wis., assignors to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware
Filed July 31, 1964, Ser. No. 386,533
1 Claim. (Cl. 198—183)

The combination with a roller slat chain conveyor having its rollers individually rotatable about their longitudinal axes, of a device comprising an elongated, resilient member secured to a rigid form member to create a closed cavity therebetween, and means connecting said cavity to a fluid source to selectively effect a change in the volume of said cavity to cause said resilient member to assume an expanded position wherein it directly frictionally engages and closely conforms to the arcuate surfaces of said rollers to effect rotation thereof when they pass thereacross, and said resilient member being disengaged from said rollers in its unexpanded position.



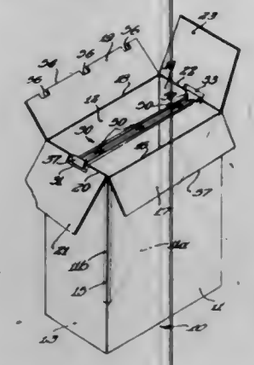
3,270,862
CONVEYOR PLATE STRUCTURE
Nathaniel D. Goldberg, 125 N. Racine Ave., Chicago, Ill.
Filed July 10, 1964, Ser. No. 381,867
11 Claims. (Cl. 198—189)



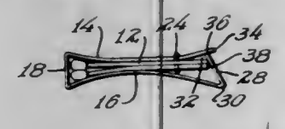
10. In a conveyor structure, a chain including a plurality of pivotally connected links, a plate member operatively connected to a first surface of a first one of said links, a depending element of said plate operatively engaging a second peripheral surface of said first link, a second link connected to said first link in such a manner that said depending element slidably engages said second link.

3,270,863
CONVEYOR DRIVING UNIT
Virgil E. Ackles, 15899 S. San Pedro St., Los Angeles, Calif.
Filed June 22, 1964, Ser. No. 376,894
1 Claim. (Cl. 198—203)

A mechanism for driving a link conveyor having a portion traversing a horizontal arc and having an arcuate inner margin with a multiple of spaced projections on said margin, comprising an endless sprocket chain having an arcuate run abutting said arcuate margin and engaged at intervals throughout its length with said projections, said sprocket chain also having a length connecting the ends of said arcuate run, means engaging said length of chain for driving the latter and thereby propelling said conveyor, a fixed arcuate rail slidably abutting the inner side of said arcuate run for holding said run in engagement with said projections, direction rollers at the ends of said arcuate rail around which said sprocket chain is passed, said direction rollers each embodying a concentrically mounted hub, stud-shafts on which said hubs are eccentrically mounted in fixed relation thereto, said stud-shafts being adapted to be turned to shift said direction rollers to adjust said sprocket chain longitudinally relative to said conveyor, and means for detachably securing said stud-shafts against rotation to releasably hold said hubs in fixed positions.

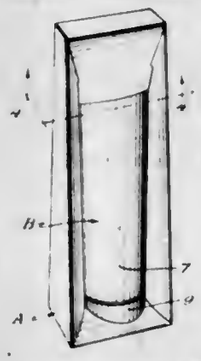


3,270,864
WORKPIECE CONVEYOR AND STORING UNIT
John G. Kay, Detroit, Mich., assignor to F. Jos. Lamb Company, Detroit, Mich., a corporation of Michigan
Filed Nov. 30, 1964, Ser. No. 414,748
12 Claims. (Cl. 198—219)



1. A conveying unit comprising a support structure including a pair of generally horizontally spaced saw-tooth tracks mounted thereon, each track having a series of successive bearing surfaces which incline downwardly and forwardly in the direction of travel of the workpieces through the unit, there being a stop surface extending upwardly from the front lower extremity of each bearing surface to the higher rear extremity of the next successive bearing surface, the stop and bearing surfaces on the two tracks being transversely aligned whereby a workpiece is adapted to roll successively down each pair of transversely aligned bearing surfaces, cam means associated with each pair of transversely aligned bearing surfaces and pivotally supported for rotation in a generally vertical plane, said cam means being eccentric about their pivot axes whereby they are adapted to orient themselves to a predetermined position in response to gravity, means on each cam means adapted when the cam means is rotated through a predetermined angle to lift a workpiece from the front lower extremity of one bearing surface and deliver it to the higher rear extremity of the next successive bearing surface and endless drive means having cam actuating means thereon which when the drive means are driven in one direction are adapted to engage said cam means successively and rotate them from their lifting position to their delivery position whereby the workpieces move forwardly along said tracks in a progressive succession.

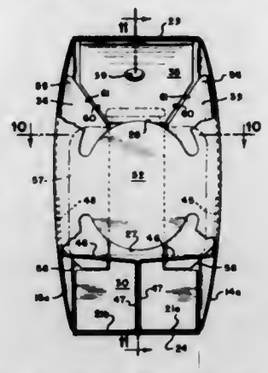
3,270,865
DEXTEROUS HANGER BAR AND CONTAINER
Francis P. Brennan, 1057 Rolling Drive, Lisle, Ill.
Filed Mar. 16, 1965, Ser. No. 440,228
6 Claims. (Cl. 206—7)



5. A corrugated container comprising,
front, rear and opposed side panels all disposed vertically, and corresponding front, rear and opposed flaps
said panels and said flaps having scorelines formed between each corresponding panel and flap,
said front and rear flaps and said opposed flaps arranged to fold into horizontal position to form a cover for the container,
said opposed flaps each being recessed adjacent a corresponding scoreline,
a cross bar extending between said opposed side panels and having mounting means engaging said side panels at the recessed portions of said flaps,
said cross bar having a plurality of L-shaped clips each including a leg spaced above said cross bar and all opening in a common direction,
one of said front and rear flaps having recesses formed therein through which said clips extend when said one flap is folded downward,
whereby said one flap will engage the hooks of hangers suspended on said cross bar,
and the other of said front and rear flaps having its margin received between said clip leg and said one flap,
thereby locking the hangers on the cross bar against inadvertent movement.

3,270,866
MATCH BOOK
Philip J. Schoenberger, 947 Bellows Ave., West St. Paul, Minn. 55118
Filed July 7, 1965, Ser. No. 470,001
7 Claims. (Cl. 206—29)

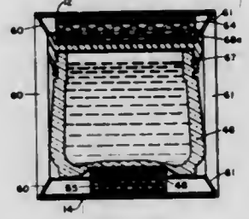
7. A match book cover in combination with a packet of matches comprising:
(a) a cover having a back portion and a front portion hingedly connected at one end to an intermediate portion to overlie said packet of matches,
(b) said back and front portions each being of a length greater than the length of said match packet,
(c) means securing said back cover portion to said packet of matches at a point spaced from the free end of said back portion to define a recess between said back portion and said packet of matches,
(d) free ends of said back portion and said front portion projecting beyond the end of said packet of matches,
(e) a flexible tab hingedly secured to the free end of said front cover portion adapted to be inserted into said recess to hold said cover closed,
(f) a strike plate secured in overlying relation of said cover.



3,270,867
TUBE DISPLAY CARTONS
Russell J. Hennessey and Richard F. Gulliver, St. Paul, Minn., assignors to Waldorf Paper Products Company, Ramsey, Minn., a corporation of Minnesota
Filed Sept. 1, 1964, Ser. No. 393,604
12 Claims. (Cl. 206—45.14)

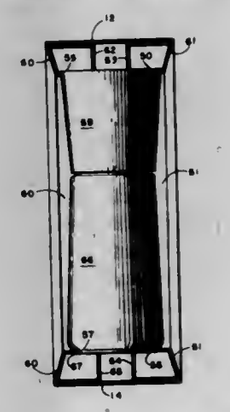
1. A carton adapted for use as a display for a collapsible tube having a flattened end and a neck end bearing a tube cap,
said carton comprising a generally rectangular back panel,
side walls hinged to opposite edges of said back panel and extending forwardly therefrom,
front liner panels hingedly connected to said side walls and converging rearwardly toward the back panel,
rear liner panels hinged to the rear edges of said front liner panels,
anchoring panels hinged to the rear edges of said rear liner panels and secured in face contact to said back panel,
the lines of connection between said front and rear liner panels being spaced apart a distance substantially equal to the diameter of the tube adapted to be displaced,
a top wall extending forwardly from the upper edge of said back panel,
a tube end retaining flap hinged to the forward edge of said top wall and adapted to be folded against the flattened end of the tube,
cooperable means on said retaining flap and on said liner panels for holding the flap locked in tube retaining position,
a bottom wall hinged to the lower edge of said back panel and extending forwardly therefrom,
a tube cap retaining flap hinged to the forward edge of said bottom wall and having a notched end adapted to straddle the tube cap, and
corner flaps holding said side walls and said bottom wall connected.

3,270,868
CURVED FRONT PANEL DISPLAY CARTON
Vincent R. Pantalone, Closter, N.J., assignor to Federal Paper Board Company, Inc., a corporation of New York
Filed June 11, 1964, Ser. No. 374,450
8 Claims. (Cl. 206—45.19)



3. A rectangular display carton having a front wall with a window therein, a rear wall spaced therefrom and side walls having top and bottom closure flaps, the bottom flaps each having a central lengthwise score line dividing the flap into front and rear sections, and platform means for supporting an article in display position with respect to said window comprising a pair of strips, one projecting from the front section of each of the bottom closure flaps, the outer end portions of such strips each being glued to the inner surface of the respective side walls, and said strips having score lines causing the remainder thereof to be folded into rectangular position when the closure flaps from which they project are folded to closed position.

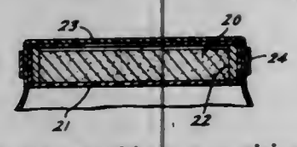
ERRATUM



For Class 206—45.33 see:
Patent No. 3,271,357

3,270,869
DISPLAY PACKAGE FOR JARS AND THE LIKE
Robert V. Burt, Cincinnati, Ohio, assignor to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio
Filed Oct. 12, 1964, Ser. No. 403,215
3 Claims. (Cl. 206—45.33)

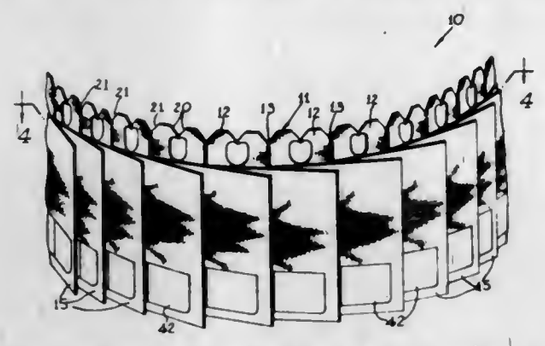
1. A package for a jar comprising a frame, said frame being formed from a frame blank made of paperboard material and generally configured in the form of an elongated strip, said frame blank having two spaced parallel scores running longitudinally from one end of said elongated strip to the other end thereof, a plurality of transverse scores at intervals along the said frame blank and being substantially perpendicular to said parallel longitudinal scores thereby dividing the central portion of the frame blank into four panels including two side panels and two end panels, said side and end panels being alternatively spaced along said frame blank, a flap articulated to and extending beyond the panel at one end of said frame blank, an extending portion projecting laterally outwardly from each of the longitudinal scores which define the edge portions of the said panels, each of said extending portions being at least partially separated by angular relief cut-outs outwardly of each of said transverse scores, each of said extending portions having three score lines all of which are parallel to the parallel scores running longitudinally from one end of said elongated strip to the other, said three score lines dividing the extending portions into an inner area, an inner intermediate area, an outer intermediate area and an outer area, each of said extending portions being folded into a tubular support with the outer area of each extending portion being adhered to its adjoining panel so that each side and end panel has a pair of spaced substantially rigid tubular supports in parallel relationship alongside the longitudinal scores forming the upper and lower extremities of said side and end panels, said tubular supports being formed so that the outer intermediate area of each is in substantially abutting relationship, an aperture cut in both tubular supports extending from the end panels to form an opening therein, an adapter member shaped to conform to the configuration of each of said openings and being inserted therein so that one end of each adapter rests on the outer area of the tubular supports adhered to the end panels, a jar, a cap on said jar, said jar having a recessed base, said cap having a recessed top, said adapter members engaging the recess in the base of the jar at one end and the recess in the cap at the other end so that the cap and jar are firmly supported in spaced relation with respect to the end panels, said side and end panels being folded into a substantially rectangular frame by folding the said frame blank on said transverse scores so that the said tubular supports face inwardly and said cap and base of said jar are supported by said adapter members without obscuring the side surfaces of the jar and cap, said flap at one end of said frame blank being secured on the panel at the opposite end of said frame blank to complete the frame structure around said jar, said frame structure being overwrapped with a flexible and heat shrinkable plastic film, said film being heated and shrunk on said frame structure to impart greater rigidity to said frame structure and to retain said secured flap in the completed package.



3,270,870
DISPLAY PACKAGE FOR BOTTLES AND THE LIKE
Robert V. Burt, Cincinnati, Ohio, assignor to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio
Filed Oct. 12, 1964, Ser. No. 403,287
3 Claims. (Cl. 206—45.33)

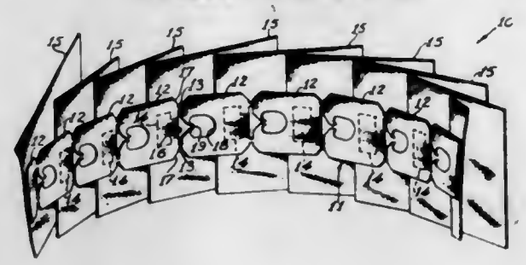
1. A package for a bottle comprising a frame, said frame being formed from a frame blank made of paperboard material and generally configured in the form of an elongated strip, said frame blank having two spaced parallel scores running longitudinally from one end of said elongated strip to the other end thereof, a plurality of transverse scores at intervals along the said frame blank and being substantially perpendicular to said parallel longitudinal scores thereby dividing the central portion of the frame blank into four panels including two side panels and two end panels, said side and end panels being alternately spaced along said frame blank, a flap articulated to and extending beyond the panel at one end of said frame blank, an extending portion projecting laterally outwardly from each of the logitudinal scores which define the edge portions of the said panels, each of said extending portions being at least partially separated by angular relief cut-outs outwardly of each of said transverse scores, each of said extending portions having three score lines all of which are parellel to the parallel scores running longitudinally from one end of said elongated strip

to the other, said three score lines dividing the extending portions into an inner area, an inner intermediate area, an outer intermediate area and an outer area, each of said extending portios being folded into a tubular support with the outer area of each extending portion being adhered to its adjoining panel so that each side and end panel has a pair of spaced substantially rigid tubular supports in parallel relationship alongside the longitudinal scores forming the upper and lower extremities of said side and end panels, said tubular supports being formed so that the outer intermediate area of each is substantially perpendicular to the side and end panels, an aperture cut in both tubular supports extending from the end panels, said apertures being shaped to receive the cap and base, respectively, of a bottle, said apertures being cut to leave upstanding inner wall portions on the outer intermediate areas, said upstanding inner wall portions bearing against said cap and said base so that the cap and base are firmly supported in spaced relation to the end panels, said side and end panels being folded into a substantially rectangular frame by folding the said frame blank on said transverse scores so that the said tubular supports face inwardly and said cap and base of said bottle are supported in said apertures, said flap at one end of said frame blank being secured to the panel at the opposite end of said frame blank to complete the frame structure around said bottle, said frame structure being overwrapped with a flexible and heat shrinkable plastic film, said film being heated and shrunk on said frame structure to impart greater rigidity to said frame structure and to retain said secured flap in the completed package.



3,270,871
PACKAGE
Rosalie Pushkin, 917 Oak St., Bellmore, N.Y.
Filed Sept. 5, 1963, Ser. No. 306,841
1 Claim. (Cl. 206—46)

An enclosure for an object comprising, a cylindrical annulus around said object, a sheet of flexible material covering one end of said annulus and wrapped around the outer periphery of said annulus and folded inwardly over the object, a second sheet of flexible material covering the opposite end of said annulus on the top of said object and wrapped around the outer periphery of said annulus and over the wrap formed by the first sheet, a second annulus having an inner diameter equal to or greater than the outer diameter of the first annulus and twice the combined thicknesses of the first and second sheets of the flexible material, said second annulus surrounding the inner annulus and the wrapping sheets of material concentrically.



3,270,872
MULTI-CLOSLURE LABEL-BEARING STRIP
Floyd G. Paxton, P.O. Box 2098, Yakima, Wash.
Filed Apr. 20, 1965, Ser. No. 449,574
2 Claims. (Cl. 206—56)

1. In a multi-closure label-bearing strip, wherein the closures each have a bag confining mouth and a narrow opening located in a longitudinal side edge of said strip and communicating with said mouth for admitting a bag neck into the latter, the structure comprising: a multiple of closures of transversely stiff, thin sheet material comprising polystyrene or the like, arranged consecutively with their transverse edges in closely spaced relation; a pair of transversely spaced webs integrally connecting with each consecutive pair of closures in frangible areas of union located between opposite ends of said webs and said closely spaced edges of said consecutive closures, said frangible areas being spaced far enough apart lengthwise of said strip and being sufficiently restricted in the cross-sectional dimension thereof, measured transversely of said strip, that compressive forces applied in the plane of said strip from opposite directions respectively to said consecutive closure and through said closures to opposite ends of said pair of webs, without causing said closures to buckle, will cause the material of said strip to substantially simul-

taneously crack in said frangible areas of union at the opposite ends of said pair of webs and thus separate said webs from said closures and said closures from each other; and a multiple of rectangular stiff, thin, flat labels, the area of each of which is substantially larger than that of a closure, a corner portion of each of said labels being affixed to one of said closures so as not to overlie said mouth or edge opening of said closure, and so as not to overlie the transverse edge of said closure which will be located at the end of said strip when said closure becomes the endmost closure of said strip, each label being feathered in overlapping relation with the labels affixed to adjacent closures.

3,270,873
BAG CLOSURES AND INDIVIDUALLY ATTACHED LABELS UNITED IN STRIP FORM
Floyd G. Paxton, P.O. Box 2098, Yakima, Wash.
Filed Apr. 20, 1965, Ser. No. 449,575
2 Claims. (Cl. 206—56)

1. A matrix in strip form for consecutively producing a series of bag closures each of which carries a stiff label substantially larger than said closure, said matrix comprising a strip of relatively thin and stiff but springy flat sheet plastic material, said strip being weakened at regularly spaced longitudinal intervals along a transverse line normal to the side edges of said strip by means eliminating the material of said strip bordering said transverse line, with the exclusion of a pair of narrow webs located on said line, said means including a hole bordering on said line and having opposite extremities located on said line, said webs being readily frangible upon the imposition of a moderate amount of traction to said strip from opposite sides of said line, said strip having, adjacent to each of said holes, an internal aperture which communicates in one direction with said hole through a narrow passageway, said strip also having a blank space in the opposite direction from said aperture, said strip also including a series of labels, each of which has an end portion thereof glued to said strip in one of said blank spaces

so that said label extends symmetrically with said strip away from the aperture adjacent said blank space, whereby the separation of said strip along a given line as aforesaid, converts the portion of said strip adjacent said line having said aperture into a bag closure having a label glued thereon as aforesaid, with the end portion of said closure having said aperture extending forwardly from said label and thus being accessible for use in applying said closure to the neck of a plastic bag.

3,270,874
POLYSTYRENE MULTI-CLOSURE STRIP SCORED FOR SEPARATION INTO INDIVIDUAL CLOSURES
Frank E. Hilton, Milwaukie, Oreg., assignor, by mesne assignments, to Kwik Lok Corp., Yakima, Wash., a corporation of Washington
Filed Aug. 27, 1965, Ser. No. 483,122
2 Claims. (Cl. 206—56)

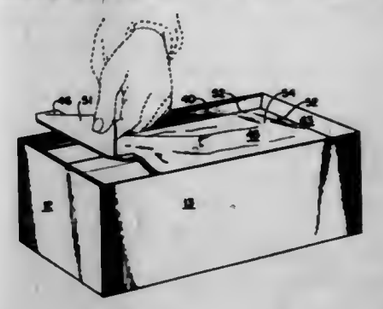
2. In a multi-closure strip, wherein the closures each has a bag-neck-confining mouth and a narrow opening located in a longitudinal side edge thereof and communicating with said mouth for admitting a bag-neck therein, said mouths and openings being symmetrical with respect to first transverse axes across said strip,

the structure comprising:

a plurality of closures of .035 inch thick polystyrene material arranged in side-by-side relation in said strip,

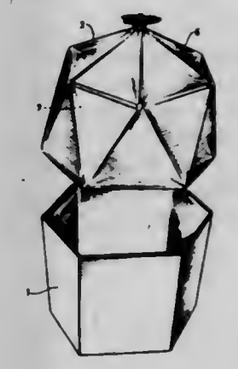
the opposite edges of said strip being die cut to form notches therein,

said notches being arranged symmetrically relative to second transverse axes which are equally spaced from said first transverse axes and parallel thereto,



said second transverse axes defining the sides of adjacent closures,

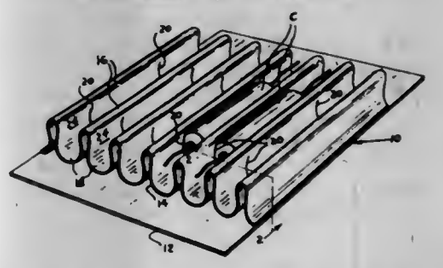
said strip being scored to a depth of between .008 and .010 inch on the opposite surfaces thereof along each of said second transverse axes with a single, continuous score extending edge-to-edge to make said strip frangible along said second transverse axes, said scores an each said second axes being in register,



thereby to permit individual closures to be separated from said strip by bending said strip along said second transverse axes.

3,270,875
REMOVABLE COVER FOR DISPLAY PACKAGE
Robert V. Burt, Cincinnati, Ohio, assignor to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio
Filed May 3, 1965, Ser. No. 452,717
7 Claims. (Cl. 206—57)

1. In a package for holding sheet material in a stack, said package having side walls, end walls and a top having a relatively narrow rim element formed thereon, a relatively large central opening in said top defined by said narrow rim, a stack of sheet material in said package with the upper edge of the stack bearing against said narrow rim of said top and being retained in the package by said narrow rim, the improvement comprising a cover member interposed between said stack of sheet material and said narrow rim of package material, said cover member comprising a thin, relatively flexible closure sheet of plastic material and a relatively stiff border member adhered to said closure sheet to hold said closure sheet in place under said narrow rim of carton material and to maintain said closure sheet taut and neat in appearance when assembled in position beneath said rim element, said cover member being removable to expose the sheet material by pulling inwardly on the cover member to dislodge the border member from under said narrow rim element of the package.



3,270,876
PACKAGE OF REGULAR AND MUTUALLY EQUAL TETRAHEDRONS
Anders Ruben Rausing, Blentarp, Sweden, assignor to AB Tetra Pak, Lund, Sweden, a Swedish company
Original application Apr. 8, 1963, Ser. No. 271,097. Divided and this application Nov. 16, 1965, Ser. No. 508,076
Claims priority, application Sweden, Apr. 13, 1962, 4,124/62
3 Claims. (Cl. 206—65)

1. A package of mutually equal tetrahedrons, said package comprising a stack of at least two layers with six tetrahedrons in each layer, said stack being completely surrounded by and the tetrahedrons being held in their relative positions by a flexible covering.

3,270,877
PACKAGE FOR COLUMNAR ARTICLES
Hanns E. Hecker, 100 Sanford St., Hamden, Conn.
Filed June 18, 1965, Ser. No. 464,972
4 Claims. (Cl. 206—72)

1. An article package of modular compartmented design for supporting a plurality of generally similarly-shaped columnar article individually in separated compartments against lateral and axial shifting therein, which comprises

(a) a generally flat backing strip of flexible sheet material;

(b) an undulated strip secured at spaced intervals to said backing strip to provide a plurality of article-receiving compartments formed by a repetitive series of peaks and troughs running transversely of the extent of said backing strip,

(1) said trough being wider than said peaks but narrower than the diameter of the columnar articles to be received therein, and

(2) the sidewalls of said troughs being slitted transversely at spaced intervals along their extent to form sling portions which are peripherally continuous with the trough walls, said sling portions corresponding lengthwise of said troughs to the axial length of the bodies of the columnar articles to be retained therein.

3,270,878
DISPLAY PACKAGES
Jerry B. Giesler, Lombard, Ill., assignor to Waldorf Paper Products Company, St. Paul, Minn., a corporation of Minnesota
Filed Aug. 5, 1965, Ser. No. 477,421
2 Claims. (Cl. 206—78)

1. A display package including:

(a) a pair of elongated paperboard panels in substantially superimposed relation,

(b) a score line extending across each of said panels parallel to the ends of said panels,

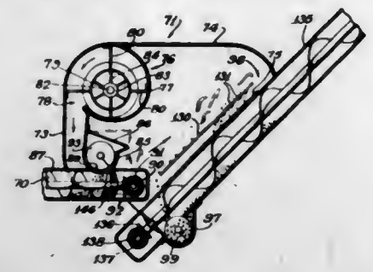
(c) said score lines being in registered relation,

(d) at least one of said panels having a window opening therein,

(e) one said score line intersecting said window opening,

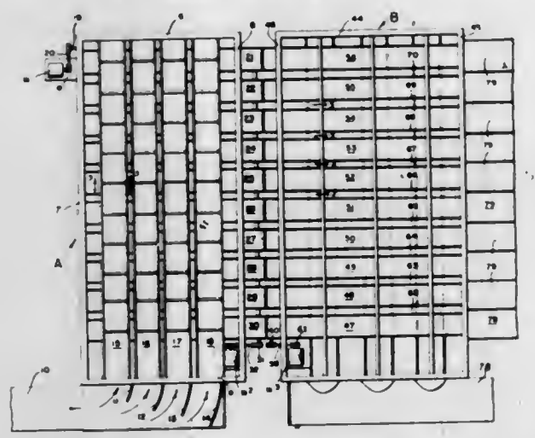
(f) a transparent film secured to said one panel extending across said window opening,

(g) means securing said panels along areas of attachment with said film sandwiched between said panels,



(h) an object having an outline size smaller than said window enclosed on at least one side by said film extending through said window,

(i) each said panel including an ear projecting beyond the periphery of the other said panel whereby said ears may be grasped to pull said panels apart and



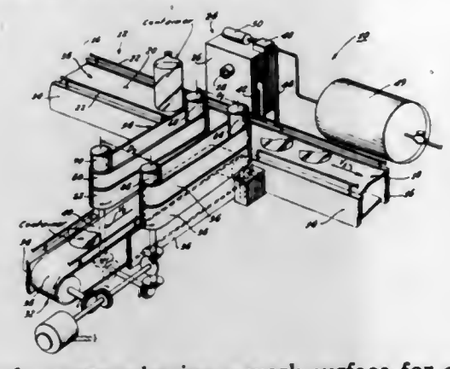
(j) the portions of said panels and film adjoining the edges of said panels intermediate said score lines and said ears being spacedly secured together in areas which are small relative to the area of contact.

3,270,879
PNEUMATIC INCLINED CURRENT SEPARATOR
Elof K. Karlsson, East Moline, Dwight B. Carlson, Rapids City, and Ernest M. Van Buskirk and Richard A. De Pauw, East Moline, Ill., assignors to International Harvester Company, Chicago, Ill., a corporation of New Jersey
Filed Jan. 10, 1963, Ser. No. 250,625
5 Claims. (Cl. 209—34)

1. A shelled corn cleaning unit comprising a hopper unit including a front vertical wall having an upper continuation rolled upon itself forming a cylinder internally of said hopper and extending across its upper front edge, said continuation terminating rearwardly of said front vertical wall such that the cylinder is not closed, a fan unit within said cylinder adapted to force air to the opening between the front vertical wall and the terminal edge of said continuation, a J-shaped sheet including a leg portion and a hook portion secured to the terminal edge of said continuation having said leg portion substantially parallel to said front vertical wall and said hook portion opening towards the rear of said hopper and terminating along a lip located relatively close to the bottom of said hook portion such that a shallow material trough is formed, a horizontal bottom wall connected to and extending rearwardly from said front vertical wall and forming in cooperation with said hook portion of the J-shaped sheet guide means for directing a stream of air beneath said trough, means for supply shelled corn to said trough, and means within said trough for spreading said shelled corn evenly across said trough such that it will spill evenly over its lip and fall through the stream of air.

3,270,880
SIZING, GRADING AND SORTING DEVICE FOR THIN SKIN VEGETABLES OR FRUITS
Kleber Dessic Brian, Pixley, Budd Jones, Visalia, and Harold Arthur O'Neal, Pixley, Calif., assignors of one-quarter to L. M. Clark, Earlimart, Calif.
Filed Aug. 20, 1963, Ser. No. 303,344
8 Claims. (Cl. 209—73)

1. In a sizing, grading and sorting device, the combination of a power belt feed thereto for products to be sized and graded, the first series of power belts at right angles to said power belt feed, fingers of progressive length extending over the power belt feed to remove products from said belt to said first series of power belts, photoelectric cells mounted above the series of power belts with means for adjusting the height of the photo-electric cell over said series of belts, and means controlled by said photo-electric cells for selectively discharging products from said series of belts.

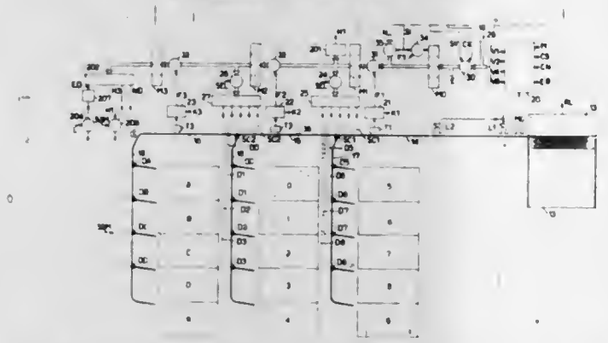


3,270,881
MATERIAL HANDLING SYSTEM
Fredrick L. Calhoun, Torrance, Calif., assignor to Electro-Dynamics Corp., a corporation of California
Filed Jan. 27, 1964, Ser. No. 347,989
16 Claims. (Cl. 209—74)

1. A device of the class described for transferring a workpiece from a first conveyor extending along a first path toward a first particular location to a second predetermined path extending toward a second particular location, said device including the combination of:

a separator disposed in proximity to said first conveyor for propelling the workpiece from the first conveyor along the second path,

a pair of counter-rotating belts disposed in proximity to said location,



a pair of registering surfaces on said belts disposed on the opposite sides of the path to capture workpieces propelled from the separator and carry the workpieces along said path,

a second conveyor having a work surface for carrying the workpieces, said work surface being disposed adjacent the belts and at an angle thereto so as to gradually engage the workpieces as they are being carried by the belts, and

drive means interconnected with the belts and the conveyor for driving them whereby the two registering surfaces and the work surface will be moving together in the same direction at the same velocity.

3,270,882
DOCUMENT SORTER
Pier Giorgio Perotto, Torino, Italy, assignor to Ing. C. Olivetti & C., S.p.A., Ivrea, Italy, a corporation of Italy
Filed Oct. 2, 1964, Ser. No. 401,028
5 Claims. (Cl. 209—74)

1. A document sorter comprising:

(a) a reading station for reading intelligence on documents,

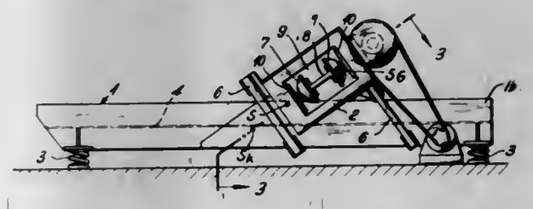
(b) a branched sorting path divided into sections, each one including at least a portion of one or more branches and having associated therewith a distinct memory for storing intelligence,

(c) a plurality of pockets located along said path, each one having an entrance from said path,

(d) a pocket deflector located at the entrance of said pocket,

(e) means for actuating said pocket deflector for directing documents from said path into said pocket,

(f) a branch deflector located at each point of said sorting path where two or more branches diverge from a preceding branch,



(g) means for actuating said branch deflector for directing documents from said preceding branch into one of said diverging branches,

(h) means fed by said memory for selectively operating the actuating means of the deflectors of the associated section according to the intelligence stored in said memory,

(i) means for conveying documents along said sorting path,

(j) and means for transferring said read intelligence from said reading station into said memory.

3,270,883
SHAKING MACHINE WITH U-SHAPED COUNTERMASS MEMBERS
Rudolf Teuteberg, Werner Nickel, and Friedrich Brenneis, Dortmund, Germany, assignors to Schuchtermann & Kremer-Baum Aktiengesellschaft für Aufbereitung, Dortmund, Germany, a corporation of Germany
Filed Apr. 3, 1963, Ser. No. 270,215
Claims priority, application Germany, Apr. 26, 1962, Sch 31,361
6 Claims. (Cl. 209—329)

1. A shaking machine comprising a spring mounted material handling member and a countermass member resiliently mounted on the material handling member, said material handling member including side members and a screen mounted within said side members, the countermass member being U-shaped disposed with one leg thereof on either side of the material handling member, and having a cross member extending across the material handling member, said side members terminating below said cross member, the legs of said U-shaped member being disposed in parallel relation and substantially in the direction of vibration, each of said legs having means defining a recess therein, a crossarm rigidly connected with said material handling member, the end portions of said crossarm projecting into the said recesses, storage springs disposed in said recesses and operatively interposed between said crossarm and said U-shaped countermass for transfer of vibration between the U-shaped countermass member and the crossarm of the material handling member, and means for imparting vibration to said material handling member and countermass.

3,270,884
DUAL VALVE, DUAL ELEMENT FLUID FILTER ASSEMBLY
Allen R. Bremer, Seattle, Wash., assignor to The Boeing Company, Seattle, Wash., a corporation of Delaware
Filed June 27, 1963, Ser. No. 291,063
4 Claims. (Cl. 210—90)

1. A two-stage fluid filter assembly comprising

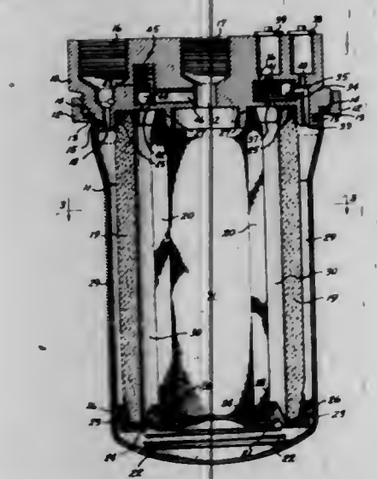
a head section with an inlet passage and an outlet passage formed therein,

a bowl section removably attached to said head section,

primary filter means removably disposed in said bowl section to define a first annular space between an interior wall of said bowl section and an exterior surface of said primary filter means,

secondary filter means concentrically positioned within said primary filter means and removably disposed in said bowl section to define a second annular space between an interior surface of said primary filter means and an exterior surface of said secondary filter means,

said secondary filter means having an internal third space,



first internal passage means formed in said head section for allowing the passage of fluid from said inlet passage into said first annular space,

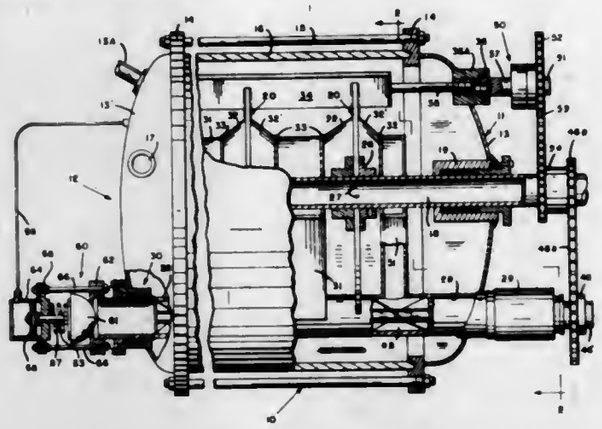
first by-pass valve means positioned in said head section and interconnecting said first annular space with said second annular space,

said first by-pass valve means being actuated by a predetermined fluid pressure differential across said primary filter means to by-pass fluid flow around said primary filter means,

second by-pass valve means positioned in said head section and interconnecting said second annular space with said third space,

said second by-pass valve means being responsive to a greater predetermined fluid pressure differential than said first by-pass valve means to by-pass fluid flow around said secondary filter means,

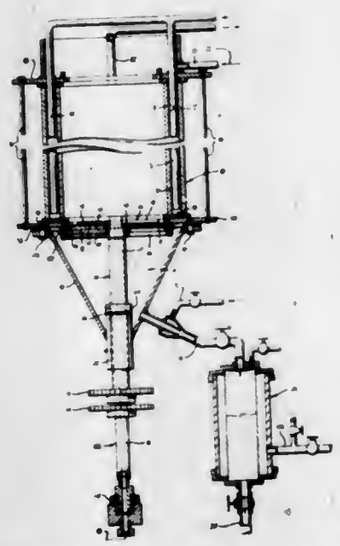
second internal passage means formed in said head section for conducting fluid from said third space into said outlet passage, and



pressure sensitive indicator means positioned in said head section and being operatively connected to said first annular space through a restrictive flow passage means,

said restrictive flow passage means being adapted to smooth out fluid pressure surge conditions of relatively short durations to prevent inadvertent tripping of said indicator means,

said indicator means being responsive to a predetermined pressure increase in said first annular space due to contamination clogging of said primary filter means.

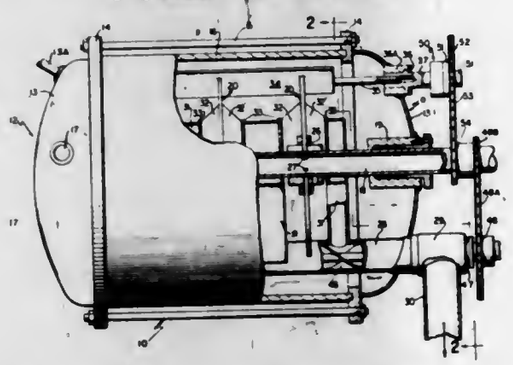


3,270,885
FILTER
Kenneth A. Anderson, Silvis, Ill., assignor to Ametek, Inc., New York, N.Y., a corporation of Delaware
Filed Nov. 29, 1963, Ser. No. 326,935
3 Claims. (Cl. 210—112)

1. In a pressure filter, a housing adapted to be partially filled with a slurry with super atmospheric pressure thereon; a hollow longitudinally extending shaft mounted for rotation within said housing; a plurality of hollow spaced filter leaves located along said shaft within said housing and fixed to said shaft for rotation therewith; communicating passage means between the interior of said leaves and the interior of said shaft; tubular means extending along the bottom of said housing, said tubular means being closed at one end and open at the other end, which open end extends through an end wall of said housing; chute means extending upwardly from said tubular means between adjacent filter leaves and to an elevation above that of the normal level of the slurry within said housing; scraper blade means adjacent each face of each filter leaf, above the level of slurry within said housing for scraping filter cake from said leaves and feeding it into said chute means; said scraper blade means being hingedly connected for movement relative to said filter leaves and said chutes, and means mounted for reciprocable movement in said housing, and means interconnecting said last mentioned

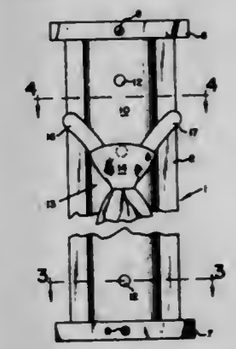
means with said scraper blade means to simultaneously move said scraper blade means into scraping relationship with both faces of at least one of said leaves; and valve means for closing the open end of said tubular means, said valve means including means for balancing it relative to the pressure within said housing.

3,270,886
APPARATUS FOR SEPARATING FINELY DIVIDED SOLID MATERIALS FROM LIQUIDS
Willard A. Sackett, Woodland, Calif., assignor to Spreckels Sugar Company, San Francisco, Calif., a corporation of California
Filed Apr. 25, 1963, Ser. No. 275,588
9 Claims. (Cl. 210—189)



9. In an elongated column wherein a finely divided treating material is continuously circulated in contact with a liquid undergoing treatment, means to continuously supply finely divided treating material to said column, means to continuously supply liquid to be treated to said column, and means to continuously separate the finely divided treating material from the treated liquid at a predetermined controlled rate, said last named means comprising first rotary means having a discharge aperture therein, means to rotate said first rotary means so that said discharge aperture moves relatively rapidly across substantially the entire cross section of said elongated column, second rotary means having a metering aperture therein, separate means to rotate said second rotary means, said first and second rotary means being mounted at one end of said column for rotation in close proximity to one another about an axis coincident with the axis of said column, said rotary means serving to discharge spent finely divided treating material from said column, and means to control the relative rates of rotation of said first and second rotary means to achieve a relatively rapid movement of said discharge aperture adjacent said finely divided solid materials and a controlled metering of said finely divided solid materials through said discharge and metering apertures.

3,270,887
FILTER PRESSES FOR SEPARATING SOLIDS FROM LIQUIDS
Adam Juhasz, Almasfuzito, and Janos Konkoly, Mosonmagyarovar, Hungary, assignors to Almasfuzitoi Timfoldgyar, Almasfuzito, Hungary
Continuation of application Ser. No. 161,340, Dec. 19, 1961. This application Sept. 15, 1965, Ser. No. 490,771
6 Claims. (Cl. 210—225)

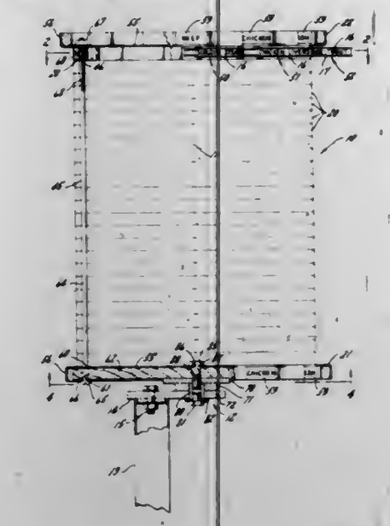


4. A filter press comprising a plurality of filter plates, filter cloths on both sides of said filter plates, filter frames disposed in alternation between said filter plates, means to support said filter plates and filter frames in contiguous relation, means defining expansible chambers carried by the filter frames, each expansible chamber having a pair of elastic side walls each of which confronts the filter cloth on an immediately adjacent filter plate and defines with that filter cloth a filter chamber, means spacing said side walls apart so as to enable them to stretch towards each other under the action of exterior pressure, means for admitting a slurry into said filter chambers through said filter frames, means for abducting a filtrate from beneath said filter cloths through said filter plates, and means for admitting and withdrawing a fluid pressure medium into and from said expansible chambers.

3,270,888
ROTARY LEAF FILTER
Kenneth A. Anderson, Silvis, Ill., assignor to Ametek, Inc., New York, N.Y., a corporation of Delaware
Filed Aug. 22, 1963, Ser. No. 303,895
5 Claims. (Cl. 210—327)

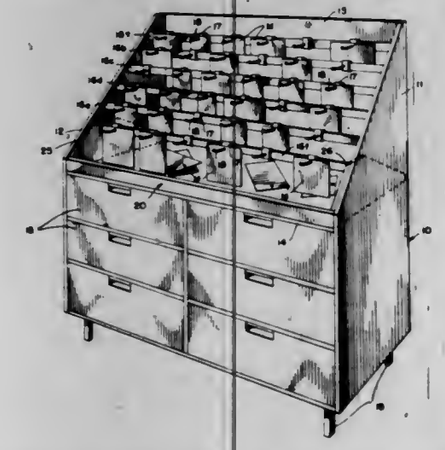
1. In a pressure filter, a housing adapted to be partially filled with a slurry with super atmospheric pressure thereon; a hollow longitudinally extending shaft mounted for rotation within said housing; a plurality of hollow spaced filter leaves located along said shaft within said housing and fixed to said shaft for rotation therewith; communicating passage means between the interior of said leaves and the interior of said shaft; tubular means extending along the bottom of said housing, said tubular means being closed at one end and extending through one end wall of said housing; chute means extending upwardly from said tubular means between adjacent filter leaves and to an elevation above that of the normal level of the slurry within said housing; scraper blade means adjacent each face of each filter leaf, above the level of slurry within said housing for scraping filter cake from said leaves and feeding it into said chute means; said scraper means being hingedly mounted for movement relative to said filter leaves and said chutes, and unitary means mounted for reciprocable movement in said housing, means interconnecting said last mentioned means with each of said scraper means so that the latter are movable into and out of scraping relationship with said leaves, said tubular means having means conveying the cake removed from said leaves to the exterior of said housing.

3,270,889
NECKTIE SUPPORTING RACK
Tassie P. Pochopien, 1454 Sheffield, Saginaw, Mich.
Filed Oct. 29, 1964, Ser. No. 407,290
3 Claims. (Cl. 211—13)



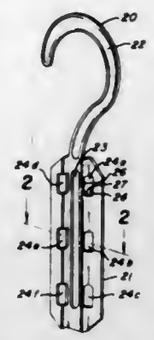
2. A rack for supporting a plurality of neckties each having a knot from which a pair of arms diverge laterally and rearwardly, each of said neckties having a projection located between said arms and extending rearwardly from said knot, said rack comprising an elongated body member having opposite side edges; an elongated support member mounted on said body and having its side edges located inwardly of the side edges of said body member, said support member being formed on the arc of a circle from one of its side edges to the other to provide a space between said body member and said support member, the arc of said support member being such that said support member is substantially tangential to a knot and to the diverging arms; a plurality of longitudinally spaced openings in said support member in communication with said space for reception of said projection; and means attached to said body member for supporting the latter in a substantially vertical position.

3,270,890
RACK
Edward C. Karp, Belvidere, Ill., assignor to Sanitary Scale Company, Belvidere, Ill., a corporation of Illinois
Filed Aug. 25, 1964, Ser. No. 391,991
10 Claims. (Cl. 211—58)



2. A storage rack for commodity information slugs or the like, comprising: a generally cylindrical body mounted for rotation about a substantially vertical axis, said body including a series of generally cylindrical modules superimposed one upon the other, each of said modules having a plurality of grooves extending into its periphery for receiving the commodity information slugs,

each of said grooves extending into a corresponding module substantially tangentially of a circle inscribed in the

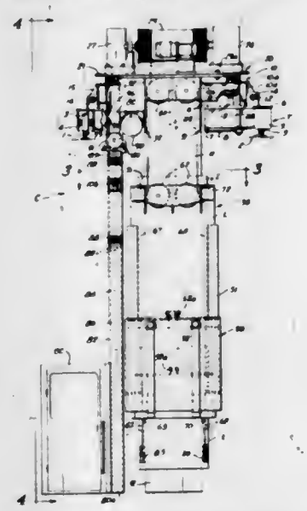


module about said axis, whereby rotation of said body about said axis tends to positively retain the slugs adapted to be seated in said grooves.

3,270,891
DISPLAY RACK WITH RECOVERY MEANS
George E. Briggs, Rockford, Ill., assignor to The Boye Needle Company, Chicago, Ill., a corporation of Illinois
Filed Apr. 15, 1964, Ser. No. 359,849
1 Claim. (Cl. 211—59)

In a stepped display rack for packaged merchandise, a horizontally-extending base providing an open front for said rack, side panels extending upwardly above said base to enclose the ends of said rack, a plurality of horizontal bars for displaying said packaged merchandise, most of said bars extending between said panels and being carried thereby and being arranged in upwardly stepped, offset relation from the front to the rear of said rack, hanger means spaced along said bars for removably supporting a multiplicity of packaged merchandise, said hanger means including forwardly-extending pins having free forward ends for slidable insertion and removal of said packaged merchandise, whereby said merchandise is subject to accidental dislodgement from said hanger means, merchandise retrieval tray means carried by said base and extending beneath said merchandise displaying bars, the portions of said tray means in vertical alignment with each of said bars and the hanger means thereon being in open, unobstructed communication therewith, and means for slidably mounting said tray means so that said tray means is slidable outwardly from the front of said rack, whereby packaged merchandise accidentally dislodged from said hanger means can be recovered by sliding out said tray and thereby avoiding the chance of dislodging additional merchandise.

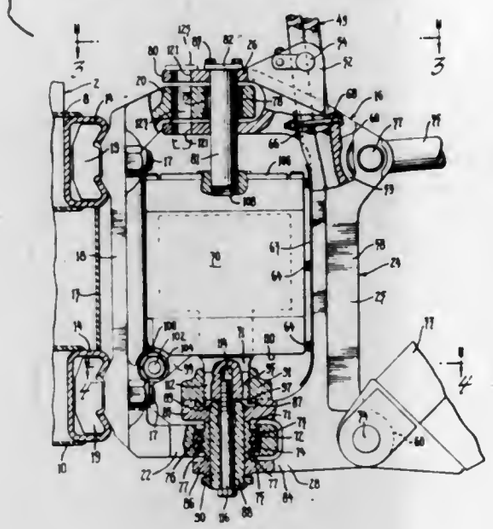
3,270,892
HANGER
Ralph E. Dennis, 2693 Fairfax Drive, Columbus, Ohio, and Ronald A. Bolin, 2087 Inchcliff Road, Columbus, Ohio
Filed Nov. 16, 1964, Ser. No. 411,387
10 Claims. (Cl. 211—113)



3. A coat hanger adapter for permitting of the hanging of a plurality of coat hangers on a horizontally extending rod wherein said hangers hang in substantially the same vertical plane, which hangers can be turned through an angle of 90° between a first vertical plane which includes said rod and a second vertical plane perpendicular to said first plane without changing the position of said adapter, said adapter comprising:

(a) a means for engaging a rod;

(b) a vertically corrugated sheet attached to and extending vertically downward from said hook;

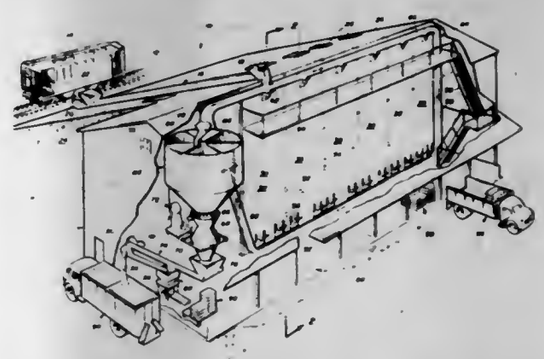


(c) at least one set of spaced, vertically arrayed openings in said sheet wherein each opening, if geometrically projected to the said planes perpendicular to each other, will effect, in each such perpendicular plane, a projected opening which is sufficiently wide to accommodate a coat hanger hook.

3,270,893
STACKER CRANE WEIGHING MECHANISM
Max J. Dechantsreiter, Milwaukee, Wis., assignor to Harnischfeger Corporation, West Milwaukee, Wis., a corporation of Wisconsin
Original application Dec. 24, 1964, Ser. No. 420,908. Divided and this application Nov. 10, 1965, Ser. No. 507,207
3 Claims. (Cl. 212—2)

1. An overhead travelling crane having a trolley frame adapted to be driven along rails in either direction, a plurality of load weighing cells on said trolley frame, a large support ring mounted on said cells, a turntable rotatably mounted on said ring on an anti-friction bearing ring assembly, a downwardly extending mast assembly secured to said turntable for rotation therewith, means to prevent horizontal movement of the support ring relative to the trolley frame to thereby prevent side loading of the load cells, and means to prevent upward movement of said support ring relative to said trolley frame beyond predetermined limits.

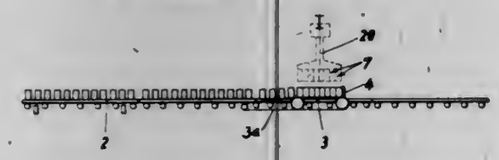
3,270,894
MATERIAL HANDLING APPARATUS
Brantford G. Elliott, Northville, and Max R. Saunders, Livonia, Mich., assignors to Massey-Ferguson Inc., Detroit, Mich.
Filed Apr. 5, 1965, Ser. No. 445,366
15 Claims. (Cl. 212—66)



1. Material handling apparatus comprising: a support bracket having a pair of upper and lower, vertically spaced, parallel arms; a mast frame having a pair of upper and lower, vertically spaced, parallel arms each of which has vertically spaced inner and outer portions at the ends thereof; means pivotally connecting the upper and lower mast frame arms with the upper and lower support bracket arms, respectively, with the upper support bracket arm received beneath the outer portion and above the inner portion of its associated mast frame arm, and the lower support bracket arm received beneath the inner portion and above the outer portion of its associated mast frame arm; a rotary motor having a housing and a rotatable shaft projecting therefrom, means detachably connecting the motor housing to the support bracket between the inner portions of the mast frame arms such that the motor shaft is movable into coaxial relationship with the pivotal axis between the mast frame and support bracket; and coupling means detachably mounted on the inner portion of one of the mast frame arms having an opening coaxial with the pivotal axis between the mast frame and support bracket for receiving the motor shaft; the motor shaft and the opening in said coupling means being secured against rotation relative to each other when the shaft is received in the opening to couple the motor shaft to the mast frame independently of the pivotal connection between the mast frame and support bracket to cause the mast frame to pivot relative to the support bracket when the shaft is caused to rotate by said motor, whereby said motor is selectively removable from the support bracket and detachable from the mast frame independently of the connection between the mast frame arms and support bracket arms.

3,270,895
AERIAL LOGGING SYSTEM
Faye H. Stewart, 2765 Fairmont Blvd., Eugene, Oreg.
Filed Apr. 22, 1965, Ser. No. 450,081
9 Claims. (Cl. 212—71)

1. A load transporting system comprising in combination; a lighter-than-air vehicle including an areodynamic lifting surface, a loading device interconnected to said vehicle for applying a load thereto, means for controlling the relative distances between opposite ends of said vehicle and a horizontal plane passing through said loading device for controlling the attitude of said vehicle, and means to move said loading device in a direction to selectively apply the aerodynamic lifting force of said surface to said loading device.



3,270,896
BULK BLENDING PLANT
Walter J. Sackett, Sr., 3700 Echodale Ave. Baltimore, Md. 21206
Filed Sept. 3, 1964, Ser. No. 394,155
15 Claims. (Cl. 214—2)

1. A bulk blending plant, comprising, a prismatic base structure having two of its sides defining a rear materials elevating slope and a forward materials discharging slope, a wall structure extending upwardly from the lowermost edge of said forward materials discharging slope to define a materials storage chamber with said forward materials discharging slope, means for dividing said materials storage chamber into a plurality of materials receiving storage bins, with said wall structure having receiving and discharging apertures provided therein for each said storage bin at its uppermost and lowermost portions, respectively, first means for elevating materials for storage in said storage bins, second means for receiving said elevated materials from said elevating means and for distributing selectively said elevated materials through said receiving apertures to said plurality of storage bins and for selectively receiving said plurality of stored materials discharged through said discharging

apertures in said wall structure, with said second means distributing, receiving, and elevating said materials simultaneously, means including an elevated compartmentized hopper for receiving said discharged selected materials from said second means to be blended together, means for selectively weighing selected compartmentized materials, and means for discharging and blending said weighed materials for further ultimate use.

3,270,897
APPARATUS FOR STACKING BRICKS
Hans Lingl, Fenningerstrasse 70, Neu-Ulm (Danube), Germany
Filed Apr. 26, 1962, Ser. No. 190,307
Claims priority, application Germany, Aug. 5, 1961, L 39,719
13 Claims. (Cl. 214—6)

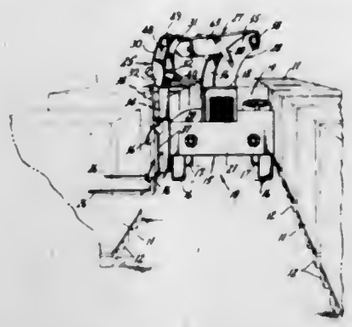
8. Apparatus for automatically stacking bricks comprising in combination a support on which a plurality of bricks are arranged in rows with adjacent rows in engagement with each other laterally, a gripper assembly for lifting the rows of bricks in unison and for depositing them at a stacking station, said gripper assembly comprising a plurality of individual gripper members each including means for grasping a row of bricks by applying pressure to its outer ends to thereby press inwardly longitudinally thereof while being supported in a lateral direction by an adjacent row of bricks in order to prevent lateral buckling of said rows, and spreader means for separating said individual gripper members in said lateral direction after said rows have been lifted from said support, thereby moving the individual rows of bricks apart while suspended and before they are deposited at said stacking station.

3,270,898
VEHICLE PARKING SYSTEM
Heinrich Kuipers, Humboldtstrasse 74a, Dusseldorf, Germany
Filed July 30, 1964, Ser. No. 386,200
Claims priority, application Germany, July 31, 1963, K 50,393
18 Claims. (Cl. 214—16.1)

1. A system for parking a self-propelled vehicle in an elevated position above a base surface, said vehicle being of a type having wheels mounted on two or more axles, with the wheels on at least one axle being drive wheels, which comprises:

(a) A frame having a pair of parallel guide rail sections;

(b) Means for fixedly supporting said frame in an elevated position above the base surface;



(c) A pair of parallel guide rails extending from the base surface up to said frame guide rail sections, and disposed so as to mate therewith;

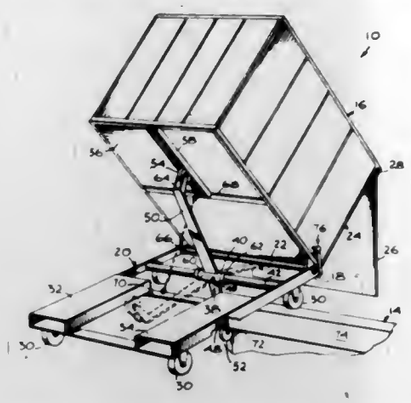
(d) Means for supporting said guide rails so as to maintain their aforesaid mating relationship with the frame rail sections;

(e) Pairs of rolls for supporting the vehicle wheels, the number of said roll pairs corresponding to the number of axles on the vehicle, the rolls in each pair being disposed so as to contact the wheels on their corresponding axles and rotate in respense to the rotation of said wheels, said roll pairs being disposed between said guide rails and supported thereby at their extremities so as to be capable of motion along the guide rails; and,

(f) Means associated with the roll pair supporting the vehicle drive wheels for driving said roll pair in the guide rails in response to the rotation of said drive wheels, whereby the vehicle, supported by the roll pairs, can be driven up on the guide rails and onto the rail sections of the elevated frame under its own power.

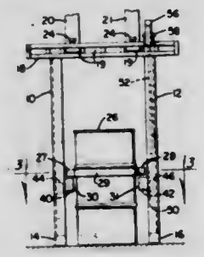
3,270,899
LOAD HANDLING VEHICLE
Edwin C. Brown, Aurora, and Granville Woolman, Naperville, Ill., assignors to Baldwin-Lima-Hamilton Corporation, a corporation of Pennsylvania
Filed Apr. 17, 1964, Ser. No. 360,501
7 Claims. (Cl. 214—75)

1. A load handling vehicle comprising, in combination, a self-propelled chassis, a load carrying platform fixed on said chassis at one end thereof, a turntable mounted at the approximate center of said chassis for rotation about a vertical axis, an extensible boom mounted on said turntable for up and down swinging movement, and a fork assembly having tines and being mounted at the end of said boom for rotation about a generally vertical axis, said boom and turntable being proportioned to permit said fork assembly to be both positioned solidly against one end of said chassis with the tines extending therefrom as well as reversed so that the tines extend toward the turntable and overlie said platform, whereby a load can be handled as with a conventional fork lift truck and can also be lifted onto and off of said platform.



3,270,900
AUTOMATIC BIN DUMPING APPARATUS
Arthur Sherman, Los Angeles, Calif., assignor of one-third each to Robert Gentile, Sylmar, Calif., and Leslie Kazarian, Torrance, Calif.
Filed Dec. 31, 1964, Ser. No. 422,627
11 Claims. (Cl. 214—302)

1. Bin apparatus adapted for automatic dumping of its contents into receiving means associated with obstruction means comprising:

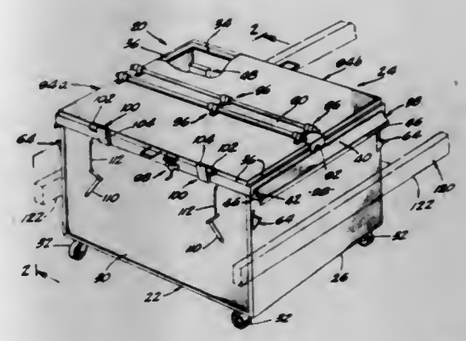


frame means adapted to be lifted and transported by fork-lift truck means or the like;

container means normally resting upon said frame means and pivotally secured to said frame means along a forward pivotal axis edge thereof, said container means having an openable front side; and

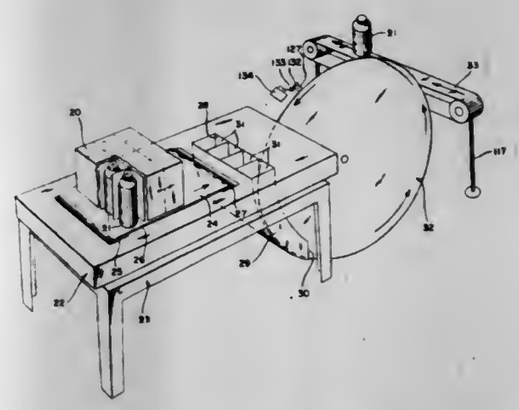
lever means pivotally mounted on said frame means and having a fulcrum axis parallel to and rearward of such forward pivotal axis, said lever means comprising a forward lever arm portion and a rearward lever arm portion extending in opposite directions from such fulcrum axis, said forward lever arm portion having a free end extending beyond said forward edge of said frame means and adapted to engage such obstruction means for travel limitation thereby, said rearward lever arm portion having a free end adapted for upward force transmission engagement with said container means at least initially rearwardly of said fulcrum axis.

3,270,901
TRANSPORTING AND DUMPING DEVICE
Thomas E. Ord, Aurora, Colo. (4210 Cook St., Denver, Colo.)
Filed Feb. 17, 1964, Ser. No. 345,460
19 Claims. (Cl. 214—314)



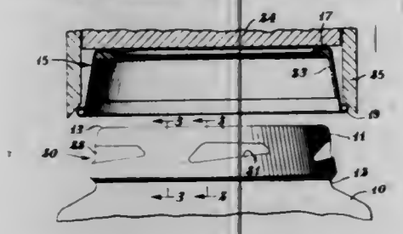
1. Apparatus for transporting and dumping containers comprising: a lifting frame including two spaced apart support members stationary with respect to each other; a sleeve bearing mounted adjacent each of said support members having an opening at its top; a rotatable split shaft in each of said sleeve bearings; and interengaging means supported adjacent at least one of said support members for engaging the end of a shaft for rotating it in its corresponding sleeve bearing.

3,270,902
TRASH BIN WITH FORK ARM LATCHING DOGS
Ernest R. Breault, 26009 E. 6th St., San Bernardino, Calif.
Filed July 6, 1965, Ser. No. 469,817
13 Claims. (Cl. 214—302)



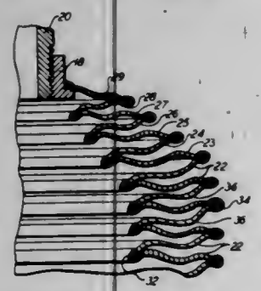
1. A trash bin for use with a service vehicle of the type having a trash receiver and a fork lift device with spaced fork arms for elevating said bin from its normal upright position of use to an inverted position of elevation over said trash receiver to empty trash from said bin into said receiver, said trash bin comprising:

a lower rectangular container adapted to be straddled endwise by said fork arms and including a bottom wall bounded by upstanding side and end walls, upper thrust shoulders at the ends, respectively, of said container having downwardly presented shoulder surfaces disposed for supporting engagement with said fork lift arms when said trash bin occupies its normal upright position, lower thrust shoulders at the ends, respectively, of said container below said upper thrust shoulders and having upwardly presented shoulder surfaces, means supporting said lower thrust shoulders on said container for movement in generally endwise directions of said container between inner retracted positions wherein



said lower shoulders are disposed to clear said fork arms for upward and movement of said arms across the ends of said container into supporting engagement with said upper shoulders, and outer extended positions wherein said lower shoulders are disposed for supporting engagement with said fork arms when said bin occupies said inverted position, means for normally retaining said lower thrust shoulders in their extended positions, and means for effecting retraction of said lower thrust shoulders to their retracted positions.

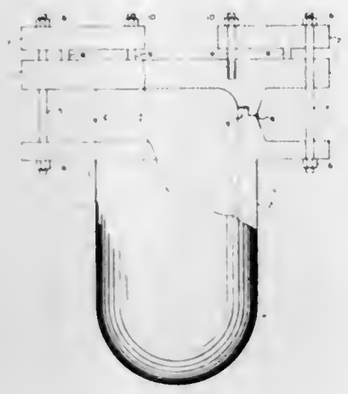
3,270,903
LIGHTWEIGHT CONTAINER HANDLING
George Willms, Kansas City, Mo., assignor to Colgate-Palmolive Company, New York, N.Y., a corporation of Delaware
Filed Aug. 29, 1963, Ser. No. 305,340
17 Claims. (Cl. 214—308)



1. Apparatus for handling lightweight empty containers comprising a platform along which an open bottom carton of said containers is adapted to be moved toward an aperture, a magazine opening into said platform aperture for receiving a plurality of said containers from the carton, means for periodically delivering a plurality of said containers as a group from out of the magazine to a first conveyor means, and means for sequentially transferring said group of containers in order to a second conveyor means.

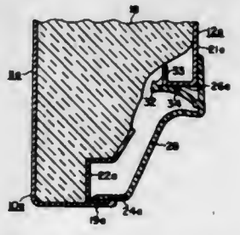
3,270,904
PRESS-ON TURN-OFF CAP
Charles N. Foster, Oak Park, Robert K. McElroy, Hinsdale, and John J. Curry, Chicago, Ill., assignors to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed May 21, 1964, Ser. No. 369,092
20 Claims. (Cl. 215—43)

1. The method of capping and sealing a container with a cap, each of said cap and container having means thereon to cam said cap upwardly upon rotation thereof during removal from said container, comprising the steps of providing a cap having a depending flange portion around the marginal edges thereof, depositing a plastic-like material at least around said marginal edges of said cap interiorly thereof, pressing said cap onto said container with a generally vertical motion, and causing said plastic-like material to flow and set thereby forming a cam means for co-operating with cam means on said container to assist in camming said cap upwardly on relative rotation between said cap and container.



3,270,905
PRESSURE CONTAINER
Rolf Heinz Werner Kroekel, West Greenwich, R.I., assignor to Sealol, Inc., Warwick, R.I., a corporation of Delaware
Filed Dec. 12, 1962, Ser. No. 244,038
3 Claims. (Cl. 220—3)

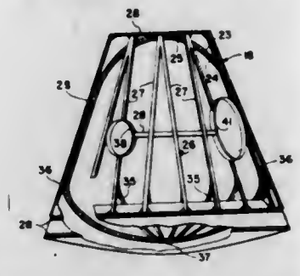
1. A substantially inextensible sheet metal pressure container of tubular cross section having a plaited outer-surface configuration with a plurality of peripherally extending creases alternately pointing inward and outward with radially extending outwardly bowed surface therebetween, said container being welded along each of said creases to secure together the edges of adjacent surfaces at said creases thereby establishing pressure resistant seams, said seams having a stress in tension in a direction generally parallel to the longitudinal axis of the sheet metal pressure container substantially beyond its yield point but less than its breaking point by subjecting the sheet metal pressure container to a pressure higher than its operating pressure.



3,270,906
CLOSURE FOR PRESSURE VESSELS
Axel Christensen, Stamford, Conn., assignor to Chemical Construction Corporation, New York, N.Y., a corporation of Delaware
Filed Sept. 25, 1963, Ser. No. 311,518
4 Claims. (Cl. 220—3)

1. A pressure vessel with improved closure assembly comprising a vessel body, a cover extending over an opening in said body, a plurality of external closure bolts having terminal nuts and extending between said body and said cover, a plurality of levers, each of said closure bolts being attached to one of said levers, said levers pivoting on said cover and extending between said closure bolts and a plurality of tension bolts attached to said cover, each of said tension bolts being attached to one

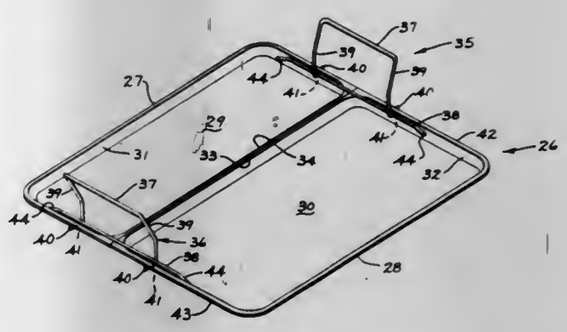
of said levers by means cooperating with said levers, whereby said tension bolts are put under tension and whereby said tension bolts exert tension on said closure bolts through said levers, and an outer sealing weld at the interface between said body and said cover, said closure bolts being under tension whereby said weld is continuously maintained under compression when said vessel body is subjected to elevated internal pressure.



3,270,907
CABINET STRUCTURE
Anthony J. Swaneck, Jr., Columbus, Ohio, assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Jan. 9, 1964, Ser. No. 336,814
3 Claims. (Cl. 220—9)

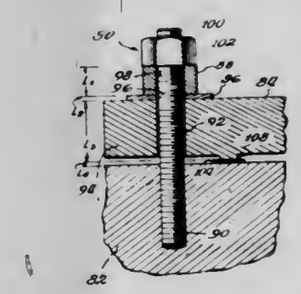
3. A refrigerator cabinet comprising:
an outer shell,
an inner shell nested in said outer shell in spaced relation thereto and having a front access opening thereto providing a storage compartment.
said outer shell having a front edge portion extending inwardly toward said inner shell, and
said inner shell having a front edge portion disposed inwardly and rearwardly of said outer shell edge portion providing a gap therebetween,
a resilient flexible breaker strip disposed across said gap and having one edge provided with an adjacent front facing surface in contact with said outer shell front edge portion to limit forward movement of said breaker strip,
said outer shell front edge portion having a rearwardly extending flange disposed adjacent said breaker strip one edge to limit outward movement of said breaker strip,
said breaker strip further having a substantially V-shaped portion disposed at the opposite edge thereof and
a rearwardly arched portion connecting said one edge of said breaker strip to said V-shaped portion,

said V-shaped portion opening rearwardly and comprising;
a rearwardly protruding leg member disposed adjacent and substantially parallel to, an inner surface of said inner shell edge portion, and
a rearwardly outwardly extending tab member having an inwardly arched portion, and
said inner shell edge portion having an outwardly extending flange provided thereon,
said flange being disposed across said rear opening of said V-shaped member to contact said flexible tab member,
said V-shaped member being so disposed in relation to said inner shell edge portion that contact of said outwardly extending flange with said arched portion of said tab member provides a clamping force between said leg member and said inner shell edge portion.



3,270,908
SPACE CAPSULE
Maxime A. Faget and Andre J. Meyer, Jr., Newport News, Robert G. Chilton, Seaford, Willard S. Blanchard, Jr., and Alan B. Kehlet, Hampton, and Jerome B. Hammack and Caldwell C. Johnson, Jr., Newport News, Va., assignors to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Original application Oct. 16, 1959, Ser. No. 847,023, now Patent No. 3,093,346, dated June 11, 1963. Divided and this application Dec. 13, 1962, Ser. No. 250,974
3 Claims. (Cl. 220—15)

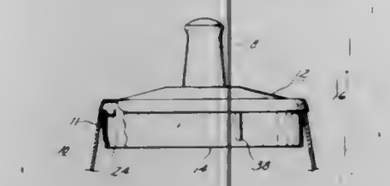
2. A capsule casing construction comprising an enclosure formed of two substantially parallel spaced thin metallic plates having a stiffening core material disposed therebetween, a framework composed of a plurality of rigidly interconnected vertical and horizontal beam members surrounding said enclosure, said vertical beam members being in supporting contacting relationship with portions of the outer one of said metallic plates, a continuous thin sheet of metallic material conformingly encircling said framework, said sheet being attached at spaced points to an intermediate one of said horizontal beam members along one entire horizontal plane thereof, clamps secured to said sheet for slidably connecting said sheet at selected points to said vertical beam members, and basket means for elastically supporting said enclosure within said framework, said basket means being formed of a plurality of metallic bands one end of each of which is commonly joined together exteriorly adjacent said enclosure and the other ends of which are rigidly secured to individual ones of said vertical beam members.



3,270,909
SECTIONAL FOOD TRAY
John D. Swartzbaugh and Blair E. Stentz, Murfreesboro, Tenn., assignors to United Service Equipment Co., Inc., Palmer, Mass., a corporation of Delaware
Filed Sept. 6, 1963, Ser. No. 307,099
6 Claims. (Cl. 220—23.4)

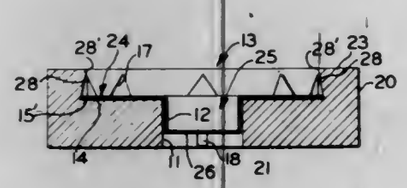
1. A food tray comprising, in combination, first and second rectangular tray sections, said first and second tray sections being movable between a separated position, and a connected position whereby said first and second tray sections are joined together along a parting line, each of said first and second sections having a flat bottom and a raised lip extending around the periphery of said bottom forming sides and ends thereon, an exterior surface on one side of first section which is complementary with a similar exterior surface on one side of said second tray section and a connecting means for securing said first and second tray sections in side-by-side relationship with said complementary exterior surfaces in abutment along said parting line, said connecting

means consisting of a pair of handles, each of said handles including spaced apart, slideable attachment members, and guide means in each of said tray sections for receiving said attachment members on each side of said parting line, said guide means extending normal to said ends of said tray sections whereby, when said tray sections are joined along said parting line, said attachment members may be slideably received by or removed from said guide means by movement normal to said ends of said tray portions.



3,270,910
JOINT STRUCTURE
Dudley Lusk, Westmont, Ill., assignor to Chicago Bridge & Iron Company, a corporation of Illinois
Filed June 28, 1963, Ser. No. 291,454
4 Claims. (Cl. 220—55)

3. In combination with a flanged fitting mounted on a cryogenic vessel and subject to cryogenic temperatures, and a flanged member adjoining said fitting, a joint structure for joining said fitting to said member including at least one of the respective flanges thereof and having component parts subject to different degrees of thermal expansion under conditions of temperature change from ambient to cryogenic temperatures and compensated for differential changes in dimension caused by said conditions, and further comprising bolt means for bolting said flanges together and having a coefficient of expansion different from the coefficient of said one flange under said conditions, and compensating washer means having a further different coefficient of expansion under said conditions and interposed between said one flange and said bolt means, said washer means being dimensioned to

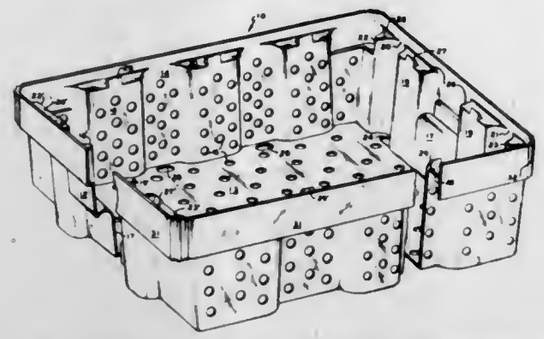


achieve a predetermined relationship by thermally induced changes between dimensions at ambient temperature and dimensions at a service temperature of the bolt means and the parts bolted together thereby.

3,270,911
COFFEE MAKER LID RETAINING MEANS
Kenneth L. Sacks, Allentown, Pa., assignor to General Electric Company, a corporation of New York
Filed Aug. 3, 1964, Ser. No. 387,046
7 Claims. (Cl. 220—55)

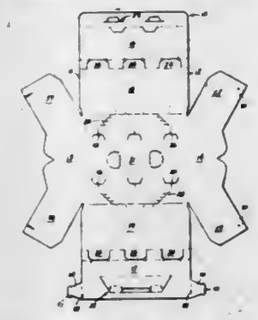
1. In a container having an open top and a lid with an annular skirt adapted to fit within the top, an improved means for retaining the lid in the top comprising a pair of closely spaced slots formed in said skirt, a flat, flexible irregularly shaped spring clip having end portions which extend through said slots into the interior of said skirt and having a middle portion which extends outwardly away from said skirt, said clip being formed such that when assembled to the lid the end portions are self-urged to engage the interior of said skirt and the middle portion of the clip is self-urged outwardly whereby the outermost surface of the middle portion is adapted to forcefully engage the inner surface of the container defining the open top.

3,270,912
ASH TRAY
Irwin H. Winkelried, 45 Van Ness Court, Maplewood, N.J.
Filed Oct. 8, 1964, Ser. No. 402,547
6 Claims. (Cl. 220—63)



1. An ash tray, comprising,
a body having a top, bottom, and sides,
a cavity having a bottom and walls, and disposed within the top of said body,
a hole disposed in said body, within said cavity and centrally positioned with respect to said cavity and penetrating the bottom of said body,
a liner designed to hold the contents of said tray, and having a collapsible outer portion disposable on said cavity bottom and fitting snugly within said cavity walls, and having inner edges abutting said hole,
a cup portion made of sheet material and having a bottom and sides and fitting snugly into said hole and attached at its upper side edges in sealing relation to said hole-abutting edges of said outer portion, and
a tab disposed on the bottom of said cup portion in a manner such that, when said tab is pulled, said cup is withdrawn through said bottom hole and said outer portion is collapsed to enclose the contents of said tray.

ERRATUM



For Class 220—64 see:
Patent No. 3,271,653

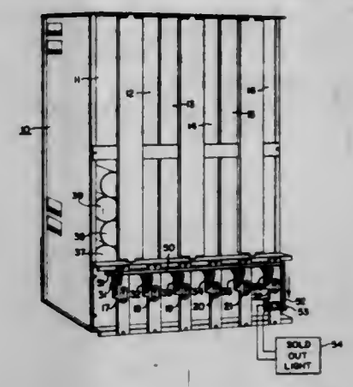
3,270,913
NESTABLE AND STACKABLE CONTAINER
Orville J. Bridenstine, Caney, Kans., and William A. Keene, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
Filed Oct. 5, 1964, Ser. No. 401,390
12 Claims. (Cl. 220—97)

1. A container adapted to be nested and stacked vertically with a container of identical shape, comprising: a pair of opposed first walls sloping inwardly toward each other from top to bottom; a pair of opposed transverse second walls sloping inwardly toward each other from top to bottom; a bottom wall connected to the lower edges of said first walls and said second walls to provide an open top structure; an inwardly and horizontally extending handle protuberance disposed in each wall of at least one said pair of opposed walls and opposite each other, each said protuberance terminating in an upper outwardly extending surface at a level intermediate the top and bottom of the wall in which it is disposed; and a pair of horizontally spaced apart substantially vertical and inwardly extending flutes disposed in each of said walls having a handle protuberance disposed therein, with one flute at each opposite end of said handle protuberance therein, the lower portion of each said flute being formed integral with the adjacent end of said handle protuberance therein, and each flute of one of said pair of flutes being wider horizontally than each flute of the other said pair of flutes.

3,270,914
WRAP-AROUND CARTON BLANK WITH END PANEL LOCK
Earl J. Graser, Monroe, La., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Filed July 17, 1964, Ser. No. 383,373
2 Claims. (Cl. 220—112)

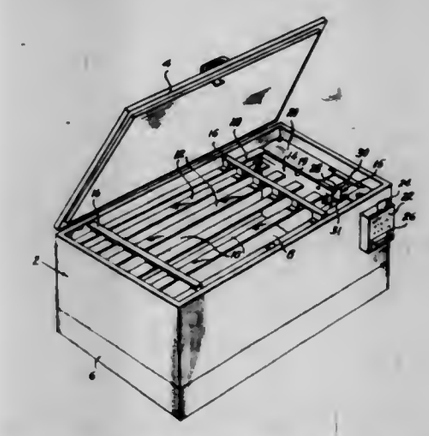
1. In a wrap-around carton of the type having a bottom wall defined by inner and outer overlapping bottom panels and two end walls each comprising a set of two end walls flaps disposed generally perpendicular to said bottom wall, the improvement comprising the opposite end portions of said bottom wall each having a single locking tongue hingedly connected thereto intermediate

the length thereof, a slot in each set of end wall flaps, each said slot extending inwardly from the inner edge portion of each said end wall flap, each of said tongues having oppositely disposed shoulder portions, one of said shoulder portions of each of said tongue operative to be inserted in said slot of one end wall flap of one set and the other shoulder portion of said tongue operative to be inserted in the slot of the other end wall flap of said set.



3,270,915
DISPENSING MEANS FOR PHARMACEUTICAL TABLETS
Jay Ronald Auer, Glenview, Ill., assignor to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware
Filed Feb. 3, 1965, Ser. No. 430,022
5 Claims. (Cl. 221—2)

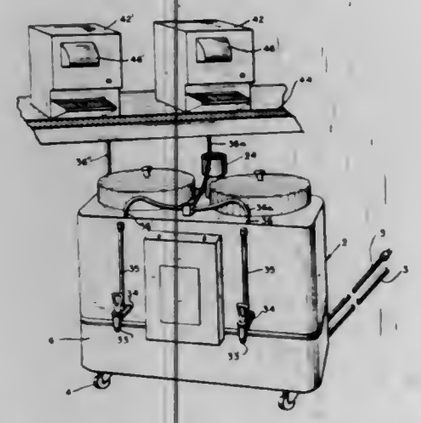
1. A device for the programmed dispensing of pharmaceutical tablets comprising, in combination,
(a) an elongate, transparent magazine having a chamber and an open end;
(b) a plurality of discrete series of indicia of periodicity on the magazine and characterized by uniformly-spaced intervals defining each of a series of indicated periods;
(c) external reference means selectively positionable about the magazine to enable reference selectively to be made and maintained in respect of one series of indicia;
(d) a base member mounted on the external reference means;
(e) a metering gate in the base member covering the open end of the magazine; and,
(f) a resiliently mounted piston within the chamber of the magazine exerting force toward the metering gate so that, when reference is made in respect of one series of indicia of periodicity and when a number of pharmaceutical tablets are within the chamber of the magazine intermediate the piston and the metering gate, the transport of one such tablet across the metering gate will cause the piston and the remaining tablets visibly to displace toward the metering gate.



3,270,916
VENDING MACHINE EMPTY SIGNAL INDICATING MECHANISM
Wallace R. Lyman, West Springfield, Mass., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Apr. 28, 1965, Ser. No. 451,576
4 Claims. (Cl. 221—6)

1. A vending machine comprising, a frame having a plurality of side by side column structures adapted to contain articles to be vended, each of said column structures having respective article sensing levers adapted to contact an article in the column and to be movable to assume a first position in response thereto and to assume a second position when no article is present in the respective column, a movable common signal member, means interconnecting each of said article sensing levers and said common signal member to move said common signal member to a first position when at least one of said article sensing levers is in its first position and to move said common signal member to a second position when

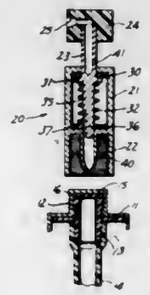
all of said article sensing levers are in their second positions, a respective individual column empty signal means responsive to a respective one of said article sensing levers to be operated when the respective lever is in a selected one of its said positions, and an all column empty signal means responsive to said common signal member to be operated when said common signal member is in a selected one of its said positions.



3,270,917
COIN CONTROLLED BOTTLE RELEASING MECHANISM
Norman L. Kesecker, Kearneysville, W. Va., assignor to Dixie-Narco, Inc., Ranson, W. Va.
Filed May 27, 1965, Ser. No. 459,251
4 Claims. (Cl. 221—133)

1. A bottle releasing mechanism for a dispensing cabinet, said mechanism comprising means defining a housing provided with a side wall, a top wall, a compartment in said housing, a side opening in said side wall for admitting an upright bottle to said compartment, and a top opening in said top wall for removal of a bottle from said compartment, a bottle restraining lip member partially closing said top opening and being movably mounted on said housing for movement away from said top opening; a movable latch holding said lip member in position to partially close said top opening when said latch is in latching position; a solenoid in said housing; and means operable by said solenoid when energized to release said latch to move to a release position, means biasing said latch to its release position; movable blocking means

engaging said latch to prevent movement thereof to its release position, said solenoid being connected to said blocking means whereby to withdraw said blocking means from said latch when said solenoid is energized.

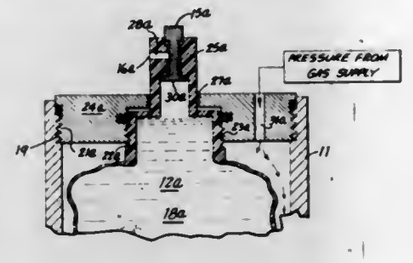


3,270,918
HOT BEVERAGE DISPENSER
Eugene E. Goodrich, Park Ridge, Ill., Paul J. Daniels, Sarasota, Fla., Glen A. Burch, Niles, Mich., and Michael R. Wilkinson, South Bend, Ind., assignors, by mesne assignments, to The Bastian Blessing Company, Chicago, Ill., a corporation of Illinois
Filed Dec. 26, 1963, Ser. No. 333,610
12 Claims. (Cl. 222—64)

1. In a fluid dispensing device the combination of a first container for a reserve supply of water, means for heating the water, a second container for a beverage disposed within said first container in heat exchange relationship with the water therein, means for transferring a predetermined amount of water to the second container from the first container including a liquid pump and vertically spaced water level responsive elements in the first container, circuit means connected to the upper element controlling the level of said water in the first container and the lower element stopping said pump, lift means for dispensing hot beverage from the second container above the level thereof including a flexible wall tube including means for progressively collapsing the tube successively along a portion of its length, and a liquid flow restricting means at the outlet of said tube.

3,270,919
AEROSOL DISPENSING APPARATUS
John Frangos, Brooklyn, N.Y., and Milton Schwarz, Westport, Conn., assignors to Revlon, Inc., New York, N.Y.
Filed Apr. 16, 1964, Ser. No. 360,225
1 Claim. (Cl. 222—82)

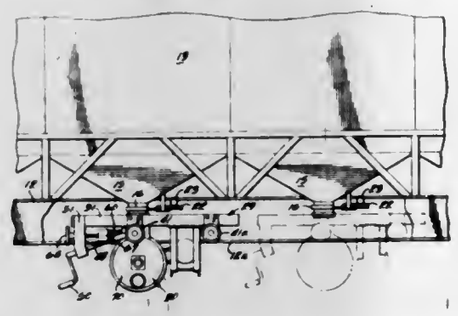
In metering valve apparatus of the character described for repeated application as a dispenser of a measured quantity of materials including a gaseous propellant from any one of a number of sealed containers having a threaded neck with a pierceable seal thereon, the combination which comprises a hollow axially extending valve body having top and bottom walls defining therebetween a volume measuring chamber the capacity of which determines said measured quantity of materials to be dispensed, a valve stem axially reciprocable in said valve body and extending axially through both said top and bottom walls, first sealing means disposed adjacent said top wall of said valve body and surrounding said valve stem in sealing engagement therewith, second sealing means adjacent said bottom wall of said valve body and surrounding said valve stem in sealing engagement therewith, means at the upper end of said valve stem and above said top wall of said valve body forming an ejection orifice, a radial port in said stem axially spaced below said ejection orifice, an axially extending internal passage in said valve stem interconnecting said radial port with said ejection orifice providing flow communication from said volume measuring chamber and said orifice through said port and axial passage when said valve stem is moved to a position where said port is below said first sealing means and within said volume measuring chamber, a reduced diameter portion at the lower end of said valve stem and extending through said second sealing means providing flow communication into said volume measuring chamber when said valve stem is in a position such that said reduced diameter portion is adjacent said second sealing means but preventing said flow into said chamber when said reduced diameter portion is wholly below said second sealing means, the axial spacing relationships of said radial port and said reduced diameter portion of said valve stem being correlated with the axial extent of said volume measuring chamber between said first and second sealing means such that said radial port is above said first sealing means whenever said reduced diameter portion permits flow through said second sealing means into said chamber and said reduced diameter portion is below said second sealing means preventing



flow into said chamber whenever said radial port is below said first sealing means permitting flow through said axial passage from said chamber, biasing means effective on said valve stem and within said chamber for urging said valve upwardly toward the position where said radial port is above said first sealing means, an abutment on said valve stem for engaging said top wall of said valve body for limiting said upward movement of said stem, a threaded skirt depending from said valve body for engaging said neck portion on said sealed containers, a generally cylindrical and pointed hollow nipple depending from said valve body and coaxially within said skirt and in flow communication with said chamber for piercing the sealed top of said containers as said skirt is threaded down on to said neck portion thereof, said hollow nipple being disposed to receive slidably said reduced diameter portion of said valve stem when said valve stem is depressed against the action of said biasing means and the hollow internal diameter of said nipple being larger than said reduced diameter portion of said valve stem permitting flow of material through said hollow nipple into said chamber.

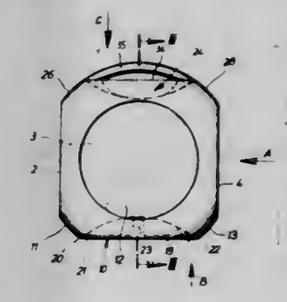
3,270,920
APPARATUS FOR PRESSURE DISPENSING LIQUIDS
Charles G. Nessler, Bokum Road, Chester, Conn.
Filed Dec. 3, 1964, Ser. No. 415,670
1 Claim. (Cl. 222—95)

An apparatus for dispensing liquids as spray, comprising in combination;



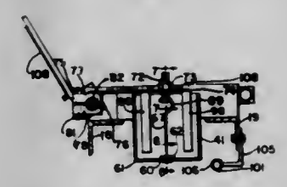
(a) a solid open-ended pressure vessel for holding a collapsible bladder therein;
(b) a collapsible bladder including a spout integral therewith which bladder in turn will contain a liquid therein which is to be dispensed as an aerosol spray from said spout, said spout having an external shoulder;

(c) a top to seal off said bladder within said vessel, said top including external coupling means for coupling to said vessel open-end, internal coupling means for coupling to said spout, an internal shoulder on said top to engage the external shoulder of said spout;
(d) an outlet section in said spout extending out through said top internal shoulder;
(e) an elongated narrow passage in said outlet section, the inner and outer terminals of said narrow passage acting as valve seats;
(f) a valve in said spout outlet section slidable along the main axis thereof normally sealed against said inner terminal by fluid pressure against said valve, a



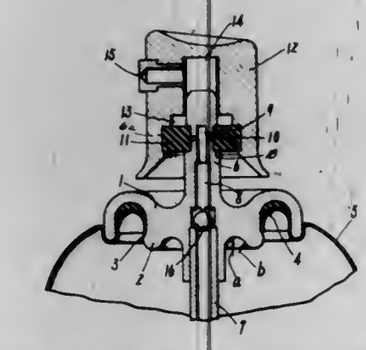
valve projection on said valve extending through said narrow passage, exterior valve depressing means integral with said valve projection which when depressed will move said valve longitudinally in said outlet section, said exterior depressing means moving only until it strikes the outer terminal of said narrow passage;
(g) a dispensing passage extending from said narrow passage to the exterior, at right angles to said narrow passage so that the depressing of said depressing means moves the valve and permits fluid from said bladder to enter said narrow passage and be sprayed under pressure from said dispensing passage.

3,270,921
UNLOADING SYSTEM FOR BULK MATERIAL BINS
William A. Nadolske and Kenneth E. Wilkin, Newark, Ohio, assignors to Styron-Beggs Research Corporation, Newark, Ohio, a corporation of Ohio
Filed Dec. 13, 1963, Ser. No. 330,299
5 Claims. (Cl. 222—132)



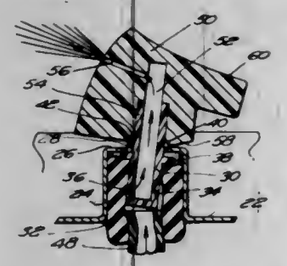
1. In combination with a supporting structure having a plurality of bulk material bins carried thereby with each having a downwardly extending outlet spout through which material will discharge therefrom, the discharge outlet spouts of the respective bins being disposed in spaced relationship along the supporting structure, an unloading unit mounted on said supporting structure for movement therealong into cooperative relationship with any of said outlet spouts, said unloading unit having an upwardly projecting inlet throat for connection to the cooperating downwardly extending outlet spout, and means on said unit for adjusting said throat on said unit into and out of connecting relationship, said means including guide wheels on said unit, guide rails with which said wheels cooperate for movably mounting the unit, and means for independently adjusting each wheel on said unit.

3,270,922
PORTABLE CONTAINER OF SYNTHETIC MATERIAL ADAPTED TO BE STACKED
Alfred Schmidt, Dusseldorf, Germany, assignor to –form– Gesellschaft für Formgebung m.b.H., Dusseldorf, Germany
Filed Nov. 8, 1963, Ser. No. 322,417
Claims priority, application Germany, Nov. 12, 1962, F 38,282
4 Claims. (Cl. 222—143)



2. A self supporting container of synthetic material having circular top and bottom end walls of substantially equal diameter and four similar vertical side walls of equal area spaced from said end walls, the margins of said end and side walls lying in planes forming the surface of a rectangular prism, said walls being within the surface of said prism with the top and bottom end walls having portions depressed inwardly of said surface, said margins being connected by a continuous curved wall within the surface of said prism, and an integral handle projecting above the margin of said top end wall, said bottom end wall being formed to receive and contact the handle of a similar container on which it is stacked with it bottom margin resting on the top margin of the lower container.

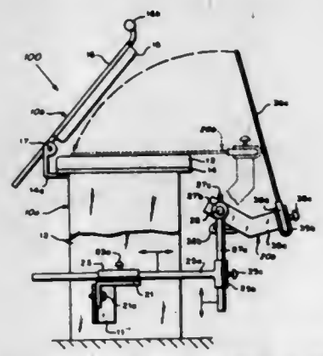
3,270,923
MACHINE FOR DISTRIBUTING PARTICULATE MATERIAL
George F. Rooney, Jr., % Winton Engineering, 2353 May St., Cincinnati, Ohio
Filed Mar. 19, 1965, Ser. No. 441,080
5 Claims. (Cl. 222—193)



3. A powder distributing device which comprises a frame, an open-topped box, means on the frame for supporting said box for vibratory movement, there being a plurality of powder-dispensing orifices in a bottom wall of said box, plate means mounted on the frame overlying the box, a plurality of valve needles pivotally mounted on said plate means and extending downwardly therefrom into the orifices, there being a valve needle for each orifice, and means for vibrating the box, the valve needles metering the flow of powder through the orifices as the box vibrates.

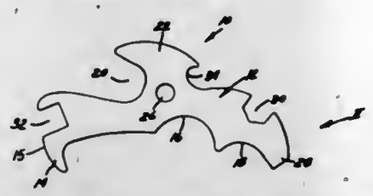
3,270,924
MOUNTING CAPS FOR AEROSOL DISPENSER
Seiichi Kitabayashi 2–2246 Nishisugamo, Toshima-ku, Tokyo, Japan
Filed Sept. 17, 1964, Ser. No. 397,333
Claims priority, application Japan, Sept. 19, 1963, 38/49,406
1 Claim. (Cl. 222—394)

A mounting cap for aerosol dispensers comprising a disc of a resilient synthetic resin having an annular wall member pendant from the bottom face of said disc and a tubular member extending from the center of the upper face of said disc, said annular wall member having an outer wall face capable of closely engaging the lower end of the mouth of the aerosol dispenser at an inner portion of said outer wall face, said tubular member being provided with a peripheral step, an axial bore closed at one end and opening at said disc bottom face and side orifices opening above said peripheral step and in said bore adjacent the closed end of said bore, a rubber ring having a pair of ends with one end mounted on said annular step normally closing said side orifices, a push button being mounted on said rubber ring other end and having an emission orifice, inner cavities communicating with said orifice and one of said inner cavities facing said rubber ring for receiving aerosol material from said side orifices when said push button is moved against said rubber ring and thereby opens said side orifices.



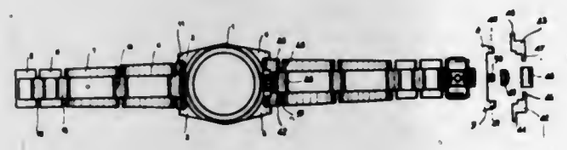
3,270,925
AEROSOL VALVE AND METHOD OF MANUFACTURE OF SAME
Charles J. Obst, West Barrington, R.I., assignor to Joseph J. Vastano, Warwick, R.I.
Filed Dec. 28, 1964, Ser. No. 421,289
6 Claims. (Cl. 222—394)

1. An aerosol valve for an open mouthed container comprising a lid adapted to sealingly engage the container at the open mouth thereof, said lid having an opening extending therethrough, a hollow valve tube extending through said opening, said tube being tiltable with respect to said lid, abutments on said tube on both sides of said lid for limiting movement of said tube in either direction with respect to said lid, an aperture in said valve tube beneath said lid, and a resilient body fixed to said lid and surrounding said valve tube, said resilient body sealing said lid opening to prevent passage therethrough outside of said tube and at the same time normally sealing said aperture in said valve tube, said resilient body being compressible upon tilting of said tube to unblock said aperture, whereupon pressurized contents of the container automatically pass out through said tube.



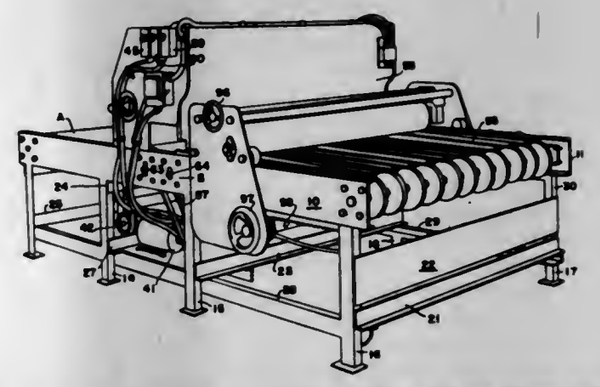
5. The method of making an aerosol valve comprising the following steps:
(1) forming a circular lid with an intermediate cylindrical cup portion;
(2) forming an opening in the top wall of said cup portion;
(3) dishing the edge of said opening so as to enlarge same;
(4) forming a rigid valve tube with a closed bottom except for a small aperture adjacent said bottom and with an open top;
(5) providing a pair of spaced circular flanges on the outside of said tube, the upper of which is just slightly smaller than the enlarged opening in the lid and the lower of which is larger than the said enlarged opening;
(6) passing the aforesaid tube upwardly through said enlarged lid opening until the lower flange engages the dished edge of the enlarged opening;
(7) straightening the dished edge of the opening in order to decrease the size of same and to capture the lid between the flanges of the valve tube; and
(8) forcing a cored rubber plug up into said cup portion so that the lower end of the valve tube is received in the core of the plug with its said aperture normally sealed by said plug.

3,270,926
GARMENT HOLDER FOR PRESSING MACHINE
Frank Machota, Philadelphia, Pa., assignor of one-half to Carmen Di Mascio, Philadelphia, Pa.
Filed Sept. 13, 1965, Ser. No. 486,666
4 Claims. (Cl. 223—70)



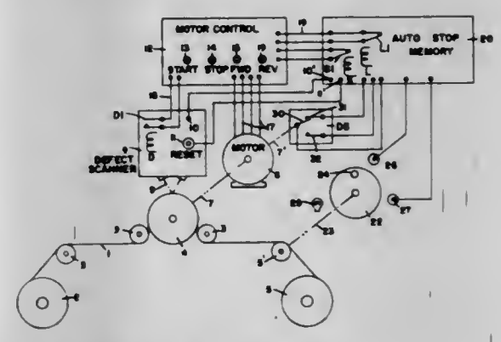
1. A pressing machine and garment holder, said pressing machine comprising a lower section, a fixed lower buck on said lower section, a tiltable upper section, an upper buck on said upper section, said upper section being hingedly connected to said lower section, said garment holder comprising (a) a horizontally sliding section mounted on said pressing machine lower section below said lower back, and (b) a pivoting section mounted on said horizontally sliding section and being pivotable in a vertical plane, said pivoting section including a garment frame, said garment frame including a planar, horizontally disposed shaped frame section adapted to receive a garment to be pressed and pivotable with said pivoting section from a horizontal position parallel to and in contact with said lower buck to a substantially upright position, said lower buck limiting the pivotable travel of said pivoting section in one direction, said horizontally sliding section including a stop, said stop being positioned to be contacted by said pivoting section when said pivoting section is so pivoted to position said shaped frame in said substantially upright position, said stop limiting the pivotable travel of said pivoting section in the other direction.

3,270,927
LACE PULLER
Mark K. Wallach, Grand Rapids, Mich., assignor to Wolverine Shoe & Tanning Corporation, Rockford, Mich., a corporation of Michigan
Filed July 6, 1965, Ser. No. 469,598
2 Claims. (Cl. 223—113)



1. A boot lace puller comprising: a generally flat, one piece, integral plate stamping having an elongated body portion with upper and lower edges; said body portion having a hooking, lace-engaging tang extending on one end thereof generally tranverse to the long dimension of said body, and generally toward said lower edge; an arcuate index-finger-receiving-cavity rearwardly of said tang along said upper edge of said body; a palm engaging surface along said upper edge between said index-finger-receiving-cavity and the body end opposite said one end; and at least two arcuate, finger receiving cavities in said lower edge adjacent said opposite end.

3,270,928
WATCH STRAP
Louis Brunet, Annecy, France, assignor to Z.R.C.-Zuccolo, Rochet & Co., Haute Savoie, France, a corporation of France
Filed July 27, 1964, Ser. No. 385,427
Claims priority, application France, July 30, 1963, 943,123
2 Claims. (Cl. 224—4)

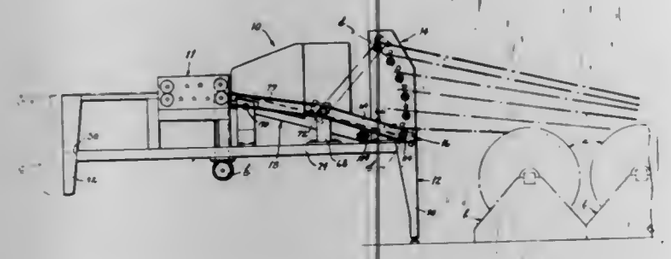


1. In combination with a watch case having two oppositely disposed pairs of spaced parallel lugs with aligned holes, and having between one of said pairs of spaced lugs a threaded sleeve barrel projecting perpendicularly from said case in the plane of said one pair of lugs and a crown screwed on to said sleeve barrel; a watch strap comprising two parts and a clasp releasably connecting one end of one of said strap parts to one end of the other of said strap parts, said strap parts each including a plurality of frame-like members and a plurality of connecting hinge members between said frame-like members to provide hinged connection therebetween, and said strap parts each including a fastening device for fastening the opposing ends of said strap parts to said watch case, the fastening device of one of said strap parts comprising a generally U-shaped stirrup-like component including a middle portion secured to the terminal frame-like member at said opposite end of said one strap and spaced from the watch case for a distance equal to that of the free end of the crown from said case when the crown is tightly screwed on the said sleeve barrel, and including end portions having outwardly directed projections engaging in said aligned holes of said one pair of lugs to provide a hinged connection, whereby the said stirrup-like component has dimensions such that it can only straddle said crown when said crown is fully screwed on said sleeve barrel, the fastening device of the other of said strap parts comprising a component including a first portion secured to the terminal frame-like member at said opposite end of the other of said strap parts and a second portion positioned between the other of said pair of spaced lugs and having a transverse channel therethrough, the fastening device of said other strap part further comprising a pin extending through said channel and terminating in said aligned holes in said other pair of lugs.

3,270,929
VIBRATION DIE CUT STRIPPING MACHINE
Joseph E. Foster, Jr., 29 Doe Lane, Malvern, Pa.
Filed Aug. 13, 1964, Ser. No. 389,502
20 Claims. (Cl. 225—97)

1. In a machine for removing scrap sections from cut and scored blanks having leading and trailing edges, the combination of a feeding conveyor, a stripping section and a delivery conveyor in continuous juxtaposed relation; said feeding conveyor delivering said cut and scored blanks to said stripping section through feed roller means; said delivery conveyor carrying stripped blanks away from said stripping section through delivery roller means; and said stripping section supporting rotary beater means and fan means respectively mounted below and above said blanks when within said stripping section.

3,270,930
WEB INSPECTION SYSTEM
Howard J. Emerson, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Sept. 28, 1961, Ser. No. 141,481
8 Claims. (Cl. 226—33)



8. A moving web control comprising:
means to decelerate and stop a rapidly moving web in response to a stop signal,
means rendered operative in response to said stop signal for determining the deceleration distance,
means operative during said deceleration for generating a signal indicating said web has come to a stop,
and means responsive to said signal generating means and said distance determining means for reversing the movement of said web at a greatly reduced speed a distance equal to said deceleration distance.

3,270,931
APPARATUS FOR SELECTIVELY FEEDING SHEET MATERIAL FROM A PLURALITY OF COILS

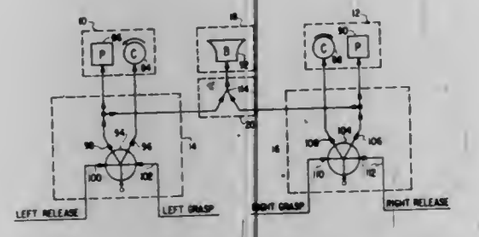
Walter A. Ried, St. Louis, and Joseph J. Schrader, Jr., Florissant, Mo., assignors to Engel Equipment, Inc., St. Louis, Mo., a corporation of Missouri

Filed Nov. 25, 1964, Ser. No. 413,848
10 Claims. (Cl. 226—49)

1. For use in selectively feeding sheet material from a plurality of coils, the apparatus comprising

a frame,

a plurality of horizontally-extending feed roller pair sets rotatably mounted on said frame and positioned at different levels one above the other, each pair being in constant gripping engagement, whereby the rolls of each set receive and retain between them sheet material from one of such coils without interference, and



means carried by said frame for selectively engaging and reversibly driving a roller of a selected roller pair set, and for disengaging same,

whereby sheet material from one of the plurality of coils may be selected and advanced to a subsequent operation station and may be retracted therefrom.

3,270,932
FLUID CONTROLLED CAPSTANS WITH BRAKES

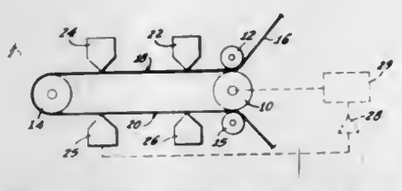
Robert T. Smith, Jr., Hatboro, Pa., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware

Filed Jan. 13, 1964, Ser. No. 337,293
24 Claims. (Cl. 226—95)

1. A web transport device which comprises:

(a) first and second web drive means each located adjacent a web path for moving a web grasped thereby, with each said drive means being adapted to receive fluid energy in either a first state or a second state for selectively creating across the web a fluid pressure gradient of either web grasping polarity or web releasing polarity, respectively;

(b) web brake means located adjacent said web path for restraining movement of a web grasped thereby, said web brake means being adapted to receive fluid energy in either a third state or a fourth state for selectively creating across the web a fluid pressure gradient of either web grasping polarity or web releasing polarity, respectively;



(c) first pure fluid amplifier means responsive to either a selectively generated first fluid grasp signal or a selectively generated first fluid release signal for respectively supplying first state fluid energy or second state fluid energy to said first web drive means; and second pure fluid amplifier means responsive to either a selectively generated second fluid grasp signal or a selectively generated second fluid release signal for respectively supplying first state fluid energy or second state fluid energy to said second web drive means; and

(d) pure fluid logic means operatively responsive to either the generation of said first fluid grasp signal or the generation of said second fluid grasp signal for supplying fourth state fluid energy to said web brake means, said pure fluid logic means further being operatively responsive to either the generation of said first fluid release signal following the generation of a said first fluid grasp signal, or the generation of said second fluid release signal following the generation of a said second fluid grasp signal for respectively supplying third state fluid energy to said web brake means.

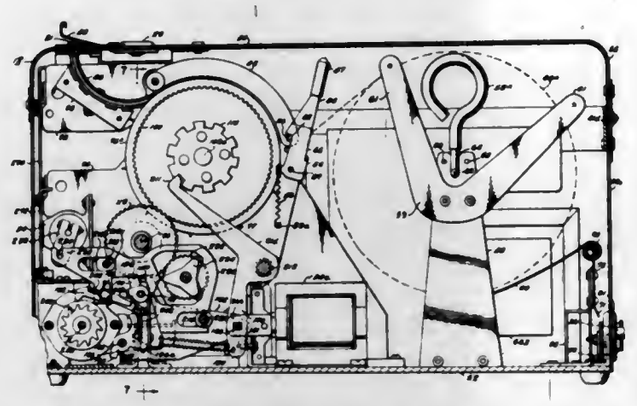
3,270,933
AIR-CUSHIONED TAPE GUIDE

Frank Dekker, Inglewood, Calif., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware

Filed Dec. 20, 1963, Ser. No. 332,014
13 Claims. (Cl. 226—97)

1. In a tape transport system wherein a travelling tape passes around a cylindrically curved means to form a loop with an ingoing leg and an outgoing leg with first means positively gripping the tape to feed the tape to the ingoing leg at a given rate and second means positively gripping the tape to withdraw the tape from the outgoing leg at a given higher rate to cooperate with the first means to maintain the loop under predetermined constant tension with transducer means cooperating with the tape adjacent at least one leg of the loop, wherein a closed-loop servo-mechanism regulates the speed of said first and second means to keep the speed of the tape in the loop constant within a small range of deviation and wherein said transducer means includes a reading head that is included in the closed-loop servomechanism, the improvement to enable the system to drive the tape in a stable manner with the range of deviation reduced to a few microinches, comprising:

said cylindrically curved means being a stationary hollow member having a curved wall at its exterior to guide the tape, the curved wall being porous and being formed from solid particles to provide numerous closely spaced exceedingly small tortuous flow passages therethrough;



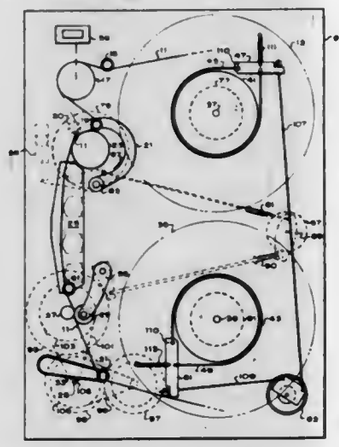
means for providing compressed gaseous fluid; and

means operatively coupled to the last mentioned means to supply the interior of the hollow member with the compressed gaseous fluid for flow through the tortuous flow passages to the curved wall to maintain a cushion of the gaseous fluid between the traveling tape and the curved wall and to maintain the tape out of contact with the curved wall in opposition to the tension of the tape.

3,270,934
DISPENSING APPARATUS

Charles E. Stansell, Dallas, Tex., assignor to Trolex Corporation, Dallas, Tex., a corporation of Texas

Filed July 31, 1963, Ser. No. 303,461
36 Claims. (Cl. 226—136)



1. An apparatus for dispensing a tape perforated to define stamps or tickets that comprises: drive roller means for engaging said tape; means producing rotation of said drive roller means; a control device including a plurality of normally open switches; a step switch having a plurality of normally closed contacts; circuit means connecting each of said plurality of normally open switches to a different one of said plurality of normally closed contacts; means to close one of said plurality of normally open switches to register the desired number of stamps to be issued; means effective responsive to closure of a circuit through said one of said plurality of normally open switches and the normally closed contact of said step switch connected thereto for actuating said means producing rotation to issue stamps; and means for indexing said step switch to open the normally closed contact connected to said one of said plurality of normally open switches when the desired number of stamps are issued.

3,270,935
TAPE RECORDING AND REPRODUCING APPARATUS

Walter T. Selsted, Redwood City, and William I. Girdner, Portola Valley, Calif., assignors to Hewlett-Packard Company, Palo Alto, Calif., a corporation of California

Filed Nov. 29, 1963, Ser. No. 326,811
6 Claims. (Cl. 226—188)

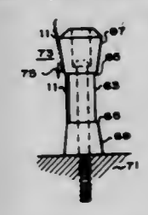
1. A mechanical filter for tape recording and reproducing apparatus which moves a continuous tape from a tape supply having angular inertia, the apparatus comprising:

a rotatable member having high angular inertia;

a roller attached to said rotatable member for rotation therewith;

means disposed away from said roller on the tape supply side thereof for positioning tape on said roller;

a tape guide disposed on a movable member intermediate said means and said roller;



said movable member being adapted to move along a path for altering the wrap angle of tape around said roller and said tape guide; and

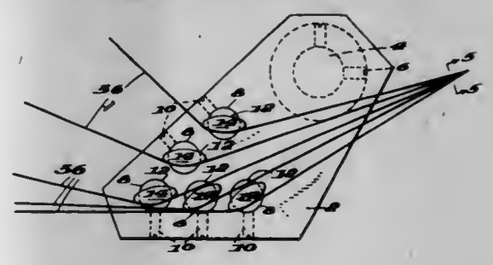
means actuated by said movable member for exerting braking torque on the combined attached roller and rotatable member as said tape guide approaches a position which produces a selected wrap angle of tape about said roller.

3,270,936
TAPE GUIDE FOR TAPE RECORDING AND REPRODUCING APPARATUS

Walter T. Selsted, Woodside, and William I. Girdner, Portola Valley, Calif., assignors to Hewlett-Packard Company, Palo Alto, Calif., a corporation of California

Original application Nov. 29, 1963, Ser. No. 326,811. Divided and this application Sept. 29, 1965, Ser. No. 491,220
4 Claims. (Cl. 226—196)

1. A tape guide for tape transport apparatus comprising:

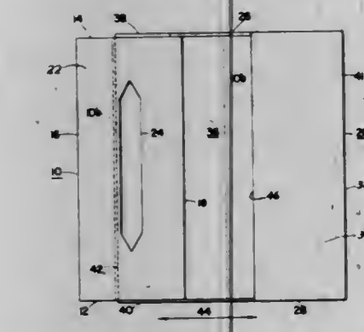


a pair of frusto-conical sections and a non-rotatable cylindrical section having a diameter smaller than the truncate diameters of said frusto-conical sections and having a length substantially equal to the width of a tape;

said cylindrical section being disposed between said pair of frusto-conical sections with the truncate diameters adjacent said cylindrical section and with the truncate surfaces of said frusto-conical sections forming outwardly extending shoulders for engaging the longitudinal edges of the tape.

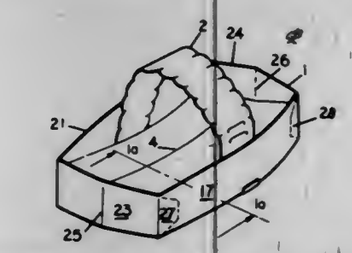
3,270,937
GUIDE ELEMENTS

William Albright Harrell, Grifton, N.C., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware



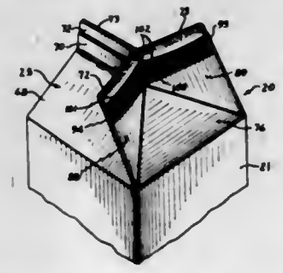
Filed Nov. 27, 1964, Ser. No. 414,158
2 Claims. (Cl. 226—197)

1. In an apparatus for continuously receiving a plurality of separate moving ribbons of filaments which comprises means vertically aligning each moving ribbon in a spaced relationship and means converging said ribbons to form a tow having said ribbons uniformly stacked and a width equal to that of a single ribbon, the improvement wherein said converging means comprises a base plate having a plurality of cantilevered guide elements mounted thereon, said guide elements each having a portion having



an oval-shaped guide surface with a radius of curvature in the range of from about 5/8 inch to about 3 inches, said guide elements being positioned on said base plate in such a manner that each guide element guides a single ribbon to a common convergence point, said ribbons contacting said guide elements on the oval-shaped surface.

3,270,938
WASTE RECEPTACLE
Floyd P. Rhinegold, 338 SW. 17th St., Richmond, Ind.
Filed Oct. 5, 1964, Ser. No. 401,462
7 Claims. (Cl. 229—7)

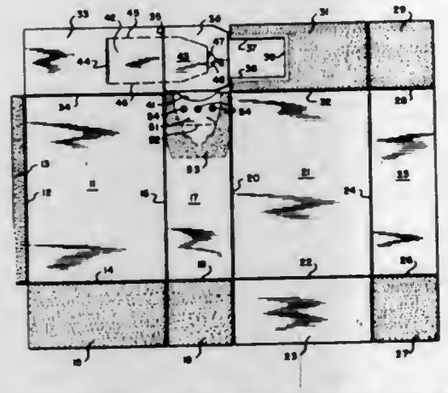


1. A combination tissue dispenser and waste receptacle comprising a rectangular waste box having two upstanding sides, a bottom, an end and a cover, said sides and said end being of equal height, said waste box being of rectangular cross-section, said cover and said end being of equal length, said cover having a width equal to a fraction of the dimension of said bottom measured in a direction parallel to said width, thereby providing for a rectangular waste box having an access opening in said cover and an open end, and a tissue box having second ends, bottom and sides, said sides and said bottom of said waste box having peripheral portion adjacent said open end adapted to fit over a portion of said second ends and bottom of said tissue box to receive said tissue box therebetween thereby securing said waste box to said tissue box and bounding said waste box and said access opening, said waste box and said tissue box being equal in height, said end of said waste box being equal in length and area with said sides of said tissue box, said waste box having means for selectively collapsing said waste box onto said tissue box and thereby varying the volume of said waste box.

3,270,939
CONTOURED CONTAINER
David P. Ebelhardt, Atlanta, Ga., assignor to The Mead Corporation, a corporation of Ohio
Filed Feb. 5, 1964, Ser. No. 342,705
7 Claims. (Cl. 229—16)

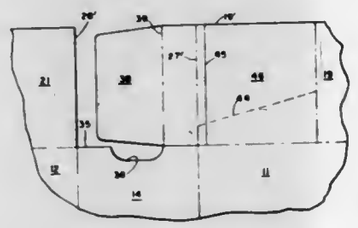
6. A container comprising a main panel of bendable material having side and end edges, a pair of side panels of bendable material disposed in generally normal relation to said main panel along opposite side edges thereof, a pair of end panels adjoined respectively to the adjacent end of said side panels, and elevator panels having one edge foldably joined to said side edges of said main panel and having another edge foldably joined to an adjacent edge of said side panels, said elevator panels being disposed in flat face contacting relation to the inner surfaces of the adjacent side panels and being configured to impart a degree of curvature to said main panel in a direction generally normal to the plane and end edges thereof and wherein a slit is formed at the edge of each side panel which is adjacent said main panel and wherein a strap is adjustably disposed within at least one of said slits so as to form a closure band for the container.

3,270,940
CONTAINER WITH EXTENSIBLE POURING SPOUT
Harry B. Egleston, Livonia, and Charles Z. Monroe, Detroit, Mich., assignors to Ex-Cell-O Corporation, Detroit, Mich., a corporation of Michigan
Filed July 7, 1961, Ser. No. 122,571
15 Claims. (Cl. 229—17)



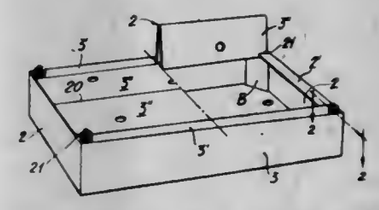
1. A gable top container of paperboard or the like coated overall with a thermoplastic material that becomes an adhesive when subjected to heat, said container comprising, in combination, a tubular body having a bottom closure thereon, a pair of opposed roof panels inclined toward each other and overlying said body, a pair of opposed triangular end panels in-folded between said roof panels from the opposite gable ends formed by the latter, two pairs of triangular fold-back panels each pair of which is integral with a respective one of said in-folded triangular end panels along fold lines which underlie said roof panels, said fold-back panels being folded adjacent the undersides of said roof panels, an outer rib panel surmounting each roof panel, a pair of inner rib panels joined by a fold line and surmounting each pair of triangular fold-back panels and adjoining end panel, a sanitarily protected extensible pouring spout housed in collapsed condition within said container and defined in part by one of said triangular end panels and an adjacent pair of said fold-back panels and an adjacent pair of said inner rib panels, said spout also being defined by adjacent portions of said roof panels and outer rib panels, an abhesive layer interposed between each of said spout-defining inner rib panels and the one of said outer rib panels adjacent thereto, said abhesive layers terminating short of the outer ends of said inner and outer rib panels and defining thereon marginal sealing areas adjacent said abhesive, an upstanding sealing flap integral with each one of said outer rib panels, each said sealing flap having a marginal sealing area defined thereon, said rib panels and said marginal sealing areas being sealed together into a top closure rib surmounted by an upstanding sealing rib enclosing said extensible spout with a fluidtight sanitary margin.

3,270,941
EASY OPEN AND RECLOSABLE CARTON
Donald E. Barnes, Minnetonka, Minn., assignor to General Foods Corporation, White Plains, N.Y., a corporation of Delaware
Filed Nov. 3, 1964, Ser. No. 408,600
20 Claims. (Cl. 229—17)



1. A carton for containing a dry free-flowing product and comprised of opposed side and end panels of semi-rigid packaging material secured together in a rectangular

tubular construction, a bottom closure formed of side panel and end panel-joined flaps bent inwardly and secured in overlying relation to one another, a first top closure flap joined to one of said side panels and formed to provide an orifice-defining portion at one end thereof, a second top closure flap joined to the other side wall panel and disposed in overlying relation to said first top closure flap, and an end closure flap joined to said second top closure flap and disposed in overlying relation to the top portion of one of said end panels, said end closure flap and said second top closure flap being weakened

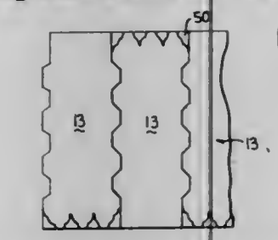


along lines defining a continuous tear strip of which the portion formed from said second closure flap is of larger dimensions than, and disposed in registration with, the orifice-defining portion of said first top closure flap, said second top closure flap and said end closure flap being firmly adhered to the first top closure flap and said end panel, respectively, only over areas thereof exclusive of said tear strip, the tear strip portion of said end closure flap being less firmly and removably adhered to said end panel to enable the severance of said tear strip from said end closure flap and said second top closure flap to expose a pouring orifice for said carton.

3,270,942
CARTON
Paul E. Cope and Charles R. Specter, Cincinnati, Ohio, assignors to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio
Filed June 14, 1965, Ser. No. 467,185
5 Claims. (Cl. 229—17)

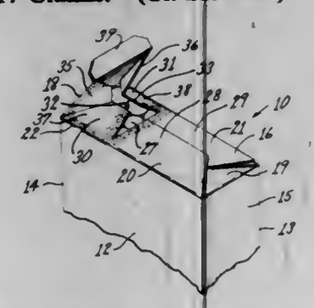
1. A seal-end carton in the form of a sleeve of rectangular cross-section and having alternating side, front and back panels, said carton having a siftproof end closure comprising adhesively attached overlapping closure flaps articulated from said front and back panels along integral score lines, said overlapping and attachment of said closure flaps to one another occurring only in areas directly overlying the end of said sleeve, the lowermost closure flap having a length and width substantially the same as the cross-section of the sleeve and having integrally connected to one end thereof an outwardly extending tab, a fold line intervening said tab and said lowermost closure flap, the region of said tab within at least about one-quarter inch of said fold line having approximately the same width as said lowermost closure flap and the balance of said tab being reduced in width as the free end thereof is approached, the inner surface of said tab in said region being adhesively attached directly to a full width area of the exterior surface of one of said side panels with the distal end of said tab free from attachment whereby it may be readily grasped in use, said one side panel terminating in a die-cut free edge coplanar with the score lines of said closure flaps, said full width area of the exterior surface being immediately adjacent said die-cut free edge, the entire said tab being adapted to be torn free from said one side panel whereby access to the carton interior is gained.

3,270,943
PACKING CASE ESPECIALLY FOR TRANSPORTING HEAVY GOODS
Roberto Polenghi, Strad Alzaia Naviglio Pavese 10, Milan, Italy
Filed May 18, 1964, Ser. No. 368,082
Claims priority, application Italy, June 17, 1963, 36,165
8 Claims. (Cl. 229—23)



1. Composable packing box suitable to be stacked with many other similar boxes in particular for the transportation of heavy goods comprising at least one blank of foldable material which is suitably sheared and provided with bending lines to be formed into a parallelepiped box, said blank including a central rectangular bottom surface with a hole at each corner, first appendant portions extending from each side of said rectangular bottom surface and adapted to be bent at right angle thereto, second appendant portions with a hole at each corner of their lateral ends, said second appendant portions extending from said first appendant portions and being adapted to be bent parallelly to the bottom surface inwardly with respect to the box and at right angle to said first appendant portions, further four angle rods with a blind hole axially extending from each of their base, and four connecting members, said angle rods being placed on the central bottom surface with their axis perpendicular thereto, with their lower blind holes in register with the holes thereof and, upon bending of said first and second appendant portions, with part of their surface in contact with said appendant portions, whereby the upper blind holes of each angle rod and the holes of the second appendant portions, which are bent to cover the upper surface of said angle rods, are brought in reciprocal register relation to be in a position to receive said four connecting members penetrating therein for holding together the different components of the box, each of said connecting members comprising a pin, a flange-like spacer body and a tapered extension projecting from said spacer body in a direction opposite to the one of the pin, the holes of the bottom surface and the lower blind holes of the relative angle rods resting thereupon being adapted to be engaged by the tapered extensions of the connecting members of an adjacent box positioned below.

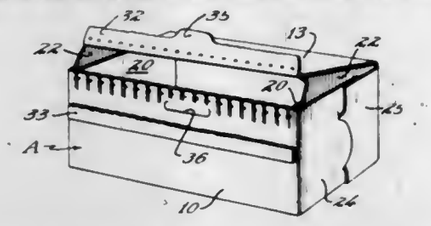
3,270,944
ARTICLE CARRIER
Theodore C. Baker, New Canaan, Conn., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed May 28, 1964, Ser. No. 370,884
8 Claims. (Cl. 229—40)



1. An elongated wrapper blank comprising a main panel, a pair of side panels foldably joined respectively to opposite side edges of said main panel, and a pair of

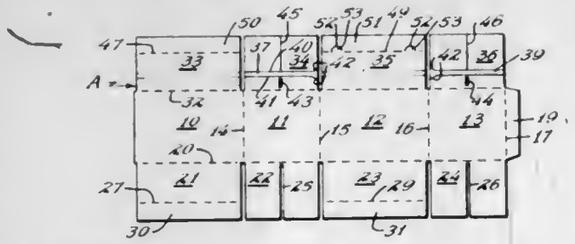
lap panels foldably joined repectively to the edges of said side panels remote from said main panel, the end edges of each of said panels being cutaway to form a uniform scallop-like configuration along both edges of the blank for substantially the entire length thereof, said lap panels having cooperating latch means, and the spacing between

one of said side panels and an adjacent end of said wrapper blank being substantially equal to the spacing between the other of said side panels and the other end of said wrapper blank plus one-half the length of a convolution of said scallop-like configuration whereby adjacent wrapper blanks in reversely turned relation internest and have substantially aligned ends.



3,270,945
CIGARETTE PACKAGE CONSTRUCTION OR THE LIKE
William C. Whitaker, Chesterfield County, and Joseph Y. Thomas, Henrico County, Va., assignors to Reynolds Metals Company, Richmond, Va., a corporation of Delaware
Filed Mar. 16, 1964, Ser. No. 351,997
17 Claims. (Cl. 229—51)

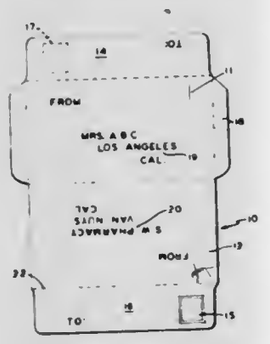
1. A container having an open end, said open end having a pair of opposed side flaps and an end flap extending therefrom, said side flaps each being formed into two portions by a slit extending inwardly from the free edge thereof toward said open end, said side flaps being folded over said open end with said one portion of one of said side flaps disposed in overlapping relation with said one portion of the other side flap and the other portion of said one side flap disposed in abutting relation with said other portion of said other side flap to close said open end, said end flap being folded over said other portions of said side flaps and extending over part of said one portions of said side flaps to completely cover said slits in said side flaps.



3,270,946
ICE CREAM CARTON
John R. Redpath, Western Springs, and Lawrence S. Wysocki, Chicago, Ill., assignors to Waldorf Paper Products Company, a corporation of Minnesota
Filed Apr. 13, 1964, Ser. No. 359,333
3 Claims. (Cl. 229—51)

1. A carton including
a sheet of paperboard of substantially uniform thickness cut and creased to provide a series of foldably connected wall panels,
a glue flap hinged to one end wall panel of said series adapted for attachment with the other end panel of the series to form a tubular body,
said glue flap having two spaced weakened lines of separation extending thereacross generally parallel to the end of the glue flap and dividing the glue flap into an anchoring section between one said weakened line and the end of the glue flap, a removable tear strip section between said weakened lines, and a detachable section between the other said weakened line and the fold line connecting said glue flap to said one end wall panel,
adhesive connecting said anchoring section securely in face contact to said other end wall of said series,

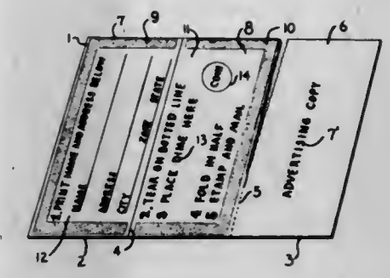
said tear strip section being free of adhesive connection to said other end wall of said series, and
one of the overlapping areas of said detachable portion and said other end wall including spaced embossed areas extending toward the other overlapping area and adhered thereto, said embossed areas holding the areas between said embossed areas out of face contact,
whereby when said tear strip section is removed, said detachable section may be easily detached from said other end wall.



3,270,947
RECLOSABLE CONTAINERS
Walter H. Rasmussen, St. Paul, Minn., assignor to Waldorf Paper Products Company, Ramsey County, Minn., a corporation of Minnesota
Filed Mar. 2, 1965, Ser. No. 436,576
6 Claims. (Cl. 229—51)

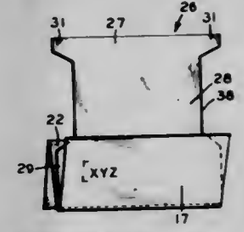
1. A reclosable container including,
a rectangular tubular body having parallel end walls and parallel side walls connected in tubular relation,
closure flaps hingedly connected to said side and end walls, the closure flaps on said side walls extending substantially in edge abutting relation when folded into a common plane,
tuck flaps hinged to the ends of said side wall closure flaps and extendable into said container at substantially right angular relation to said side wall closure flaps and in face contact when said side wall closure flaps are folded into a common plane,
said end wall closure flaps being foldable outwardly of said side wall closure flaps,
said end wall closure flaps including removable tear strips defined by spaced parallel weakened lines of separation extending substantially parallel to the lines of fold connecting said end wall closure flaps to said end walls and dividing each said end wall closure flaps into an end portion between said tear strip and the end of said end wall closure flaps and a hinged portion between said tear strip and the lines of fold connecting said end wall closure flaps to said end walls.

said portions including lines of separation extending from said tear strip to the end of said end wall closure flaps, said slits being adapted to substantially register with the end edges of said side wall closure flaps in closed condition of said container, and
said end wall closure flaps having apertures therein extending substantially across said hinged portions thereof in alignment with said lines of separation in said end portions and of a width to receive said tuck flaps,
whereby after said containers are closed and said end portions of said end wall closure flaps are adhered in face contact with the portions of said side wall closure flaps which they overlie, said tear strips may be removed to open said container, and said hinged portions of said end wall closure flaps may be folded beneath said side wall closure flaps to receive said tuck flaps in said apertures.



3,270,948
TWO-WAY ENVELOPE
Marion Donovan, 435 E. 52nd St., New York, N.Y.
Filed May 14, 1965, Ser. No. 455,879
1 Claim. (Cl. 229—73)

A two-way envelope including first and second opposed walls forming front and rear walls when first sent, and having areas for imprinting thereon, respectively, a first receiver's name and a sender's name, each wall having imprinted thereon above said name, a word, flaps permanently closing the opposed ends of the envelope, and gummed flaps extending upwardly from each of said walls and having a word imprinted thereon, each of said flaps being of sufficient depth to cover the word on the first and second walls when adhered downwardly thereon, one of the gummed flaps remaining unadhered on its first journey to the receiver while the other gummed flap is adhered over the wall carrying said unadhered flap and concealing the word printed thereon, said latter flap being removable when received by the first receiver, and the other wall flap when adhered over the opposite wall concealing the word thereon and converting the envelope to one addressed to the original sender.

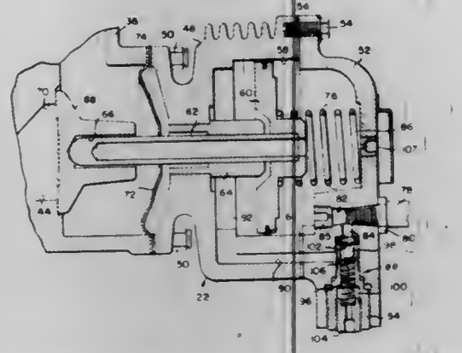


3,270,949
MAILING PIECE
Joel Hillman II, New York, N.Y., assignor to Tension Envelope Corporation, Kansas City, Mo., a corporation of Delaware
Filed Mar. 1, 1965, Ser. No. 435,955
2 Claims. (Cl. 229—92.1)

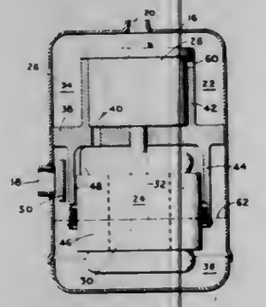
2. A mailing piece comprising a blank having at least three like panels secured together by integral fold lines, only one of said fold lines being perforated, two of said like panels being secured together by an unperforated fold line; each of said last named panels having U-shaped strips of pressure sensitive adhesive with the ends of the U-shaped strips terminating adjacent said unperforated fold line and in matching relation to one another when said panels are folded along said unperforated fold line in face contacting relation; and said blank when folded

along, first said perforated fold line and then along said unperforated fold line, forming at least a three ply mailing piece.

3,270,950
ENVELOPE AND WRITING SHEET COMBINATION
Marion Donovan, 435 E. 52nd St., New York, N.Y.
Filed Apr. 14, 1965, Ser. No. 448,000
4 Claims. (Cl. 229—92.1)



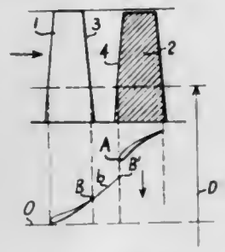
1. A sealed correspondence assembly including a writing sheet and an envelope sheet partially enclosing the writing sheet, the sheets having transverse fold lines dividing the same into a plurality of sections, the writing sheet having a downwardly extending pocket between its first and second sections, the envelope sheet including a shallow first section having short inwardly extending cut lines at the bottom thereof and forming laterally extending tabs with adhesive thereon, a third section which is positioned in said writing sheet pocket and is of substantially the same depth and width as the pocket, and an intermediate section which is positioned rearwardly over the back of the folded writing sheet sections, the folded writing sheet sections and the second and third envelope sections having fold lines adjacent but spaced from opposite ends thereof, the portions of said sections lying outside the fold lines positioned inwardly and rearwardly of the folded writing sheet sections and enclosed by said intermediate envelope section, the shallow first section of the envelope sheet extending upwardly from the lower edge of the folded writing sheet sections and partially over the foremost section thereof with its adhesive tabs adhered to the rear face of the folded assembly.



3,270,951
TURBOCHARGER CONTROLS
Wendell E. Reed, Chula Vista, Calif., assignor, by mesne assignments, to International Harvester Company, a corporation of Delaware
Filed Apr. 4, 1963, Ser. No. 270,646
5 Claims. (Cl. 230—9)

1. Control apparatus for a waste gate valve for a turbocharger having a turbine and a compressor comprising a piston connected to said valve, means forming inner and outer chambers at the sides of said piston adjacent and remote from said valve, respectively, means defining a restricted inlet connecting the compressor discharge pressure to said outer chamber, means defining a restricted

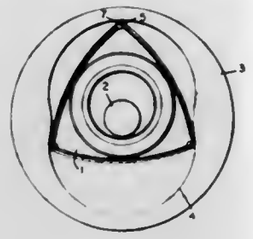
outlet connecting said outer chamber to a low pressure area, said restricted inlet and outlet cooperating to establish a reference pressure in said outer chamber bearing a predetermined relation to the compressor discharge pressure, a spring biasing said piston in a valve-closing direction, the force of said spring plus the reference pressure normally holding said valve closed, and valve means normally venting said inner chamber, said valve means being responsive to an increase in the compressor discharge pressure to a predetermined level to connect said inner chamber to said compressor discharge pressure to overcome the force of said spring and said reference pressure to thereby open said waste gate valve.



3,270,952
PROTECTIVE DEVICE FOR COMPRESSORS
Friedrich O. Bellmer, East Orange, N.J., assignor to Worthington Corporation, Harrison, N.J., a corporation of Delaware
Filed Apr. 26, 1965, Ser. No. 450,785
16 Claims. (Cl. 230—58)

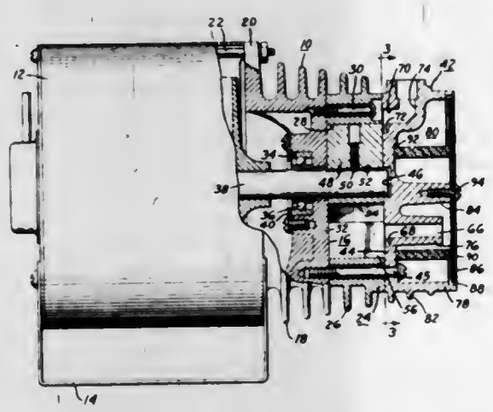
1. Apparatus comprising:
(a) a casing,
(b) a motor disposed within said casing,
(c) a shell positioned within said casing about said motor,
(d) said motor being operative to drive means for withdrawing gas from within said shell,
(e) partition means for dividing said casing into two portions,
(f) said motor and shell being positioned in one of said portions of said casing,
(g) said casing having an inlet opening for introducing fluid into said lower portion,
(h) said shell having an inlet opening to allow fluid to pass from said lower portion into said shell,
(i) valve means at said shell inlet opening operative in a sealed position thereof to seal said shell inlet opening when liquid is collected in said shell up to the level of said shell inlet opening,
(j) said valve means including a valve actuator operative to be forced into a said sealed position when liquid in said casing reaches the level of said shell inlet opening.

3,270,953
AXIAL FLOW COMPRESSOR, BLOWER OR VENTILATOR WITH REDUCED NOISE PRODUCTION
Jan Jerie, 27 Komornicka, Prague 6, Czechoslovakia; Jaroslav Němec, 3 Libicka, Prague 3, Czechoslovakia; and Zdeněk Moravec, 8 Legerova, Prague 2, Czechoslovakia
Filed May 19, 1964, Ser. No. 368,649
Claims priority, application Czechoslovakia, May 21, 1963, 2,900/63
2 Claims. (Cl. 230—120)



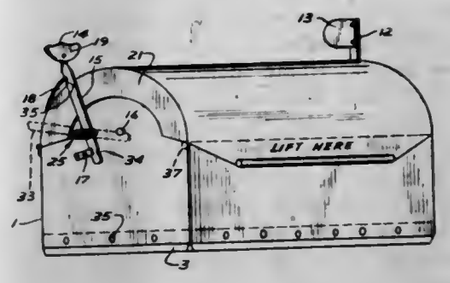
1. An axial compressor, blower, or ventilator having a set of rotor blades and a set of stator blades, said blades satisfying the relationship $S=\tau/\tau_0>0.65$, wherein τ is the characteristic crossing value of one of said sets by the other set, and τ_0 is the pitch of the blades of said other set,
(1) the blades of each set being spaced about a common axis and extending radially between a root circle near said axis and a tip circle remote from said axis, said circles being centered in said axis, said pitch being the circumferential spacing of adjacent blades of the other set as measured on said tip circle,
(2) said characteristic crossing value being the circumferential spacing of two lines projected on a plane perpendicular to said axis, said spacing being measured on said tip circle, said projected lines intersecting in said root circle,
(3) one of said projected lines being an axial projection of a line of intersection between a surface of rotation about said axis and a plurality of radially spaced trailing rays of one of the blades of said other set, each trailing ray being defined by the point of intersection of the camber line of said one blade with the trailing edge of said one blade in the airfoil section of said one blade and by a point on said camber line spaced from said trailing edge toward the leading edge of said one blade a distance equal to one fourth of the length of the chord between said camber line and said leading edge, said distance being measured along said chord,
(4) the other one of said projected lines being an axial projection of the leading edge of one blade of the other set,
(5) said surface of rotation being defined by said leading edge of the last-mentioned blade when said other set rotates about said axis.

3,270,954
SEALING DEVICE FOR ROTARY PISTON ENGINE
Kenichi Yamamoto, Hiroshima-shi, Japan, assignor to Toyo Kogyo Company Limited, Hiroshima-ken, Japan
Filed Feb. 10, 1965, Ser. No. 431,639
Claims priority, application Japan, Feb. 17, 1964, 39/10,973
3 Claims. (Cl. 230—145)



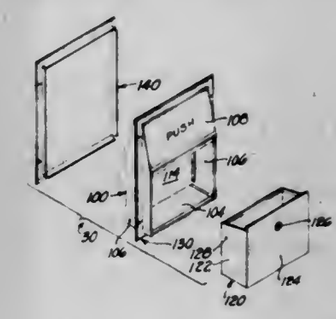
1. A rotor and sealing device for a rotary piston internal combustion engine having an annular casing with a trochoidal shaped internal peripheral wall and a crankshaft within said casing for eccentrically rotating a rotor within said casing, comprising a triangular rotor adapted to be eccentrically rotatably mounted on the crankshaft for rotation within the annular casing, said rotor having

an axially extending groove at each apex thereof, an apex seal piece radially slidably mounted in each groove, each apex seal piece having at least one longitudinally extending bore therethrough adjacent the radially outward edge of the seal piece and leaving between said bore and the radially outward edge a frictional sliding contact portion of sufficient thickness for withstanding the sliding frictional forces of the seal piece on the internal wall of



the casing, said bore being entirely within the portion of the seal piece which projects out of the groove with the edge of the groove at a position on the seal piece radially inwardly of the said at least one bore, and at least one radially extending hole in said seal piece extending from the edge thereof within the groove into said bore and positioned substantially midway of the length of the seal piece.

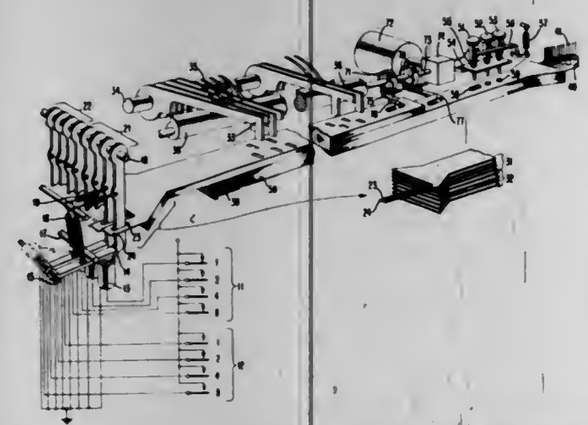
3,270,955
AIR COMPRESSOR
Curtis W. Huyser, Zeeland, and Frederick T. Vaas, Jr., Grand Rapids, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Mar. 16, 1965, Ser. No. 440,130
5 Claims. (Cl. 230—232)



1. An air compressor comprising, an open-ended cylinder forming a cavity, impeller means in said cavity including means for dividing said cavity into a variable volume intake chamber and a variable volume discharge chamber, an inlet and an outlet in communication with said chambers, a base plate for closing one end of said cylinder, a cover plate for closing the other end of said cylinder having said inlet therein, said cover plate including an outwardly opened enclosure having a planar extent substantially equal to the outer dimension of said cylinder, an annular filter disposed within said enclosure surrounding said inlet opening in spaced relationship therewith, closure means for closing one end of said annular filter including means for producing an annular inlet opening into said enclosure for directing fluid intake across said filter and thence through said inlet into said cavity, said closure means in cooperation with said enclosure forming a large volume chamber serving to muffle noises within said cavity produced during compressor operation.

3,270,956
RURAL MAILBOX WITH AUTOMATIC SIGNALS
Jake S. Mullner, Box 148, Westport, S. Dak.
Filed Mar. 9, 1964, Ser. No. 350,337
2 Claims. (Cl. 232—35)

1. In a mailbox, an upwardly opening receptacle having adjoining upright end and rear walls, a cover hinged to the upper portion of the rear wall for swinging movement between a closed position over the receptacle and an upwardly extending open position, a signal positioned outside of the receptacle and pivoted to the end wall on an axis parallel to the hinge axis for movement of the signal along a path between a normal lowered position extending rearwardly from the rear wall and a raised position beside the end wall, spring means on the signal device for yieldably retaining the device in said path, a lifter member integrally mounted on the cover to extend into said path, said lifter member having a beveled rear edge and a hooked front edge whereby as the cover is opened the rear edge of the lifter member will engage the signal device and move it from said path against bias of the spring means until said front edge has passed under the device to raise the device upon closing movement of the cover.



3,270,957
PARTITION MOUNTED CONTAINER
William S. Louchheim, Beverly Hills, Calif., assignor to The Bobrick Corporation, Los Angeles, Calif., a corporation of Delaware
Filed May 18, 1964, Ser. No. 368,234
4 Claims. (Cl. 232—43.2)

1. In a partition mounted container for location in an opening formed in a relatively thin partition, the combination of: a box-like receptacle having a substantially enclosed, hollow interior, said receptacle being formed by horizontal, transversely extending top and bottom walls and vertical, transversely extending end walls with vertically extending sidewalls connected to the transverse extremities of the top and bottom and end walls, the sidewalls being of substantially equal dimensions and being positioned by the top and bottom and end walls substantially transversely aligned, said receptacle being mounted with said top and bottom and end walls extending transversely through the partition opening and transversely beyond the sides of the partition, said receptacle sidewalls being spaced transversely outwardly of said partition sides

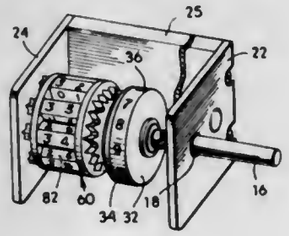
and thereby fully exposed; frame means operably connected between said receptacle and said partition for supporting said receptacle in said mounted position extending through said partition opening, said frame means including first and second frame members, said first frame member having a leg secured to said receptacle within said partition opening and a leg overlying one of said partition sides, said second frame member having a leg slidably engaged with said receptacle within said partition opening and a leg overlying the other of said partition sides; access opening means formed through each of said receptacle sidewalls at upper portions of said sidewalls and providing access to said receptacle interior, said access opening means of one sidewall being substantially transversely aligned with the access opening means of said other sidewall, said lower portions of said receptacle sidewalls normally being closed and being substantially free of access to said receptacle interior; and servicing means forming at least a part of one of said receptacle sidewalls selectively operable for opening at least a part of said one sidewall to provide servicing access to said receptacle interior.

3,270,958
MECHANICAL CALCULATING APPARATUS
John E. Hickerson, Lexington, Ky., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Oct. 27, 1964, Ser. No. 406,842
11 Claims. (Cl. 235—61)

1. Apparatus for performing an ordered operation with a plurality of operands comprising:

a group of selecting members for each operand in the operation, the selecting members in each group being positioned according to the given character of the group's operand and each selecting member having a pattern of openings;

a plurality of operational members normally retracted but being active to pass into channels formed by the openings in the selecting members when the selecting members have been positioned, each operational member being representative of one combination of characters for the operands;



each group of selecting members, when selecting members in the group have been positioned, forming channels to pass a set of operational members wherein the operational members of the set represent all combinations of the group's given-character operand with all other characters which could be given for the other operands;

each group of selecting members, when selecting members in the group have been positioned, forming in cooperation with the other groups of selecting members a single channel to pass the one operational member which represents the combination of characters given for the operands;

a group of read-out members in proximity to the groups of selecting members, each read-out member having a pattern of multiple-size openings to receive any operational member passed by the groups of selecting members so that those read-out members engaged at a smaller opening by the operational member are limited in movement while those read-out members engaged at a larger opening by the operational member are permitted greater movement; and

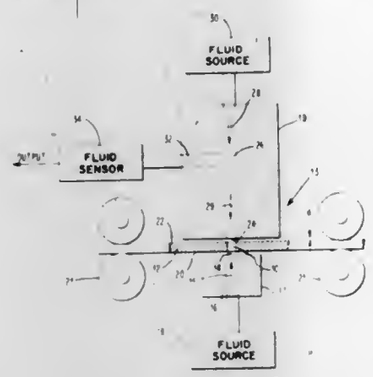
biasing means to bias said group of read-out members to move after the operational member has passed into the read-out members so that the pattern of movement of the read-out members will indicate the result of an ordered operation performed on the combination of characters given for the operands.

3,270,959
INDICATOR
James R. Young and Robert L. Mills, Fort Wayne, Ind., assignors to Planet Instrument, Inc., Fort Wayne, Ind., a corporation of Indiana
Filed Feb. 17, 1964, Ser. No. 345,166
6 Claims. (Cl. 235—110)

1. An indicator device, comprising input drive means including a rotatable drive shaft, a first unitary rotatable indicator means, including first rotatable indexing means, said rotatable indicator means providing information spaced at regular circumferential intervals around the periphery of said rotatable indicator means, a rotatable carrier means operatively indexed at each revolution of said first indicator means by said rotatable indexing means, a plurality of additional indicator means spaced at regular angular intervals about the circumference of said carrier means and each mounted for independent rotational indexing movement thereon, said additional indicator means having at least three indicating surfaces, and second rotatable indexing means including a toothed gear forming a part of each of said additional indicator means for individually indexing each of said additional indicator means, and stationary means for coordinating the rotational movement of the carrier means and the rotational indexing movements of said additional indicator means with respect to said first named indicator means to provide a sequence of coordinated movements.

3,270,960
FLUID SENSOR
Edwin R. Phillips, Rosemont, Pa., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Sept. 11, 1964, Ser. No. 395,796
16 Claims. (Cl. 235—201)

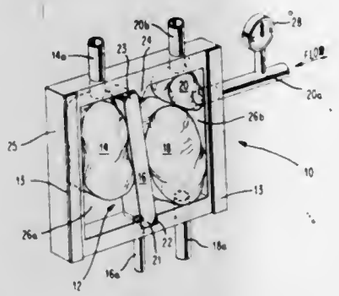
1. Fluid apparatus for sensing the presence of an aperture extending through a body, which comprises:



(a) a region in which the body can be selectively placed;

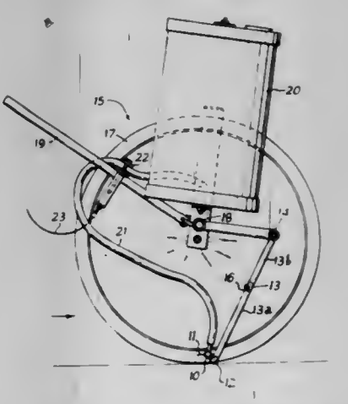
(b) a first fluid orifice having a predetermined first flow area which is located to one side of said region and oriented such that a fluid jet stream issuing therefrom will pass through a body aperture in alignment therewith to emerge at the opposite side of said region;

(c) a second fluid orifice having a predetermined second flow area which is located at the opposite side of said region in alignment with said first fluid orifice for receiving a fluid jet stream therefrom, said second orifice being spaced from the body a distance sufficient to provide a predetermined third flow area therebetween;



(d) a fluid recovery channel of predetermined volume connected to said second fluid orifice;

(e) fluid static pressure sensing means including means directly connected to said fluid recovery channel, said sensing means being in at least a first or a second state in response to a fluid static pressure of a first or a second value, respectively, in said fluid recovery channel; and

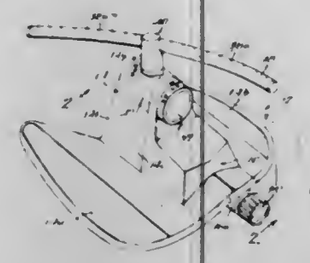


(f) a first pressurized fluid source connected to said first fluid orifice for producing a first fluid jet stream therefrom, and a second pressurized fluid source connected to said fluid recovery channel for producing a second fluid jet stream from said second fluid orifice, where the energies of the fluid from said first and second fluid sources are such, relative to each other, to said recovery channel predetermined volume, and to said first, second, and third flow areas, that fluid in said recovery channel any time substantially comes only from said second fluid source and is at either said one or said second static pressure value in response to the respective absence or presence of said first fluid jet stream impingement on said second fluid orifice so that fluid from said second fluid source is the sole fluid acting on said pressure sensing means.

3,270,961
PNEUMATIC TUBING MEMORY
Arnold Schonfeld, Levittown, Pa., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Nov. 17, 1964, Ser. No. 411,846
7 Claims. (Cl. 235—201)

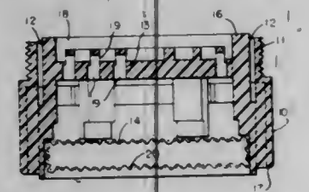
1. A fluid memory unit comprising: a housing; a memory element within said housing and movable between two stable states within said housing, and responsive to fluid pressure to be locked in either state; said memory element comprising a flexible semi-rigid element having a fluid inlet conduit whereby fluid pressure may be introduced into the element to effect the locking thereof in either of its stable states; a first fluid responsive means within said housing for moving the memory element from a first state to another; a second fluid responsive means within said housing for returning the memory element to its first state; said first and second fluid responsive means comprising flexible elements positioned on opposite sides of said memory element and each having a conduit for introducing fluid pressure therein to expand the selected fluid responsive means whereby the memory element is moved; and fluid flow means cooperating with one of said fluid responsive means to sense the state of said memory element.

3,270,962
APPLICATOR
Robert Watts, Fernhurst, England, assignor to Imperial Chemical Industries Limited, Millbank, London, a corporation of Great Britain
Filed Nov. 29, 1962, Ser. No. 241,007
Claims priority, application Great Britain, Dec. 8, 1961, 44,005/61
1 Claim. (Cl. 239—165)



A device for applying liquid weedkiller to the ground between adjacent rows of growing plants while preventing undesirable application of liquid weedkiller to said plants comprising: a vehicle and a distributor assembly; means pivotally securing said distributor assembly to said vehicle for free vertical movement thereof in response to ground irregularities, said distributor assembly comprising at least one longitudinally slidably telescopically adjustable distributor tube extending generally transversely with respect to said rows and being shorter than the distance between said rows, means defining an inlet orifice on said tube; a supply tank on said vehicle for receiving liquid weedkiller; means communicating said supply tank with said inlet orifice; means defining a plurality of generally downwardly directed discharge orifices spaced from one another along said tube; and means on said tube arranged to engage the ground at each end of said tube to support said tube a short distance thereabove to thereby prevent clogging of the discharge orifices by dirt and undesirable application of liquid weedkiller to the plants.

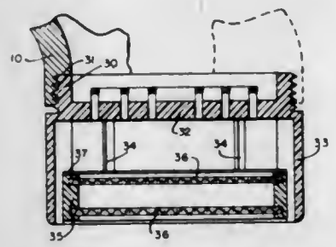
3,270,963
LAWN SPRINKLER
Ivar Jepson, Oak Park, Ill., assignor to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Filed Apr. 18, 1962, Ser. No. 188,407
12 Claims. (Cl. 239—242)



1. An oscillating sprinkler comprising an elongated spray tube, carrier means for said spray tube pivotal about a horizontal axis, a water motor operable to oscillate

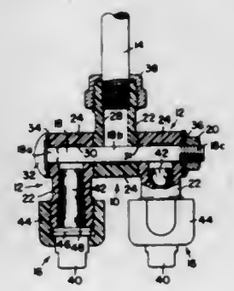
said carrier about said axis, means mounting said spray tube on said carrier for selective manual positioning at various angles to said axis, and means defining a water

conduit for supplying water to said spray tube, said last-mentioned means being water sealed at any of said various angles of positioning of said spray tube.



3,270,964
MOLDED WATER AERATORS
Elie P. Aghnides, 46 W. 54th St., New York 19, N.Y.
Filed Jan. 31, 1962, Ser. No. 170,140
5 Claims. (Cl. 239—428.5)

4. A water aerator comprising, an annular generally cylindrical casing, a circular diaphragm integral with the side walls of said casing and transverse to the axis of said casing near its inlet end, said diaphragm defining a plurality of tortuous paths for water to thereby break up the stream of water into a plurality of high velocity jets, said side walls defining a first annular passageway therein which extends from the inlet end of said aerator parallel to the axis of said casing and terminates downstream of said diaphragm, said first annular passageway communicating with the hollow interior of said annular casing downstream of said diaphragm, said side walls of said casing also defining a second annular passageway extending from the discharge end of said aerator also parallel to the axis of said aerator and terminating upstream of the downstream end of said first annular passageway, said first annular passageway having an outer diameter which at least equals the inner diameter of said second annular shell passageway to thereby provide an air flow path from the discharge end of said aerator to the interior of said casing downstream of said diaphragm, means joining the opposing side walls of at least one of said annular shell passageways at a plurality of places around the circumference of said casing, and mixing means including at least one mixing screen in frictional engagement with the side walls of said casing near its discharge end for thoroughly admixing the water jets and air to provide a bubble-laden stream of water.



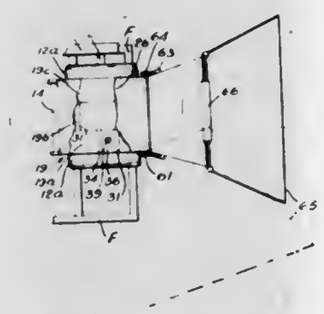
3,270,965
SELF-SEALING AND DEPOSIT-PROOF AERATOR
Elie P. Aghnides, 46 W. 54th St., New York 19, N.Y.
Filed Feb. 5, 1963, Ser. No. 256,343
20 Claims. (Cl. 239—428.5)

18. A device for producing a coherent jet of water containing air bubbles comprising, a casing having an inlet end adapted for connection with the discharge end of a tube containing water under pressure and being in the form of a metal faucet having outside threads and with an outlet end adapted to discharge said coherent jet, said casing having threads on its inside wall adapted to mate with those on the faucet, said casing including a sealing portion adapted to engage the lower end of the faucet and thus seal the casing to the faucet and require substantially all of the water to flow downstreamwardly through the casing, a diaphragm at the upstream end of said casing having at least one orifice through which the stream of water is adapted to be forced into the casing with substantial velocity, an air inlet means opening into the chamber through which air is induced by the stream of water, and means in the path of the stream of water after it leaves the orifice and before it discharges at the outlet end for finely breaking up the water and for offering sufficient resistance for throughly mixing it

with air and for thereafter uniting the aerated water to form a coherent jet having small bubbles disseminated throughout the jet, the resistance offered by the said means and the cross-sectional area of the orifice being proportioned to effect the entrainment and mixing of the air with water before their discharge from said outlet end, substantially all surfaces of said casing and of said diaphragm which are exposed to water comprising a yieldable, moldable synthetic polymer plastic which is resistant to the accumulation of calcium deposit thereon to prevent calcium deposits from forming which might impair the aforesaid proportioning, said air inlet means defining an air passageway extending downstreamwardly from the threads on the casing to the bottom end of the aerator to thus discharge through said air passageway any water that should leak past the seal effected between the said sealing portions and said faucet.

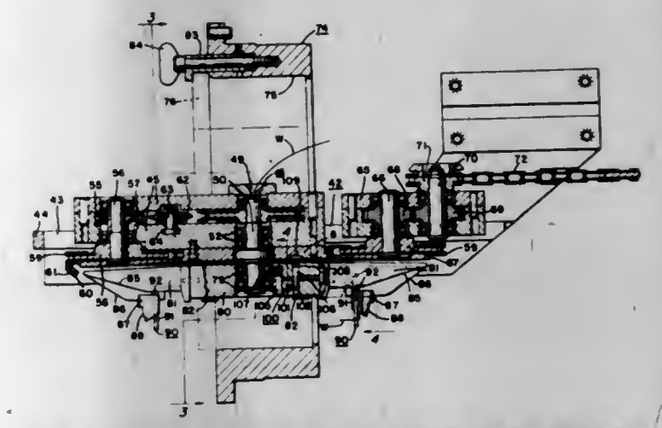
3,270,966
SPRAYER NOZZLE
John W. Ackley, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Filed July 15, 1964, Ser. No. 382,885
6 Claims. (Cl. 239—550)

1. A spray nozzle construction comprising: a plurality of substantially identical nylon bodies including one inlet body and at least one outlet body, each of the bodies being of generally T-shaped configuration having a leg portion and a transverse head portion, a transverse



aperture extending entirely through the head portion and a longitudinal aperture extending entirely through the leg portion and extending into communication with said transverse aperture, the leg portion of each of the bodies being provided with a threaded external surface and a threaded internal surface, a drop pipe threaded at one end and matingly engaged with the threaded internal surface of the inlet body, fastener means holding the head portions of said inlet and outlet bodies together whereby the transverse apertures are in communication with each other, spray tip means, and spray tip cap means holding said spray tip means at the end of said outlet body means, said spray tip cap means including an internally threaded bell-shaped portion matingly engaged with said external threads on said outlet bodies.

3,270,967
GAS BURNERS
Albert Westerman, Normanton, and Douglas Harrison, Leeds, England, assignors to Geo. Bray & Co. Limited, Leeds, England, a British company
Filed Jan. 10, 1964, Ser. No. 337,503
Claims priority, application Great Britain, Jan. 18, 1963, 2,357/63
8 Claims. (Cl. 239—560)

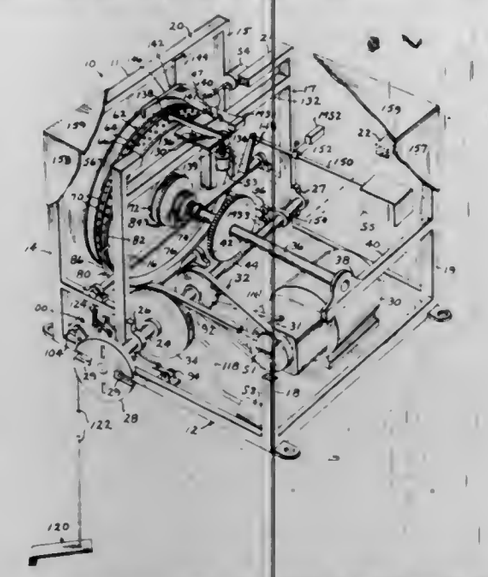


1. A gas burner having a plurality of symmetrically arranged flame ports each having a diameter of the order of 0.030 to 0.060 of an inch and being formed in a strip of heat resisting metal such that each flame port diameter is between 0.8 and 2.0 times the thickness of the metal strip, the flame ports being spaced at centres of between 2 and 4 times the flame port diameter.

3,270,968
BRUSH CHIPPING MACHINE
Norman E. Hess and Dean L. Larsen, Saginaw, Mich., assignors to Mitts & Merrill, Saginaw, Mich., a corporation of Michigan
Filed May 20, 1963, Ser. No. 281,433
11 Claims. (Cl. 241—186)

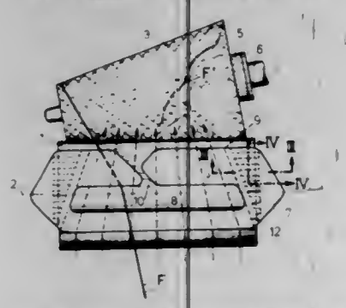
6. In a brush chipper machine; housing means; revolvable cylinder means therein; a material feeding surface for said housing means leading in toward said cylinder means, said material feeding surface including throat bar means with a leading edge adjacent the path of said cylinder means; actuating means having a tapered surface engageable with a cooperative surface on said throat bar means for moving said throat bar means toward said cylinder means; said cylinder means having a plurality of openings therein at spaced intervals around the periphery thereof; a chipping knife received in each opening and extending a predetermined distance peripherally beyond the cylinder means; and anchor means received in each opening and bearing against each knife to hold it in position.

3,270,969
POLYPHASE STATOR WINDING APPARATUS
Paul B. Greene, Miamisburg, and Lewis H. Le Valley, Albert B. Mewhinney, and Emmet C. Nevin, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Original application Dec. 4, 1962, Ser. No. 242,236, now Patent No. 3,210,020, dated Oct. 5, 1965. Divided and this application Nov. 2, 1964, Ser. No. 408,040
5 Claims. (Cl. 242—1.1)



1. In a polyphase stator winding apparatus including a cantilever supported winding head structure having a snorkel member with an axial wire passage and a wire guiding shoe portion pivotally connected to said snorkel member in a spaced relationship from said winding head structure with said wire guiding shoe portion being movable toward and retractable from a magnetic stator core during progressive placement of wire conductors into slots of said core, and interlocking means selectively interconnecting said winding head structure and said wire guiding shoe portion comprising, a recessed area within one of the adjacently spaced surfaces of said winding head structure and said wire guiding shoe portion, and a movable pin means aligned with said recessed area and projecting from the other of said adjacently spaced surfaces, the projecting end of said pin means being receivable within the recessed area and engageable therewith to restrain lateral turning movement of the wire guiding portion about the pivotal support when the wire guiding portion is retracted from the slots of said stator core.

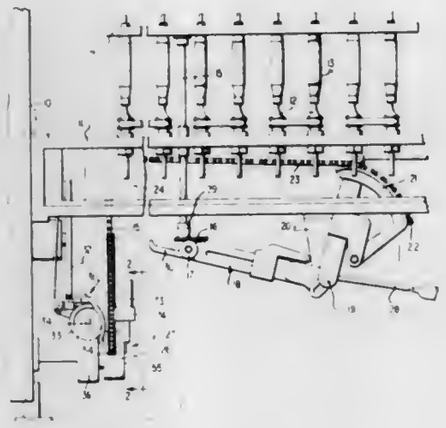
3,270,970
AUTOMATIC COIL WINDER
Chester A. Luke, 1124 St. Charles, Oklahoma City, Okla.
Filed Nov. 26, 1963, Ser. No. 325,996
5 Claims. (Cl. 242—9)



1. A coil winding machine, comprising: a frame; a spindle journaled by the frame and projecting outwardly of the frame at one end; a coil form holding head secured to the outwardly projecting end of said spindle; a variable speed motor drivably connected with said spindle; brake means on said spindle; a cam on said spindle; an indexing shaft journaled by the frame; gears connecting said index shaft to said spindle; pinwheel counting means supported by the frame coaxial with respect to said index shaft; clutch means interconnecting said index shaft and said pinwheel means; control means within the frame and having a control arm connected with said motor; and electrical components connected with a source of electrical energy for stopping said motor at a predetermined setting of said counting means, said electrical components

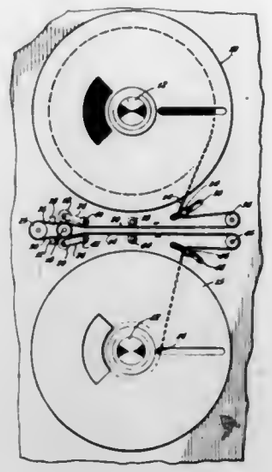
including a solenoid operatively connected with said brake means and said control arm, a first normally open switch closed by the rotation of said counting means at a predetermined setting, a second normally open switch

connected in series with said first switch and closed by said cam completing a circuit with a source of electrical energy and energizing the solenoid connected with said control arm.



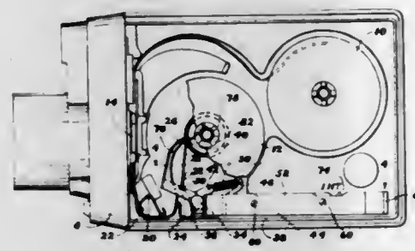
3,270,971
YARN OR THREAD GUIDING APPARATUS FOR A WINDING LOCATION
Rudolf Jenny, Thalwil, Zurich, Switzerland, assignor to Schweiter Engineering Works Ltd., Horgen, Switzerland, a corporation of Switzerland
Filed June 4, 1964, Ser. No. 372,484
Claims priority, application Switzerland, June 18, 1963, 7,568/63
10 Claims. (Cl. 242—18)

1. Yarn guide apparatus comprising, in combination, a rotatable grooved drum located at a winding location, a curved yarn guide plate increasingly curved inwards in the direction of rotation of said grooved drum arranged in front of said grooved drum, said yarn guide plate having curved frontal surfaces and lateral bounding means cooperating with the surface of said grooved drum such as to form and limit a passage extending in the direction of rotation of said grooved drum which narrows in such direction of rotation.



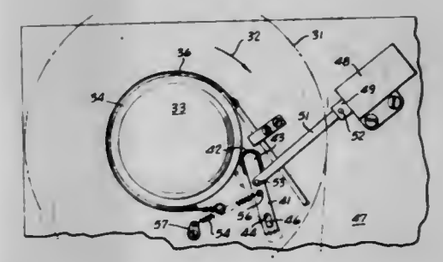
3,270,972
APPARATUS FOR REWINDING BUILDER CHAIN OF SPINNING MACHINE
Otto E. A. Edler, Greenville, and Coy V. Jones, Sr., Greer, S.C., assignors to Southern Machinery Company, Greer, S.C., a corporation of South Carolina
Filed June 5, 1964, Ser. No. 372,972
15 Claims. (Cl. 242—26.1)

1. In a spinning frame having a movable ring rail to lay yarn on bobbins for building the same, lift means connected with the ring rail and constantly biasing it upwardly, a builder motion to dictate the movement of the ring rail in coordination with the lift means and including a fixed arm, and a builder chain interconnecting the lift means and builder motion, the improvement comprising a support shaft fixed to said arm, a sleeve member rotatably mounted upon said shaft, builder motion gearing connected with the sleeve member to turn the same in one direction, a one-way active clutch on the sleeve member to turn therewith in said one direction and being active in that direction and freely turning in the reverse direction, a builder chain pulley on said clutch and driven thereby positively in said one direction to unwind the builder chain from the pulley, said chain secured to the pulley and windable and unwindable thereon, a separate one-way active brake means interconnecting said pulley and shaft and allowing free turning of the pulley in one direction to unwind the chain and preventing reverse turning of the pulley in the direction which said one-way clutch is free to allow, and power-operated means to release the brake means at a predetermined time after the chain is substantially fully unwound from the pulley to allow reverse turning thereof relative to said shaft and sleeve member in the direction permitted by the one-way clutch, resilient means connected with the pulley and building up energy during turning of the pulley in said one direction to unwind the pulley and automatically turning the pulley in the opposite direction to rewind the chain thereon when said power-operated means releases said brake means.



3,270,973
TAPE TRANSPORT MECHANISM FOR MULTIPLE TAPE WIDTHS
Frank Dekker, Inglewood, Calif., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware
Filed Apr. 21, 1964, Ser. No. 361,478
17 Claims. (Cl. 242—55.12)

1. In a tape transport system for quick conversion from handling a relatively narrow tape on a pair of relatively thin reels to handling a relatively wide tape on a pair of relatively thick reels, the combination of:
two hub assemblies to engage and mount the two pairs of reels interchangeably;
means including a drive capstan to engage and drive the narrow tape and the wide tape interchangeably; and
a plurality of guide means located and shaped to guide the tapes from one of the reels to the drive capstan and from the drive capstan to the other reel,
at least a portion of each of at least some of the guide means being rotatable between one operating position presenting a pair of shoulders spaced apart for slidingly confining the opposite longitudinal edges of the narrow tape and a second operating position presenting a pair of shoulders spaced apart for slidingly confining the opposite longitudinal edges of the wide tape.



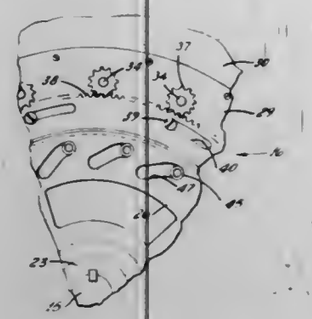
3,270,974
SELF-THREADING CAMERA
John H. Eagle, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Oct. 30, 1963, Ser. No. 320,026
5 Claims. (Cl. 242—71)

1. In a self-threading motion-picture camera of the type in which film chute means is engageable with a film take-up spool to releasably hold the spool against rotation and direct film into a film receiving slot in the hub of the spool as the film is fed by a drive motor having selective run and stop conditions and connected by a tendency drive to the take-up spool, the improvement comprising means interconnecting said film chute means to said drive motor for controlling the operation of the motor in accordance with movement of said film chute between (a) a first position in which it starts said drive motor, releasably holds said take-up spool and directs said film into said slot, (b) a second position in which it releases said take-up spool for rotation by said drive motor for winding said fed film onto said hub, and (c) a third position in which it stops said motor.

3,270,975
INCHING DEVICE FOR A REEL
John D. Sperry, Los Altos, and Martin Siegel, San Mateo, Calif., assignors to Ampex Corporation, Redwood City, Calif., a corporation of California
Filed Aug. 23, 1963, Ser. No. 304,111
5 Claims. (Cl. 242—75.4)

1. A reel brake comprising:
a base on which said reel is mounted for rotation;
a brake drum coupled to said reel for rotation therewith;
a pivot pin mounted on said base in spaced relation to said drum;
a brake shoe in the form of an arm provided with a longitudinal slot defining a pair of parallel bearing surfaces and mounted thereby for pivoting and lengthwise sliding of said surfaces on said pin, said arm extending from said pin toward said drum in the winding direction of said reel;
said arm having a retracted position with said pin engaging the end of said slot remotest from said drum and the extending end of said arm pivoted slightly away from said drum, a first limiting position of engagement with said drum with said pin engaging said end of said slot remotest from said drum, and a second limiting position of engagement with said drum with said pin engaging the end of said slot closest to said drum;
means coupled to said arm for moving said end of said arm in said winding direction of said reel and away from said drum to said retracted position of said arm, and for releasably holding said arm in said retracted position, said means including a solenoid mounted on said base and having a plunger

coupled to said arm and an energized position corresponding to said retracted position of said arm; and
a tension spring having one end coupled to said arm and the other end extending from said arm in the unwinding direction of said reel and anchored to said base, the line of urging of said spring on said arm being inclined toward said drum and defining an angle β of inclination with respect to the plane of one of said bearing surfaces, said angle β opening toward said drum and being chosen so that in all of the engaged positions of said drum and arm



$$180° > \beta > \arctan \frac{a+b}{b \tan \alpha}$$

where α is the lesser dihedral angle between said plane and a plane tangential to said drum at the point of engagement of said arm and drum, a is the moment arm between said point and the point of coupling of said spring to said arm, and b is the moment arm between said last-named point and the point of engagement of said arm and pin.

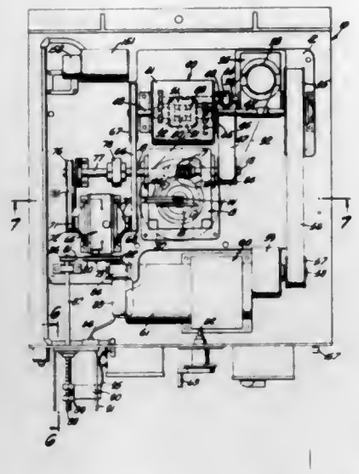
3,270,976
WINDING DRUM
Rolland H. Smith, Broomall, Pa., assignor to FMC Corporation, Philadelphia, Pa., a corporation of Delaware
Filed Dec. 1, 1964, Ser. No. 415,139
5 Claims. (Cl. 242—78.1)

5. Winding apparatus comprising an inner hub and rim section and an outer section mounted on the inner section for limited oscillation with respect thereto, said outer section comprising means forming a surface adapted to have strip material wound thereupon, means for rotating the inner section and for stopping the inner section, said outer section lagging behind the inner section at the start of rotation and overrunning the inner section when the

winding is stopped, and strip end gripping means articulated to both said inner and outer sections, said gripping means being moved into strip end gripping position when

said outer section lags behind said inner section and into non-gripping position when said outer section overruns said inner section.

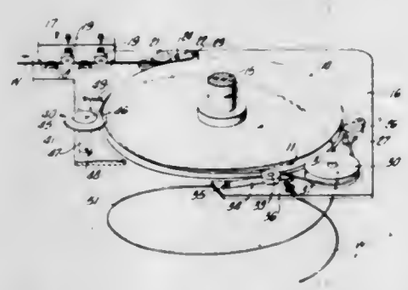
3,270,977
STRAND DISTRIBUTING DEVICE FOR OPEN-TOP CONTAINERS
Manley B. Tillou II, Buffalo, N.Y., assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York
Filed May 6, 1964, Ser. No. 365,335
5 Claims. (Cl. 242—82)



1. A device for deflecting a strand into an open-top container, comprising:

a plate spaced from and mounted for rotation about a substantially vertical axis, the plate being gradually curved inwardly so as to intersect the vertical axis at an oblique angle, and

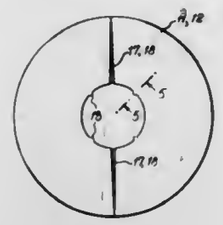
means for rotating the plate about the vertical axis.



3,270,978
WIRE-COILING MACHINE WITH DIFFERENTIAL DRIVE
Donald P. Whitacre, 1013 N. Margarita Ave., Alhambra, Calif.
Filed Oct. 28, 1964, Ser. No. 407,103
9 Claims. (Cl. 242—82)

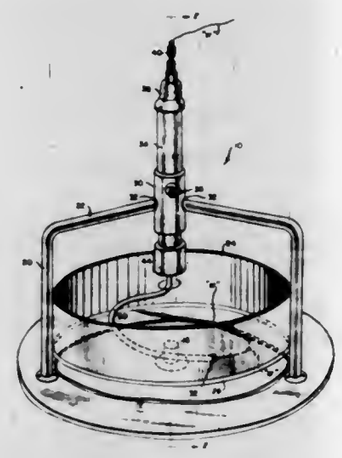
1. In a wire-coiling machine, the combination of: a block mounted to rotate about a vertical axis, a rotary-flyer assembly mounted to rotate about said axis for wrapping wire upon said block, a differential drive device having a first driven member connected to said block and a second driven member connected to said rotary-flyer assembly, said differential drive device having a power input

member, means for driving said power input member, and adjustable control means for regulating the speed ratio between said block and said rotary-flyer assembly.



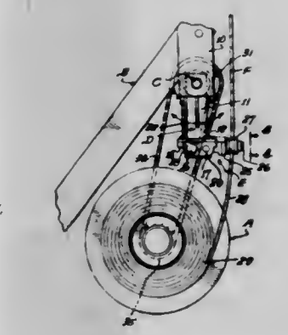
3,270,979
WIRE COILING MACHINE HAVING GROOVED BLOCK
Donald P. Whitacre, 1013 N. Margarita Ave., Alhambra, Calif.
Filed Dec. 14, 1964, Ser. No. 417,874
12 Claims. (Cl. 242—82)

1. Apparatus for controlling the feed rate of a continuous wire, comprising: a block having a continuous peripheral groove, means to guide the wire into the groove, a pulley positioned adjacent the periphery of the block and having a diameter substantially less than the diameter of the block, a casting roller, a pressure roller, the said guide means, pulley, casting roller and pressure roller being circumferentially spaced about said block in the order named and supported substantially in the plane of said groove, the wire passing from said groove around a portion of the pulley remote from the block, then around a portion of the casting roller adjacent said block, and then back into said groove, said pressure roller having a peripheral portion extending into the groove and contacting the wire under pressure to hold it in the groove, the wire then emerging from said groove.



3,270,980
SPOOL FOR THREADS, YARNS AND THE LIKE
Michael R. Philips, Park Ridge, N.J., assignor to Jonathan Temple & Co. Inc., Hackensack, N.J., a corporation of New Jersey
Filed Mar. 25, 1965, Ser. No. 442,737
9 Claims. (Cl. 242—118.7)

1. A spool for serving thread or yarn to a wire, said spool being a molded thermo-plastic organic composition and comprising a hollow cylindrical core and a pair of flanges one at each end of said core, the inner surface of said core being slightly tapered from one end to the other and having ridges directly on said tapered surface spaced circumferentially about the inner surface of said core and extending approximately from end to end of said core, said ridges tapering complementary to the taper of

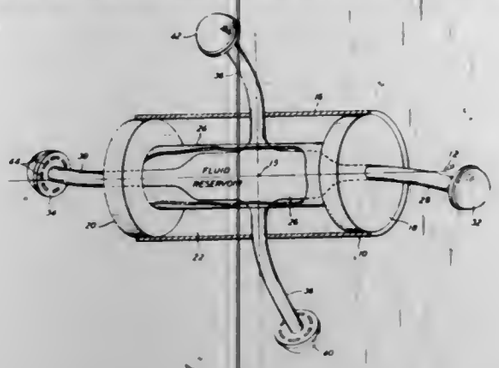


the inner surface of said core, the inner edges of said ridges lying in a cylindrical surface to rest on the outer surface of a supporting spindle and being distortable to accommodate a spindle of slightly larger diameter than that of a cylindrical surface tangent to the inner edges of said ridges.

3,270,981
WIRE UNCOILING APPARATUS
Archie Lee Perren, Lemont, Edmund Frank Mokersky, Chicago, and Mitchell J. Shepard, Hinsdale, Ill., assignors, by mesne assignments, to Rockwell-Standard Corporation, a corporation of Delaware
Filed Jan. 27, 1964, Ser. No. 340,339
2 Claims. (Cl. 242—128)

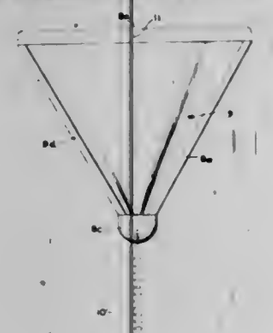
1. Apparatus for feeding a wire from a coil comprising a base on which said coil may rest, a frame structure detachably carried by said base and extending upwardly therefrom, an essentially cylindrical wall carried by said frame structure for confining said wire coil, a hollow tubular support member fixedly supported by said frame structure in axial alignment with said coil, a fixed exit throat member carried by the upper end of said hollow support member, hollow tubular wire guide means, means carried by the lower end of said hollow support member supporting said guide means for rotation coaxially of said coil, said hollow tubular guide means having an internal passage for said wire, said guide means having an inlet portion extending essentially tangentially of said coil, an outlet portion extending axially of said coil, and a smoothly, curved intermediate portion connecting said inlet and outlet portions, said outlet portions communicating with the interior of said support member whereby when said wire is pulled through said exit throat member, said guide means is caused to move in the direction opposite to the direction in which said wire is coiled and said wire passes through said guide means, thence along the length of said hollow support member and through said fixed exit throat member.

3,270,982
CABLE WINDING APPARATUS FOR CABLE DRUMS OF SEWER CLEANING MACHINES
Charles J. Prange, Lima, Ohio, assignor to Flexible Sewertool Corporation, Lima, Ohio, a corporation of Ohio
Filed Mar. 6, 1964, Ser. No. 349,965
9 Claims. (Cl. 242—158.3)



1. Sewer cleaning drag bucket hoist apparatus comprising: a cable-winding drum; a guide for receiving a stretch of cable extending tangentially from the drum; a double-helix scroll shaft on which said guide is mounted for reciprocating movement in response to rotation thereof; means supporting said scroll shaft in a position parallel to the axis of said drum, said supporting means being movable transversely with reference to a radius of said drum to effect shifting movements of said guide so as to follow movements of said cable stretch corresponding to changes in the radial distance from the axis of said drum to the point of tangency of said cable stretch with the cable-wound periphery of the drum in accordance with changes in the amount of cable wound upon the drum; and means transmitting rotary drive from the drum to said scroll shaft to rotate the same in timed relation to drum rotation, said scroll shaft supporting means being disposed above said drum and comprising a swing and fixed supporting pivot means from which said swing is free-hanging, depending toward the drum with its lower portion clearing the upper side of the drum, said scroll shaft being mounted in said lower portion of the swing.

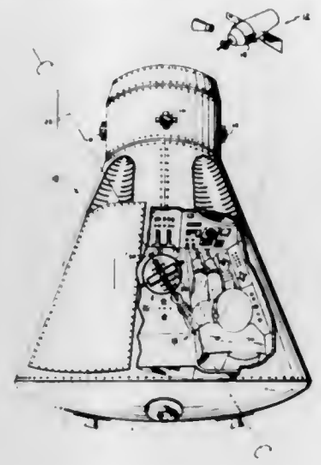
3,270,983
APPARATUS FOR REDUCING SPIN OF A SPACE SATELLITE
Robert T. Adams, Short Hills, N.J., and Gordon Raisbeck, Lexington, Mass.; said Adams assignor to International Telephone and Telegraph Corporation, New York, N.Y., a corporation of Maryland, and said Raisbeck assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Nov. 1, 1961, Ser. No. 149,416
11 Claims. (Cl. 244—1)



5. In a spinning space satellite, means for reducing the spin of said satellite comprising a reservoir of fluid under pressure located within said satellite, at least one normally straight flexible tube connected to said reservoir, said tube attached to and protruding radially from the surface of said satellite, and a recurved nozzle terminating said flexible tube to redirect the fluid expelled by said nozzle tangential to the axis of said tube when the satellite is not spinning such that the Coriolis force exerted

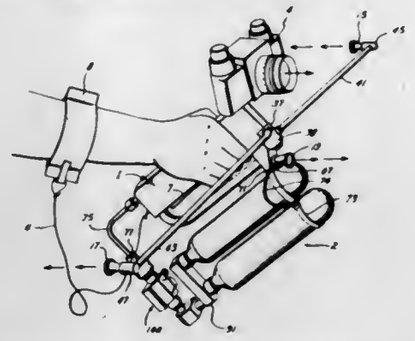
upon the fluid flowing through said tube during rotation of said satellite orients said nozzle to expel fluid in a di-

rection to produce a torque counteracting the spin of said satellite.



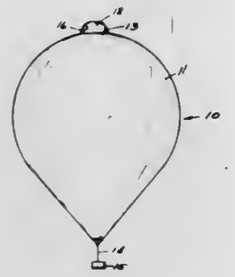
3,270,984
GRAVITY GRADIENT SATELLITE DAMPING DEVICE
James E. Rice, Cuyahoga Falls, Ohio, assignor to Goodyear Aerospace Corporation, Akron, Ohio, a corporation of Delaware
Filed Dec. 13, 1963, Ser. No. 330,402
5 Claims. (Cl. 244—1)

5. In a satellite damping system, the combination of a satellite,
a mass means,
a helically coiled spring having one end operatively connected to the satellite and the other end operatively connected to the mass means, said spring adapted to effect rotary motion to said mass means as defined by the period of oscillation of said satellite and the rotational inertia of said mass means to achieve a maximum cross-coupling of rotation to extension ratio of the spring, and
means operatively carried by said mass means which displaces upon rotation of said mass means to effect friction losses.



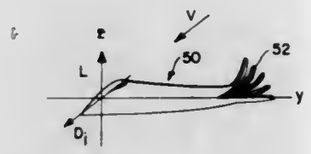
3,270,985
REACTANCE CONTROL SYSTEM
Richard Schmidt, Madison, Ala., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Dec. 26, 1963, Ser. No. 333,770
19 Claims. (Cl. 244—1)

1. In combination with a craft adapted to move through a fluid or substantial vacuum, a reactance attitude control system for controlling the angular movement of said craft around a predetermined axis thereof, comprising:
(a) bearing means mounted on said craft,
(b) reactance producing means mounted on said bearing means and adapted to be placed in rotation about an axis parallel to said predetermined axis,
(c) a source of potential energy attached to and carried by said craft for placing said reactance producing means in rotation;
(d) coupling means for selectively connecting said source of potential energy to said reactance producing means thereby placing said reactance producing means in rotation,
said craft being moved about said predetermined axis by the reactance force produced by said reactance producing means;



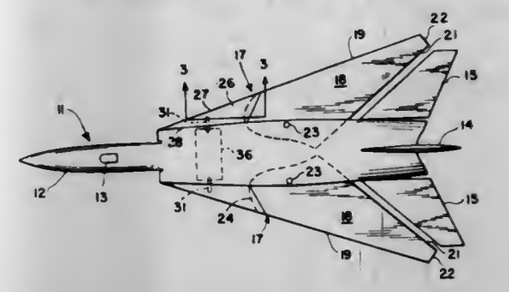
(e) energy storage means mounted on said craft for receiving and storing the kinetic energy contained in said rotating reactance producing means; and
(f) means for connecting said rotating reactance producing means to said energy storage means so that the kinetic energy of said reactance producing means is removed therefrom and stored in said energy storage means and the movement of said craft is thereby stopped at a predetermined angular position.

3,270,986
HAND-HELD SELF-MANEUVERING UNIT
Harold I. Johnson, Seabrook, and William C. Huber, League City, Tex., assignors to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Dec. 3, 1965, Ser. No. 511,567
10 Claims. (Cl. 244—4)



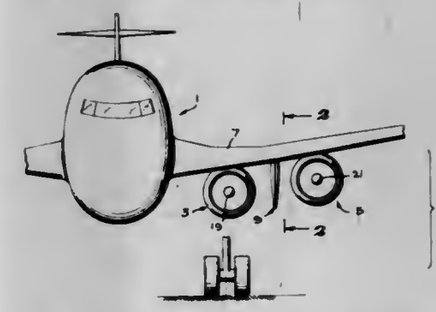
1. A propulsion and attitude control device for hand supported use by an astronaut in a reduced gravity environment comprising:
a housing having conduits therein for conducting fuel to reaction nozzle means;
reaction nozzle means affixed to said housing in operative communication with said conduits, said nozzle means adapted to emit pressurized gas so as to impart thrust to the unit; and
an actuation means operatively connected to said housing for selectively directing fuel through said conduits to said nozzle means to thereby control translational and orientating movements of the astronaut.

3,270,987
BALLOON STRUCTURE WITH DISTRIBUTED EXCESS MATERIAL
John R. Winckler, Minneapolis, Minn., and James A. Winker, Sioux Falls, S. Dak., assignors to Raven Industries, Inc., Sioux Falls, S. Dak., a corporation of South Dakota
Filed Dec. 14, 1964, Ser. No. 418,081
8 Claims. (Cl. 244—31)



1. A balloon structure comprising in combination,
a balloon envelope formed of a lightweight thin flexible material,
said envelope having a lower body portion and an upper dome portion with a smaller circumference than the body portion and forming a bubble at the top end of the balloon envelope,
said dome portion being inflated at launching of the balloon and said body portion inflating after launching as the gas within the dome portion expands at higher altitudes,
means for supporting a payload from the balloon envelope below the body portion,
said envelope formed of a plurality of one-piece vertical gores of thin flexible film extending from the lower to the upper end of the balloon and joined at their side edges in seams with the gores shaped along the overall length to form said body and dome portions.

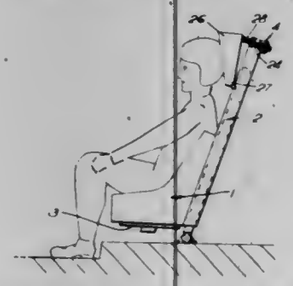
3,270,988
MINIMUM INDUCED DRAG AIRFOIL BODY
Clarence D. Cone, Jr., Hampton, Va., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Dec. 26, 1962, Ser. No. 247,423
3 Claims. (Cl. 244—35)



1. Improved means for reducing the induced-drag of a conventional wing configuration without excessively increasing wing surface areas comprising: a wing semispan of substantial planar configuration; and an unconventional split wing tip configuration having a plurality of separate winglets with different radii of curvature integrally formed with the wing semispan and collectively positioned vertically in a plane normal to the freestream velocity and disposed in the plane containing the wing span to insure reduced induced drag.

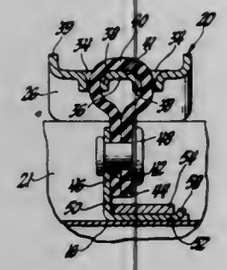
3,270,989
VARIABLE SWEEP AIRCRAFT
Edward C. Polhamus, Newport News, and Alexander D. Hammond, Hampton, Va., assignors to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Mar. 30, 1965, Ser. No. 444,087
10 Claims. (Cl. 244—46)

1. A variable sweep aircraft comprising:
a fuselage having a fineness ratio suitable for supersonic flight,
propulsion means carried by said fuselage,
an empennage assembly carried by said fuselage adjacent the after end thereof,
a wing connected to each side of said fuselage and projecting substantially horizontally and outwardly therefrom,
each said wing including a main wing panel and a forward auxiliary wing panel,
each said main wing panel having a straight leading edge pivotally connected to said fuselage for rotation in a substantially horizontal plane between a low-sweep position and a high-sweep position,
each said auxiliary wing panel having a straight leading edge and pivotally connected at a single pivot point substantially intermediate the length thereof to said fuselage for rotational movement only about said single pivot and in a plane substantially perpendicular to the horizontal rotative plane of said main wing panel, and
means engaging the trailing edge of said auxiliary wing panel and said leading edge of said main wing panel for combined contributory aircraft lift when said main wing panel is in said high-sweep position.



3,270,990
ABSORPTIVE SPLITTER FOR CLOSELY SPACED SUPERSONIC ENGINE AIR INLETS
James E. Webb, Administrator of the National Aeronautics and Space Administration with respect to an invention of Howard Kastan
Filed Dec. 8, 1964, Ser. No. 416,946
4 Claims. (Cl. 244—53)

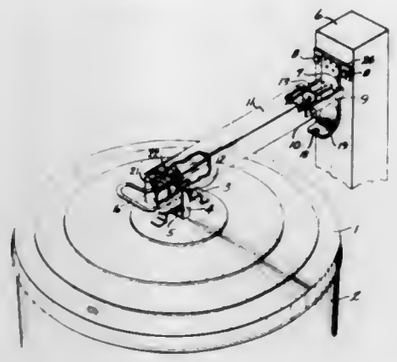
1. A supersonic aircraft having at least two jet engines mounted thereon in close proximity to one another:
(a) an absorptive barrier assembly mounted on said aircraft and disposed between said two engines, said assembly comprising:
(1) a solid plate and



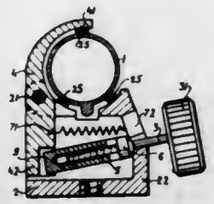
(2) perforated and arcuate side panels mounted to the sides of said plate to form shock cavities that absorb any shock waves generated by the engines.

3,270,991
EJECTION SEATS
James Martin, Southlands Road, Denham, near Uxbridge, Middlesex, England
Filed Aug. 5, 1965, Ser. No. 477,417
Claims priority, application Great Britain, Aug. 5, 1964, 31,742/64
4 Claims. (Cl. 244—122)

1. An ejection seat comprising a seat frame and a seat pan mounted thereon; an ejection gun for effecting at least initial ejection of the seat from an aircraft; at least one auxiliary rocket motor positioned on said seat to produce thrust in a direction such as to cause variation of the flight path of the seat; actuating means for initially firing said auxiliary rocket motor and such means being sensitive to aerodynamic forces in excess of a predetermined value.



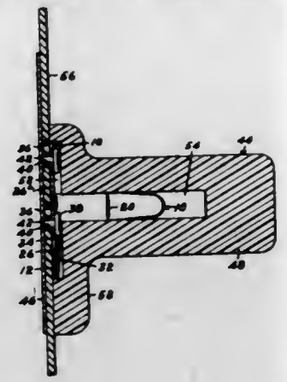
3,270,992
EXHAUST SYSTEM HANGER
Thomas R. Cassel, Birmingham, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Oct. 5, 1965, Ser. No. 493,143
3 Claims. (Cl. 248—60)



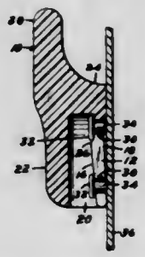
1. Hanger means for connecting a vehicle exhaust system to a vehicle body comprising, a support member mounted on said body and provided with a pair of openings therein, a loop member of flexible material received through said openings and having a surface thereof frictionally engaging the portion of said support member intermediate said openings, and means securing said exhaust system to said loop member, said loop member being relatively movable with respect to said portion of said support member in response to exhaust system vibrations to thereby frictionally damp said vibrations.

3,270,993
GARBAGE CAN LID MOUNTING
Ernest R. Montague, Moses Lake, Wash., assignor of one-half to Fred C. Bindel, Moses Lake, Wash.
Filed Feb. 2, 1965, Ser. No. 429,821
8 Claims. (Cl. 248—147)

1. A garbage can lid mounting comprising an attachment securable to a support and having a pivot mounting, an arm connected to said pivot mounting for swinging between a substantially horizontal position and an upright position, means for supporting a garbage can lid on the swinging end of said arm, and latch means interengageable between said swinging arm and said attachment and including a latch member carried by said arm and first latch-engageable means carried by said attachment and engageable by said latch member to latch said swinging arm in upright position with the garbage can lid raised to open position, and second latch-engageable means carried by said attachment and alternatively engageable by said latch member to latch said swinging arm in its substantially horizontal position with the garbage can lid on a garbage can.

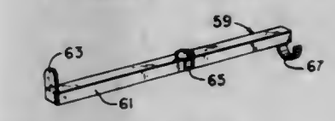


3,270,994
TRIPOD BASE
Antonin Machán and Ladislav Dubný, Prerov, Czechoslovakia, assignors to Meopta, národní podnik, Prerov, Czechoslovakia
Filed Aug. 25, 1964, Ser. No. 391,908
Claims priority, application Czechoslovakia, Aug. 27, 1963, 4,767/63
5 Claims. (Cl. 248—187)



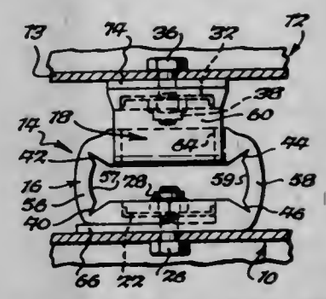
1. A tripod base for a photographic camera and the like, comprising
(a) base means having an outwardly disposed surface adapted to partly support a guiding rod of a camera or the like,
(b) a two-armed lever pivoted on said base means,
(1) one of the arms of said lever having a gripping surface to cooperate with said base means surface,
(c) operating means adapted to act upon the other of said lever arms to cause said lever to swing between two end positions,
(d) an abutment member on said operating means, adapted to bear against said base means and to position said lever in one of said end positions, while positioning said first named or gripping arm in gripping condition, said gripping arm being in a grip-releasing condition when said lever is in the other of said end positions, and
(e) spring means attached to said base means and said other or actuating lever arm to normally urge said gripping arm toward the grip-releasing position thereof.

3,270,995
SHELF SUPPORT
Stuart T. Shears, Belmont, Mass., assignor to United-Carr Incorporated, Boston, Mass., a corporation of Delaware
Filed Nov. 26, 1965, Ser. No. 509,732
2 Claims. (Cl. 248—224)



1. The combination of a fastening device and a support, said fastening device comprising a pair of studs and an adapter socket element, said adapter element socket having a base portion, a first and second slot formed through said base portion, said slots being spaced from each other along a long axis of said base portion, each of said slots comprising a large opening and a small opening connected by a necked channel, a locking tab extending from an edge of said base portion, over the area defined by said large opening of said first slot, said locking tab having a free engagement edge and lying on a plane in substantially parallel relation with said base portion, each of said studs having a head portion and a shank portion extending from said head portion in integral right angle therewith, said shank having a free end, each of said studs being secured at said free end of said shank to said support without perforation of said support, said large opening of said slots having a diameter greater than said head portion of said stud and said head portion being in abutting superposed relation to said base adjacent said small opening and said free engagement end of said locking tab being in approximate relation to said head portion of the stud engaged with said first slot and said fastening device having means of engaging an article to be held.

3,270,996
COAT HOOK AND ATTACHMENT
Wilmer H. Churchill, Wellesley, and Julius B. Wilhelmi, Nantasket, Mass., assignors to United-Carr Incorporated, Boston, Mass., a corporation of Delaware
Filed Dec. 1, 1965, Ser. No. 510,837
2 Claims. (Cl. 248—224)

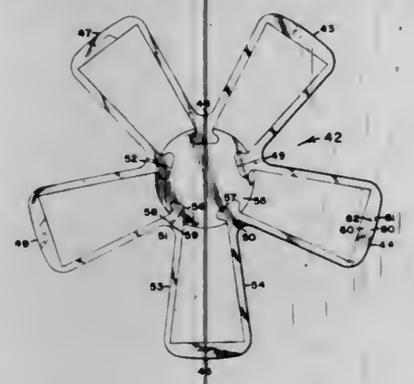


1. The combination of a fastening device, a support and an article, said article having a base portion, said base portion having an upper surface, sloped to provide a ramp, a lower surface in substantially parallel relationship with upper surface and a forward edge, a longitudinal slot extending through said base portion and extending from said forward edge, said fastening device including at least one stud, said stud comprising a head portion having a shank portion extending therefrom, said shank having a free terminal end, said stud secured at said terminal end of said shank to said support without perforating said support and said head portion overlying in abutting relation a portion of said upper surface of said base portion adjacent said slot and a portion of said shank portion lying within said slot and a part of said lower surface abutting said support.

3,270,997
SCAFFOLD DEVICE
Kenneth W. Gethmann, Gladbrook, Iowa
Filed Mar. 19, 1964, Ser. No. 353,192
6 Claims. (Cl. 248—235)

1. In a material support bracket,
an elongated horizontal member,
a plank retaining means extending upwardly from one end of said horizontal member,
a first sleeve segment secured to one side of said horizontal member adjacent to its other end,
and a second sleeve segment secured to said horizontal member at one side thereof intermediate its length
said first sleeve segment being arcuate about a horizontal axis and being open at its upper portion to receive a horizontal tubular member,
said second sleeve segment being arcuate about a vertical axis and having an open portion which opens in a direction towards said plank retaining means to receive a vertical tubular member.

3,270,998
ELASTOMERIC ISOLATOR
William A. Keetch, Ho-Ho-Kus, N.J., assignor to Robinson Technical Products, Inc., Teterboro, N.J., a corporation of New York
Filed Sept. 30, 1964, Ser. No. 400,330
4 Claims. (Cl. 248—358)



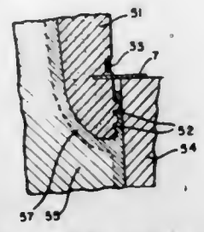
1. In a shock and vibration isolator, the combination of a yieldable element comprising at least two loops stacked vertically and fixed against rotation relative to one another about a vertical axis with the axes of said loops lying respectively in vertically spaced horizontal planes and disposed angularly with respect to one another, each of said loops being made of elastomeric material and comprising at least four walls hinged to one another in series along lines of intersection which extend parallel with the axis of said loop, two of said walls being in opposed generally horizontal relation to constitute upper and lower walls, the upper and lower walls respectively of the uppermost and lowermost of said loops being adapted to be connected to two objects between which it is desired to isolate vibration and shock loads; each of said loops having a plurality of grooves opening into the inner surface of said loop, one of said grooves being provided for each of said lines of intersection and each groove extending lengthwise along a line parallel with and adjacent the line of intersection for which it is pro-

vided, each of said grooves having the bottom thereof extending toward but terminating short of the outer surface of said loop adjacent the line of intersection between the respectively adjacent walls thereby providing in the vicinity of each line of intersection a wall portion having a thickness of elastomeric material which is substantially less than that of the thinnest portions of the respectively adjacent walls, said grooves being so shaped and disposed that incident to deflections of said objects toward or laterally with respect to one another which are greater than a predetermined amplitude at least one of said grooves in at least one of said loops will close thereby increasing the effective wall thickness in the vicinity of the line of intersection adjacent said closed groove at least to a thickness approximately that of the walls which intersect along said adjacent line of intersection.

3,270,999
SEGMENTED CORE FOR MOLDING A CAVITY IN A CAST SOLID PROPELLANT ROCKET MOTOR

Russell Fowler, James L. Bulfer, and Louis L. Ullman, Huntsville, Ala., assignors to Thiokol Chemical Corporation, Bristol, Pa., a corporation of Delaware

Filed Apr. 12, 1963, Ser. No. 272,771
2 Claims. (Cl. 249—61)



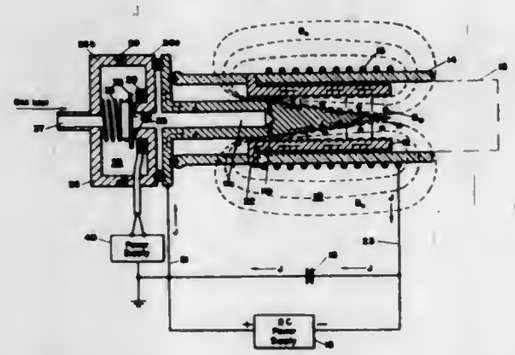
2. In a segmented core, a plurality of preformed sections that are adapted to be assembled into a unit of predetermined configuration for creating a cavity of preformed configuration in a cast solid propellant grain for a solid propellant rocket motor, a rigid centering member extending longitudinally of said core and said cavity, said centering member having a plurality of radially disposed cutouts, and the inner ends of said sections are to be positioned in said cutouts to detachably connect said sections directly to said centering member, the outer ends of said sections being in interlocking engagement with each other and wedge members coacting with the inner and outer ends of said sections to retain said sections in rigid relation to said centering member and with each other.

3,271,000
DISPOSABLE HOT TOP

Darold W. Thiem, Elm Grove, and Gordon W. Gottschalk, Hales Corners, Wis., assignors to Universal Refractories Corporation

Filed Aug. 13, 1963, Ser. No. 301,723
6 Claims. (Cl. 249—197)

1. The combination of a disposable hot top and an ingot mold, said mold comprising a metallic body having an opening in its upper end, said hot top comprising a sinkhead casing having a lower end of such shape and dimensions as to be adapted for insertion into the opening in the body of said ingot mold in close proximity to the inner surfaces of the walls of said opening, said casing comprising a formed structure of heat degradable refractory material having sufficient strength to withstand necessary handling and to contain molten metal when the ingot is poured, at least one half-round chill channel dam integral with and extending outwardly from the outer wall of said casing and encircling the lower portion thereof, independent support means holding the casing in position in the opening of the body of the mold with said chill channel dam spaced slightly from the inner surfaces of the walls of said opening and exposed to the molten metal



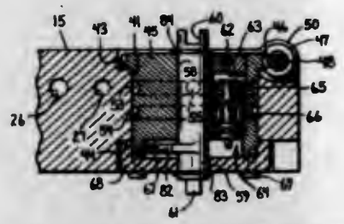
which rises in the space between the hot top and the walls of said opening, whereby the molten metal which is chilled by the wall of the ingot mold will set rapidly, anchoring the hot top to the chilled metal on the inner surface of the ingot mold preventing upward displacement of the hot top by the buoyant force of the molten metal in the mold.

3,271,001
QUICK ACTING VALVE

Per Gloersen, Levittown, Bernard Gorowitz, Elkins Park, and Kenneth G. Moses, Philadelphia, Pa., assignors to General Electric Company, a corporation of New York

Original application Aug. 18, 1959, Ser. No. 834,574, now Patent No. 3,151,259, dated Sept. 29, 1964. Divided and this application July 23, 1963, Ser. No. 304,710
1 Claim. (Cl. 251—139)

A quick-acting valve comprising:
a member having a passage therethrough;
a flat electrically conductive plate disposed over the said passage;
sealing means disposed between the said member and the said plate;
force means for producing a biasing force on the said plate to hold the plate against the sealing means to close the said passage;
a magnetizing coil surrounding the said member and positioned to produce, by passage of current through the said coil, a magnetic field to impinge on the said electrically conductive plate and induce therein eddy currents to interact with the said magnetic field to overcome the said biasing force and thereby to open the said passage.



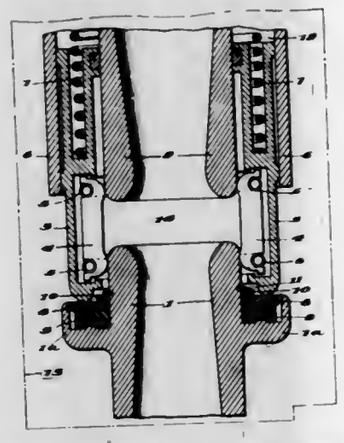
3,271,002
ADJUSTABLE FLUID TIMER

Anthony T. Zappia, 6230 E. 56th St., Indianapolis, Ind.

Filed Dec. 30, 1965, Ser. No. 517,719
6 Claims. (Cl. 251—259)

1. In a device of the class described, a housing formed to provide a straight-through, cylindrical bore and further formed to provide a first passage and a second passage opening into said bore at spaced levels along the axis of said bore and opening to the exterior of said

housing, a cylindrical plug mounted in said bore for turning movement relative to said housing about the axis of said bore and spanning said passages, said plug having a first peripheral groove disposed at the level of said first passage and a second peripheral groove disposed at the level of said second passage when said plug is so mounted, said plug being formed with an axial bore communicating near one end of said plug with a concentric enlargement in said plug and said plug further being formed with an internal chamber spanning the levels of said grooves and with a first port opening from said first groove to said chamber and a second, separate port

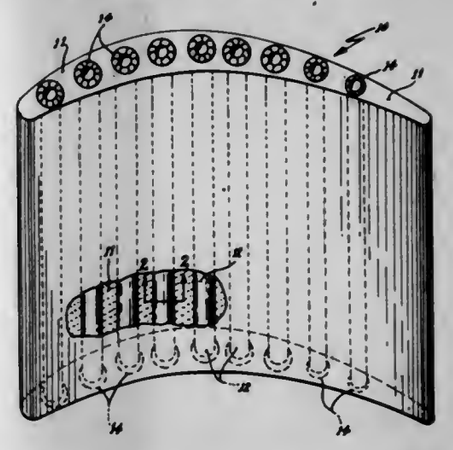


opening from said second groove to said chamber, valve means disposed in said chamber and comprising seat means disposed between said first port and said second port and a valve body biased toward flow-preventing engagement with said seat and having a portion extending into said enlargement at a point eccentric relative to said plug axis, a rotor journalled in said plug bore, cam means carried by said rotor within said enlargement and engageable with said valve body once in every revolution of said rotor to shift said valve body off its seat against its bias, and means for retaining said plug in any one of a plurality of selected position of rotational adjustment relative to said housing.

3,271,003
BLAST VALVE STRUCTURE FOR AN ELECTRICAL CIRCUIT BREAKER

Dieter Floessel, Fislisbach, and Gerhard Mauthe, Baden, Switzerland, assignors to Aktiengesellschaft Brown, Boveri & Cie, Baden, Switzerland, a joint-stock company

Filed Oct. 28, 1963, Ser. No. 319,323
Claims priority, application Switzerland, Dec. 21, 1962, 15,069/62; Feb. 9, 1963, 1,593/63
4 Claims. (Cl. 251—363)

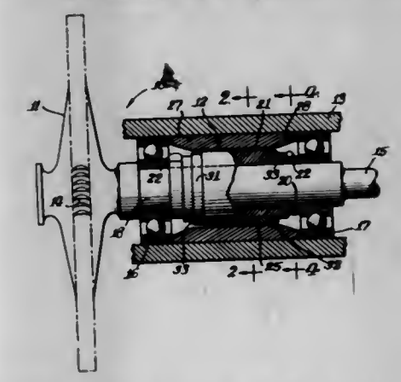


1. In a combined pneumatic circuit breaker and blast valve structure the combination comprising a gas-pressurized chamber within which is located a stationary tubular contact member and a tubular movable contact structure coaxial with said stationary tubular member and adapted for movement longitudinally of itself into and out of engagement with said stationary tubular contact member, and a blast valve sealing off communication between said chamber and the interior of said stationary tubular contact member when said contact members are engaged, said blast valve including a tubular valve member forming part of said movable contact structure and the end face of which serves as a movable valve seat arranged to strike against a stationary annular sealing means surrounding and supported by a lateral surface on said stationary tubular contact member, said sealing means being constituted by two annular superimposed hard and soft sealing discs, said hard sealing disc being strikable by the end face of said movable tubular valve member to effect a closing of said blast valve and being made from polytetrafluoroethylene reinforced with glass fibres and said soft disc being made from a silicone rubber.

3,271,004
TURBINE VANE ADAPTED FOR HIGH TEMPERATURE OPERATION

Robert John Smuland, Reading, Mass., assignor to the United States of America as represented by the Secretary of the Air Force

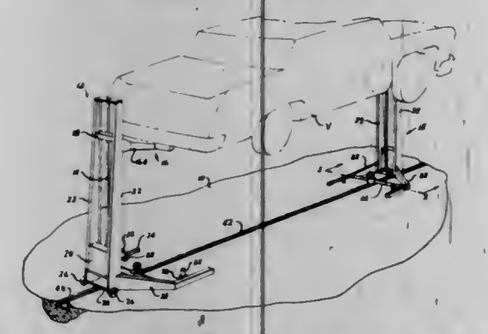
Filed June 22, 1965, Ser. No. 466,131
1 Claim. (Cl. 253—39.1)



A rotary vane for gas turbine engine comprising: a ceramic member of airfoil cross-section; said member having longitudinally extending holes, serially arranged along its lateral axis; and metal tubes fitted in and extending through the holes of said ceramic member; said tubes being flared at each end and adapted to carry a coolant; said tubes further constructed of a metal such that the thermal coefficient of expansion is matched to the ceramic vane whereby the compressive load on the vanes, caused by flaring the ends of said tubes, is increased at higher temperatures.

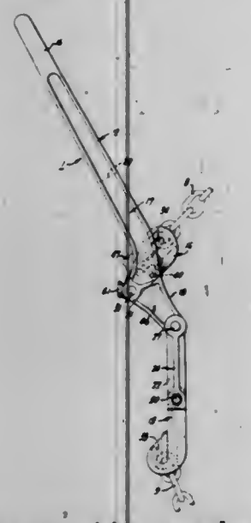
3,271,005
MECHANICAL OVERSPEED PREVENTION DEVICE

George R. Jones, Arvada, Colo., assignor to Sundstrand Corporation, a corporation of Illinois



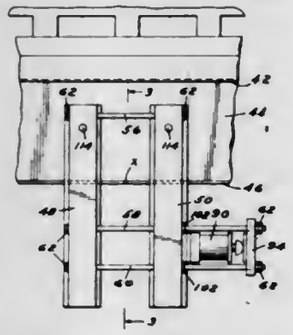
Filed Mar. 2, 1964, Ser. No. 348,590
8 Claims. (Cl. 253—59)

1. A failsafe device for reducing the speed of a turbine drive unit having a turbine wheel below the maximum operating speed thereof against the accelerating forces of



a propellant, comprising; a first member driven by said turbine unit, a brake shoe mounted on said first member in contiguous contact therewith and prestressed just below the proportional limit of the material from which the shoe is constructed, a retainer on said shoe for urging said shoe against said first member, said retainer being of sufficient thickness to fracture under the sum of the centrifugal force of the shoe upon the retainer at the maximum desired overspeed and the elastic force of the shoe upon the retainer, and a second stationary member adjacent said shoe whereby the shoe will rapidly recover from its prestressed position upon fracture of the retainer and engage the second member thereby reducing the speed of the turbine unit.

3,271,006
PORTABLE SERVICE LIFT
Charles Huston Brown and Robert J. Haddix, Dayton, Ohio, assignors of one-third to said Brown, one-third to Ion V. K. Hott, and one-third to Warren E. Webster, all of Dayton, Ohio
Filed July 6, 1962, Ser. No. 208,015
3 Claims. (Cl. 254—2)

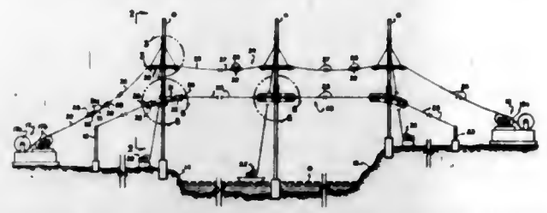


1. A portable jacking unit for use on a floor having clamp receiving means connected thereto or formed therein or thereon comprising: a frame; a vehicle engaging means mounted for vertical movement upon said frame; a pair of horizontally disposed legs connected to said frame; a clamp support plate connected between said legs; and a clamp slidably mounted on said support plate between said legs adapted to releasably engage said clamp receiving means.

3,271,007
OVER-CENTER LOAD BINDER
Ralph A. Ratcliff, 1300 Sunnyslope Ave., Belmont, Calif.
Filed Jan. 6, 1965, Ser. No. 423,733
14 Claims. (Cl. 254—78)

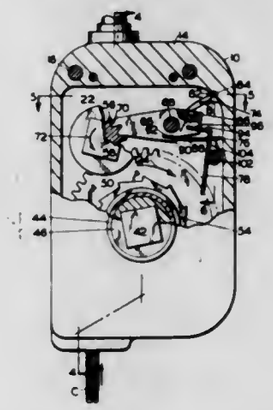
1. A load binder comprising: an elongated operating lever movable between a load binding closed position and a load releasing open position, said lever being defined by a graspable handle portion and a clevis portion integral with said handle portion; a first hook member pivotally connected with said clevis portion adjacent an end thereof; a second hook member pivotally connected with said clevis portion inwardly of said clevis end; and automatically engageable latching means provided between said clevis portion and said second hook member, said latching means becoming automatically engaged when said operating lever is moved from said open position to said closed position during a load binding operation, said latching means thereafter insuring movement of said second hook member with said lever as said lever is moved from said closed position toward said open position during a load releasing operation whereby unrestrained motion of said operating lever during such load releasing movement thereof is precluded.

3,271,008
APPARATUS FOR TREATING STRUCTURAL MEMBERS
Robert Krammer, Detroit, Mich., assignor to Taylor & Gaskin, Inc., Detroit, Mich., a corporation of Michigan
Filed Dec. 27, 1963, Ser. No. 333,955
7 Claims. (Cl. 254—98)



1. Apparatus for treating a longitudinally extending transversely loaded structural member having a web and a flange, comprising: opposed pairs of rigid fingers positioned adjacent opposite lateral edges of said flange with each pair of fingers being spaced from each other longitudinally along a flange edge adjacent opposite sides of a localized flange area to be treated; shoe members secured to said fingers having end portions overhanging the flange surfaces in spaced relation thereto; a plurality of wedge members interposed between said shoes and the flange surfaces frictionally held in non-slipping engagement against the flange surfaces; and force applying mechanism including means coupling together the fingers of each pair to urge said fingers in a direction to apply prestressing forces to the beam flange longitudinally of the beam to stress relieve the beam flange in said area to be treated.

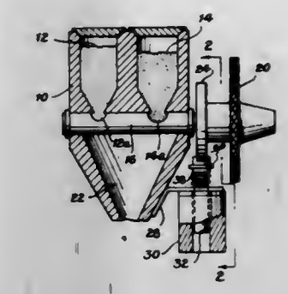
3,271,009
METHOD OF AND APPARATUS FOR STRINGING EXTRA HEAVY DUTY ELECTRIC POWER CONDUCTORS
Robert H. Wright, 6366 Cobbler Rock Lane, and Edward J. Moulton, 2223 Castle Hill Lane, both of Salt Lake City, Utah
Filed Jan. 4, 1965, Ser. No. 422,960
7 Claims. (Cl. 254—134.3)



1. A method of stringing an electric power conductor for a power line, said conductor having at least one portion along its length unsuited for passing over the usual supporting block on a tower or other elevated structure, comprising the steps of
passing an end of said conductor over such a block and pulling thereon until the said portion reaches the block;
transferring the weight of the conductor to a different support at a location adjacent to the block;

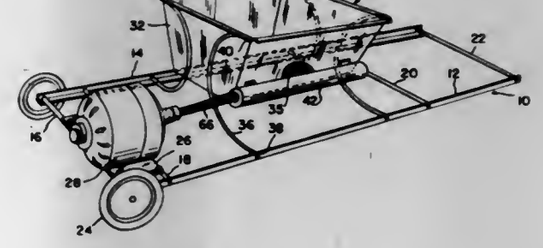
separating the conductor and the block sufficiently for said portion of the conductor to by-pass the block upon continued pulling of the conductor;

pulling the conductor until said portion thereof by-passes the block;
and transferring the weight of the conductor back to the block for continued stringing.



3,271,010
REVERSIBLE HAND WINCH
Robert H. Gray, 4420 NE. Maywood Place, Portland, Oreg.
Filed Nov. 26, 1963, Ser. No. 325,981
9 Claims. (Cl. 254—167)

1. A reversible hand winch comprising a housing, a shaft journaled in said housing, a winding drum on said shaft, a gear wheel operably connected for rotation with said drum, a pawl pivotally mounted in said housing and having a toothed end engageable with said gear wheel, said pawl being arranged to provide ratcheted movement of said gear wheel in one direction, a first spring engaged with said pawl and having a pair of overcenter positions one of which urges said pawl into engagement with said gear wheel and the other of which urges and is adapted to hold said pawl out of engagement with said gear wheel, a second spring engaged with said pawl and arranged to urge said pawl into ratcheting engagement with said gear wheel, selector means rotatable between set positions, and a cam on said selector means engageable with said second spring, said cam in one position of the selector means distorting said second spring sufficient to override the forces of said first spring to cause the pawl to pivot into engagement with said gear wheel and in another position releasing said second spring to permit operating influence of said first spring on said pawl.

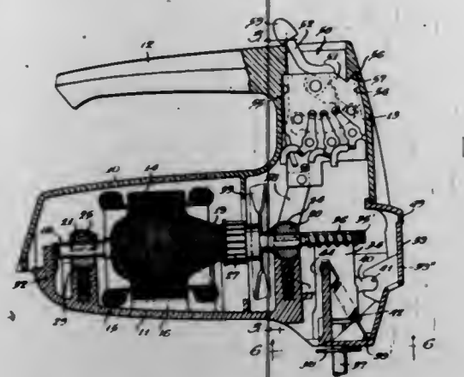


3,271,011
METERING AND MIXING DEVICE FOR DENTAL MATERIALS
Fritz Röhm, Stuttgart-Kaltental, Wilhelm Ahrens, Bergen-Enkheim, and Heinz Strähle, Schwabisch Gmund, Germany, assignors to Dr. Walter u. Schmitt G.m.b.H., Schwabisch Gmund, Germany
Filed Nov. 4, 1964, Ser. No. 408,973
Claims priority, application Germany, Nov. 6, 1963, W 35,574
1 Claim. (Cl. 259—12)

In a power driven mixing device for metering and mixing dental materials and having a plurality of hoppers for holding dental materials, a pocketed metering valve shaft rotatably mounted beneath said hoppers, electric motor means for shaking said device, and timer switch means joined to said motor, the improvement comprising a disc secured to said shaft, a notch in the periphery

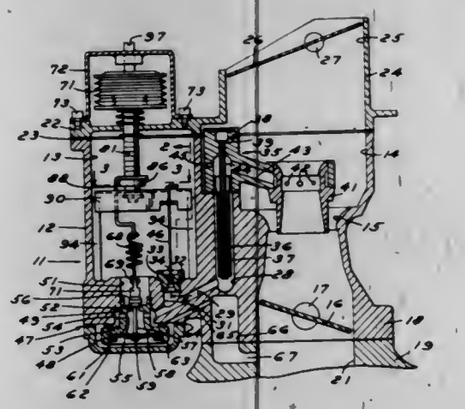
of said disc, solenoid locking means actuatable by said timer switch means engageable with said notch to prevent the rotation of said shaft until said motor means has started, and spring means for holding said solenoid means normally engaged with said notch.

3,271,012
WET LIME SCREENER
Joseph Van Bael, 37426 Lakeshore Drive, Mount Clemens, Mich.
Filed Nov. 18, 1963, Ser. No. 324,346
16 Claims. (Cl. 259—29)



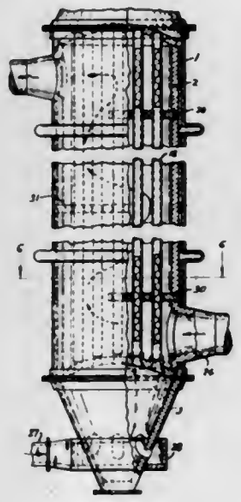
1. A wet lime screener comprising a frame, a hopper having a screen at its bottom wall, resilient means mounting said hopper on said frame, and centrifugal agitating means connected to said hopper, said agitating means comprising elongated rotary means extending substantially from end to end of said hopper and mounted for rotation about a single axis, said rotary means comprising two masses whose centers of gravity are spaced longitudinally of said axis substantially midway between the center and ends of said hopper and further are spaced circumferentially of said axis about 90 degrees from each other.

3,271,013
MIXER
Worthy L. Chambers, Wilmette, and James A. Wright, Chicago, Ill., assignors to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Filed Mar. 27, 1964, Ser. No. 355,171
7 Claims. (Cl. 259—131)



1. A mixer comprising a housing, said housing comprising top and bottom members which together define said housing, a handle connected to said top member, and a mixer motor including motor shaft bearings inside said housing, said bottom member comprising a molded plastic member having integrally formed bearing seats formed therein, said motor and said bearings being di-

rectly mounted on said plastic member and its bearing seats, and metallic bearing retainers for retaining said



bearings in said seats, said bearing retainers having cooling fins integrally formed thereon.

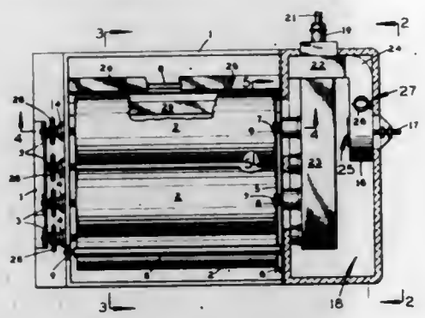
3,271,014
ALTITUDE COMPENSATED CHARGE FORMING DEVICE
Tao-Yuan Wu, Ann Arbor, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Dec. 27, 1963, Ser. No. 333,948
7 Claims. (Cl. 261—43)

1. A charge forming device for an internal combustion engine comprising an induction passage, a throttle valve in said induction passage, a fuel source, fuel discharge circuit means connecting said fuel source with said induction passage for discharging fuel into said induction passage, metering valve means in said fuel discharge circuit means for regulating the rate of fuel discharge into said induction passage, said metering valve means comprising a metering jet through which at least a portion of the fuel discharge passage passes and a metering rod adapted to be inserted varying depths into said metering jet, said metering rod having a substantially uniform cross-sectional area and shape along at least a portion of the length that is adapted to be inserted into said metering jet whereby the cross-sectional flow area is relatively independent of the degree of insertion of said metering rod into said metering jet, the external surface of said metering rod having a predetermined surface finish to offer a frictional resistance to flow dependent upon the depth of insertion, power valve means in said fuel discharge circuit means responsive to the pressure in said induction passage posterior to said throttle valve, said power valve means being adapted to open at a predetermined pressure to provide additional fuel flow into said induction passage in response to increased engine power demand, an altitude responsive device, and means operatively connecting said altitude responsive device to said power valve and to said metering rod for simultaneously adjusting the pressure at which said power valve opens and the depth of insertion of said metering rod into said metering jet in response to altitude variations.

3,271,015
PROCESS OF PREPARING LIME AND A SYSTEM INCLUDING MEANS FOR PROVIDING A HOT GAS FOR USE IN THE PROCESS
Harold A. Mahony, 1827 Taylor Road, East Cleveland 12, Ohio
Filed Jan. 25, 1963, Ser. No. 253,874
11 Claims. (Cl. 263—1)

1. In the process of preparing lime, the steps which comprise feeding limestone in a finely divided state of approximately minus 200 mesh or finer into the lower housing of a vertical reactor having a plurality of externally heated elongated tubes, each composed of a material capable of resisting a temperature above the sintering temperature of lime and being of a diameter of approximately four to six inches communicating with the lower housing and extending upwardly therefrom and enclosed in an upper housing of the reactor with the open end of each tube communicating with conduit means leading from the upper end of the reactor, and passing a hot gas through the limestone particles in said housing to force the limestone particles upwardly through each of said tubes at such pressure that the buoyant force of the gas and the aerodynamic drag upon the limestone particles and the lime formed therefrom are just sufficient to overcome the force of gravity thereon to thereby cause the limestone and the lime formed therefrom to pass from one side to the other side of each of the tubes as it ascends through each tube and said gas being at such temperature and said tubes being of such length that the gas will convert a predominant amount of the limestone into lime and carbon dioxide during the passage of the limestone and lime converted therefrom through the tubes but at a temperature insufficient to sinter a substantial amount of the lime.

3,271,016
MACHINE FOR HEAT SETTING SYNTHETIC FABRICS
George M. Marks, Greenville, S.C., assignor to Industrial Heat Engineering Corp., Greenville, S.C., a corporation of South Carolina
Filed Oct. 27, 1964, Ser. No. 406,784
6 Claims. (Cl. 263—3)



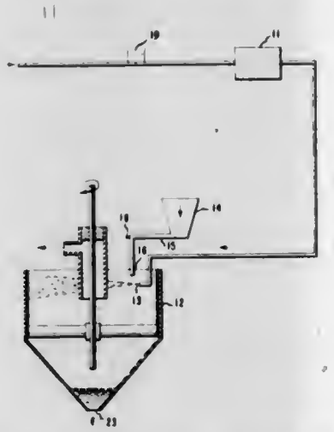
5. In a machine for heat setting synthetic fabrics of the character described

a means forming a frame,

a hollow drum journalled in said frame about the principal axis thereof with a predetermined opening in one end thereof,

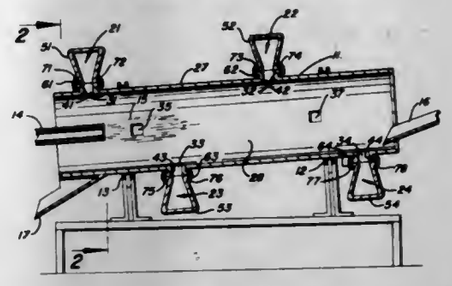
a longitudinal duct fixed to said frame positioned in said drum having a cylindrical shaped foraminated baffle along one side thereof positioned in close proximity to the inside cylindrical surface of said drum with the inlet of said duct extending from the said opening,

a gas burner means for burning a predetermined mixture of flammable gas and air including an outlet orifice for conducting the products of combustion therefrom when operated,



a manifold having the outlet thereof connected to said inlet of said duct and having a common inlet thereof connected to said orifice,

a power driven rotary blower means having an inlet and outlet with the latter connected into said common inlet of said manifold means,



a casing enclosure connecting the opening in said drum to the inlet of said blower means whereby the products of combustion of said burner means will be circulated and recirculated through said drum for heating same when said blower means and said burner means are operated.

3,271,017
APPARATUS FOR MELTING PLASTIC POWDER
Willis F. Brondyke, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Apr. 24, 1964, Ser. No. 362,447
3 Claims. (Cl. 263—7)

1. An apparatus for melting particulate plastic material which comprises a cylindrical chamber, a cylindrical wall mounted longitudinally in said chamber for rotational movement therein, means to rotate said wall, feed means to deliver said plastic material into said chamber at a point within said cylindrical wall and means disposed within said cylindrical wall at a point adjacent said feed means to render said plastic material molten upon delivery within said cylindrical wall and to deposit said plastic material on said cylindrical wall.

3,271,018
ROTARY CALCINING KILN
Warford A. Reaney, 264 W. Lincoln Ave., Delaware, Ohio, and David W. Reaney, 898 Shore Drive, North Madison, Ohio
Filed Apr. 8, 1964, Ser. No. 358,220
1 Claim. (Cl. 263—33)

A rotary kiln for treating material such as lime comprising, in combination:

a cylindrical drum, having a cylindrical wall of refractory material forming the shell of said drum, having a plurality of circumferentially and longitudinally spaced wall openings formed through said cylindrical wall through which a portion of the material being treated may at times move, and having end openings at the ends thereof for the input of material to be treated and for the outlet of material which has been introduced at the inlet end, treated within the drum, and after treatment, removed at the outlet end;

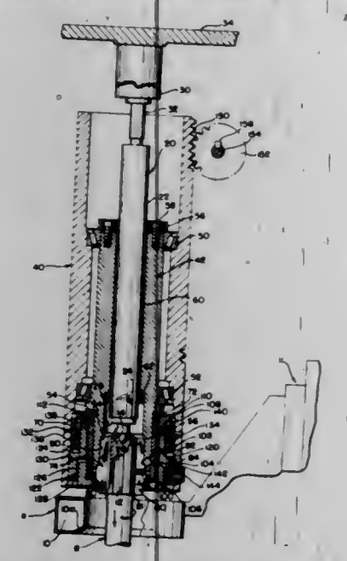
means for mounting said drum for rotation substantially about its longitudinal axis and with its longitudinal axis at an acute angle to the horizontal and sloping from the inlet end downward towards the outlet end;

means for rotating said drum continuously about its longitudinal axis;

means for supplying material to be treated to the inlet end of said kiln;

means for removing material which has been treated from the outlet end of said kiln;

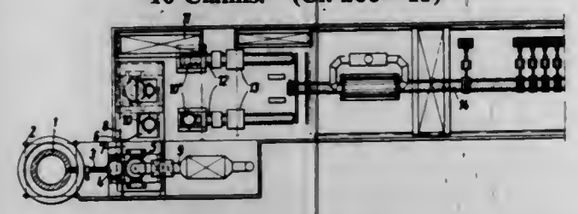
means for applying heat to the material to be treated within the interior of said drum;



a plurality of separable heat resistance receptacles secured to the outside of said kiln each having an open mouth, each formed with a substantially closed interior except for said mouth, each having the mouth secured in registration with one of said wall openings, each of said receptacles being staggered longitudinally about said wall relative to adjacent receptacles, each of said wall openings registering with one of said receptacles, and each of said receptacles being removable and replaceable; and

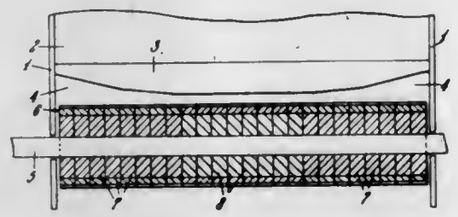
fastening means for securing said receptacles to said cylindrical drum with their mouths in alignment with the openings in said drum.

3,271,019
MECHANISM FOR AN INDUCTION HEATING APPARATUS
Robert G. Armstrong, Chardon, Ohio, assignor to The Ohio Crankshaft Company, Cleveland, Ohio, a corporation of Ohio
Filed July 23, 1963, Ser. No. 297,109
8 Claims. (Cl. 266—4)



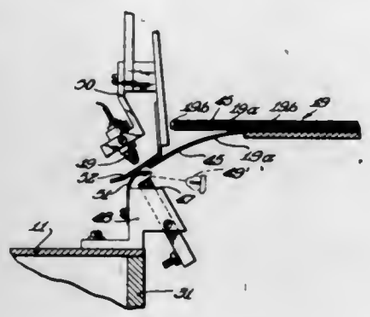
1. In an induction heating apparatus for progressively hardening an elongated workpiece having a first and second end, said apparatus including a first and second center for locating said workpiece in said apparatus with the axis of said workpiece assuming a desired position with respect to said induction heating apparatus means for forcing said centers together to secure said workpiece within said apparatus, a first clamping device adjacent said first center for holding said first end of said workpiece, a second

clamping device adjacent said second center for holding said second end of said workpiece, said clamping devices being rotatably mounted with respect to said apparatus, an inductor and quenching device positioned on said apparatus and encircling said workpiece, a quench passage associated with said device for quenching said workpiece after said workpiece has been heated by said device, means for rotating said workpiece about said axis and means for causing relative movement of said workpiece with respect to said inductor and quenching device with said



relative movement being in the direction with said workpiece moving through said inductor and quenching device, the improvement comprising: said second clamping device comprising a rotatable clamping collet for gripping said second end of said workpiece, a non-rotatable frame member, means for supporting and jaurnalling said collet in said frame member and means for applying a controlled force on said frame member in a direction substantially parallel to said axis of said workpiece to create a tension within said workpiece as said inductor and quenching device scan and harden said workpiece.

3,271,020
STEEL PLANT
Wilhelm Heemeyer, Dusseldorf-Kaiserswerth, Germany, assignor to Klockner-Werke AG, Duisburg, Germany
Filed Nov. 30, 1965, Ser. No. 510,612
Claims priority, application Germany, Oct. 11, 1961, K 44,907; Dec. 1, 1964, K 54,675
10 Claims. (Cl. 266—13)

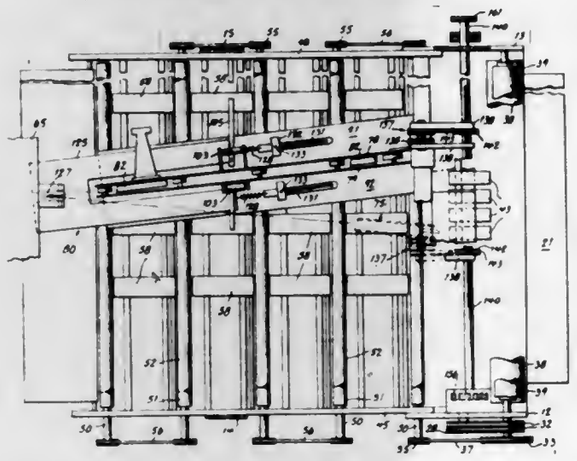


1. In a steel plant, in combination, converter means movable along a path; blast furnace means located on one side of said path; hearth furnace means located between said blast furnace means and said path for receiving molten iron from said blast furnace means and for discharging the heated iron into said converter means while the same are located on said path; steel molding and forming means located on the other side of said path extending along at least one line transverse to said path and spaced along the same from said hearth furnace means; and treating means located along said path for transforming iron in said converter means into steel while said converter means are located on said path so that said converter means receives iron from said hearth furnace means in a first position on said path and discharges steel in a second position on said path for supplying said steel molding and forming means.

3,271,021
EXTRACTION OF ZINC
Patrick Alexander Tempest Keeping, Walter Lindsay Linton, and Harry Gilead Spencer Havard, Avonmouth, England, assignors to The National Smelting Company Limited, London, England
Filed July 18, 1963, Ser. No. 295,888
Claims priority, application Great Britain, July 30, 1962, 29,238/62
9 Claims. (Cl. 266—24)

1. In a continuously operable externally heated retort for the production of zinc and the like, containing charging means for briquettes at the upper end of the retort and discharging means for spent briquettes as residues at the lower end of the retort, the discharging means including a horizontally disposed rotatable extractor roll and an extractor plate with a free edge extending along and spaced from the extractor roll, the improvement in combination therewith which comprises: the horizontal extractor roll has exterior pockets in its outer surface for receiving and thereafter discharging the residues; the distance of the extractor plate free edge from the outer surface and the bottoms of the extractor roll pockets increases from the central portion of the extractor roll to at least one end portion of the extractor roll so that spent residues may be withdrawn more rapidly from that end portion of the extractor roll than from its central portion to alter the pattern of flow of the briquettes through the retort.

3,271,022
INSERTER WITH DOCUMENT RESPONSIVE TRACK CONTROL MEANS
Eugene Sather, Washington, and Lester H. Stocker, Phillipsburg, N.J., assignors to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Filed July 11, 1963, Ser. No. 294,367
14 Claims. (Cl. 270—58)



1. In an inserter including means for supporting a stack of groups of inserts comprising in each group at least a master insert and optionally an indefinite number of companion inserts with sensibly differentiating identification means on either the master insert or the companion inserts and means for withdrawing the inserts

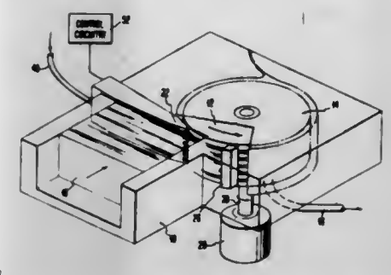
one-by-one from the stack and depositing them in an insert track including an insert conveyor with means for indexing intermittent advancing movements of the conveyor in timed relation to the withdrawing and delivering means, the improvement comprising:

means for controlling operations of said indexing means including sensing means responsive to said identification means for enabling functioning of the indexing means to advance the conveyor when a master insert is withdrawn from the stack and for disabling the indexing means to hold the conveyor in a dwell when a companion insert is withdrawn from the stack to be collated with the master insert in the track.

3,271,023
SHEET COLLATING APPARATUS
Harley J. Disbrow, Richland, and Ingvar L. Tolf, Battle Creek, Mich., assignors to General Foods Corporation, White Plains, N.Y., a corporation of Delaware
Filed Dec. 30, 1963, Ser. No. 334,230
16 Claims. (Cl. 270—58)

1. An apparatus for collating sheetlike articles being fed seriatim in a plurality of separate files disposed in coplanar and parallel relation to one another comprising, a first conveyor means for advancing the articles of one file within the common plane and along a predetermined directional axis, a second conveyor means for feeding the articles of another file within another plane and along a directional axis converging with said predetermined directional axis, and means disposed at the input and output ends, respectively, of said second conveyor means for diverting the articles of said another file from said common plane to said another plane and from said another plane to said common plane, respectively, whereby the articles within the first and second files become merged at a location of convergence of the respective directional axis for delivery in superposed relation to one another from the apparatus.

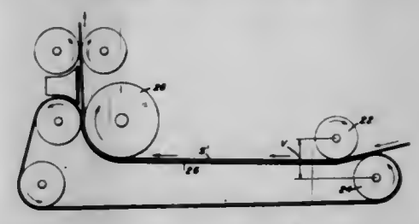
3,271,024
HIGH SPEED CARD FEED
Gordon H. May, San Jose, Calif., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 23, 1963, Ser. No. 332,819
11 Claims. (Cl. 271—27)



1. A record card feeding means for feeding record cards from a hopper, comprising:

a feeding means disposed adjacent a record card in said hopper;

means for producing a vacuum force on the periphery of said feeding means adjacent said record card;



means for directing a high velocity stream of fluid to create a fluid bearing adjacent to said feeding means for overcoming said vacuum force; and

means for selectively interrupting said high velocity fluid stream so that said vacuum means pulls said

record card to said feeding means to feed said record card.

3,271,025
SHEET CONVEYOR
Norman J. Rosenburgh and David D. McNair, both of Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Apr. 6, 1964, Ser. No. 357,435
6 Claims. (Cl. 271—45)

1. A conveyor for transporting and changing the direction of movement of a sheet having a predetermined length, comprising:

(a) a moving endless belt for supporting such sheet and defining a path of travel of said sheet;

(b) a first member having a curved surface in peripheral contact with said belt, whereby said sheet, when moving on said belt and in contact with said curved surface, has a speed relative to said curved surface which is different from the speed of the belt at the neutral axis of said belt by virtue of the deformation of said belt as it moves along said curved surface; and

(c) compensating means for arcuately deforming said belt, at a point in said path ahead of said first member relative to the movement of said belt, said belt being deformed by said compensating means in such a manner as to cause the sheet contacting surface of said belt in the area of contact with said compensating means to move at a speed not greater than the speed of the sheet relative to said curved surface;

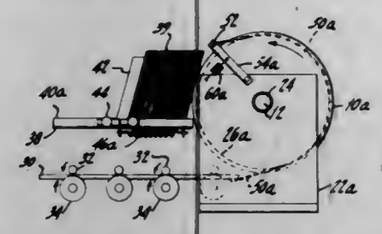
(d) the distance of said path between said first member and said compensating means being less than said predetermined length;

(e) whereby when said sheet is moving in simultaneous contact with said first member and said compensating means the speed of the portion of the sheet in contact with said curved surface is at least as great as the speed of the portion of the sheet which is in contact with said compensating means, the sheet thereby being held in a taut condition as it moves in said path.

3,271,026
DOCUMENT STACKING DEVICE
Üstün Germen, Newton Center, Mass., assignor to Radio Corporation of America, a corporation of Delaware
Filed July 1, 1964, Ser. No. 379,451
9 Claims. (Cl. 271—71)

1. The combination comprising:

first and second wheels rotatably mounted on a shaft;



a third wheel, smaller in diameter than the first and

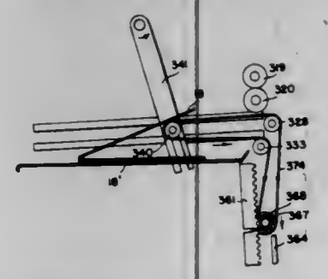
second wheels, mounted on said shaft between said first and second wheels;

a document hopper having an input end located adjacent said wheels;

a band concentric with a peripheral portion of said third wheel at a radial distance from said shaft that is less than the radii of said first and second wheels;

one end of said band extending beyond the peripheries of all of said wheels and being operatively connected

at a fixed point, said one end of said band and the adjacent peripheral portion of said third wheel defining a throat for documents;

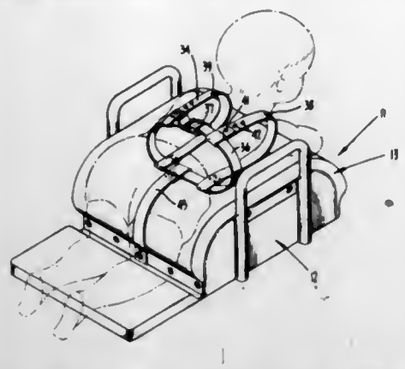


means operatively connecting the other end of said band to a fixed point near the input end of said hopper;

the peripheries of the first and second wheels having a higher coefficient of friction than said band;

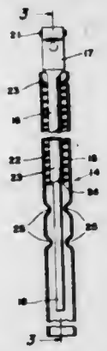
means for feeding a document into said throat; and

means for rotating said first and second wheels.



3,271,027
STACKING DEVICE
Jerome J. Liedl, Mahtomedi, and Donald L. Snyder, St. Paul, Minn., assignors to Minnesota Mining & Manufacturing Company, St. Paul, Minn., a corporation of Delaware
Original application Sept. 4, 1962, Ser. No. 221,039, now Patent No. 3,218,950. Divided and this application July 2, 1965, Ser. No. 469,222
3 Claims. (Cl. 271—78)

1. In a stacking device, a first revolvable roller, a second revolvable roller parallel to said first roller, an endless flexible web passing around said rollers defining spaced first and second runs of said web, means for placing said web under tension, means for reciprocating said first roller in a plane containing the axis thereof, and limit means engaging each run of said web between said rollers and oppositely acting to limit the rotational movement of said web about said rollers to a single direction, a first of said limit means preventing movement of the first run of the web as said first roller is moved in one direction and a second of said limit means preventing movement of the second run of the web as said first roller is moved in a direction opposite said one direction.

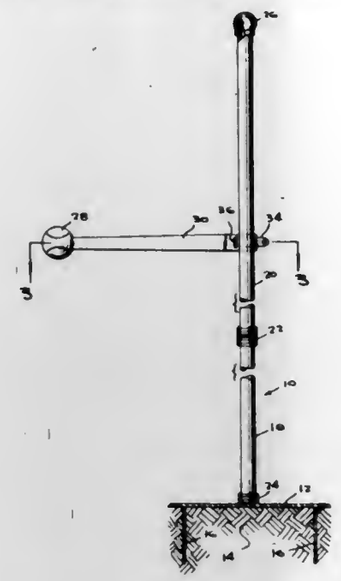


3,271,028
BABY EXERCISER
Alvina K. Albin, Oakland, Calif.
(9 Redwood Road, San Anselmo, Calif.)
Filed May 21, 1963, Ser. No. 282,015
4 Claims. (Cl. 272—57)

3. A baby exerciser comprising a generally rectangular support including side walls and interconnecting cross members and a padded cover secured to said cross members and arcuately extending over said cross members to define a curved upper support surface, a pair of handles

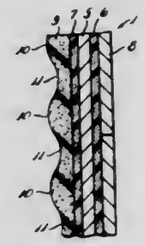
secured to said side walls and projecting above the crown of said support surface, a knee pad secured to a cross member of said support at the lower end thereof, and a body harness secured to a cross member of said support.

3,271,029
AIRGLIDE SUSPENSION DEVICE
Daniel P. Grudoski, Hartstown, Pa., assignor to Blazon, Inc., Akron, Ohio, a corporation of Ohio
Filed Aug. 6, 1962, Ser. No. 215,105
1 Claim. (Cl. 272—87)



In combination with a gym set having a top crossbar and drop arms pivotally connected to said top crossbar, the improvement which comprises a resiliently extensible drop arm pivotally connected to said crossbar, said drop arm comprising an outer tubular member, an inner tubular member telescoped within said outer tubular member, means resiliently interconnecting said inner and outer tubular members, pivot means on said inner tubular member for attaching said inner tubular member to the top crossbar of the gym set, said inner tubular member having a flattened lower end portion, said outer tubular member having lower, inwardly crimped portions cooperating with said flattened lower end portions to prevent substantial relative rotation of said members.

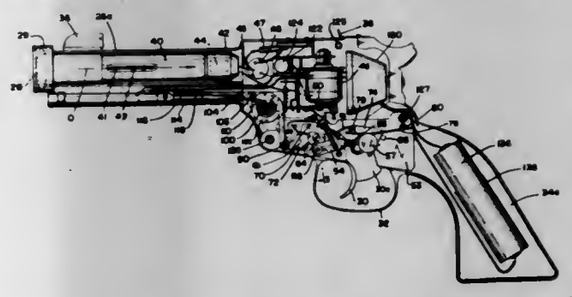
3,271,030
CAPTIVE BATTING BALL
Theodore H. Mueller, 312 Gaines Ave., Mobile, Ala.
Filed Apr. 23, 1965, Ser. No. 452,452
2 Claims. (Cl. 273—26)



1. A batting practice device comprising a plate adapted to rest upon a ground surface, spikes depending from the underface of said plate and penetrating the ground when the plate rests upon the ground surface to thereby fixedly-attach said plate to said ground surface, a threaded boss rising from the mid-part of the upper face of said plate, a standard rising from said plate and having the portion adjacent the lower end in threaded-engagement with said boss, a cap on the upper end of said standard, a flexible arm having an outer end provided with a simulated ball and having an inner end provided with a

loop, said arm being horizontally-disposed at a location below said cap and having the loop surrounding-receiving the adjacent part of said standard, a clamp encompassing

said loop and supported on said loop, and releasable-fastening means fixedly securing said clamp about said loop to thereby attach said loop to said standard.



3,271,031
RIBBED BOWLING BALL PATCH
Charles F. Mitchell, 181 Crescent Drive, Akron, Ohio
Filed June 7, 1962, Ser. No. 200,687
3 Claims. (Cl. 273—63)

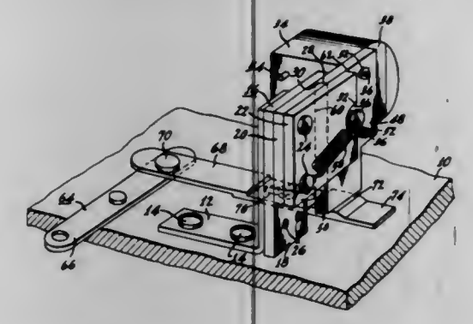
2. A bowling ball finger or thumb hole patch comprising an adhesive flexible backing layer having a pressure sensitive adhesive on both surfaces thereof and having a back surface for engaging a wall of a bowling ball hole, and a solid, but flexible rubber-cork strip secured to the face surface of said backing layer, said rubber-cork strip having a frictional face surface that is free from any surface skin thereon, with a plurality of solid ribs having smoothly curved convex surfaces and smoothly connected together by arcuately contoured concave recesses formed thereon, said rubber-cork strip having about equal quantities by weight of (A) a ground vulcanized material comprised of cork mixed with a significant quantity of rubber to give a tough substance having a relatively hard gripping characteristic and (B) a rubber material to provide a fairly hard, high frictional surface on the patch.

3,271,032
PHOTOELECTRIC TARGET PRACTICE PISTOL
Jacob G. Rabinowitz, Jamaica, and Victor Yager, Long Island City, N.Y., assignors to Clairex Corporation, New York, N.Y., a corporation of New York
Filed Sept. 7, 1962, Ser. No. 222,095
5 Claims. (Cl. 273—101.1)

1. A target practice pistol, comprising a hollow casing having a tubular barrel at one end, a photoelectric cell in the casing exposable through said barrel to a light target external of said casing, said light target emitting light of sufficient brightness to activate said cell, circuit means connected to said cell, power supply means in said casing connected to said circuit means to energize the same, signal means connected to said circuit means and controllable thereby to indicate when said circuit means is energized, said circuit means including a switch having normally open contacts to keep said circuit means in a normally deenergized state, whereby said circuit means is energized only momentarily while light from said target impinges on said cell simultaneous with momentary closure of the switch contacts, a manually movable trigger disposed to cause the contacts of said switch to close automatically for only an instant at a time during each operative movement of the trigger and then to permit the switch contacts to open automatically and remain open during the remainder of said movement, so that said circuit means is energized by said power supply means only momentarily while the contacts of said switch are

momentarily closed and while the light from said target impinges on said cell, whereby said signal means is actuated only during the momentary instants of closure of the switch contacts occurring while the light from said target impinges on said cell to indicate that the axis of said barrel is precisely aligned with said light target; said signal means comprising an electromagnet having a movable armature, a cocking lever pivotable by said trigger, means actuated by the cocking lever for closing the contacts of said switch momentarily; a hammer lever pivotable by the cocking lever and engageable by said armature when the trigger is moved in one direction, a hammer carried by said hammer lever, and a bell disposed adjacent the hammer, whereby the hammer strikes the bell when the electromagnet is energized to move the armature and release the hammer lever, said electromagnet being energized only during the instants when said circuit means is energized.

3,271,033
TOY DEVICE FOR LAUNCHING AND INTERCEPTING ROTARY WING FLYING TARGETS
Frederick R. Parker, Long Beach, Calif., assignor of one-half to Johnny E. Johnson, Santa Fe Springs, Calif.
Filed Feb. 25, 1963, Ser. No. 260,647
9 Claims. (Cl. 273—101)

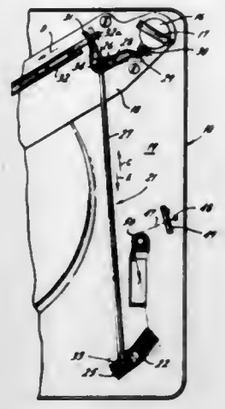


1. A device for launching a rotary wing flying target and for propelling a missile at such launched target, comprising:

a body portion;

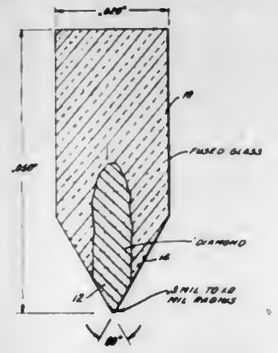
launching means rotatably mounted on said body portion for detachably drivingly engaging a rotary wing

target device and actuatable for imparting flying rotational speed thereto;
mounting means on said body portion for detachably supporting a missile thereon including means for propulsion of said missile in a predetermined direction relative to said body portion;
and means carried by said body portion and manually actuatable for sequentially imparting by movement in one direction such rotation to said launching means and by movement in another direction for detaching and effecting such propulsion of such missile from said mounting means.



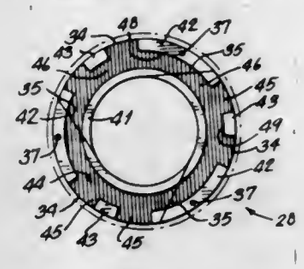
3,271,034
POSITIONING MECHANISM
Dallas R. Andrews, Indianapolis, Ind., assignor to Radio Corporation of America a corporation of Delaware
Filed Sept. 9, 1963, Ser. No. 307,493
4 Claims. (Cl. 274—4)

1. A mechanism for shifting the position of a magnetic head into scanning relationship with selected ones of a plurality of record tracks on a magnetic tape record, said head having at least one head unit including a signal gap disposed along a gap line, said mechanism comprising
(a) a stationary mounting member defining a slot having side and bottom walls parallel to said gap line, said bottom wall being beveled,
(b) a bracket plate mounting said head and disposed in said slot, said bracket plate having a beveled edge complementary to said beveled bottom wall, the corner of said beveled edge being parallel to said gap line,
(c) means for tilting said bracket plate toward at least one of said side walls of said slot and providing lines of intimate contact between said plate and the walls of said slot at said corner and at the side of said bracket plate adjacent said one side wall, and
(d) means for moving said bracket in said slot in a direction along said lines of contact whereby to shift said head among selected ones of said tracks.



3,271,035
PHONOGRAPH APPARATUS
Henry E. Johnston, Huntingdon Valley, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Filed Jan. 13, 1964, Ser. No. 337,362
11 Claims. (Cl. 274—23)

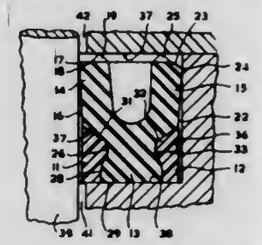
9. In an electrically driven record-playing phonograph having a tone arm movable to and from a rest position and record-playing position, the combination of a switch movable to OFF position for stopping the phonograph and to ON position for starting the phonograph, a manually operable element for moving the switch between ON and OFF positions, an automatically operable member for moving the switch from ON position to OFF position, linkage means linking the switch to said element and member and operable in response thereto for imparting the aforesaid movements to the switch, and tone arm engaging means connected to and operated by the linkage means for automatically securing the tone arm in rest



position when the phonograph is stopped and automatically releasing the tone arm for placement in the record-playing position when the phonograph is started.

3,271,036
PHONOGRAPH STYLUS AND METHOD OF MAKING SAME
Paul L. Kuzmick, 30 Oval Road, Essex Fells, N.J.
Filed May 6, 1963, Ser. No. 278,364
2 Claims. (Cl. 274—38)

1. A diamond point phoograph stylus comprising a glass shank and a diamond point set at the end of the glass shank, the said end of the glass shank being fused onto the diamond point thereby bonding the diamond point to the stylus shank.

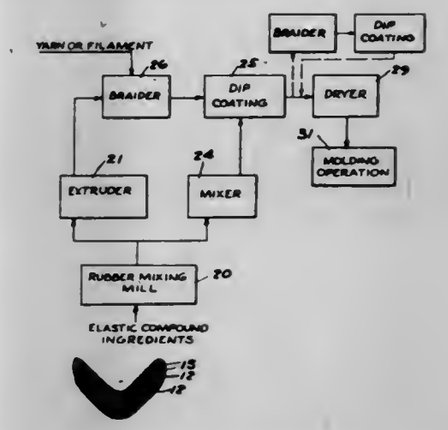


3,271,037
PRESSURE-BALANCED SEGMENTAL PACKING RINGS
Frank E. Hammond, Palmyra, N.Y., assignor to Garlock Inc., Palmyra, N.Y., a corporation of New York
Filed Apr. 1, 1963, Ser. No. 269,617
1 Claim. (Cl. 277—27)

A segmental packing ring comprising segments, of substantially non-deformable material, which are in abutment at axially extending surfaces of tangentially extending splits; said segments having radially outwardly facing surfaces receptive to fluid pressure directed radially inwardly thereon to urge the segments forcefully against a rod

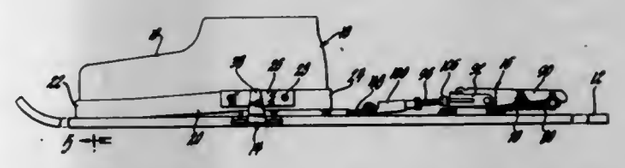
extending through said ring and each of said segments being formed with spaced arcuate lands extending circumferentially of the ring and having radially inwardly facing surfaces receptive to fluid pressure directed radially outwardly thereon to oppose said radially inwardly directed pressure and thereby ease the engagement of said segments with the rod; said lands on each segment being located adjacent the segment's outer circumferential surface and at the tangentially extending splits at opposite ends of the segment in abutment with similarly located arcuate lands of adjacent segments, whereby to provide lateral support at the outer periphery of the ring against wobbling of the segments thereof; said lands, further, being provided at both the pressure side and the rear side of the ring.

3,271,038
SEALING DEVICES
Frank Bastow, Charlton Kings, Cheltenham, England, assignor to Dowty Seals Limited, Ashchurch, near Tewkesbury, England, a British company
Filed Oct. 29, 1963, Ser. No. 319,785
Claims priority, application Great Britain, Oct. 30, 1962, 41,049/62
2 Claims. (Cl. 277—205)



1. A sealing device for use between relatively movable members which have co-axial sealing surfaces, comprising a sealing ring of resiliently deformable material having a base portion defined in part by an end face transverse to the central axis of the ring, inner and outer sealing lips extending from the base portion on opposite sides thereof so as to be capable of effecting sealing engagement with the respective co-axial sealing surfaces when the sealing device is interposed therebetween, an annular recess formed in the angle of the sealing ring which is defined by the intersection of the transverse end face and the outer face of that sealing lip which has a sealing edge that in use is engageable with the relatively movable member, a backing ring of a flexible material harder than that of the sealing ring having a surface complemental to the surface of the recess, said complemental surfaces being shaped to provide on one of said rings an annular groove and on the other of said rings an annular bead, whereby the sealing ring and the backing ring may enter into releasable locating engagement of one ring radially within the other and an annular projection in the axial direction beyond the sealing edge of at least that sealing lip which engages the relatively movable member, said annular projection being set back in a radial sense from the sealing edge, and said annular projection having a radial gap therein for providing communication for pressure fluid across the end of the lip when the sealing device is mounted in a housing.

3,271,039
PACKING RING AND METHOD OF MAKING
John Kohl, Birmingham, Mich. (111 E. 10 Mile Drive, Hazel Park, Mich.), and Gene Pillar, Livonia, Mich.; said Pillar assignor to said Kohl
Filed Mar. 29, 1962, Ser. No. 183,467
5 Claims. (Cl. 277—228)

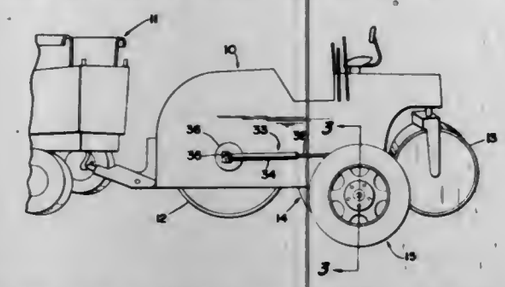


1. A packing comprising a ring having a predetermined molded cross section, said ring comprising a core of cured elastomeric material, and a seamless tubular layer of braided fabric having a covering of substantially the same cured elastomeric material thereon surrounding said core, at least some of said cured elastomeric material penetrating the interstices of said braided fabric, said elastomeric material covering said fabric and said elastomeric material penetrating said interstices being cured in situ at the same time as curing of said core.

3. The method of making a packing which comprises braiding a seamless tubular layer of fabric over a core of uncured elastomeric material,

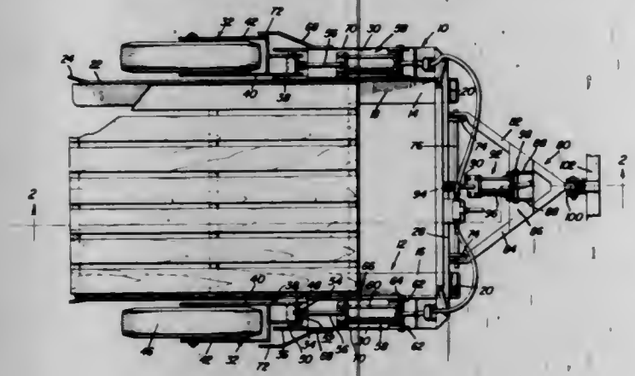
dipping said core with said braided layer of fabric in a coating comprising a solution of elastomeric material and a solvent,
drying the dipped fabric and core,
cutting off a predetermined length of said dipped dried fabric and core,
shaping said predetermined length into a ring by bringing the ends of said length adjacent one another,
and compressing and curing said ring into a predetermined cross section to form the packing.

3,271,040
SAFETY BINDING
Richard G. Spademan, 3655 Colegrove, San Mateo, Calif.
Filed Apr. 29, 1965, Ser. No. 451,881
80 Claims. (Cl. 280—11.35)



1. In combination; a ski, a ski boot, and a binding mechanism for binding said ski boot to said ski, said mechanism coacting only with the side portions of said ski boot and being the only means by which said ski boot is secured to said ski, and said mechanism being positioned on said ski rearwardly of the point of application of heel lifting force on said ski boot.

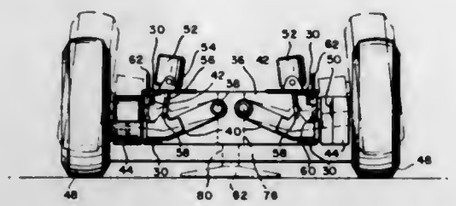
3,271,041
TANDEM ROLLERS
Richard E. Acker, Marion, Ohio, assignor to Huber-Warco Company, Marion, Ohio, a corporation of Ohio
Filed July 15, 1964, Ser. No. 382,883
10 Claims. (Cl. 280—43.23)



7. A road roller comprising a frame, road working rolls mounted on said frame, a lever arm pivoted at one end to said frame, a socket at the other end of said lever arm, a ground-engaging trailing wheel rotatably mounted on a wheel spindle, a hollow wheel hub extension removably fixed to said wheel hub spindle and projecting into said socket, means to releasably lock said extension with-

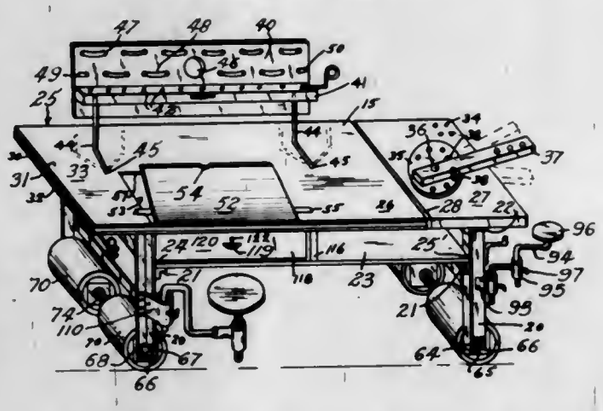
in said socket, means to move said lever arm between a first position wherein said working rolls engage the ground and the trailing wheel is retracted and a second position wherein the trailing wheel engages the ground and the

working rolls are liftable, and a locking means cooperative with said hollow wheel hub extension to lock said wheel and lever arm to the frame when the trailing wheel is in said second position.



3,271,042
TRAILER WITH LIFT-TYPE LOAD BED
Frank L. Flodin, Sunnyside, Wash., assignor to Flodin Inc., Sunnyside, Wash., a corporation of Washington
Filed Jan. 9, 1964, Ser. No. 336,748
4 Claims. (Cl. 280—43.23)

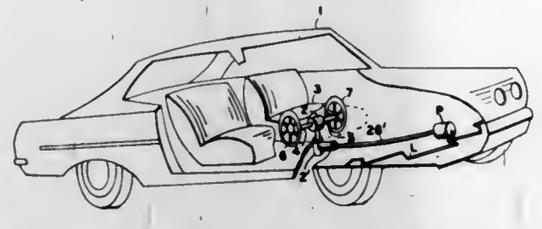
1. A trailer with a lift-type load bed, comprising: (a) a pair of spaced apart, longitudinal main frame members, (b) transverse frame means interconnecting said main frame members at their forward ends leaving the area between said main frame members unobstructed rearwardly of said transverse means and having towing means attached thereto, (c) reinforcing members attached generally to the outside, forward portion of each of said main frame members, (d) a trailing arm means pivotally secured to the rear end of each of said reinforcing members, each of said trailing arm means having a generally rearwardly extending arm portion on which is rotatably supported a ground-engaging wheel, each of said trailing arm means also having a generally upwardly extending lever arm portion, and (e) extendible fluid motor means pivotally secured at one end thereof on each of said reinforcing members and the other end of said fluid motor means being pivotally attached to the outer end of said lever arm portion, whereby said load bed may be raised when said motor is extended and lowered when said motor is retracted.



3,271,043
TRAILER SLED WITH RETRACTABLE WHEEL ASSEMBLY
Reid G. Priest, Port Angeles, Wash., assignor to Hyster Company, Portland, Oreg., a corporation of Nevada
Filed Feb. 24, 1964, Ser. No. 346,712
20 Claims. (Cl. 280—43.23)

1. A mobile trailer-sled for supporting spar towers comprising: (1) a rigid platform having at least two generally parallel spaced apart longitudinal main frame members interconnected by cross frame structure, the forward end of said platform having a front ground engaging sled and a detachable towing tongue, the rear end of said platform having a second ground engaging sled, said platform being provided with a pair of spaced apart axle frame means extending between said longitudinal members generally rearwardly of the transverse center line of said platform and defining an elongated axle space therebetween, and axle openings being provided in said longitudinal members at the ends of said axle space, (2) axle means being provided within said axle space and extending outwardly through

said axle openings beyond said longitudinal members to the outboard sides of said platform, said axle means being capable of moving upwardly and downwardly within said axle space and said openings, (3) wheel supporting means attached to the ends of said axle means, said wheel supporting means having rotatable wheels thereon, (4) a plurality of platform raising and lowering means located on said platform for raising and lowering said platform with respect to said wheels, and (5) locking means located near the ends of said axle means for locking said axle means in either one of its up and down positions within said space and openings.



3,271,044
PORTABLE WORKBENCH FOR HAND AND TABLE TOOLS
John M. Bosko, 6691 Cleveland Road and Wall St., Ravenna, Ohio; John L. Bosko, Upland, Calif. (6691 Cleveland Road and Wall St., Ravenna, Ohio); and Joseph B. Lindecker, Skokie, Ill. (1193 Valetta Drive, Temperance, Mich.)
Filed Mar. 4, 1964, Ser. No. 349,326
8 Claims. (Cl. 280—79.3)

1. A device of the character described including a portable workbench having a top formed of a wooden section and a metal section, said top adapted for supporting wood working tools and metal working tools, a vertical tool supporting back board movably secured above the rear side portion of said wooden section and remote therefrom, said wooden section having an aperture and a leaf pivotally secured in the aperture and provided with means for supporting it in angular relation above the wooden section and also adapted to be retained in closed position flush with the top surface of the wooden section, a supporting frame comprising vertical corner leg members at the ends thereof secured with and beneath said top, a shaft extending between the lower end portions of the corner leg members at each end of the frame, a pair

of elongated rollers rotatably and slidably mounted on each shaft, a coil spring mounted on each of said shafts between said rollers adapted to bias the rollers and resist a change in position on said shaft, and said rollers adapted to movably support said portable workbench.

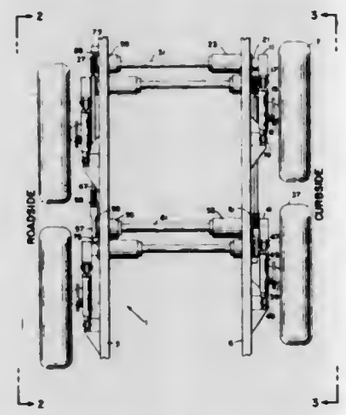
3,271,045
STEERING WHEEL MECHANISM
Matthew Vacante, Old Bethpage, N.Y., assignor to Postless Steering By Dual Wheels Co., Inc., Baldwin, N.Y.
Filed Apr. 22, 1965, Ser. No. 450,030
1 Claim. (Cl. 280—87)

Steering wheel means for a vehicle having a driver's seat and a steering linkage extending between the front wheels of the vehicle comprising,

a gear box having upper and lower portions mounted in the floor board of the vehicle, said upper portion located under the substantially horizontal portion of said driver's seat,

said lower portion having a flange adapted to rest on said floor board, the remainder of said lower portion extending below said floor board,

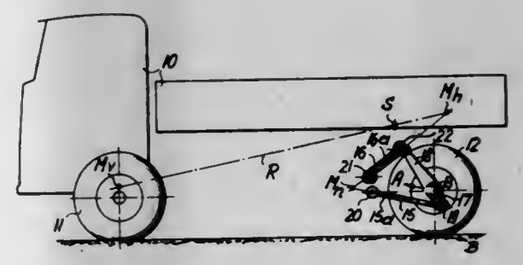
a pair of horizontal shafts extending from the upper portion of said gear box to just beyond the side of said driver's seat,



a pair of hand wheels, one mounted on each of said shafts,

gear means in said gear box connecting said wheels and shafts for counter rotation,

an output shaft in said gear box connected to said gear means and,

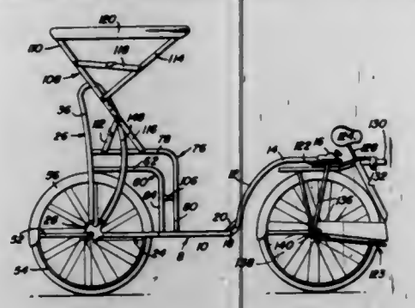


means to connect said output shaft to said steering linkage.

3,271,046
BOGIE ACTION TORSION BAR SUSPENSION SYSTEM
George D. Evans and Lawrence L. Mitchell, Salt Lake City, Utah, assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Army
Filed May 26, 1964, Ser. No. 370,390
6 Claims. (Cl. 280—104.5)

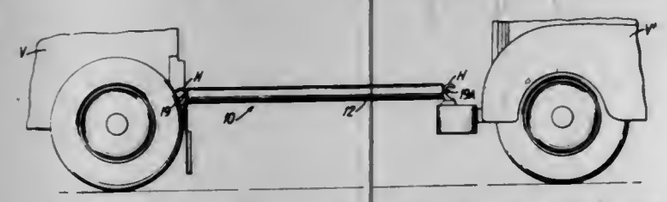
1. A bogie action torsion bar suspension system for a vehicle having a frame, said suspension system including: a roadside and a curbside bogie action suspension system mounted on said frame; said roadside and said curbside bogie action suspension system each including, a forward wheel and a rear wheel which are interconnected by a generally U-shaped linkage which extends from one side of said frame to the other and which includes at least one torsion bar as a part of said linkage, said linkage being arranged in such a manner as to have a bogie action built therein; and said curbside suspension system being mounted on said frame forward of said roadside suspension system.

3,271,047
AXLE SUSPENSION
Paul E. Strifler, Dettingen, Teck, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Filed June 15, 1964, Ser. No. 375,203
7 Claims. (Cl. 280—124)



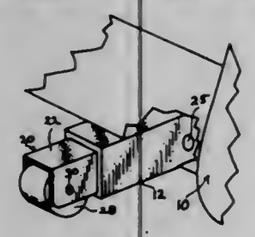
1. An axle suspension for a road vehicle having at least two axles and wheels thereon, and an upper vehicle structure resiliently supported on said axle, one of said axles being a rigid rear axle having an upwardly extending axle arm rigidly secured to each side thereof, a pair of upper guide arms pivotally connected at one end to said axle arm and at the other end to said upper structure and extending from said axle arm at an oblique direction to the longitudinal direction of the vehicle and away from each other and adapted to swing in said oblique direction and also extending at an oblique angle to the horizontal plane so that the longitudinal axes of said upper guide arms, as seen in a side view of the vehicle, intersect at a point located above said axle near a perpendicular transverse plane of the vehicle extending from the centers of the wheels on said axle, said point being located near the level of the center of gravity of said upper structure, a pair of downwardly extending axle arms rigidly secured to said axle at the opposite sides thereof, a pair of lower guide arms pivotally connected at one end to said last axle arms and extending therefrom at a small angle upwardly and pivotally connected at the other end to said upper structure, said longitudinal axis of each of said upper guide arms extending steeply downwardly and forwardly from their respective axle arms, the longitudinal axes of said upper and lower guide arms on each side of said axle intersecting at a point located in front of said axle and above the center of the wheel thereon.

3,271,048
SULKY VEHICLE ATTACHMENT FOR BICYCLES
Albert E. Beesley, 2609 Cheyenne, and Jack R. Hitchcock, 2941 Azalea, both of Pueblo, Colo.
Filed Dec. 21, 1964, Ser. No. 419,790
10 Claims. (Cl. 280—204)



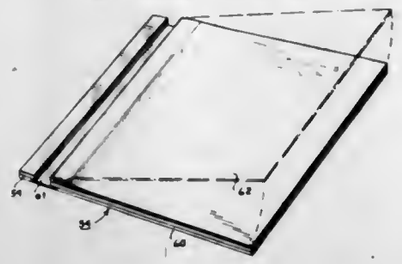
1. A trailer of the character described comprising a frame including a pair of spaced side members, a floor panel on said side members, supporting wheels on the frame, and a seat structure on the frame, said seat structure including a backrest comprising a pair of upstanding wings mounted on the frame, angulated supports having

one end affixed to the frame and their other ends affixed to the wings, a seat panel mounted on said supports, angular hand rails mounted on the frame and the wings



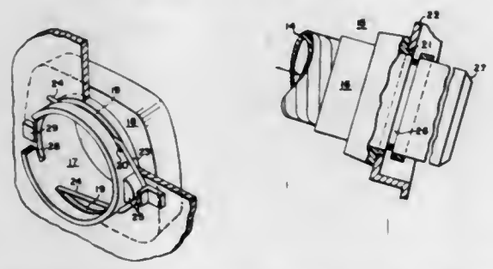
adjacent to and in spaced parallelism with the supports, and means for connecting the frame to a bicycle to be towed thereby.

3,271,049
VEHICLE TOW BAR
George P. Schoonmaker, R.R. 2, Roscoe, N.Y., and Andrew M. Schoonmaker, 4 Tandler Ave., Conklin, N.Y.
Filed Apr. 7, 1964, Ser. No. 357,955
6 Claims. (Cl. 280—493)



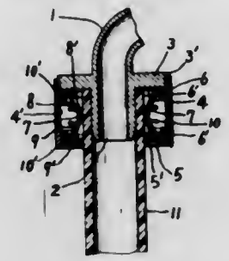
1. A tow bar for connecting two vehicles having towing elements, said bar comprising a rigid tubular member adapted to extend between the towing elements of said vehicles, a looped cable positioned within said tubular member and including looped portions projecting from the opposite ends of said tubular member and adapted to engage said towing elements, said cable further including opposed end portions disposed exteriorly of said tubular member, and means located exteriorly of said tubular member for engaging the opposed cable end portions and drawing the same together to thereby tighten said cable looped portions about said towing elements and bringing said towing elements into close abutting relation to the opposite ends of said tubular member.

3,271,050
HITCH BAR PROTECTOR
Eldon J. Saunders, 13420 Frazo Road, Warren, Mich.
Filed Dec. 14, 1964, Ser. No. 418,051
3 Claims. (Cl. 280—507)



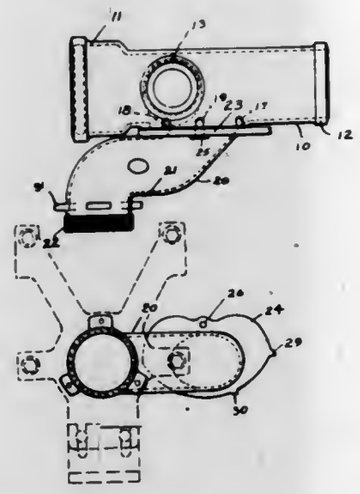
1. For use on road vehicle tractors equipped with a trailer hitch bar for receiving the projecting end of a trailer hitch, a close-off device for closing off the open end of said hitch bar comprising a member having a rear end insertable into said hitch bar, means on said rear end for removably affixing the device to said hitch bar, and a wheel rotatably mounted at the lower front end of said member for rollably supporting the rear end of the tractor when it goes up driveways and the like inclines such as would otherwise scrape the hitch bar.

3,271,051
ALBUM COVER BOARDS AND METHOD OF MAKING SAME
Edward K. Mullen and Leewood C. Carter, Union County, N.J., assignors to Book Covers, Incorporated, Newark, N.J., a corporation of New Jersey
Filed May 20, 1965, Ser. No. 457,357
16 Claims. (Cl. 281—29)



1. An album cover board structure comprising a multilayer spine board portion; a multi-layer panel board portion disposed in spaced relation to said spine board portion; a hinge material portion bonded to a surface of said spine board portion and a first surface of said panel board portion, said hinge material being indented substantially flush into said panel board portion; and a flap portion bonded solely on one side of the album cover board structure to a second surface of said panel board portion for disposition only on said one side of the album cover board structures, said flap portion substantially covering said second surface of said panel board portion.

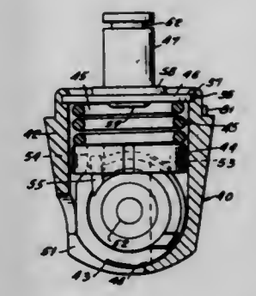
3,271,052
COUPLING
Robert S. Waters, Lexington, Ohio, assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Mar. 20, 1964, Ser. No. 353,507
5 Claims. (Cl. 285—7)



1. Mechanism for detachably connecting one end of a hose to a housing having an opening through a wall thereof, said mechanism comprising: a cylindrical sleeve member rotatably supported in said housing opening, said sleeve member being provided with means adapted to abut said housing wall at one side thereof, said sleeve member having at least one slot means disposed therein, spring means disposed in said slot means and extending beyond the periphery of said sleeve means, said slot means being of such a depth that at least a portion of said spring means extends into the interior of said sleeve member and the wall forming said slot means which is closest to said abutment means being removed axially therefrom a distance substantially equal to the thickness of said housing so that said portion of said spring means which extends beyond said sleeve periphery contacts said housing wall at the side thereof opposite the side thereof abutted by said abutment means whereby said abutment means and said spring means cooperate to retain said sleeve member in said housing opening, a cylindrical terminal member connected to said hose and receivable in said sleeve member, means carried by the outer surface of said terminal member for engaging said portion of said spring means extending into the interior of said cylindrical sleeve whereby said terminal member is retained in said sleeve member, cooperating means carried by said sleeve member and said housing adapted upon rotation of said sleeve member to temporarily effect disengagement of said portion of said spring means from said engaging means for permitting withdrawal of said terminal member from said sleeve member.

3,271,053
MEANS FOR COUPLING A HOSE TO A PIPE
Hisaharu Kurachi, 1–13 Suehirochi, Naka-ku, Nagoya, Japan
Filed July 2, 1964, Ser. No. 379,884
5 Claims. (Cl. 285—8)

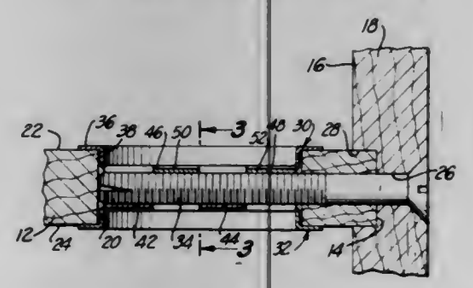
1. A means for coupling a hose to a pipe comprising a flange means provided adjacent an outlet of said pipe, a cup member engaging said flange means by means of threads and having an opening in the bottom wall thereof to receive said hose therein, and a spring means disposed between said flange means and said bottom wall of the cup member and adapted to function so as to vary the inside diameter thereof by the movement of said cup member, said spring means comprising a pair of supporting rings, a plurality of hinged members pivotal intermediate the ends thereof and a helical spring disposed between said supporting rings, opposite ends of each of said hinged members being hooked on the opposite end turns of said helical spring so that said hinged members may form a drumlike cylindrical body.



3,271,054
FITTING FOR BATTERIES OF WALL MOUNTED WALL CLOSETS
John H. Schmid, Erie, Pa., assignor to Zurn Industries, Inc., Erie, Pa., a corporation of Pennsylvania
Continuation of application Ser. No. 127,248, July 27, 1961. This application Oct. 23, 1965, Ser. No. 503,984
4 Claims. (Cl. 285—93)

1. A fitting for connecting a closet in a generally horizontal line slightly inclined toward the outlet comprising a hollow member having means on the ends thereof for connecting it in said line,

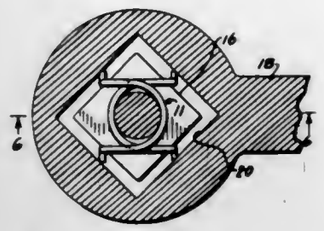
a hollow arm disposed generally parallel to said line,
an opening in one side of said hollow member,
said opening being longer in a horizontal direction than its height,
a finished outwardly disposed surface around said opening,
a finished surface on said arm around a hollow end thereof engaging said finished surface on said hollow member,
pivot means swingably connecting said arm to said member,
said pivot means being attached to said member above and on the side of said opening remote from the distal end of said arm whereby said distal end swings through a generally vertical line,
said arm having a peripheral edge defining a curve of predetermined shape,
a cam swingably connected to said hollow member,
an edge of said cam engaging said curved edge,
said cam and said hollow member adjacent said peripheral edge having calibration marks indicating the position to which said distal end of said arm is swung.



3,271,055
COUNTERBALANCED OSCILLATIVE JOINT
Nathan R. Schwartz, Yonkers, N.Y., assignor, by mesne assignments, to Swivelier Company, Inc., Nanuet, N.Y., a corporation of New York
Original application May 27, 1960, Ser. No. 32,438, now Patent No. 3,122,331, dated Feb. 25, 1964. Divided and this application July 31, 1963, Ser. No. 307,275
5 Claims. (Cl. 285—264)

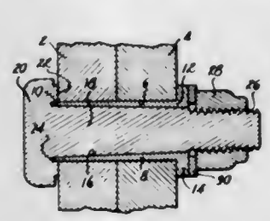
1. A counterbalanced swivel joint which comprises:
(a) a swivel ball having a bore therethrough;
(b) a shell wherein said ball is disposed, the shell comprising a cast member having a rounded internal wall at one end thereof against which the ball is seated, said shell having an elongated opening adjacent said bore of said ball and the longitudinal axis of said shell being parallel to the axis of said ball;
(c) a torsion spring mounted within said shell and having its axis arranged normal to the axis of said ball and normal to the axis of the bore in said ball, one end of the torsion spring being secured to the ball and the other end being held in fixed relationship with respect to the shell;
(d) a first means formed integrally with said shell and operatively engaging cooperating means on said ball for preventing the ball from pivoting about the axis of said bore while permitting the same to pivot about the axis of said torsion spring, said elongated opening, bore of said ball, longitudinal axis of said shell and the axis of said ball, all lying in a common plane;
(e) a washer having a curved seat engaging said ball and means on the washer for securing said other end of the torsion spring;
(f) a second means formed integrally with said shell and operatively engaging cooperating means on said washer for preventing relative rotation between the washer and the shell;

(g) retaining means attached on the end of said shell opposite from the rounded internal wall thereof;
(h) a loaded compression spring interposed between said retaining means and said washer to urge the washer against said ball and, in turn, to urge the ball against the rounded internal walls of said shell, and
(i) a third means formed integrally with said shell and operatively engaging cooperating means on said retaining means for preventing relative rotation between the retaining means and the shell.



3,271,056
FASTENING DEVICE
George W. Frisbey, Jr., Garden Grove, Calif. (7899 Westminster Ave., Westminster, Calif.)
Filed Dec. 3, 1963, Ser. No. 327,687
2 Claims. (Cl. 287—20.92)

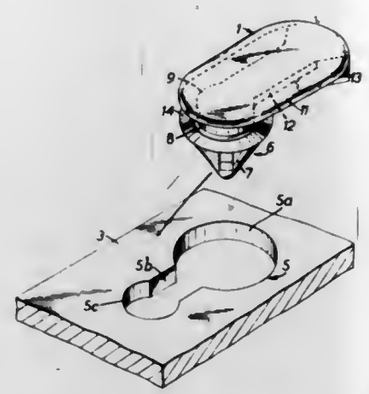
1. A fastened assembly comprising a first piece of material having an end, first and second sides and a first hole extending through said first piece of material from said first side to said second side thereof, first and second inserts engaged in said hole in said first piece of material, said first insert having a surface engaged upon said first side of said first piece of material and said second insert having a surface engaging upon said second side of said first piece of material, said first hole in said first piece of material having an axis and each of said inserts having an axis, said inserts being inserted in said first hole so that said axes of said inserts are substantially coincidental and are substantially parallel to said axis of said first hole, said first and second inserts each having fingers thereon, said fingers being positioned in overlapped relationship and defining a screw receiving opening, said fingers being located between said first and second sides of said first piece of material, said screw receiving opening having an axis at an angle to said axis of said first hole in said first piece of material, a second hole in the end of said first piece of material, said second hole having an axis which is substantially coincidental with said axis of said screw receiving opening, and a screw passing through said second hole and into said screw receiving opening so that said screw engages with fingers and prevents separation of said first and second inserts.



3,271,057
FASTENING DEVICE
Robert M. Kimbro, South San Gabriel, Calif., assignor to Kimbro Corporation, South San Gabriel, Calif., a corporation of California
Continuation of application Ser. No. 219,603, Aug. 27, 1962. This application July 30, 1964, Ser. No. 387,552
3 Claims. (Cl. 287—53)

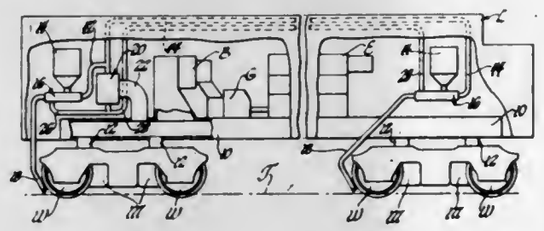
1. A device for preventing rotation between a member having a shaft receiving recess with a side wall and a bottom wall and a shaft extending into said recess, wherein said recess is larger than said shaft,
and means are provided for moving said shaft endwise toward said bottom of said recess, comprising a member of spring wire formed intermediate its ends into a generally U-shaped loop,
said loop lying between said bottom of the recess and the adjacent end of said shaft,
said loop lying in a plane that extends at least substantially perpendicular to the axis of said shaft and intersects said axis at a point,
the ends of said loop being bent to form legs extending

along the length of said shaft and between said shaft and the sides of said recess,
portions of said legs engaging and binding against the peripheral edge of said end of said shaft upon said movement of said shaft by said moving means, and
the terminal portions of said legs extending radially outwardly to drivingly engage the sides of said recess.



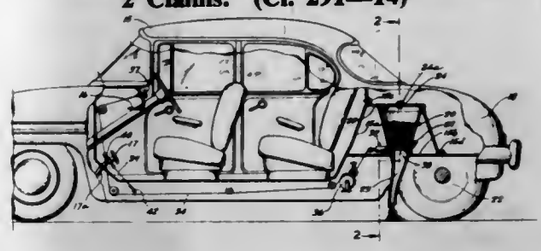
3,271,058
TAPERED FASTENER
Ben M. Anderson, Houston, Tex., assignor to Anderson, Greenwood & Company, Houston, Tex., a corporation of Texas
Filed May 22, 1963, Ser. No. 282,360
8 Claims. (Cl. 287—189.36)

1. A fastener comprising: a hollow sleeve having an outer surface shaped to conform generally to an opening through workpieces to be joined; the interior of said sleeve tapering uniformly from one end to the other; a draw pin member having a shank with an external surface tapered complementary to the tapered interior of said sleeve; a head on the large end of said shank, having a generally transverse bearing surface adjacent said shank; and a recess in said head circumscribing said shank and of a size and shape to receive the said one end of said sleeve.



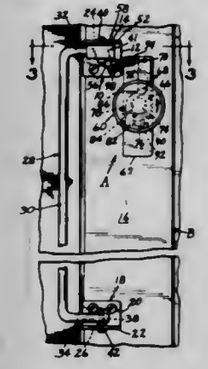
3,271,059
CLIP FOR FASTENING TOGETHER TWO APERTURED PANELS
Arthur Stanley Pearson, Sherwood, England, assignor to United-Carr Incorporated, a corporation of Delaware
Filed Feb. 17, 1964, Ser. No. 345,443
Claims priority, application Great Britain, Feb. 22, 1963, 7,287/63
3 Claims. (Cl. 287—189.36)

1. A clip for fastening together two panels, the first panel having an aperture and the second panel having an elongated slot, said clip formed of resilient material and comprising a stud-like member for snapping engagement in the aperture in the first panel and an integral arm extending radially away from the stud-like member, and said stud-like member having a neck portion of reduced diameter between the head of the stud and said arm and the radially outmost end of said arm carrying a peg projecting in a direction of said head of said stud, the configuration of the clip being such that it is slidable into assembly in said slot in the second panel with the stud-like member abutting at one end of the slot and a rib extending from said arm extending into and abutting the opposite end of said slot to prevent movement of the clip in the plane of the second panel, said slot being shaped in



plan like a dumbbell with unequal ends, flanges being provided on the clip for engaging into opposite faces of the second panel and preventing movement of the clip perpendicular thereto, and said stud-like member being receivable in snapping engagement in the aperture in the first panel and said peg snapping into the wider end of the slot, to abut the end wall thereof, when the stud-like member abuts the wall of the narrow end of the slot.

3,271,060
SANDING SYSTEM
Harry A. Kilgore, Elmhurst, and Harold L. Smith, La Grange, Ill., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 17, 1965, Ser. No. 488,210
6 Claims. (Cl. 291—3)

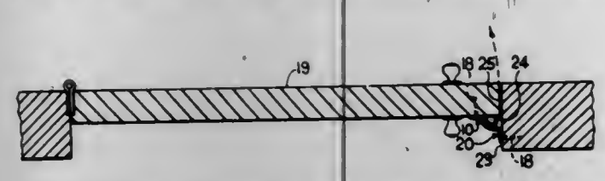


1. In a railway locomotive including wheels adapted to roll along a track, a system for supplying sand to said wheels to increase traction comprising: a delivery conduit extending adjacent one of said wheels, sand storage means connected to said delivery conduit and adapted to deliver sand thereto, a source of air under pressure, an air conduit from said source connected to said delivery conduit upstream of said storage means and adapted to direct a stream of air through said delivery conduit whereby sand is delivered to said wheel, a bypass conduit from said source connected to said delivery conduit downstream of said storage means and adapted to direct a stream of air through said delivery conduit whereby said delivery conduit is maintained free of obstruction, and switching means in said source adapted to direct a stream of air through said air conduit only when delivery of sand to said wheel is required.

3,271,061
VEHICLE TRACK SANDING DEVICE
Milford A. Miller, 8035 S. Euclid Ave., Chicago, Ill. 60617
Filed Mar. 22, 1965, Ser. No. 441,801
2 Claims. (Cl. 291—14)

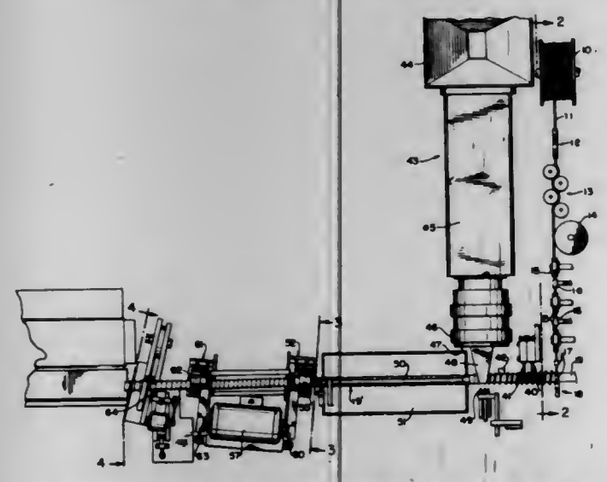
1. An installation for the luggage locker of a motor car for releasing an abrasive in front of the rear wheels thereof, comprising a pair of nozzles mounted in the floor of the locker above said wheels, hoppers mounted above the nozzles, valves controlling communication between the hoppers and the nozzles, a strip between the hoppers with ends removably attached to the front and bottom of the luggage locker respectively, and a cross-bar carried by the strip and connecting the hoppers at the top, the detaching of said ends enabling the hoppers to be raised off the nozzles as a unit.

3,271,062
RELEASE DEVICE FOR DOOR LATCH
Ross P. Schelin, Culver, Minn.
Filed Mar. 16, 1964, Ser. No. 351,985
5 Claims. (Cl. 292—336.3)



2. A release device for a door lock comprising:
(a) an elongated release bar,
(b) upper and
(c) lower spaced brackets,
(d) means laterally of said release bar for pivotally mounting said bar on said brackets,
(e) a lever plate connected to said release bar,
(f) an arm,
(g) means for securing said arm to the shaft of a door lock,
(h) a coil spring connected to said lever plate and said arm whereby the shaft of the door lock is rotated when said release bar is pivotally actuated.

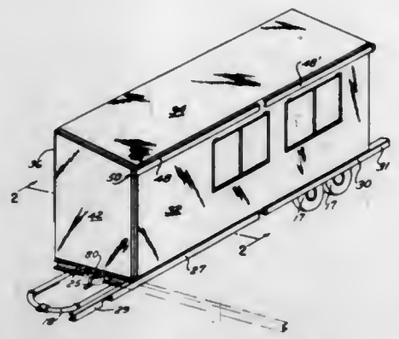
3,271,063
DOOR GUARD
Edd W. Garrett, 4350 S. Prairie Ave., Chicago, Ill.
Filed Apr. 29, 1964, Ser. No. 363,506
1 Claim. (Cl. 292—346)



A door guard of the character described, comprising a first elongated flat metal strip, an elongated U-shaped channel having one edge terminating in one edge of the metal strip and the other edge in the same plane as the metal strip, a second elongated, flat metal strip, a second elongated metal channel which is substantially a quadrant of a hollow cylinder, the second channel having

one edge terminating in one edge of said second elongated strip and the other edge terminating in a plane at right angles to the plane of said second metal strip, the metal strips having elongated transverse openings near each end thereof and spaced circular openings between

said elongated openings, whereby the first metal strip can be secured to a door near the free edge thereof and the second metal strip can be secured to the door jam of said door is in a position such that the channels nest when the door is closed.



3,271,064
METHOD AND APPARATUS FOR MAKING INDEFINITE LENGTH FLEXIBLE CONDUIT
Marcus A. Hall, Branford, Conn., assignor to Flexible Tubing Corporation, Guilford, Conn., a corporation of Connecticut
Filed Dec. 5, 1962, Ser. No. 242,448
4 Claims. (Cl. 264—93)

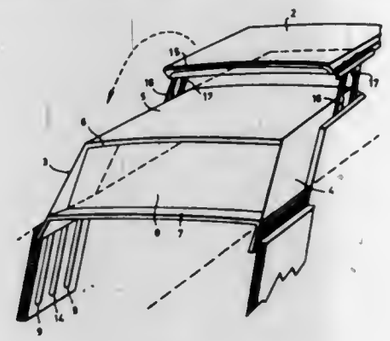
1. In a method of making indefinite length flexible conduit on a continuously advancing and rotating mandrel surface, the improvement which comprises
(a) forming a spaced-turn helix of wire about the mandrel surface,
(b) freshly extruding an unset thermoplastic strip at a temperature above its setting temperature directly above the wire at an unset and a tacky stage and at a rate less than the tangential velocity of the mandrel surface so that the strip necks down to produce a covering of overlapping turns around the wire,
(c) fluid-blasting the unset strip radially into corrugated shape over the wire turns and mandrel surface, and
(d) removing the thermoplastic strip with the wire turns off the mandrel surface in the form of a conduit after the thermoplastic sets.

3,271,065
EXPANDIBLE HOUSE TRAILER
Peter C. Scuris, 21 Colonial St., Hartford, Conn.
Filed Apr. 23, 1964, Ser. No. 361,982
5 Claims. (Cl. 296—23)

1. A laterally expandible house trailer having a carriage frame adapted for mobility, a rectangular body section having end walls fixed to said frame, an extensible side section telescopically received over said body section, said side section having end walls, side wall and a roof, an auxiliary roof hingedly related to said extensible section roof along the longitudinal edge thereof remote from the said side wall, auxiliary end walls hingedly related to said extensible section end walls along the vertical edge remote from the said side wall so that the auxiliary end walls will overlie the extensible section end

walls in folded position and partially overlie the body end walls in extended position, said extensible side section having a collapsible floor section, and laterally extendible frame members carried by said carriage frame adapted to support said extensible side section when extended.

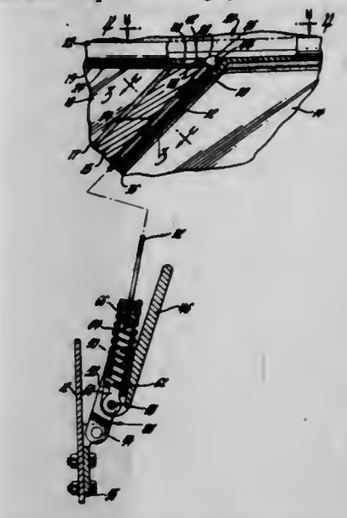
3,271,066
EXPANSIBLE VEHICLE STORAGE COMPARTMENT
Richard A. Teague, Franklin Village, Mich., assignor to American Motors Corporation, Kenosha, Wis., a corporation of Maryland
Filed Sept. 8, 1964, Ser. No. 394,740
5 Claims. (Cl. 296—76)



1. A vehicle body comprising:
(a) a passenger compartment;
(b) a storage compartment rearwardly of the passenger compartment and being open at its upper end;
(c) a cover for closing off the open upper end of the storage compartment;
(d) spaced hinge arms pivotally connected at their forward ends to the vehicle body and pivotally connected at their rearward ends to the cover;
(e) said hinge arms being removably anchored to the cover intermediately of the forward and rearward pivots whereby to selectively immobilize the rearward pivots.

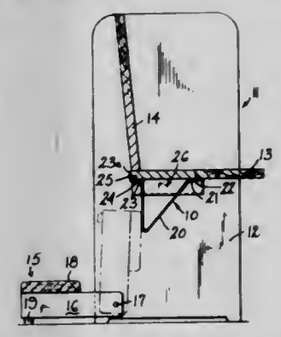
3,271,067
RETRACTABLE FOLDABLE RIGID ROOF FOR VEHICLE BODY
Paul Pierre Rollman, 1 Cite Beaumont, Fribourg, Switzerland
Filed Oct. 20, 1964, Ser. No. 405,106
Claims priority, application Switzerland, Nov. 18, 1963, 14,126/63
3 Claims. (Cl. 296—116)

1. In a vehicle having a windshield, front and back seats and a storage space behind said back seats, a rigid, foldable, convertible roof comprising



(A) a main rear roof section covering approximately the space between said front seats and the back of said rear seats;
(B) lateral panels supporting said main roof section and extending downwardly from the main roof section;
(C) a frame, supported by said panels and having a window;
(D) sliding members secured to said panels;
(E) guides in said storage space for receiving said sliding members, said guides lying in a vertical plane parallel to the forward direction of the vehicle, and being inclined downwardly and backwardly of the vehicle;
(F) means for raising and retracting said sliding members in said guides and thereby raising and retracting said main roof section into said storage space;

(G) a forward roof section having a front edge adapted to be secured to the top of said windshield, said forward section being pivotally secured to said main section by means of lateral arms so as to swing rearwardly to fit over said main roof portion and having means for pivoting said forward section to fold the same over said main section;
(H) said roof extending substantially rearwardly from the rear edge of the back of said front seats when in the unfolded and retracted position so as to transform said vehicle into a vehicle of the "spider" type with tonneau cover; said roof extending substantially rearwardly from the back of said front seats when in the raised but folded position so as to transform said vehicle into a sun roof sedan; said roof fitting in said storage space when in its retracted and folded position so as to transform said vehicle into a convertible.

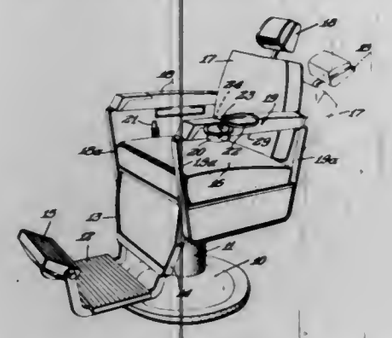


3,271,068
CONVERTIBLE TOP LATCHING MECHANISM
William T. Collins, Jr., Birmingham, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Nov. 13, 1964, Ser. No. 410,879
7 Claims. (Cl. 296—120)

1. A top latching mechanism for a convertible vehicle body including
a windshield mounting member extending upwardly from the vehicle body forwardly of a body formed passenger compartment,
top supporting means including a member movable proximate the upper end of the windshield mounting member in closing the convertible top with respect to the passenger compartment,
said windshield mounting member defining a housing extending upwardly and opening toward said top supporting member in its top closed position,
a latch member having an enlarged head thereon projecting outwardly of the upper end of said housing,
flexible means extending through said housing and mounting the latch member for reciprocable movement between a retracted top latching position and an extended top releasing position, and

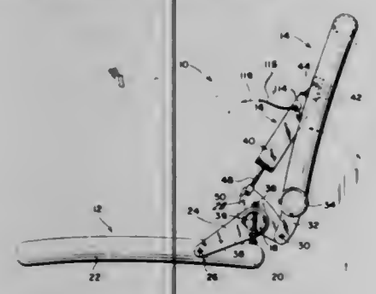
said top supporting member having a keeper slot therein enlarged at one end to receive the extended latch head during movement of the top supporting member toward its top closed position and narrowed adjacent its opposite end to engage and retain the retracted latch head upon movement of the top supporting member to its extreme top closed position.

3,271,069
BOOKRACK AND KNEELER STOP
Rudolph J. Gondar, 11 Shelton Road, Shelton, Conn.
Filed Oct. 6, 1965, Ser. No. 493,356
10 Claims. (Cl. 297—192)



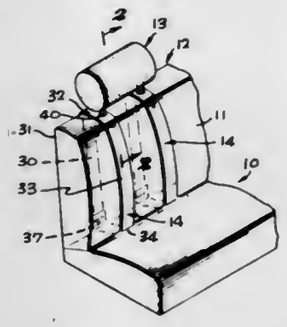
1. For use in combination with a church pew including floor-mounted upright members supporting a seat therebetween and a kneeler extending between the upright members and pivotally mounted therebetween for pivotal movement between a horizontal kneeling position and a storing position generally 90° therefrom between the upright members; a kneeler stop and bookrack comprising a pair of spaced apart arms adapted to be fastened to the underside of the seat and provide substantially vertical surfaces depending from the seat adapted to stop the kneeler when pivoted to a storing position, and rack means carried between said arms for storing books therein.

3,271,070
BARBER CHAIR WITH MANICURE SOCKET
John A. Dlouhy, River Forest, and Paul A. Springer, Palatine, Ill., assignors to Emil J. Paidar Company, Chicago, Ill., a corporation of Delaware
Filed Apr. 9, 1965, Ser. No. 446,853
5 Claims. (Cl. 297—194)



1. In a barber chair having a seat,
a back at the rear of the seat movable between an erect position and a reclining position,

and horizontally elongate side arm rests,
the combination comprising:
an elongate slide track means mounted on one of the arms substantially parallel thereto extending toward the front and extending toward the rear of the chair,
a holder slidably mounted and supported on said track means and shiftable therealong to different positions,

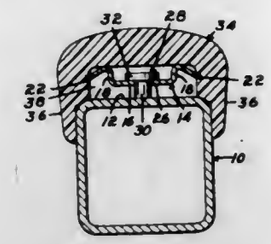


and means for locking said holder in any one of said positions so that the holder may be repositioned and locked at different locations along said arm with change in position of said back to accommodate the change in position of a chair occupant.

3,271,071
POSITION ADJUSTERS FOR SEAT BACKS
Paul C. Tabor, Clawson, Mich., assignor, by mesne assignments, to Rockwell-Standard Corporation, a corporation of Delaware
Filed June 22, 1964, Ser. No. 376,775
4 Claims. (Cl. 297—375)

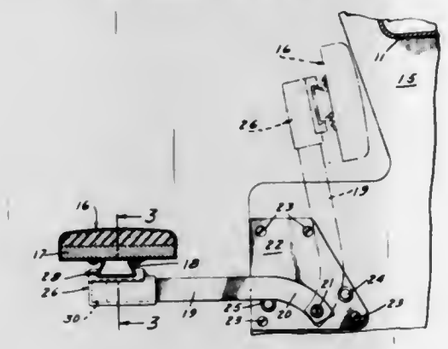
1. In a seat assembly having a relatively fixed seat member and a back member mounted on said seat member for pivotal movement between an inclined position and an upright position; means for adjusting the position of said back member comprising an extendable and contractable connector assembly pivotally secured at its opposite ends to said seat member and said back member respectively, and arranged to be extended when said back member is moved to said inclined position, said connector assembly comprising a housing connected to one of said members, a rod slidably received in said housing and connected to the other member, an operating spring wholly within said housing biasing said connector assembly to its contracted position, a plurality of juxtaposed centrally apertured lock plates carried by said housing, said rod extending through the apertures therein, and said apertures being larger than said rod whereby said lock plates can be tilted relative to said rod, a fixed fulcrum rigid with said housing for preventing the movement of said lock plates toward the end of said housing from which the rod protrudes, said fulcrum being offset to one side of the axis of said rod, a locking spring encircling said rod and compressed between a fixed housing part and the side of said lock plates remote from said fulcrum, said spring being operative to tilt said lock plates around said fulcrum to lock said rod and said housing against extensible movement to lock said seat back member against movement toward its inclined position, said locking plates being effective to brake, but not lock, said rod against movement in a contracting direction whereby said seat back member may be moved toward its upright position, a cam member rotatably supported in said housing for selective direct engagement with said locking plates on the side of said rod opposite said fulcrum, and means for rotating said cam to move said lock plates against the force of said locking spring until said lock plates are substantially normal to said rod whereby said rod may be freely moved in either direction.

3,271,072
HEAD REST FOR MOTOR VEHICLES
Donald E. Barker, 9352 Balcom Ave., Northridge, Calif.
Filed June 14, 1965, Ser. No. 463,755
15 Claims. (Cl. 297—397)



1. A device for connection to a motor vehicle seat back comprising at least one flexible strap to be connected to the seat back and having a first portion to extend upwardly along the rear side of said back and a second portion to extend forwardly from the upper end of said first portion and along the upper side of the seat back, a more rigid element carried by said strap and having a first portion to extend upwardly along the rear side of said seat back, adjacent said first portion of the strap, and a second portion turned forwardly from the upper end of said first portion of said element at a location to extend along the upper side of the seat back adjacent said strap and in vertical force transmitting relation to the seat back so that downward forces exerted on said element are transmitted to and taken by said upper side of the seat back to prevent relative downward movement of said element, means carried by said strap forming a pocket structure extending longitudinally of the strap into which at least a part of said element is insertible by movement generally longitudinally of the strap to a position of confinement in the pocket, and from which said element is withdrawable by movement generally longitudinally of the strap, and a head rest structure to be received above said seat back and connected to and supported by said element.

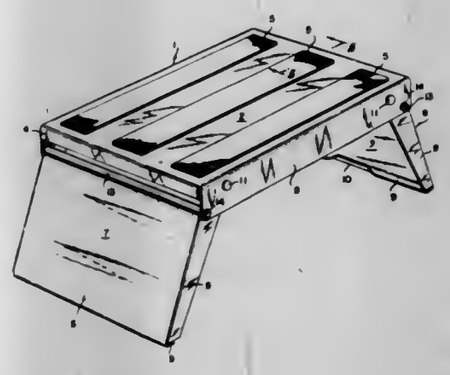
3,271,073
ARM CHAIR FASTENER
Harold S. Van Buren, Jr., Cambridge, Mass., assignor to United-Carr Incorporated, Boston, Mass., a corporation of Delaware
Filed Oct. 23, 1965, Ser. No. 503,821
3 Claims. (Cl. 297—422)



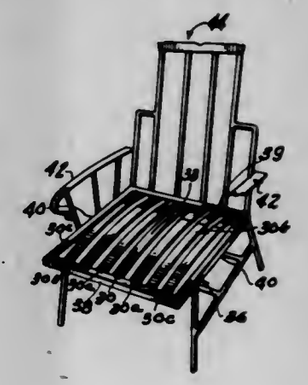
1. A combination of a fastening device, a support and an article, said fastening device comprising a rectangular base portion having an upper surface and having side edges, an integral wall extending from each of said side edges in right angle relation to said base portion, each of said walls having a free terminal end bent back toward the plane of said base portion and having a series

of serrations formed thereon and a keyhole slot formed through said base portion said keyhole slot having an enlarged portion and a long, narrow portion opening into said enlarged portion, said stud comprising a head portion having a shank portion extending therefrom said shank portion having an inner end, said stud secured

at said inner end of said shank to said support without perforating said support and said head portion overlying a portion of said body portion adjacent said long, narrow portion of said keyhole slot, said article having a cavity formed therein and said free terminal ends engaged to said article within said cavity.



3,271,074
ADJUSTABLE CHURCH KNEELER
William Hahnlein, Glendale, Calif., assignor to Hamlin Manufacturing Co., a corporation of California
Filed May 3, 1965, Ser. No. 452,729
4 Claims. (Cl. 297—426)

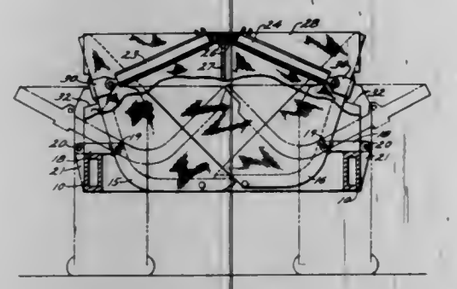


1. A kneeler of the character described, comprising:
(a) an elongate kneeling bench;
(b) fixed bracket means adapted to be mounted on a flat surface of a supporting structure and having a projecting pivot member;
(c) means supporting said kneeling bench for translatory movement between positions of use and non-use, including a swingable bracket arm having one end rotatably movable on said pivot member and the other end connected to said bench; and
(d) spaced stop members adjacent said pivot member respectively engaged with the bracket arm in the non-use and the use positions of said bench, said bracket arm in the use position providing a cantilever for supporting the bench independently of an underlying floor surface.

3,271,075
FOOT STOOL
Wayne W. Good, Sturgis, Mich., assignor to Harter Corporation, Sturgis, Mich., a corporation of Michigan
Filed May 20, 1965, Ser. No. 457,420
5 Claims. (Cl. 297—439)

1. A foldable stool comprising a platform member having a leg member pivotally mounted at each end thereof, said platform member comprising a sheet-form top member having depending lateral flanges at the sides thereof, each of said leg members comprising a sheet-form web having a lateral flange at each side thereof disposed at substantially right angles to said web, each lateral flange of said leg members being pivotally connected at one end to the end of a lateral flange of said platform member and being tapered toward the other end, and a transverse limit rod provided at each end of said platform member having its ends affixed to the ends of the lateral flanges thereof, the arrangement being such that said leg members are retained in downwardly divergent relationship by said limit rods in operative position, and whereby said leg members may be folded against said platform member in inoperative position and said limit rods utilized as carrying handles, and wherein in the inoperative position said leg members are nested completely within the space defined by said plaform member and its depending flanges.

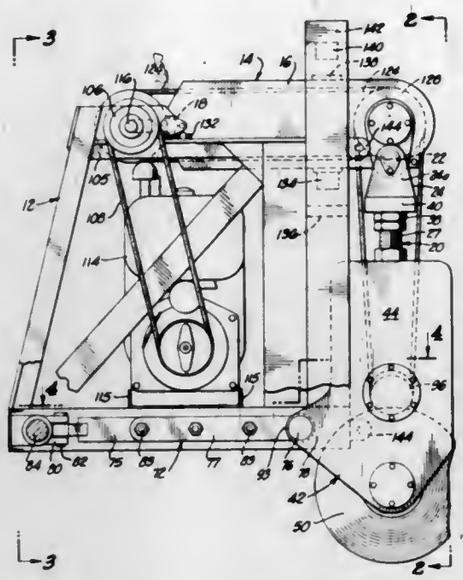
3,271,076
SEATING CONSTRUCTION
William I. Smith, Marinette, Wis., assignor to Heywood-Wakefield Company, Gardner, Mass., a corporation of Massachusetts
Filed Mar. 26, 1965, Ser. No. 443,020
8 Claims. (Cl. 297—445)



1. In a seating construction including a rectangular seat frame, having front, rear and side members and floor engaging members extending downwardly from the frame, the improvement which comprises a plurality of resilient members extending between the front and rear portions of the frame disposed in spaced parallel relationship defining a resilient supporting surface within the frame, the resilient members having a rigid sector extending forwardly and upwardly from the rear frame member to an apex and a flexible resilient sector extending forwardly from the said apex to the front frame member.

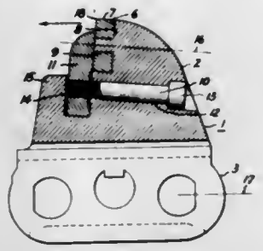
3,271,077
TRUCK SUSPENSION SYSTEM
Hillis J. Timmer, 2150 Mariacoba Drive, Holland, Mich., and Norman P. Unema, 3281 Oak St., Hudsonville, Mich.
Filed July 13, 1964, Ser. No. 381,967
5 Claims. (Cl. 298—22)

1. A truck assembly comprising: front and rear axle assemblies; a frame supported on said axle assemblies; said frame forming a load bed generally over said rear axle assembly; a dump box pivotally mounted on the rear of said frame; a third tandem axle assembly displaced to the rear of said load bed; a tandem frame extension extending from said truck frame rearwardly to said tandem axle assembly; the rear of said tandem frame extension being supported by said tandem axle assembly; the forward end of said extension being pivotally mounted on said truck frame, and said extension intermediate its ends being in supporting engagement beneath said dump box to allow distribution of part of the load normally applied to the rear axle assembly to the front and tandem axle assemblies.



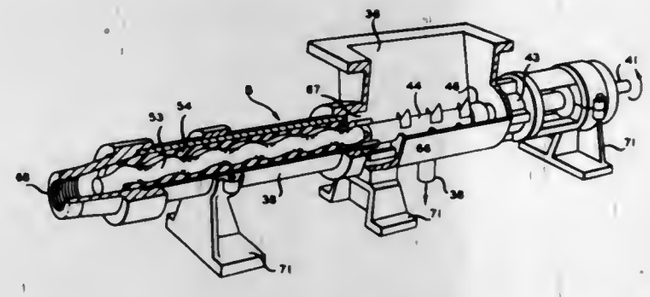
3,271,078
ROCK WAGON
Dean C. Klingaman, Decatur, and Alfred C. La Grow, Peoria, Ill., assignors to Caterpillar Tractor Co., Peoria, Ill., a corporation of California
Filed May 18, 1965, Ser. No. 456,709
4 Claims. (Cl. 298—25)

1. A dump wagon having a frame supported on wheels and including two spaced longitudinally extending beams, a body between said beams comprising two halves each having a side wall and a bottom wall, pivot means supporting said halves each with respect to one of said beams and with edges of the bottom walls meeting between the beams to form a receptacle, and power means engaging each half adjacent its side wall to swing it to a position for dumping its contents outwardly over the beam to which it is pivoted.



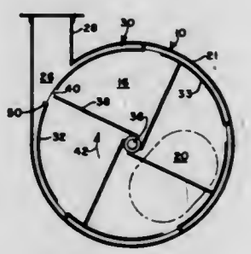
3,271,079
PAVEMENT CUTTER
James B. Simmons, 12203 Gneiss Ave., Downey, Calif.
Filed July 18, 1963, Ser. No. 295,887
16 Claims. (Cl. 299—40)

4. In a pavement cutter, the combination of:
a frame;
an assemblage including a substantially vertical arm pivotally mounted on the frame for limited movement relative thereto, and a sharp edged disc rotatably held about a horizontal axis to the lower end of the arm and movable about a vertical axis;



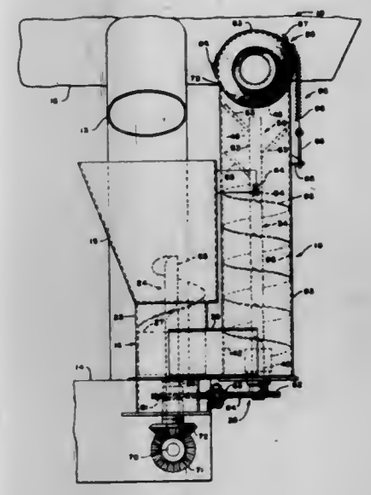
means for imparting a vibratory motion to the assemblage, said means including a rotatable off-center mass rotatably held to the assemblage; and
means for pivoting the cutting disc about its substantially vertical axis.

3,271,080
CUTTER BIT ASSEMBLY FOR MINING MACHINES
Thomas W. Gowanlock, Detroit, Mich., assignor to General Electric Company, a corporation of New York
Filed Feb. 6, 1964, Ser. No. 343,092
8 Claims. (Cl. 299—92)



1. A cutter bit assembly for mining machines comprising in combination
a cutter bit holder adapted at a first end thereof for attachment to a mining machine, the other end thereof having a recess to receive a disposable cutter bit, said recess having a first and second supporting surface for said cutter bit at substantially right angles to each other,
said disposable cutter bit having two opposite parallel surface and an edge surface therebetween perpendicular to both said opposite parallel surfaces to provide a plurality of cutting edges on both said parallel surfaces, the cutter bit mounted for rotatable adjustment in said recess at a negative rake angle with one of said parallel surfaces fully supported by the first parallel surface of the recess of the cutter bit holder and a portion of the edge surface of said cutter bit resting on the second supporting surface of said recess,
the dimension of said cutter bit holder along the cutter bit axis being substantially in excess of the width of said cutter bit along the cutter bit axis so as to provide substantial structural support for the cutter bit in the direction of the cutting forces, said cutter bit being indexable and invertible in the recess of said holder for full utilization of said cutting edges on both parallel surfaces of said cutting insert, and clamping means for securely retaining said cutter bit in said recess, said clamping means being releasable for rotation and inversion of said cutter bit in said cutter bit holder.

3,271,081
APPARATUS AND PROCESS FOR PUMPING SLURRY
Thomas J. Huddleston, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed Sept. 28, 1964, Ser. No. 399,807
5 Claims. (Cl. 302—14)

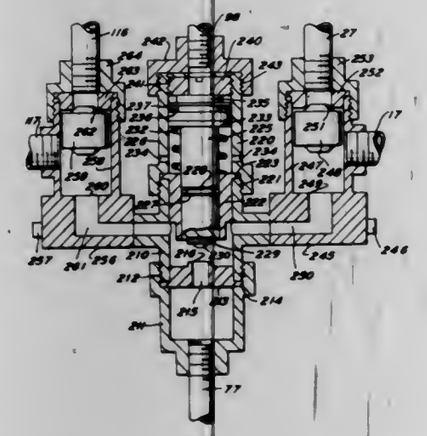


1. A progressing cavity pump having a feed hopper and a progressing cavity stator, an inlet to the feed hopper, an outlet to the stator, and a stator inlet space between the hopper and the stator, a progressing cavity rotor mounted in the stator, a drive shaft with pitched paddle feeding means thereon mounted on the hopper and connected to the rotor, and an agitating bar mounted on the nearest paddle of said feeding means and extending into said stator inlet space to a point adjacent said rotor to prevent the crystals in said slurry bridging in said stator inlet space.

3,271,082
BLOWER CONVEYOR
Keith E. Wood, Ottumwa, Iowa, assignor to Deere & Company, Moline, Ill., a corporation of Delaware
Filed Dec. 3, 1964, Ser. No. 415,749
13 Claims. (Cl. 302—37)

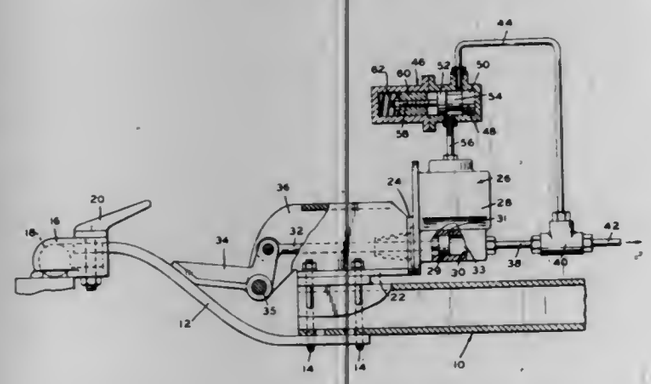
2. In a blower conveyor having a housing, an impeller rotating within the housing and including a plurality of radial impeller vanes, one end of the housing transverse to the impeller axis having an inlet for feeding material to the impeller, the housing also having an outlet for delivery of the propelled material, the improvement comprising an impeller member interposed between the vans and the housing, open toward the housing inlet and having a plurality of radial apertures, the impeller member coaxially rotating in a timed relationship with the impeller vanes for discharge of the material through the apertures and the housing outlet.

3,271,083
PNEUMATIC CONVEYOR
William Hobbs, Jr., Lancaster, and William W. Mann, Talmage, Pa., assignors to Sperry Rand Corporation, New Holland, Pa., a corporation of Delaware
Filed Sept. 13, 1965, Ser. No. 486,999
10 Claims. (Cl. 302—50)



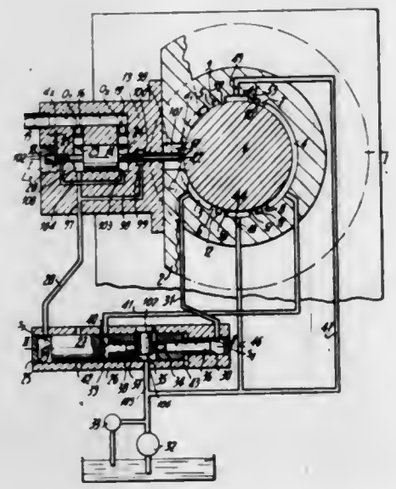
1. A pneumatic conveyor for dry, fluent material such as forage, shelled corn, feed supplements and other products comprising a vertically extending tubular imperforate housing having an inlet opening at a bottom end and a discharge opening at an upper end, said discharge opening being open in an axial direction relative to said housing, a conveying tube extending perpendicular to said housing and through which a high speed air stream passes, said tube having a bottom opening communicating with said housing discharge opening to receive material therefrom, means for continuously delivering material to said housing through said inlet opening, a vertically extending feed auger within said housing and having flights in close proximity to the housing inner walls, said feed auger having a lower receiving end at said inlet opening and an upper discharge end located below said discharge opening to define a chamber for a material plug between the feed auger and said conveying tube to prevent downward passage of air from the tube and through said housing, an agitator on said auger discharge end and projecting into said chamber to facilitate upward movement of material from the chamber into said conveyor tube, means detachably connecting said agitator to said feed auger whereby the agitator may be removed to provide an unobstructed chamber, said agitator being affixed to said feed auger for rotation therewith and being of such length that it projects through a major portion of said chamber, and drive means for rotating said feed auger.

3,271,084
AUTOMATIC BRAKE VALVE
Robert H. George, Melrose Park, Pa., assignor to Brakmaster Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Filed June 30, 1964, Ser. No. 379,173
6 Claims. (Cl. 303—8)



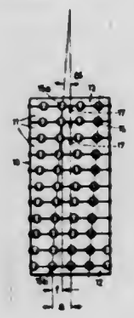
1. A brake control valve interposed between the fluid pressure supply and storage and the fluid pressure operated brakes comprising
a valve body with a movable valve member therein having a valve seating portion,
said valve body having a fluid space therein,
a fixed valve seat in said body at a boundary of said fluid space for engagement by said valve seating portion,

a fluid connection for applying the pressure from a brake operating storage tank for moving said valve member toward seated position on said fixed seat,
a resilient member for normally urging said valve member away from said fixed seat,
a venting valve communicating with said fluid space,
a fluid pressure responsive member for actuating said venting valve,
a fluid connection for applying the pressure from a supply of fluid pressure against said pressure responsive member for opening said venting valve,



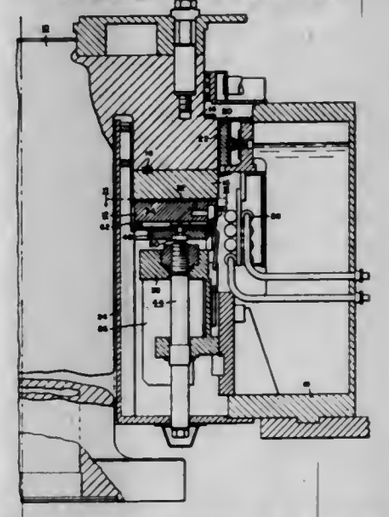
said valve body having a bore in offset relation to the movable member,
one end of said bore having a valve seat and being in communication with said fluid space,
the other end of said bore having a valve seat and being in communication with an operator controlled variable supply of brake operating pressure,
a brake operating delivery fluid connection in communication with said bore between said seats, and
a valve seating member seating on one of said seats as determined by the supply of fluid through the other of said seats.

3,271,085
VEHICLE TRAILER BRAKE ACTUATING MECHANISM
William J. Payne, Livonia, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Filed Nov. 24, 1964, Ser. No. 413,411
5 Claims. (Cl. 303—18)



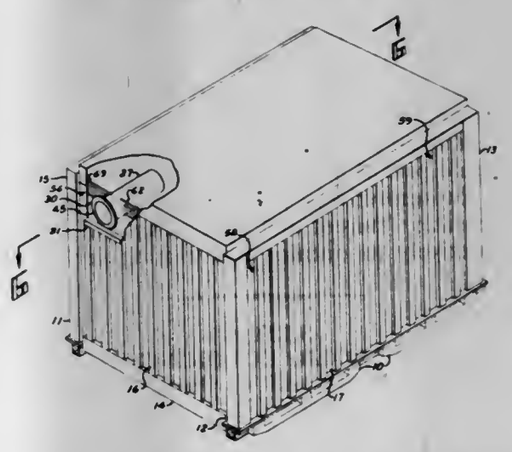
4. A vehicle trailer brake comprising a rigid tongue support structure, a resiliently flexible tongue portion connected to said structure and adapted to be hitched to a towing vehicle, a brake master cylinder assembly connected to said support structure, said master cylinder assembly having a pressure chamber and a reservoir chamber, a fluid pressure outlet from said pressure chamber adapted to be connected to the wheel brakes of a trailer, means responsive to the reflexing of said resilient tongue portion constructed to force pressure fluid from said actuating chamber, said means comprising a bell crank pivotally supported on said support structure and having one end engaging said resilient tongue portion, the other end of said bell crank being connected to a piston within said pressure chamber.

3,271,086
DEVICE FOR MAINTAINING CONSTANT THE DISTANCE BETWEEN ADJACENT SURFACES OF A REFERENCE BODY AND A MOVABLE BODY SUBJECT TO A VARIABLE EXTERNAL FORCE
Paul Deffrenne, Geneva, Switzerland, assignor to Mecanorga S.A., Geneva, Switzerland, a corporation of Switzerland
Filed Oct. 10, 1963, Ser. No. 315,334
Claims priority, application Switzerland, Oct. 26, 1962, 12,625
22 Claims. (Cl. 308—5)



1. A device for maintaining constant in a determined direction the distance between adjacent and lightly spaced surface of a reference body (**2**) and of a movable body (**1**), said movable body being subjected to an outer variable force and to an antagonistic force exerted in at least two pressure zones (**3**, **4**) located opposite each other, fluid circuits under pressure controlling said pressure zones, said device comprising a corrector element (**14**) slidable in the reference body (**2**) in the manner of a slide valve, the distance of which to the movable body (**1**) determining the pressure in a primary gas circuit in which a flow of gas, at a certain feed pressure, takes place through two orifices, one of said orifices consisting of a nozzle (**16**) with the cross section O_1 and the other being composed of the surface (L_1 x d_1) of a cylinder whose base is the perimeter circumference (L_1) forming the lips of an opening (**17**) provided in the corrector element (**14**) and whose height is the distance (d_1) between the plane of the said circumference and the surface of the movable body (**1**), the distance from a wall integral with the reference body (**2**) determining the pressure in a secondary gas circuit in which a flow of gas, at the same feed pressure, takes place through two secondary orifices of the same nature as those of the primary circuit and placed in the same order, one of said secondary orifices consisting of a nozzle (**19**) with the cross section O_2 and the other being composed of the surface L_2 x d_2 of a cylinder whose base is the perimeter circumference L_2 forming the lips of an opening (**21**) which is part of the reference body and communicates with said corrector element (**14**), the height of said other secondary orifice being the distance d_2 between the plane of the said circumference and the corresponding face of the adjacent corrector (**14**), the assembly being so arranged that the pressures p_1 and p_2 of the primary and secondary gas circuits act respectively on the surfaces s_1 (**23**) and s_2 (**24**) of the corrector (**14**) in such directions that an elementary displacement of the movable body (**1**) causes a displacement in the opposite direction of the corrector (**14**), the various values O_1, L_1 O_2 and L_2, on which the values of p_1 and p_2 depend, being determined in such a way that the product of p_1 by s_1 is always equal to the product of p_2 by s_2, whatever the feed pressure, provided only that the distance d_2 of the corrector (**14**) from the wall integral with the reference body (**2**) is equal to the distance d_1 of the corrector (**14**) from the movable body (**1**) which forces the latter to remain in a predetermined position, a distributor (**25**) adapted to regulate the pressure in at least one of the fluid circuits which feed the two opposite pressure zones (**3**, **4**) as a function of the position occupied by the corrector (**14**) so that the pressure of the fluid in said zones varies in such a direction that the variation of the force acting on the movable body has a tendency to oppose the variation of the outer force, so that the corrector (**14**) can only find its equilibrium when the movable body (**1**) occupies the said predetermined position with regard to the reference body (**2**) and that any displacement of the movable body (**1**) from the said position, caused by the variation of the outer force, has the effect of disturbing the equilibrium of the pressures acting on the two faces of the corrector (**14**) and of producing a displacement of said corrector (**14**), which in turn results in the antagonistic force exerted by the fluid by means of the distributor to be varied and create a new state of equilibrium by bringing the movable body (**1**) to its predetermined position with regard to the reference body (**2**).

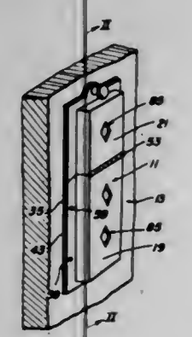
3,271,087
CAGE FOR BALL OR ROLLER BEARINGS
Gerhard Wieland, Gochsen, and Robert Blassnitz, Wustenrot-Hasenhof, near Heilbronn, Germany, assignors to Fischer-Brodbeck G.m.b.H.
Filed Oct. 16, 1963, Ser. No. 316,678
Claims priority, application Germany, Oct. 18, 1962, F 38,080
8 Claims. (Cl. 308—6)



1. A cage adapted to receive and retain a plurality of rolling elements of a bearing, the cage comprising a plurality of rings made of synthetic resin material, grooves spaced in circumferential direction from each other being formed in each of the end faces of said rings, the grooves of each adjacent pair of rings co-operating to provide sockets for the rolling elements, the grooves in one end face of any one ring being displaced circumferentially with respect to the grooves in the other end face of the same ring.

3,271,088
SUPPORTING MEANS FOR BEARING PADS IN A THRUST BEARING ASSEMBLY
Albert W. Latham, Murrysville, and Barney Slotnick, Irwin, Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed May 25, 1964, Ser. No. 369,953
4 Claims. (Cl. 308—160)

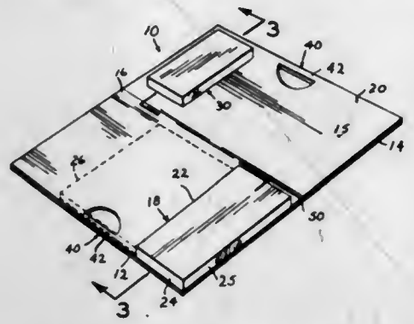
1. A supporting arrangement for a thrust bearing assembly having a plurality of segmental bearing pads circumferentially disposed and having respective bearing surfaces for supporting a rotating thrust runner of a vertical machine shaft, said supporting arrangement comprising for each of said bearing pads a spring plate disposed on a stationary pivot support substantially at its center of loading, three discs supporting the associated pad on said spring plate, means forming a part of each spring disc for characterizing the support of said pad relative to said spring plate with a given degree of spring response, one of said spring discs disposed radially inwardly of the other two spring discs so as to provide substantial uniformity of loading on the bearing surface of the associated bearing pad and so as to promote sufficient and appropriate pad bending for efficient bearing surface lubrication during machine operation, and means retaining said spring discs in the positions described.



3,271,089
DEHUMIDIFYING BREATHER SYSTEM FOR MOBILE CARGO CONTAINER
Harry I. Krellen, Newport News, Va., assignor to the United States of America as represented by the Secretary of the Army
Filed Oct. 29, 1963, Ser. No. 319,896
1 Claim. (Cl. 312—31.2)

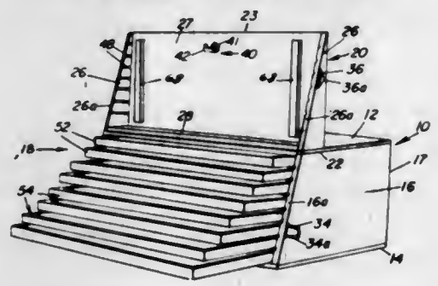
In combination with a cargo container having four vertical walls one of which is provided with an access opening to the interior of the container, means render-

ing said container substantially air tight, apparatus providing substantially free breathing between the interior of said container and the ambient atmosphere while maintaining the interior of said container substantially free of moisture comprising a receptacle mounted in said container and opening through one vertical wall thereof, said receptacle including a plenum chamber in one end portion, desiccant material in said receptacle between said plenum chamber and the interior of said container, and a plurality of breather tubes extending from said plenum chamber through the vertical walls of said container, said breather tubes sloping downwardly away from said plenum chamber for gravity flow of condensation therefrom, said tubes passing for substantial distances inside of said container where they are subject to ambient temperatures which, at times, are cool enough to condense moisture from ambient air surrounding said container as it enters said tubes, the arrangement being such that air entering said container from the outside atmosphere passes first through said breather tubes and then through said desiccant material before entering said container.



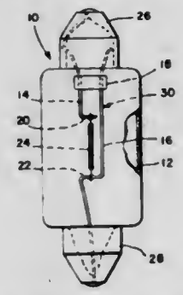
3,271,090
TOILET PAPER CABINET
Bethel E. Smithers, 1036 Shawnee Circle, Memphis, Tenn.
Filed Sept. 29, 1964, Ser. No. 400,135
6 Claims. (Cl. 312—41)

1. A toilet paper cabinet adapted to be fixed to a bathroom wall for dispensing the paper of an open core type toilet paper roll, said cabinet comprising a hollow body structure having a front body member, a door hingedly secured on said front body member with said door being hinged on a horizontal axis and supported from said front body member and movable in a 180° arc toward and away from upwardly closed and downwardly open positions, roll handling means including a pair of arms pivotally secured from said body structure and with each arm having a distal portion, said pair of arms being oppositely arranged and pivotable together, said roll handling means including roll support means for supporting a roll of paper between said pair of arms, and connecting link means interconnecting said door and said distal portions of said pair of arms said roll handling means being adapted for respectively presenting a roll of paper for the dispensation thereof and concealing said roll responsive respectively to opening and closing said door.



3,271,091
PORTFOLIO COLORING KIT
Jennie Henry, 425 W. Douglas Drive, Midwest City, Okla.
Filed Apr. 26, 1965, Ser. No. 450,826
4 Claims. (Cl. 312—231)

4. A portfolio coloring kit, comprising: an edge abutted identical pair of rectangular sections lying in a common plane forming a writing surface; a panel of pliable material coextensive with and underlying said sections, said panel being bonded to said sections except along the adjacent edge portion opposite the writing surface of the abutted edges of said sections permitting said sections to be hinged toward each other and disposed in spaced-apart parallel relation; a pocket secured to the surface of said panel opposite one end portion of one said section, said pocket being open toward the other end portion of said



one section; a rectangular box-like container formed by said panel opposite the end portion of the other said section diagonally opposite said pocket, said other section having an opening coinciding with said box-like container; a lid slidably connected to the surface of said other section around the opening; and a handle formed in the free edge of said panel and each said section opposite the abutted edges of the latter.

3,271,092
DISPLAY AND OTHER CASES AND METHOD OF MAKING
Thomas Pierson Hatfield, 705 Zimmerman St., and James Earl Squyres, 1112 N. Main, both of Homer, La.
Filed Aug. 13, 1963, Ser. No. 301,855
1 Claim. (Cl. 312—311)

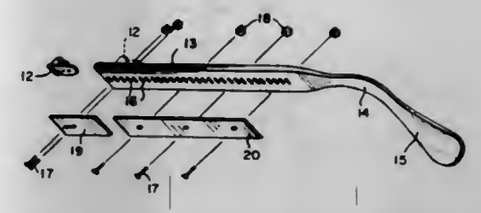
A portable display case which is open at its front end and provides top, bottom and rear walls, and parallel side walls which latter and the rear wall are perpendicular to said bottom wall; a closure for the open front end of said casing, said closure providing top and side walls as continuations of corresponding casing walls and an end wall which latter provides the casing front and parallels the casing rear wall when the closure is closed; hinge means connecting the top walls of the casing and closure whereby the latter, when opened, will seat upon the top wall of the casing; a plurality of display trays in said casing and insertable thereinto from the open casing end when the closure is opened, said trays being of uniform length and width, with the length of each slightly less than the interior length of the casing when the closure is closed, so that the front ends of said trays can be spaced from the closure end wall at the casing front, there being a casing side wall-provided supporting means for the respective trays, a lock means for retaining the closure closed, and comprising a rotatable member extending through the closure end wall and having operating means adjacent the outer surface of the latter, the inner end of said rotatable member within the casing having a right angularly disposed arm, a seat provided by the bottom casing wall into which the free end of said arm is movable to prevent opening movement of the closure, and the inner surface of the closure end wall having secured thereto at each opposite side of said lock means a compressible strip, each strip being disposed in opposition to the front ends of said trays, the thickness of said compressible strips being such as to force the rear tray ends against the rear casing wall whereby to prevent tray shifting in transit, the outer rearwardly disposed surfaces of said strips disposed rearwardly of the plane of arm and seat whereby to admit of free movement of said arm to lockingly engage its seat to lock the closure against opening movement.

3,271,093
METHOD FOR MAKING INCANDESCENT LAMPS
Arthur P. Meier, Bloomfield, N.J., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed June 10, 1960, Ser. No. 35,360
2 Claims. (Cl. 316—19)

1. The method of sealing an incandescible filament under predetermined tension within an envelope, which method comprises: supporting a relatively short first conducting lead in spaced and generally parallel relationship with respect to a relatively long second conducting lead having a resilient section bent generally transverse to adjacent conducting lead portions, and positioning in predetermined spaced relationship the bent section of said second conducting lead and the closest extremity of said first conducting lead; connecting a filament of predetermined dimensions between the bent section of said second conducting lead and said first conducting lead proximate its positioned extremity; inserting into an open-ended vitreous envelope said supported conducting leads and said filament, with portions of both said first and second conducting leads projecting from one envelope end and only a portion of said second conducting lead projecting from the other envelope end; sealing into one selected end of said envelope portions of both said first and second conducting leads as project through such selected envelope end; applying a predetermined tension on said second conducting lead to cause the bent section thereof to flex a predetermined amount to place a predetermined tension on said filament; sealing the other end of said envelope about the second conducting lead portion projecting therethrough while maintaining the predetermined tension on said second conducting lead; and removing oxygen from said envelope and hermetically sealing same.

3,271,094
ADJUSTABLE EYEGLASS TEMPLE UNIT
Wallace P. Wildermuth, Lead, S. Dak.
Filed Nov. 28, 1961, Ser. No. 155,354
1 Claim. (Cl. 351—120)

An interchangeable and length adjustable eyeglass temple member for pivotal attachment to one end of an eyeglass frame,



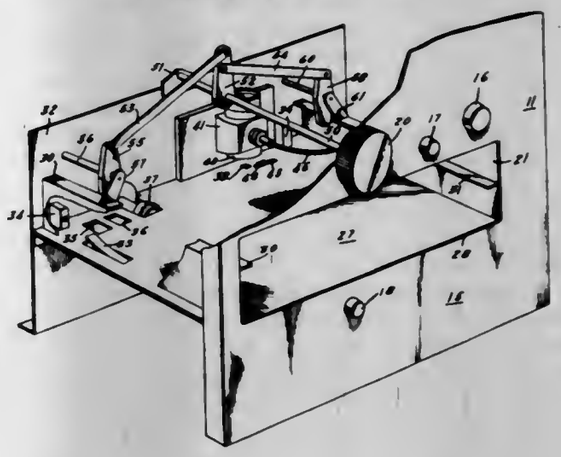
said temple member comprising an elongated member generally of rectangular section having flat parallel and relatively wide opposite vertical side faces and relatively narrow upper and bottom sides,

one of said flat vertical side faces providing an attaching portion at one end thereof for an eyeglass frame and an ear-engaging portion at the opposite end thereof,

a plurality of parallel and relatively closely spaced elongated apertures extending transversely through said temple member substantially at right angles to the longitudinal axis thereof,

said plurality of elongated transversely positioned apertures extending adjacent the attaching end of said temple member to provide for selective detachment of end portions thereof to vary its length to fit the wearer,

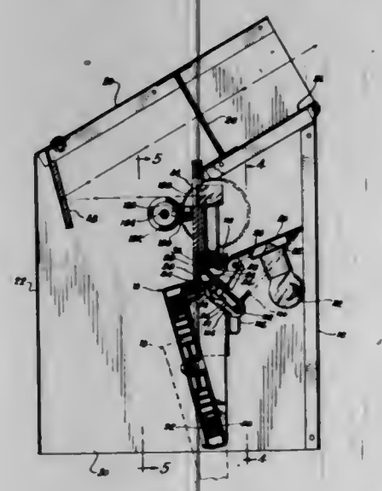
a first hinge member fixedly mountable on the attaching end portion of an eyeglass frame,



a second hinge member cooperatively pivotally engageable with said first hinge member and having releasable securing means coacting with a pair of said elongated apertures in said temple member adjacent the attaching end thereof for adjustably and fixedly mounting said second hinge member on one flat vertical side of the attaching end of said temple member,

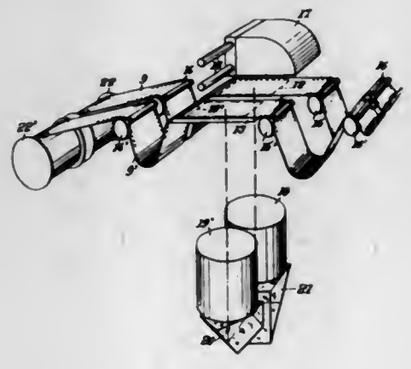
a reinforcing back-up plate disposed along the other flat vertical side of said temple member and opposite said second hinge member and fixedly held in position against said other side of the temple member by said securing means,

said elongated apertures coacting with said releasable securing means to provide for angular adjustment of said temple member relative to said second hinge member in the plane of said temple member.



3,271,095
PROJECTOR FOR CONTINUOUS SOUND AND MOTION PICTURE FILM
Volmer S. Jensen, Glendale, and Louis M. Goldstone, Beverly Hills, Calif., assignors, by mesne assignments, to Jayark Instruments Corporation, a corporation of New York
Filed June 15, 1964, Ser. No. 374,998
10 Claims. (Cl. 352—34)

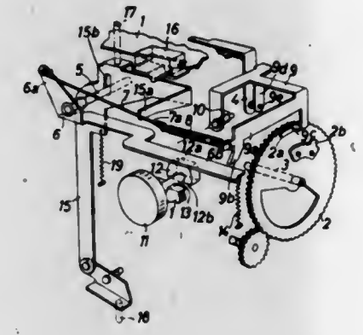
1. A projector for projecting motion picture film and for reproducing sound recorded on the film, the film having sprocket holes and being disposed in a self-winding film cartridge,



(a) said projector having a housing provided with an aperture for receiving the cartridge;
(b) a bottom wall in said housing;
(c) a pair of spaced guide rails disposed parallel to said bottom wall to confine the cartridge when introduced into said aperture;
(d) a continuously rotatable sprocket wheel extending through said bottom wall;
(e) spring means on said bottom wall for normally urging the cartridge when introduced into said aperture upwards against said guide rails to clear said sprocket wheel; and
(f) manually operable means for pushing the cartridge downwardly against said bottom wall to engage said sprocket wheel with the sprocket holes in the film.

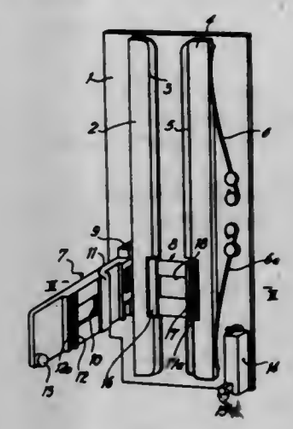
3,271,096
PROJECTOR CONSTRUCTION
Robert C. Blackmore, 3950 Lake Shore Drive, Chicago, Ill.
Filed Aug. 5, 1963, Ser. No. 299,952
9 Claims. (Cl. 352—72)

1. In a projector construction, the improvement comprising a housing, a film strip included in a cartridge mounted within said housing, said cartridge being of the type confining an endless length of film strip whereby repeated projection of the film strip can be accomplished without removal of the strip from the cartridge, a light source within the housing adapted to direct light onto frames in said film, a projector screen mounted on the housing for displaying the projected images on said strip, and drive means for engaging said strip to successively move said frames past said light source, said drive means including a manual actuating means whereby the strip can be stopped during projection and whereby the speed of movement of the strip past said light source can be manually controlled, said cartridge including a guide plate for said film strip with an aperture in said guide plate for passage of light therethrough, said strip including sprocket holes, an opening defined by said guide plate over which the sprocket holes of said film strip pass, a sprocket connected to said drive means having teeth adapted to extend through said opening and to be received by said sprocket holes for movement of said film, an aperture plate mounted in said construction having an aperture defined therein for communication with said first mentioned aperture, projections formed in said aperture plate, additional openings in said guide plate for receiving said projections to thereby accurately align said cartridge in said construction, a reflecting mirror and lens whereby said light source is adapted to direct light onto said mirror and then through said lens for passage through said film strip, means mounting said lens and mirror on a common pivotal axis, said cartridge including a recessed portion for receiving said mirror and lens in an operating position, and means on said cartridge for pivoting said mirror and lens between said operating position and an inoperative position to thereby provide clearance for insertion and removal of said cartridge.



3,271,097
METHODS AND APPARATUS FOR MAKING ANIMATED CARTOONS
Jean de Montremy, 8 Ave. des Tilleuls, and Jean Véran Dejoux, 15 Rue de Castellane, both of Paris, France
Filed Apr. 24, 1964, Ser. No. 362,415
Claims priority, application France, Nov. 16, 1960, 844,085, Patent 1,280,047; Feb. 19, 1964, 964,418, Patent 85,956, 964,419, Patent 1,411,004
25 Claims. (Cl. 352—133)

5. The method of making animated cartoons which comprises recording a series of individual pictures which constitute an animated sequence directly onto two separate bands of film, successive pictures of the sequence being recorded alternately first on one band and then on the other band, and projecting an image of each successive picture recorded on each band onto an area of the other band on which the next picture of the sequence is to be recorded.



3,271,098
ASSEMBLY FOR SELECTIVELY OPERATING AN APPARATUS SUCH AS A MOTION PICTURE APPARATUS, IN DIFFERENT WAYS
Karl Neudecker, Munich, and Johann Zanner, Unterhaching, near Munich, Germany, assignors to Agfa Aktiengesellschaft, Leverkusen, Germany
Filed Mar. 12, 1964, Ser. No. 351,283
Claims priority, application Germany, Mar. 15, 1963, A 42,607
7 Claims. (Cl. 352—169)

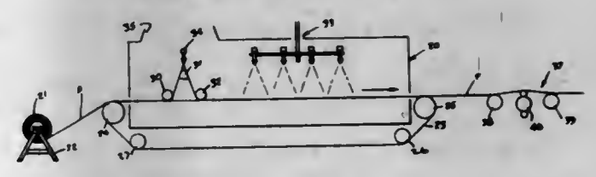
1. In an assembly for selectively operating an apparatus, such as a motion picture apparatus, in different ways, in combination, support means; control means carried by said support means for movement on a rest position to one of a pair of operating positions which respectively provide different types of operation of the apparatus, said control means moving through one of said operating positions thereof before reaching the other of said operating positions thereof; a positioning lever turnably carried by said support means for movement between a pair of locations in which said lever is situated in the path of movement of said conttrol means from said rest position to said operating positions thereof and said lever in one of said locations being located nearer to said control means, when the latter is in said rest position thereof, than when said lever is in the other of said locations thereof; manually operable selecting means engaging said lever for placing the latter in one or the other of said locations, said lever when in said one location arresting the movement of said control means when it reaches said one operating position and when in the other of said locations arresting the movement of said control means after it has moved through said one operating position to the other of said operating positions; manually operable actuating means for initating the movement of said control means from said rest position thereof to one or the other of said operating positions; and motion-transmitting means operatively connected to said control means and engaged by said actuating means for displacing said control means from said rest position to

one or the other of said operating positions upon operation of said actuating means by the operator, said motion-transmitting means including an elongated rod pivotally connected at one end to said positioning lever and an elongated coil spring connected to the end of said rod distant from said lever and having an end distant from said rod and connected to said control means, said rod being located in the path of movement of said actuating means to be deflected thereby to transmit movement of said actuating means through said spring to said control means to displace the latter from said rest position to that one of said operating positions determined by the location of said positioning lever which has been selected by said selecting means.

3,271,099
FILM-GUIDING TRACKS OR CHANNELS IN CINEMATOGRAPHIC APPARATUS
André Victor Léon Clément Debrie, 131 Ave. de Malakoff, Paris, France
Filed Jan. 30, 1964, Ser. No. 341,380
Claims priority, application France, Feb. 14, 1963, 924,822
4 Claims. (Cl. 352—224)

1. A film guide track for cinematographic apparatus for controlling the braking of film as it moves longitudinally along said guide track comprising two spaced opposing strips having V-shaped grooves mounted on a fixed plate and adapted to be oppositely engaged by the longitudinal edges of the film therebetween, at least one of said strips being movable and subjected to the action of spring means towards the other strip, said strips being interrupted in their lengthwise direction about a portion of said plate where an image aperture is located, a film gate and a shoe cooperating with said film gate located at said aperture being located on either side of said plate, said film gate and said shoe in combination being adapted to bear upon peripheral margins of the film, said margins being exterior at least of the image track, whereby said strips insure the braking of the film while said film gate and said shoe insures the flatness of the film at the location of said image aperture.

CHEMICAL

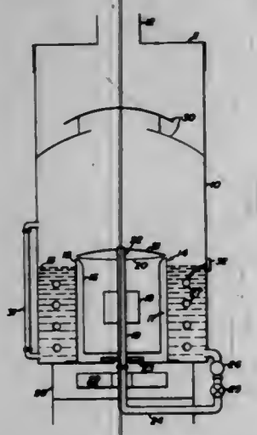


3,271,100
DYEING AND PRINTING PROCESS
Donald K. Clough, Bradford, England, assignor to Sandoz Ltd. (also known as Sandoz A.G.), Basel, Switzerland
No Drawing. Filed May 6, 1965, Ser. No. 453,826
Claims priority, application Switzerland, Nov. 13, 1961, 13,128/61
12 Claims. (Cl. 8—54)

1. A process for dyeing wool which comprises applying to the wool an aqueous solution containing as essential ingredients 0.5 to 5% of a water-soluble hydroxylamine salt and a water-soluble dye selected from the group consisting of an acid dye, a reactive dye and a direct dye and subjecting the wool to a wet heat treatment at temperatures ranging from 60° to 110° C. for at least 5 minutes.

3,271,101
PROCESS FOR TREATING FIBROUS MATERIALS AND RESULTING PRODUCTS
Edward L. Patton, Middlesex, N.J., and Robert D. Lundahl, Hawthorne, N.Y., assignors to Shell Oil Company, New York, N.Y., a corporation of Delaware
No Drawing. Filed Sept. 11, 1961, Ser. No. 137,024
12 Claims. (Cl. 8—120)

1. A process for treating cellulosic fibrous materials to impart dimensional stability thereto which comprises impregnating the fibrous material with a 1% to 25% aqueous caustic solution and exposing for a period of from about 15 seconds to 3 minutes the resulting wet impregnated material to hot vapors of a mixture of water and a member of the group consisting of epihalohydrins and materials which liberate epihalohydrins in an alkaline medium, said mixture containing at least 10% by weight of water.



3,271,102
SPRAY DYEING PILE FABRICS
Harry L. Morgan, Collegeville, Pa., assignor to James Lees and Sons Company, Bridgeport, Pa., a corporation of Delaware
Filed Nov. 24, 1961, Ser. No. 154,430
4 Claims. (Cl. 8—151)

1. The method of continuously dyeing a textile pile fabric which comprises the steps of continuously passing the fabric through a first liquid spray zone, bending the

fabric at said first liquid spray zone to open up the pile and expose the base of the pile, applying conditioning liquid to the opend up pile in said first spray zone to aid and assist in the subsequent dye penetration, continuously passing the fabric through a second spray zone in a straight line path and applying liquid dye under pressure to the fabric at said second spray zone by oscillating liquid dye spray means transversely across the fabric while it is being fed.

3,271,103
LIQUID DISSEMINATOR
Lee M. Buchanan, Frederick, Md., assignor to the United States of America as represented by the Secretary of the Army
Filed Mar. 11, 1964, Ser. No. 351,260
1 Claim. (Cl. 21—92)

An apparatus for vaporizing liquid disinfectant comprising a cylindrical container; a cap on said container; a centrally disposed flue on said cap; a centrifugal atomizer unit within said container comprising a motor means located within a motor housing and having a hollow, vertically disposed, driven shaft, a pair of concentric, rotatable discs located at the upper end of said shaft, the said discs extending to be coterminous with the upper diameter of the motor housing, and the said discs being concavely opposed to each other and meeting at their peripheries to form a slit for improved atomization of the conveyed liquid, said shaft being provided with radial bores in that portion located between said discs, a fan attached to the lower end of said shaft and located below said motor housing, and an atomizer housing surrounding said motor housing and forming therewith a narrow air conduit; liquid heating means located in the lower portion of said container where the liquid to be vaporized is confined; a base on the bottom of said container for supporting the same; an air heater means located within said base; a liquid conduit extending from near the bottom of the container, external thereto, to said hollow shaft of said motor; baffle means within said container and located between said centrifugal atomizer unit and said flue; and thermostat means for controlling the temperature of said liquid.

3,271,104
PROCESS FOR THE RECOVERY OF TUNGSTEN FROM ITS ORES
Joseph P. Suris, Jr., Walnut Creek, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Filed Feb. 7, 1963, Ser. No. 256,842
6 Claims. (Cl. 23—19)

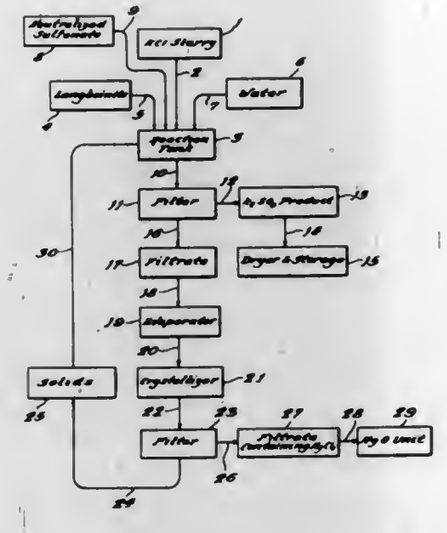
1. A process for recovering high purity tungsten values from tungsten source materials which comprises:

(a) reacting a tungsten bearing source material with a concentrated alcoholic hydrogen halide solution acidulating agent at a temperature of from about 40 to about 70° C. for a period of from about 0.25 to about 4 hours employing an amount of said acidulating agent such that the original hydrogen halide/tungsten weight ratio of the reaction mix expressed as equivalent HCl/WO_3, is at least 3 thereby to dissolve substantially all of the tungsten values present in said tungsten containing source material, the alcohol component of said acidulating agent being a member selected from the group consisting of aliphatic monohydric alcohols containing from 1 to 3 carbon atoms, and the hydrogen halide being a member selected from the group consisting of HCl and HBr, said concentrated alcoholic hydrogen halide solution being saturated with said hydrogen halide based on said alcohol component being substantially anhydrous, and said alcoholic hydrogen halide solution being further characterized as having from 0 to about 70 volume percent of said alcohol replaced with water,

(b) separating the resulting solution containing substantially all of the tungsten values present in said tungsten bearing source material from any undissolved solid residue,

(c) treating said solution thereby to precipitate said tungsten values therein by reducing the hydrogen halide concentration therein,

(d) separating said precipitated tungsten values from the residual solution and washing said precipitated tungsten values; and,



(e) recovering said precipitated tungsten values as a high purity product.

3,271,105
PROCESS FOR THE SEPARATION AND RECOVERY OF HYDROXYLAMMONIUM SALT
Wallace F. Runge, Terre Haute, Ind., assignor to Commercial Solvents Corporation, a corporation of Maryland
No Drawing. Filed Feb. 3, 1964, Ser. No. 342,284
13 Claims. (Cl. 23—87)

1. A process for the separation and recovery of an hydroxylammonium salt from an aqueous reaction mixture produced by the reaction of a primary nitroalkane having from 2 to 10 carbon atoms, a mineral acid and water, said reaction mixture containing the hydroxylammonium salt corresponding to said mineral acid and the acid corresponding to said nitroalkane, comprising maintaining said reaction mixture above the crystallization temperature of said hydroxylammonium salt, passing said reaction mixture through a solvent extraction zone containing a water-insoluble mono-ring aromatic hydrocarbon solvent selective for said acid and said nitroalkane, removing an aqueous phase containing said hydroxylammonium salt from said zone, and recovering said hydroxylammonium salt from the aqueous phase.

3,271,106
PRODUCTION OF POTASSIUM SULFATE AND POTASSIUM CHLORIDE
Alfred F. Nylander, Redwood City, Calif., assignor to International Minerals & Chemical Corporation, a corporation of New York
Filed Oct. 9, 1963, Ser. No. 314,979
19 Claims. (Cl. 23—121)

10. In the crystallization of potassium chloride from an aqueous medium, the improvement comprising incorporating in said medium 250 to 2,000 parts per million of a neutralized agent of the group consisting of sodium, potassium, and magnesium salts of monosulfonic acids of oleic acid, stearic acid, lauric acid, valeric acid, palmitic acid, capric acid, caproic acid, caprilic acid, and sylvic acid; the sodium, potassium, and magnesium salts of acid sulfates of oleic acid, stearic acid, lauric acid, valeric acid, palmitic acid, capric acid, caproic acid, caprilic acid, and sylvic acid; the compounds triethanol amine oleic

acid sulfonate, disodium 4-dodecylated oxydibenzene sulfonate, and sodium dodecyl benzene sulfonate; and mixtures thereof prior to crystallizing the potassium chloride therefrom.

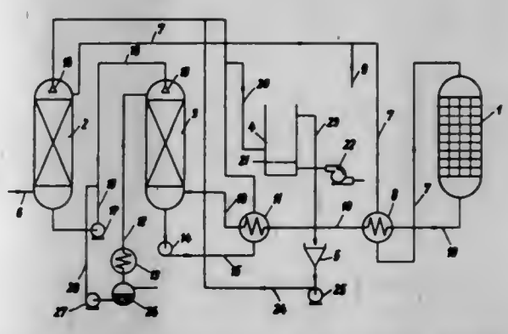
3,271,107
SILICA PIGMENTS FROM FLUOSILICIC ACID
John D. Nickerson and George M. Burkert, Lakeland, Fla., assignors to International Minerals & Chemical Corporation, a corporation of New York
Filed July 31, 1963, Ser. No. 298,856
9 Claims. (Cl. 23—182)

1. In the preparation of silica by the reaction of fluosilicic acid with ammonium hydroxide in aqueous medium, the improvement comprising carrying out the reaction in two separate stages which comprise:

(a) reacting fluosilicic acid with ammonium hydroxide in a reaction zone of high agitation, and adjusting the proportions of the reactants to maintain a pH in the range of 6.0 to 8.0, whereby a silica-containing slurry is produced;

(b) then reacting said slurry in a quiescent reaction zone with additional ammonium hydroxide in an amount sufficient to provide a final pH in the range of 8.3 to 9.0 for a time of about 20 minutes to 120 minutes, and separating precipitated silica from the resulting slurry.

3,271,108
PREPARATION OF LITHIUM HYDRIDE
George S. Fujioka, Walnut Creek, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Filed Mar. 26, 1962, Ser. No. 183,329
5 Claims. (Cl. 23—204)



1. A process for the preparation of lithium hydride which comprises intermixing a lithium halide selected from the group consisting of lithium chloride, lithium bromide and lithium iodide with sodium hydride in an inert organic diluent in which at least one of the reactants is at least partially soluble, to thereby react the lithium halide with sodium hydride at a temperature in the range of from 20° C. to 150° C. to form lithium hydride and recovering the lithium hydride from the reaction mixture.

3,271,109
PIGMENTARY SILICON CARBIDE
Eugene J. Mezey and Hans H. W. Schwantje, Wadsworth, Ohio, assignors to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Filed Apr. 11, 1963, Ser. No. 272,236
11 Claims. (Cl. 23—208)

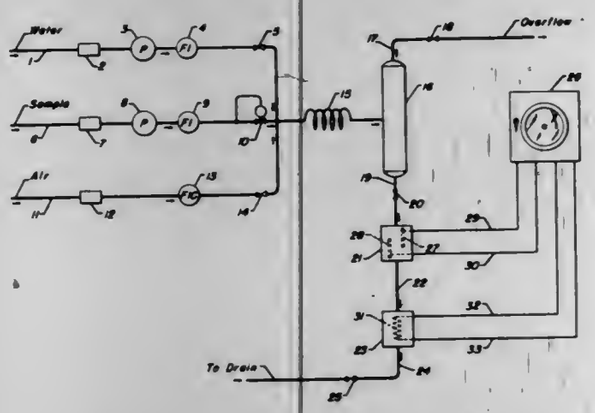
1. A process for producing pigmentary silicon carbide which comprises reacting an oxide of silicon with carbon particles of from 0.005 to 1.5 microns in size while said carbon is in the form of particles in a flowing inert gaseous atmosphere whereby to form pigmentary silicon carbide.

10. A novel particulate composition of pigmentary silicon carbide, the silicon carbide content of which consists of silicon carbide particles, at least 80 percent, on a number basis, of which particles are substantially spherical and have a mean number particle size between 0.05 and 0.4 micron.

3,271,110
METHOD OF PRODUCING HYDROGEN
Karl Bratzler, Bad Homburg vor der Hohe, Germany, assignor to Metallgesellschaft Aktiengesellschaft, Frankfurt am Main, Germany
Filed Nov. 6, 1961, Ser. No. 150,543
Claims priority, application Germany, Nov. 12, 1960, M 47,102
1 Claim. (Cl. 23—213)

A cyclic process for recovering hydrogen, which process comprises the following steps:

(a) passing a crude gas containing hydrogen, carbon monoxide, carbon dioxide and hydrogen sulfide into a saturation zone, in contact with an aqueous alkaline solution containing a hydrogen sulfide and carbon dioxide absorbent selected from the group consisting of an alkali metal arsenate and an alkali metal ferricyanide, withdrawing at the top portion of said saturation zone the unabsorbed gases saturated with water vapor and withdrawing at the bottom portion of said saturation zone the said aqueous alkaline absorbent solution, passing on and distributing the said solution at the top of the cooling zone;

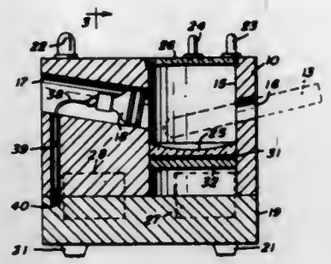


(b) introducing steam into the unabsorbed gases and then passing the said unabsorbed gases saturated with water vapor and containing the aforesaid introduced steam into a catalyst reaction zone wherein the said gases and water vapor are catalytically reacted at 350–500° C. to produce hydrogen and carbon dioxide;

(c) passing the resultant reacted gases from the catalytic reaction zone to the bottom portion of the cooling zone wherein said gases are cooled by countercurrent contact with the absorbent solution supplied thereto, to thereby further remove carbon dioxide and hydrogen sulfide impurities from said reacted gases;

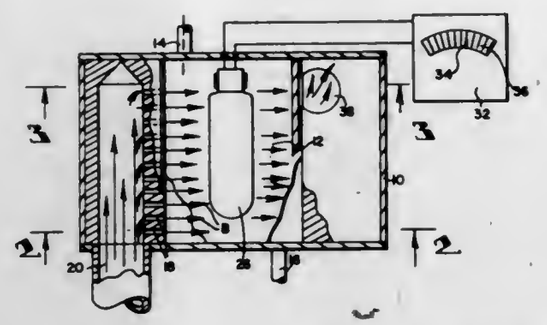
(d) withdrawing the purified hydrogen-containing reacted gases from the top portion of said cooling zone;

(e) recycling to the top of the saturation zone a portion of the aqueous alkaline absorption solution withdrawn from the bottom of the said cooling zone, and transferring the remaining portion of the aqueous alkaline absorption solution withdrawn from the bottom portion of the cooling zone to the regenerating zone, aerating the latter solution therein for precipitating sulfur, removing the said sulfur by filtration, and recycling the said regenerated aqueous alkaline solution free from precipitated sulfur to the top of said saturation zone.



3,271,111
METHOD AND APPARATUS FOR BORON TRIHALIDE ANALYSIS
David M. Boyd, Jr., Clarendon Hills, and Kenneth O. Rockey, Evanston, Ill., assignors to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware
Filed Jan. 28, 1965, Ser. No. 428,767
7 Claims. (Cl. 23—230)

1. A method for continuously determining the concentration of a boron trihalide in a flowing stream of liquid hydrocarbon containing said boron trihalide which comprises withdrawing from said flowing stream a sample stream of said hydrocarbon; passing said sample stream, under a pressure sufficiently high to maintain all constituents of the sample stream in the liquid phase, to a pressure reducing means; reducing the pressure of the sample stream and partially vaporizing it to form a vapor-liquid mixture; commingling a stream of aeration gas and a stream of substantially pure water with said vapor-liquid mixture; intimately mixing said streams and dissolving in the water the boron trihalide present in said sample an electrical conductance cell; and continuously measurwater-rich stream; passing said water-rich stream through ture to a separation zone and withdrawing therefrom a stream; passing the resultant gas-hydrocarbon-water mixing the electrical conductivity of said water-rich stream as a measure of the boron trihalide content of said sample stream.

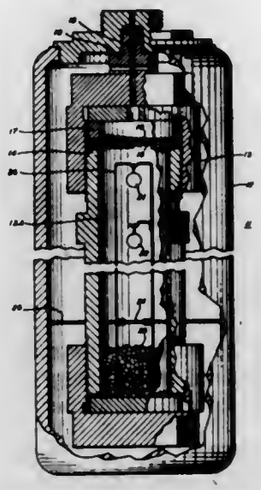


3,271,112
APPARATUS FOR LABORATORY TESTING
Donald L. Williams, 1687 N. 17th, Coos Bay, Oreg., and Robert D. Pence, 363 N. Commercial, Empire, Oreg.
Filed Dec. 12, 1962, Ser. No. 244,160
5 Claims. (Cl. 23—253)

1. Apparatus for determining prothrombin time in blood plasma comprising a housing, means for heating said housing and maintaining it at a predetermined temperature, said housing being of material having a good heat conductivity characteristic whereby said housing has a uniform temperature, first container means for carrying blood plasma to be tested, storage means in said housing for said first container means whereby said blood plasma is preheated to said predetermined temperature prior to the measurement of prothrombin time, viewing chamber means substantially fully enclosed by said housing and adapted to receive at least a portion of said first container means, means for illuminating said viewing

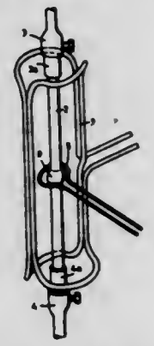
chamber, and means for viewing that portion of said first container which is inserted into said chamber, said viewing chamber being substantially closed to the ambient atmosphere and being maintained at said predetermined temperature whereby said prothrombin time may be accurately determined.

3,271,113
CHEMILUMINESCENCE DETECTION APPARATUS
Bernard I. van Pul, 6531 W. Devonshire Ave., Phoenix, Ariz.
Filed Apr. 12, 1963, Ser. No. 272,651
6 Claims. (Cl. 23—255)



1. In a chemiluminescence detection apparatus the combination of: a housing structure; a chamber for containing liquid luminescent material; first means for establishing an upper surface of said liquid luminescent material in said chamber; oxidant gas inlet means communicating with said chamber and disposed to conduct oxidant gas to said surface position of said luminescent material in said chamber; an outlet in said chamber to permit the escape of said gas therefrom and an illumination sensitive device disposed to receive light emitted from said luminescent material as it reacts with said oxidant gas.

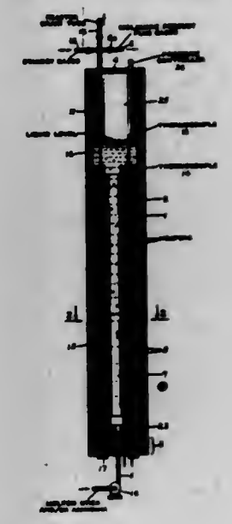
3,271,114
CRYSTAL GROWTH CONTAINER
Ernest D. Kolb, New Providence, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed June 15, 1964, Ser. No. 375,096
1 Claim. (Cl. 23—273)



Hydrothermal crystal growth apparatus including an outer container and an inner container, said inner container being suspended within said outer container by means of a head therebetween, said inner container having disposed therein a noble metal liner including a pair of rupture disks, the outer of said rupture disks being perforate, the outer of said rupture disks being solid and so designed

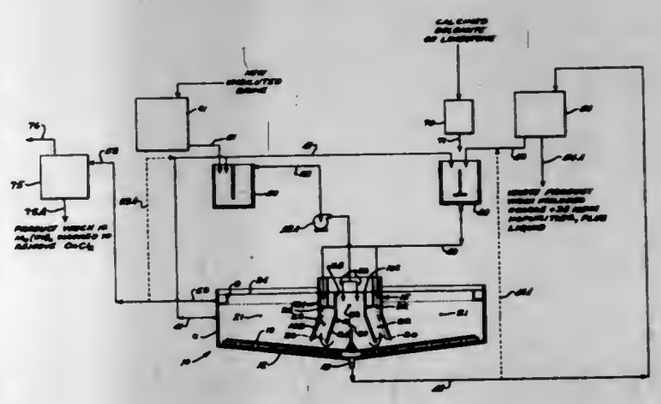
as to rupture in an outward direction at a predetermined pressure differential, said head being so constructed that said rupture disks are the only impediment to a free exchange between said inner container, said outer con-

tainer and the atmosphere, an external baffle in the annulus between said inner and said outer container, a baffle intermediate the inner chamber and a seed rack for suspending crystals above the baffle within said inner chamber.



3,271,115
APPARATUS FOR CRUCIBLE-FREE ZONE MELTING OF SEMICONDUCTOR MATERIAL
Wolfgang Keller, Pretzfeld, Germany, assignor to Siemens-Schuckertwerke Aktiengesellschaft, Erlangen, Germany, a corporation of Germany
Filed June 21, 1965, Ser. No. 469,048
Claims priority, application Germany, June 20, 1964, S 91,638; Mar. 29, 1963, S 84,442
7 Claims. (Cl. 23—273)

1. In an apparatus for crucible-free zone melting of a semiconductor rod, a first induction heating coil for melting a zone of the rod, said coil being located adjacent the rod and displaceable in the direction of the rod axis, and a second induction heating coil for heating the rod to a temperature below its melting point, said second coil comprising at least one turn having portions extending substantially parallel to each other and to the rod axis.

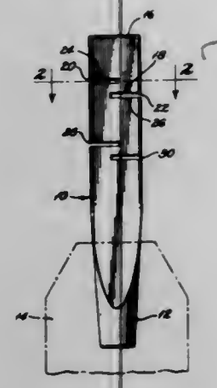


3,271,116
APPARATUS FOR CONTINUOUS PYROLYSIS OF LIQUID MATERIALS
Russell Frank Hazelton, Chester, Va., assignor to Allied Chemical Corporation, New York, N.Y., a corporation of New York
Original application Mar. 6, 1962, Ser. No. 177,919. Divided and this application Jan. 8, 1964, Ser. No. 336,521
12 Claims. (Cl. 23—284)

1. An apparatus which comprises a vertically elongated pressure resistant reaction vessel having a top closure and a bottom closure, a series of vertical bayonet-type electrical heaters extending a major portion of the height of said vessel so disposed within said vessel as to provide a heated zone and a laterally adjacent unheated zone, means for introducing liquid feed to the bottom portion of said vessel and distributing it about said heaters, and a dip tube extending vertically downward from said top closure a fraction of the total height of said vessel for

continuously removing liquid reaction product and by-products from the upper portion of said vessel and maintaining a substantial gas buffer volume between liquid material in said vessel and said top closure, and a vertical draft tube coaxially aligned within said vessel and extending from the lower portion of said vessel upward to a point lower than the lower end of said dip tube.

3,271,117
APPARATUS FOR RECOVERY OF MAGNESIUM VALUES
Earl Leatham, Wexford, Pa., Albert H. Pack, Ludington, Mich., and Ernest P. Weaver, Pittsburgh, Pa., assignors to Harbison-Walker Refractories Company, Pittsburgh, Pa., a corporation of Pennsylvania
Original application May 22, 1963, Ser. No. 282,379. Divided and this application Oct. 20, 1965, Ser. No. 498,412
8 Claims. (Cl. 23—287)



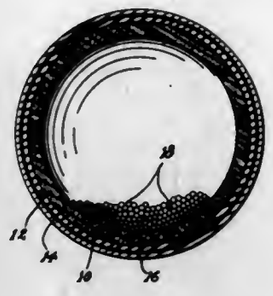
1. An arrangement for recovery of magnesian values from concentrated magnesium salt-containing aqueous solutions comprising; a reactor vessel, a slurry vessel and a dilution vessel, said reactor vessel having a bottom discharge opening for withdrawing settling solids in the reactor vessel, means connected to the discharge for transporting said solids to a disposal, at least two adjacent tubu-

lar shells substantially centrally suspended within the vessel, said shells being arranged to define a path for the flow of fluid therebetween, fluid agitating means disposed within an upper section of one of said shells for drawing fluid upwardly through said shell and enabling downward flow through an adjacent shell, first conduit means opening from said vessel at a point above the bottom discharge opening and interconnected with said slurry vessel and dilution vessel for circulating a volume of fluid from the reaction vessel to said slurry and dilution vessels, second conduit means opening from said reaction vessel at a point above said fluid agitating means to withdraw a volume of fluid from said reaction vessel and pass it to washing and thickening means, washing and thickening means arranged to recover magnesium hydroxide substantially free of magnesium chloride impurities from the fluid passed thereto, channel means connecting the slurry vessel and the tubular shell containing the fluid agitating means for delivering a mixture of lime containing material and fluid thereto, and channel means connecting the dilution vessel and other tubular shell for delivering a mixture of concentrated magnesium salt containing solution and fluid thereto.

3,271,118
SEED CRYSTALS AND METHODS USING THE SAME

Siri Ram Bhola, St. Louis, Mo., assignor to Monsanto Company, a corporation of Delaware

Filed Oct. 18, 1961, Ser. No. 145,866
19 Claims. (Cl. 23—301)



1. A crystalline seed comprising an elongated crystalline body, at least one end portion of which is formed substantially entirely from a single crystal, said portion having at least one longitudinally extending, intermediate zone having a substantially reduced cross-sectional area relative to the cross-sectional area of the portions of said seed disposed immediately adjacent said one zone, said zone of reduced cross-sectional area being formed by at least one notch intermediate the termini of said end portion, the opposed faces of said notch lying in substantially parallel planes.

3,271,119
FOAMED PLASTIC STRUCTURE HAVING A UNIFORM CONTINUOUS METAL COATING INTEGRALLY BONDED TO THE SURFACE THEREOF

Paul T. Woodberry, Reading, Mass., assignor to the United States of America as represented by the Secretary of the Air Force

Filed Mar. 13, 1964, Ser. No. 351,874
2 Claims. (Cl. 29—191)

1. A load-bearing structure comprising an inner core member of a rigid foamed plastic and having a hollow portion, a heat decomposable blowing agent positioned within the hollow portion of said core member, an intermediate layer of latex rubber bonded to the outer surface of said core member, an electrically conductive coat-

ing adhesively bonded to said intermediate layer, and a layer of electrodeposited metal integrally bonded to said conductive coating to form a unitary structure.

3,271,120
ALCOHOL FUEL GELS

Garland George Corey, Milltown, N.J., assignor to Colgate-Palmolive Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed Dec. 12, 1963, Ser. No. 329,996
8 Claims. (Cl. 44—7)

1. A stable alcohol gel composition comprising a major proportion of a lower aliphatic monohydroxy alcohol, a nitrocellulose gelling agent, about 15% to about 30% by weight water and about 0.05% to about 0.3% by weight of an alcohol-soluble and water-soluble hydrated inorganic polyvalent metal nitrate salt.

3,271,121
ETHYLENE-STYRENE COPOLYMER AS POUR POINT DEPRESSANT

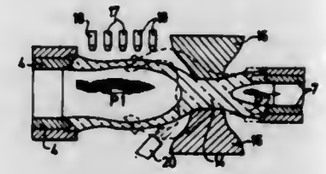
David W. Young, Homewood, and George A. Uhl, Markham, Ill., assignors to Sinclair Research, Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Mar. 14, 1963, Ser. No. 265,047
2 Claims. (Cl. 44—62)

1. A hydrocarbon fuel oil distillate boiling primarily in the range of about 300° to 750° F. containing a small amount of a mineral oil-soluble polymer of about 10 to 90% by weight styrene and about 10 to 90% by weight ethylene, said copolymer having a Staudinger molecular weight of about 1,000 to 40,000 and being prepared by subjecting said styrene and said ethylene to a gamma ray dosage of at least about 5,000,000 roentgens to obtain said oil-soluble product and said amount being sufficient to provide the oil with a reduced pour point.

3,271,122
METHOD FOR FORMING GLASS FIBERS

Donald W. Denniston, Ross Township, Pa., and Clarence H. Helbing, Shelbyville, Ind., assignors to Pittsburgh Plate Glass Company, Allegheny County, Pa., a corporation of Pennsylvania



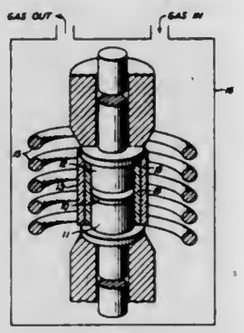
Filed Nov. 25, 1959, Ser. No. 855,416
5 Claims. (Cl. 65—3)

1. A method of forming glass fibers which comprises drawing a plurality of fibers from a supply of molten glass, applying a coating to the fibers, advancing fibers to a collecting position, imparting rapid, sidewise oscillations to the fibers thereby removing portions of the coating from the fibers, surrounding the fibers with an atmosphere moving in the direction of travel of the fibers and continuing movement of this atmosphere in the same general direction beyond the collecting position thereby carrying the coating particles removed from the fibers away from the supply of molten glass.

3,271,123
METHOD OF MAKING HOLLOW GLASSWARE WITH A STEM AND A FOOT

Emil Jan Johan Benard, Leerdam, Netherlands, assignor to N.V. Vereenigde Glasfabrieken (United Glassworks), Schredam, Netherlands, a limited-liability company of the Netherlands

Filed Mar. 26, 1963, Ser. No. 268,017
Claims priority, application Netherlands, Mar. 28, 1962, 276,533
3 Claims. (Cl. 65—80)

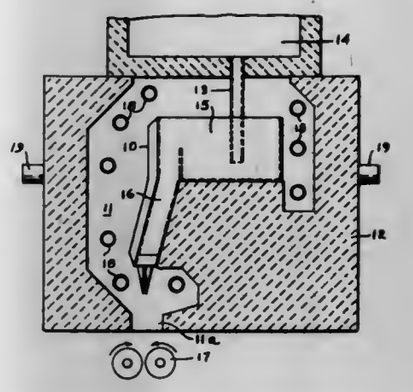


1. A machine performed process for manufacturing hollow glassware with a stem and a foot, comprising pressing a preformed blank to form impressions in the upper and lower ends of the blank, seizing the upper and lower ends of the blank and rotating the latter about a vertical axis while air is simultaneously blown into both of said impressions to initially inflate the end portions of the blank and have a solid intermediate portion therebetween, turning the blank to dispose its axis horizontally, pulling the opposite ends of the horizontally disposed blank in directions away from each other while simultaneously rolling the solid intermediate portion of the blank to form a stem therefrom and blowing air into the end portions for further inflating the latter, positioning the blank in a blowing mould, and blowing air into the further inflated end portions to effect final inflation of the latter to the shape of the blowing mould.

3,271,124
SEMICONDUCTOR ENCAPSULATION

James E. Clark, Upper Saucon Township, Lehigh County, Pa., assignor to Bell Telephone Laboratories, Incorporated, a corporation of New York

Filed Sept. 16, 1963, Ser. No. 309,161
4 Claims. (Cl. 65—54)



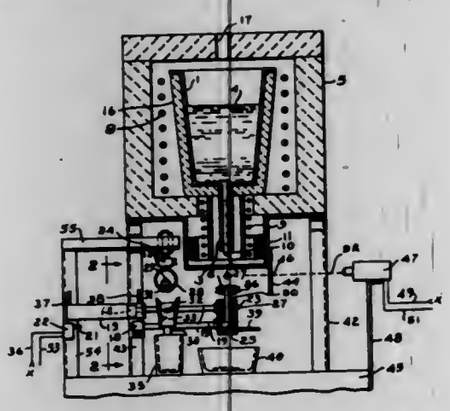
1. The process of fabricating a semiconductor assembly comprising the steps of:
forming a laminated tubular envelope having an inner layer of substantially alkali-free glass and an outer layer of a chemically durable glass which has a composition that is not alkali-free;
positioning the envelope around two metal studs which contain a semiconductor element therebetween;
heating the envelope to a temperature above the softening point temperature of both of the two layers;
increasing the ambient pressure to which the envelope is subjected, thereby forming a seal between the envelope and the two studs;
and cooling the envelope.

3,271,125
GLASS STREAM FEEDER

George D. Lipp, Corning, N.Y., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York

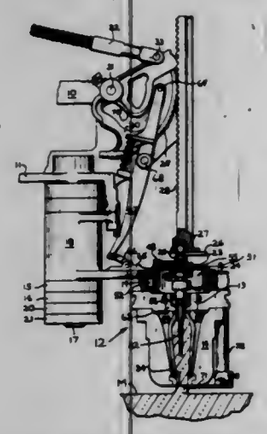
Filed Oct. 12, 1962, Ser. No. 230,054
4 Claims. (Cl. 65—145)

1. In the manufacture of sheet glass, apparatus for uniformly feeding a plurality of closely spaced streams of molten glass along the bite of a pair of sheet forming rolls positioned therebelow so as to form a continuous uniform pool along the length of the bite of such rolls which comprises, a hollow refractory housing, a container positioned within said housing for receiving and maintaining a pool of molten glass, a downwardly inclined chute communicating with said container for delivering glass from said pool downwardly therealong, weir means for maintaining the pool of molten glass in said container at a predetermined height and for overflowing molten glass from said pool into said chute, a plurality of spaced-apart dividers depending from the lower end of said chute and having tapered guide means for delivering a plurality of separate individual streams of molten glass substantially along the entire line contact of a pair of forming rolls positioned therebelow to produce a continuous pool of molten glass along such bite, and pivot means for pivoting said refractory housing and accordingly said pool-containing container about an axis extended substantially normal to a vertical plane passing through such line of contact so as to vary the head across such pool and relatively control the amount of flow delivered by the various dividers.



3,271,126
PRESS FORMING APPARATUS FOR FORMING WAFERS FROM DRIPS OF GLASS

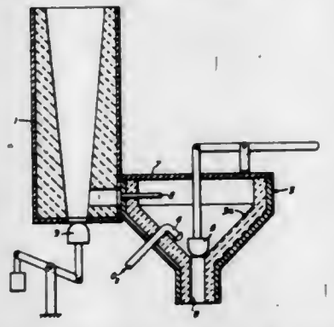
Weston H. Jenkins, Corning, N.Y., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York



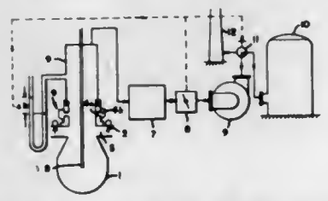
Original application Mar. 20, 1963, Ser. No. 266,649. Divided and this application Nov. 25, 1964, Ser. No. 413,815
2 Claims. (Cl. 65—160)

2. An apparatus for forming disks or wafers of a molten glass-making material, comprising, in combination, a container of said material including an orifice so located and having a diameter so chosen in accordance with the viscosity of the melt of said material at the chosen temperature of the melt that the material falls from the orifice in freely forming and falling drops, photo-responsive means for detecting each falling drop, a mold actuable at varying times between a drop catching position and a drop pressing position, means responsive to the detection of one of said drops by said photo-responsive means for moving said mold from its drop catching position to its drop pressing position following a time delay of a duration sufficient only to assure the catching of the drop by the mold after the detection of

the drop by said photo-responsive means, means actuated by the movement of the mold to its pressing position for thereafter pressing the drop for a predetermined period of time, means actuated following the expiration of said predetermined period of time for ejecting the pressed drop from the mold, and means thereafter responsive to the detection of another falling drop by said photo-responsive means for moving said mold from its drop pressing position to its drop catching position following a preset time delay, such time delay being of a duration sufficient only to assure the clearance by such other drop of the path of movement of the mold to its drop catching position prior to the movement of the mold into the path of fall of the drops.

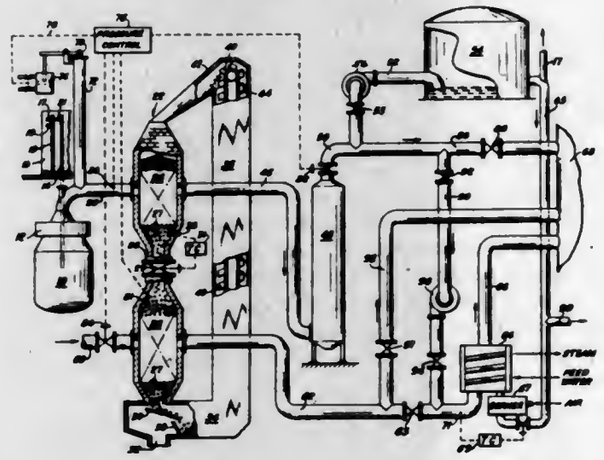


3,271,127
PARISON FORMING APPARATUS
Edward F. Wendle, Godfrey, Ill., assignor to Owens-Illinois, Inc., a corporation of Ohio
Filed May 1, 1963, Ser. No. 277,164
4 Claims. (Cl. 65—207)



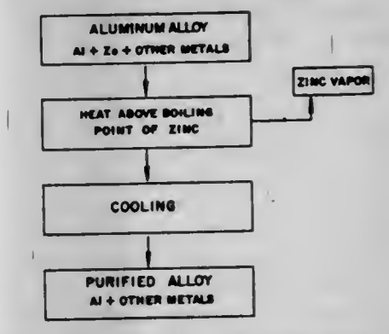
1. A glass parison forming apparatus comprising in combination a partible neck mold defining in closed position a neck finish portion of a parison, means supporting said neck mold for opening and closing movement at a parison forming station, a partible blank mold defining in closed position the body of a parison having a shoulder defining region for an article to be formed from said parison and being open at the one end opposite the neck mold for loading molten glass therein, means supporting said blank mold for opening and closing movement with respect to said neck mold at the parison forming station, an elongated, narrow plunger adapted to be inserted axially through said neck mold cavity and extend centrally into the blank mold inwardly beyond said shoulder defining region of the parison whereat the plunger is in a glass molding position, means connected to said plunger and operable for moving the plunger into and out of said molding position with respect to said blank mold cavity, means for loading molten glass into the open end of the blank mold, said means being operated to move said plunger into its said molding position whereby the plunger is in said molding position at the time the glass is loaded into said blank, and means applying vacuum into the neck mold and blank mold for filling the cavity defined by said blank and neck mold with glass around said plunger, the said mold cavities, when filled, forming a final narrow neck parison shape.

3,271,128
PREREFINING BLAST FURNACE IRON
Francis X. Tartaron, Pittsburgh, Pa., assignor to the United States of America as represented by the Secretary of the Interior
Filed July 9, 1963, Ser. No. 293,913
4 Claims. (Cl. 75—60)



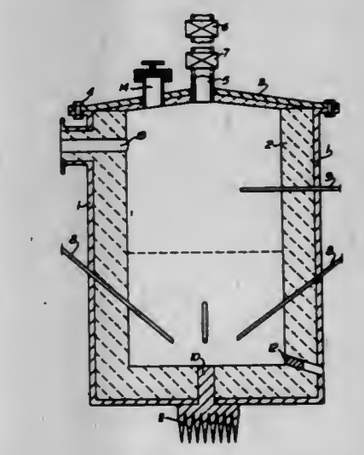
1. A process for prerefining molten iron comprising:
(a) passing a thin layer of said iron over a stationary surface,
(b) establishing a vortical path of movement for said layer as it travels over said stationary surface, whereby a vortex is formed,
(c) introducing an oxidizing gas into said layer as it travels said vortical path, and
(d) removing the molten iron from the center of the vortex.

3,271,129
METHOD OF RECOVERING AN UNBURNT WASTE GAS PRODUCED IN AN OXYGEN TOP-BLOWING CONVERTER
Shigeru Maehara and Isoji Garashi, Yawata District, Fukuoka, Japan, assignors to Yawata Iron & Steel Co., Ltd., and Yokoyama Engineering Co., Ltd., Tokyo, Japan, both corporations of Japan
Filed Apr. 22, 1963, Ser. No. 274,545
Claims priority, application Japan, Apr. 24, 1962, 37/16,573
3 Claims. (Cl. 75—60)



1. A method of recovering in a gas recovery system unburned waste gas issuing from an oxygen top-blowing converter during the refining of molten pig iron in the converter by blowing oxygen into said converter, comprising the steps of positively introducing air into the waste gas flowing from the converter into the recovery system during the initial period of blowing while the CO content of the waste gas is below the desired value, the air being introduced in an amount in excess of that necessary for burning the waste gas and in an amount which when combined with the products of combustion produces a gas flow at a level substantially above the amount of waste gas flowing from the converter at the end of said initial period and sufficient to effectively control the pressure within the gas recovery system by means of a damper installed in the recovery system, discharging burned gas and excess air from the recovery system; then when the CO content of the waste gas reaches the desired value, preventing the entry of air into the gas from the converter flowing into the recovery system, then introducing an inert gas into the gas flowing from the converter into the recovery system in an amount sufficient to maintain said level of the gas flow, terminating the input of inert gas when the gas flow from the converter reaches said level, recovering the waste gas flowing from the converter in an unburned state starting just after the air is excluded and the introduction of the inert gas has started and throughout the middle period of blowing; then just before the flow of gas from the converter falls below the said level, introducing inert gas into the waste gas in an amount sufficient to maintain said level of gas flow, and just before the CO content of the waste gas falls below the desired value, terminating the recovery of the unburned waste gas and introducing air into the waste gas flowing from the converter into the recovery system in an amount in excess of that necessary for burning the waste gas and in an amount which when combined with the products of combustion is sufficient to keep the level of gas flow substantially above the level of waste gas flow from the converter at the end of said middle period of blowing, and discharging the combustion gas and excess air from the recovery system.

3,271,130
METHOD AND APPARATUS FOR TREATING GASES
Fred Denig, Kilchberg, Zurich, Switzerland, assignor to Koppers Company, Inc., a corporation of Delaware
Filed Nov. 5, 1963, Ser. No. 321,561
8 Claims. (Cl. 75—60)



1. Apparatus for the treatment of dirty waste gases from a metallurgical furnace comprising, a pebble heat exchanger having two chambers, a first chamber for cooling said waste gases, a second chamber for heating a gaseous material while simultaneously cooling said pebbles, means to pass pebbles from said first chamber to said second chamber, and means to recycle pebbles from said second chamber to said first chamber; conduit means to pass gases from said metallurgical furnace to said first chamber; a gas cleaner to clean said waste gases; means to pass gas from said first chamber of said pebble heat exchanger to said gas cleaner; a gas holder for storage of gas; means for passing cleaned gas from said gas cleaner to said gas holder; means to pass cold gas into said second chamber of said pebble heat exchanger for cooling said pebbles and heating said cold gas; heat recovery means to recover heat from said heated cold gas; means for pasing gas from said second chamber to said heat recovery means; stack means for venting gas to the atmosphere; and means for passing gas from said heat recovery means to said stack means.

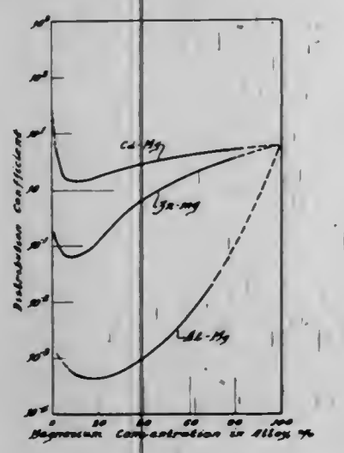
3,271,131
RECLAMATION OF ALLOY
Edward E. Dickey, R.F.D. 1, Millersport, Ohio
Filed Aug. 19, 1963, Ser. No. 305,917
12 Claims. (Cl. 75—63)

1. A method of purifying an aluminum alloy of zinc impurities where the alloy consists of at least 80% of aluminum, from 4 to 6.5% of zinc, together with from 0.64 to 13% of at least one metal selected from the group consisting of beryllium, boron, bismuth, chromium, copper, iron, lead, magnesium, manganese, nickel, silicon, tin, and titanium comprising
heating the alloy to a temperature in the range of from 1665° F. to 1800° F. at a temperature of about 1700° F. which is below the boiling point of all of the other constituents of the alloy excepting zinc;
allowing zinc to evaporate from the liquid alloy; and
cooling the remaining liquid to secure an aluminum alloy, substantially free of zinc.

3,271,132
METHOD AND APPARATUS FOR THE TREATMENT OF ALUMINUM
James Dennis Groves, Stockton-on-Tees, England, assignor to British Titan Products Company Limited, Durham, England, a corporation of the United Kingdom
Filed Nov. 19, 1963, Ser. No. 324,682
Claims priority, application Great Britain, Nov. 21, 1962, 44,019/62
12 Claims. (Cl. 75—68)

1. In an apparatus for the treatment of molten aluminium, which apparatus comprises a container for said molten aluminium having a lining of a refractory, corrosion-resistant material of relatively poor heat-conducting properties, the improvement comprising a plug of solid aluminium passing through a wall of said container

and through said lining, the interior end of said plug adapted to be in direct heat exchange contact with contained molten aluminium, and the exterior end of said plug having a substantially expanded cross sectional area adapted for direct heat exchange with a fluid, and means associated with the exterior end of said plug for passing a heat exchange fluid into direct, intimate contact therewith, said means adapted to remove heat from said exterior end of said plug at a rate greater than the minium rate necessary to maintain said plug substantially unmelted when the interior end of said plug is in contact with contained molten aluminium.



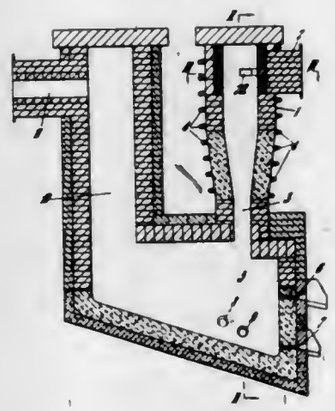
7. A process for the production of aluminium chloride by reaction of gaseous chlorine with molten aluminium in a reactor having a refractory, corrosion-resistant lining of relatively poor heat-conducting properties, said reactor provided with an aluminium plug passing through a wall of said reactor and through said lining into direct heat exchange contact with the contained molten aluminium and having an exterior end portion of substantially expanded cross sectional area comprising the steps of (a) introducing gaseous chlorine into said molten aluminium beneath the surface thereof with a pressure drop in the range of 0.25 to 50 times the pressure drop between the point of chlorine introduction and said surface of said molten aluminium, (b) reacting said chlorine and said molten aluminium to form aluminium chloride vapor, (c) recovering aluminium chloride from the vapor space above said surface of said molten aluminium, (d) passing a cooling fluid into direct, intimate contact with said expanded exterior portion of said aluminium plug to effect substantial withdrawal of heat from said contained molten aluminium through said aluminium plug, and (e) maintaining the flow of said cooling fluid across said expanded portion of said plug at a rate sufficient to maintain said plug substantially intact and to withdraw at least a major portion of the heat of reaction from said reactor.

3,271,133

PURIFICATION OF MOLTEN SALTS

James B. Knighton, Joliet, and Robert, K. Steunenberg, Naperville, Ill., assignors to the United States of America as represented by the United States Atomic Energy Commission

Filed June 29, 1965, Ser. No. 468,169
6 Claims. (Cl. 75—84.1)



1. A process of purifying a fused salt containing fission products comprising contacting said fused salt with a binary alloy of aluminum and magnesium whereby essentially all of the rare-earth fission products are extracted into the binary alloy, and separating the salt and metal phases.

3,271,134

EXTRACTION OF ZINC

Leslie Jack Derham, Avonmouth, England, assignor to The National Smelting Company Limited, London, England, a British company

Filed Aug. 5, 1963, Ser. No. 299,888
Claims priority, application Great Britain, Aug. 20, 1962, 31,919/62
14 Claims. (Cl. 75—87)

1. In the method of smelting a mixed charge of finely divided oxidic zinciferous material and carbonaceous fuel-reducing agent suspended in a stream of oxygen containing gas moving downwardly in a vertically disposed reduction zone, the improvement in combination therewith which comprises:

(a) the finely divided oxidic zinciferous material and the finely divided carbonaceous fuel-reducing agent suspended in the stream of oxygen containing gas are injected under pressure horizontally and tangentially into the upper portion of a vertically disposed reduction zone generally in the shape of a cyclone, with its larger end at the top and its smaller but open end at the bottom;

(b) a swirling downwardly spiraling motion of sufficient strength is imparted to the charge to cause it to pass into and around the peripheral upper portion of the cyclone-shaped reduction zone and into and around the inwardly inclined peripheral lower portion of the cyclone-shaped reduction zone;

(c) the temperature of the upper and lower portions of the reduction zone is kept sufficiently high to oxidize the carbon in the charge to a mixture of carbon dioxide gas and carbon monoxide reducing gas to reduce the zinc oxide in the charge with the carbon monoxide and to vaporize the resulting zinc, and to melt non-volatilizable metal compounds normally present in the charge and carbon ash impurities to a slag;

(d) the swirling downwardly spiraling motion of the charge is maintained throughout the reduction zone sufficiently long to provide the detention time required to effect the reduction of the oxidic zinciferous material and to melt the non-volatilizable metal compounds and ash impurities to a slag;

(e) the resultant droplets of molten slag are forced centrifugally to the periphery of the inwardly inclined and gradually constricted lower portion of the cyclone-shaped reduction zone;

(f) the droplets of molten slag are there coalesced and dropped through the open bottom of the cyclone-shaped reduction zone, and gathered in a molten slag collecting zone, immediately below the reduction zone, as a pool of molten slag;

(g) molten slag is tapped from the pool of molten slag; and

(h) the resultant zinc vapour is passed downwardly from the reduction zone into the molten slag collecting zone and from above the top of the pool into a condensing system for the separate recovery of the zinc.

11. In apparatus for smelting a mixed charge of finely divided oxidic zinciferous material and carbonaceous fuel-reducing agent suspended in a stream of oxygen-containing gas moving downwardly in a vertically disposed reduction shaft, the improvement in combination therewith which comprises:

(a) the vertically disposed reduction shaft of the smelting furnace is refractory-lined and is in the shape generally of a cyclone with its larger end at the top and its smaller end at the bottom, the lower portion of the shaft being frusto-conical in shape, tapering downwardly and inwardly towards its lower end so that its cross-sectional area is gradually constricted to a bottom outlet throat;

(b) an insulated charge-feeding device connects the upper exterior portion of the smelting furnace with the upper interior portion of the reduction shaft, the charge-feeding device having a conduit extending therethrough that connects the upper exterior portion of the smelting furnace with the upper interior portion of the reduction shaft horizontally and tangentially to permit the charge to assume a swirling, downwardly spiraling, motion,

(c) a combined slag collecting and zinc vapour receiving chamber is located immediately below the bottom of the vertical shaft to collect a pool of molten slag and to permit separation of zinc vapour therefrom;

(d) at least one slag-tapping conduit extends through the wall of the slag collecting chamber for removing molten slag therefrom; and

(e) a zinc vapour outlet offtake, separate and distinct from the reduction shaft, connects the upper portion of the slag collecting and zinc vapour receiving chamber for the passage of zinc vapour therefrom.

3,271,135

GOLD RECOVERY PROCESS USING AN ALKALI METAL HYDROSULFITE WITH A WATER SOLUBLE OXYGEN CONTAINING COMPOUND

Charles Davidoff, 118 Rollinghill Road, Manhasset, N.Y.

No Drawing. Filed Dec. 26, 1963, Ser. No. 333,717
6 Claims. (Cl. 75—106)

1. A method of recovering gold from an aqueous solution of alkali metal gold cyanide consisting essentially in adding to the solution alkali metal hydrosulfite and at least one member selected from the group of water soluble oxygen-containing compounds consisting of aldehydes, hydroxyl-containing amines, ammonium and alkali metal phosphates, hypophosphites and thiosulfates, and amino- and hydroxy-carboxylic acids and their ammonium and alkali metal salts in a combined molar amount at least equivalent to the gold in said solution, maintaining the resulting solution at an elevated temperature above about 150° F. until cessation of precipitation of the gold, and removing the precipitated gold from the solution.

3,271,136

GOLD RECOVERY PROCESS USING AN ALKALI METAL HYDROSULFITE WITH A WATER SOLUBLE ALKALI METAL ALKANOATE

Charles Davidoff, 118 Rollinghill Road, Manhasset, N.Y.

No Drawing. Filed July 8, 1964, Ser. No. 381,214
8 Claims. (Cl. 75—118)

1. A method of recovering gold from an aqueous solution of alkali metal gold cyanide comprising adding to the solution an alkali metal hydrosulfite in a molar amount at least equivalent to the gold in said solution and about 0.2 to 20 parts of a water soluble alkali metal alkanoate per part by weight of the hydrosulfite, maintaining the resulting solution at an elevated temperature above about 150° F. until cessation of precipitation of the gold, and removing the precipitated gold from the solution.

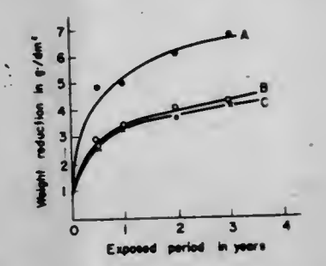
3,271,137

VACUUM TREATED HIGH SILICON CAST IRON WITH GRAPHITIZING INOCULANT

Walter A. Luce and Glenn W. Jackson, both of Dayton, Ohio, assignors to The Duriron Company, Inc., Dayton, Ohio, a corporation of New York

Filed Jan. 2, 1964, Ser. No. 335,207
7 Claims. (Cl. 75—123)

Fig. 3 Vacuum treated Duriron containing calcium. Photomicrograph from a 2" section shows small graphite flakes (Type A) and little porosity. 100X.



1. High silicon cast iron having a silicon content of from 12% to 15%, carbon from 0.3% to 1.5%, manganese of from approximately 0.65% to 1.0%, plus retained calcium of from 0.02% to 0.05%, the balance substantially all iron; said alloy as cast having its residual gas content reduced by vacuum furnace treatment to remove hydrogen to not over about 2 p.p.m., nitrogen to not over about 6 p.p.m. and oxygen to not over 20–30 p.p.m.; said alloy having a minimum transverse load strength of 1600 pounds and a microstructure characterized by fine acicular graphite uniformly distributed in a fine grain dendritic iron silicide matrix.

3,271,138

ATMOSPHERIC CORROSION RESISTANT NOTCH DUCTILE HIGH TENSILE STRENGTH STEEL

Tadashi Ohtake, Tobata, Toru Muta and Takashi Zaizen, Yawata, and Tadashi Nishi, Wakamatsu, Japan, assignors to Yawata Iron & Steel Co., Ltd., Tokyo, Japan, a corporation of Japan

Filed Mar. 12, 1962, Ser. No. 179,099
Claims priority, application Japan, Mar. 17, 1961, 36/9,585
1 Claim. (Cl. 75—125)

An atmospheric corrosion resistant notch ductile high tensile steel, which has a tensile strength greater than 60 kg./mm.², consisting essentially of 0 to 0.20% carbon, 0.01 to 1.0% silicon, 1.05 to 1.61% manganese, 0 to 0.10% phosphorous, 0.20 to 0.60% copper, 0 to 1.0% chromium, 0.027 to 0.5% titanium, 0.05 to 0.5% niobium, and iron, said percentages being by weight based on the total weight of the steel.

3,271,139
PROCESS FOR THE PRODUCTION OF LOW SULFUR FERROCHROMIUM

Richard A. Crago, Grand Island, James H. Downing, Clarence, and Harold S. Redline, Lewiston, N.Y., assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Apr. 10, 1962, Ser. No. 186,310
5 Claims. (Cl. 75—130.5)

1. In a process for producing ferrochromium alloy by smelting a mixture of chrome ore, carbon and slag-forming material to cause reduction of the ore and the production of ferrochromium and a basic slag, the improvement for producing a low sulfur, low silicon alloy which comprises adjusting the composition of the mixture so that (1) the base to acid molar ratio of the mixture is between about 2.5:1 and 8.5:1, (2) the CaO to SiO_2 ratio of the mixture is greater than about 0.75, (3) the resulting slag has a 25 poise temperature of at least about 1575° C., and (4) the alloy produced is at least 95 percent in the form of $(Fe,Cr)_7C_3$.

3,271,140
HIGH TEMPERATURE COBALT-BASE ALLOY

John C. Freche, Fairview Park, Stanley J. Klima, Rocky River, and Richard L. Ashbrook, Berea, Ohio, assignors to the United States of America as represented by the National Aeronautics and Space Administration

No Drawing. Filed Mar. 26, 1964, Ser. No. 355,126
4 Claims. (Cl. 75—170)

1. A cobalt base alloy capable of high load carrying capacity at elevated temperatures consisting essentially of from 48.5% to 84.5% cobalt, from 15% to 45% tungsten, from 0.4% to 2.5% titanium, and from 0.1% to 1.0% carbon.

3,271,141
PROCESS FOR PRODUCING A COLUMBIUM ADDITION AGENT

Thomas F. Kaveney, Lewiston, and Rodney F. Merkert, Buffalo, N.Y., assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Original application Jan. 10, 1961, Ser. No. 81,683, now Patent No. 3,143,788, dated Aug. 11, 1964. Divided and this application Feb. 13, 1964, Ser. No. 344,561
5 Claims. (Cl. 75—206)

1. A process for producing a sintered, columbium-containing, low-carbon ferrochromium addition agent which comprises admixing a particulate high-carbon ferrochromium, a particulate oxidic columbium material, and a binder; compacting the resulting admixture so as to form a coherent body, heating the coherent body under a pressure below about 3 mm. of Hg to a temperature below about 1500° C. but sufficiently high to react the carbon present in the ferrochromium with the oxygen present in the oxidic columbium materials; maintaining the coherent body at such temperature and pressure until the evolution of carbon oxides substantially subsides; and thereafter recovering the sintered, columbium-containing, low-carbon ferrochromium addition agent.

3,271,142
METHOD FOR FORMULATING MASTER ALLOY COMPOSITIONS FOR USE IN DISPERSION HARDENED COMPACTS

Joseph P. Hammond, Knoxville, Tenn., and Krishna Kuman Sinha, Bombay, India, assignors to the United States of America as represented by the United States Atomic Energy Commission

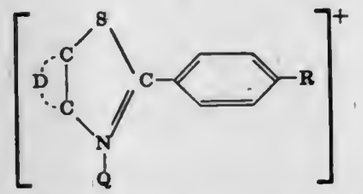
No Drawing. Filed Feb. 25, 1965, Ser. No. 435,385
6 Claims. (Cl. 75—206)

1. A process for producing a compact containing a refractory metal oxide uniformly dispersed within a matrix of a metal or alloy selected from tungsten, molybdenum, and rhenium which comprises mixing a colloidal-like dispersion of a water-soluble compound of said selected metal with a colloidal dispersion of a refractory metal oxide which is stable and non-reactive with said selected metal at any temperature up to about 2500° C., separating the liquid phase from the colloidal mixture to obtain a solid dispersion of metal oxide-metal compound, heating the resultant solid cake in a reducing atmosphere to selectively reduce the metal compound of the selected metal and then compacting the resultant powdered dispersion of metal oxide in the selected metal to a densified structure.

3,271,143
PHOTOCONDUCTOR SHEET MATERIAL

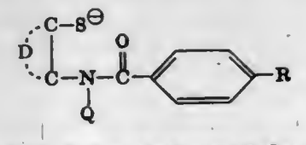
David P. Sorensen, White Bear Lake, Minn., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware

No Drawing. Filed Jan. 6, 1964, Ser. No. 336,066
10 Claims. (Cl. 96—1.7)



1. A photoconductor sheet material comprising a flexible backing, uniformly adhered to a layer containing discrete particles of a zinc oxide and an organic binder, said zinc oxide particles being intimately associated with a photoreducible sensitization dye and from 10 to 100 molar excess of a complexing agent for zinc ions, based on the molar concentration of said dye, said complexing agent when used in the absence of said photoreducible sensitization dye having essentially no sensitization properties for said zinc oxide.

3,271,144
SUPERSENSITIZED ZINC OXIDE



Ralph L. Clausen, South St. Paul, and Donald K. Meyer, West St. Paul, Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware

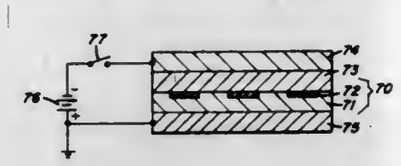
No Drawing. Filed Sept. 8, 1964, Ser. No. 395,362
10 Claims. (Cl. 96—1)

1. A supersensitized zinc oxide dispersion suitable for use in the preparation of photoconductor sheet materials which comprises an admixture prepared from zinc oxide, binder, sensitizing dye and at least 0.001 percent, based on the weight of said zinc oxide, of a compound having the nucleus

wherein D represents atoms completing an aromatic ring, R is a tertiary amino group and Q is hydrogen, aryl, alkyl or alkaryl, said dispersion having substantially no color attributable to said compound due to the conversion thereof into a colorless zinc (II) complex of

wherein D, Q and R are as above defined.

3,271,145
PROCESS FOR PRODUCING AN ELECTROSTATIC CHARGE IMAGE



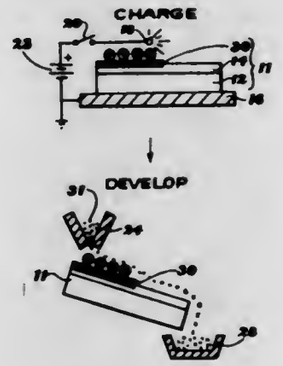
Gene H. Robinson, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

Filed Dec. 23, 1963, Ser. No. 332,695
2 Claims. (Cl. 96—1)

1. A process for producing an electrostatic charge image, corresponding to an image on a document to be recorded, on a xerographic sheet comprising a photoconductive insulating layer on a conductive backing, comprising the steps of:

(a) positioning said document in facing, virtual contact with said sheet, said document and said sheet being separated by a minute air gap, with said image of said document in contact with said layer,

(b) sandwiching said document and said sheet between and in contact with two plate electrodes,



(c) applying a voltage across said electrodes of a value sufficient to ionize the air in said air gap whereby ions of one polarity deposit on and therefore charge said layer, and

(d) continuing said voltage application for a time sufficient to allow the light produced by said ionization to reflex expose said layer, whereby an electrostatic charge image, corresponding to said image to be recorded on said document, is produced on said layer without the necessity for a separate, additional exposure step from an external source of actinic radiation.

3,271,146
XEROPRINTING WITH PHOTOCONDUCTORS EXHIBITING CHARGE-STORAGE ASYMMETRY

Gene H. Robinson, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

Filed Mar. 19, 1963, Ser. No. 266,233
8 Claims. (Cl. 96—1.4)

1. An electrostatic printing process comprising

uniformly applying to a photoconductive layer which exhibits charge-storage asymmetry, electrostatic charges of the polarity which said layer readily stores, in the absence of any substantial amount of radiation to which said layer is sensitive,

imagewise exposing said layer to cause the charges to leak away in the exposed areas,

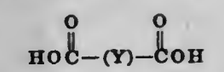
applying electrically insulating toner to said layer whereby said toner becomes distributed in accordance with the electrostatic image,

fusing said toner to said layer to form insulating image areas,

uniformly applying to said layer electrostatic charges of the polarity which said layer does not readily store,

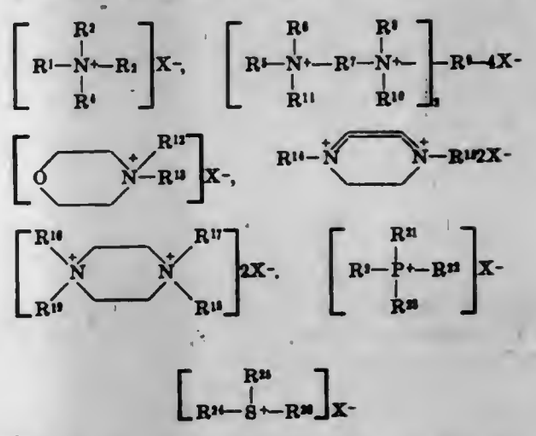
applying toner to the electrostatic image formed by the charges retained on said insulating areas,

transferring the last-mentioned toner from said layer to a receiving sheet, and



fusing said last-mentioned toner to said receiving sheet.

3,271,147
COACERVATE MORDANT DISPERSIONS FOR ACID DYES



Walter M. Bush, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed July 19, 1962, Ser. No. 211,094
20 Claims. (Cl. 96—29)

10. In a photographic color diffusion transfer process wherein an acid dye is transferred imagewise by diffusion to a mordanting reception layer, the improvement which comprises utilizing as said mordanting reception layer a layer comprising a hydrophilic organic colloid containing substantially uniformly dispersed therein finely-divided particles less than about 30 microns in diameter of a hydrophobic salt prepared with gelatin acylated with a dicarboxylic acid having the formula

wherein Y is a divalent hydrocarbon radical having 1 to 10 carbon atoms and a nonpolymeric organic cationic mordant for acid dyes selected from the group consisting of compounds having the formulas

and

wherein:

A. R^1, R^2, R^5, R^6, R^8, R^{10}, R^{11}, R^{14}, R^{15}, R^{16}, R^{17}, R^{18}, R^{19}, R^{20}, R^{21}, R^{22}, R^{24} and R^{25} are alkyl radicals,

B. R^3 is selected from the group consisting of

(1) an amino radical,

(2) an alkyl radical, and

(3) a cyclohexyl radical,

C. R^4, R^{12}, R^{13}, R^{23} and R^{26} are selected from the group consisting of

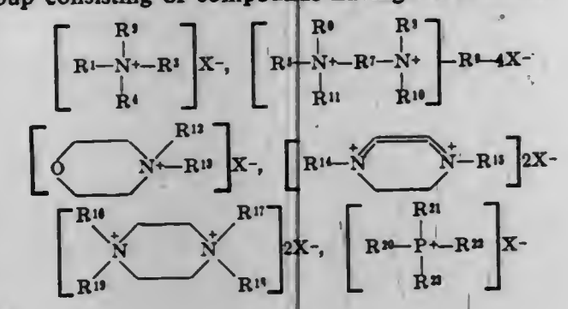
(1) an alkyl radical, and

(2) a cyclohexyl radical,

D. X is an acid anion, and

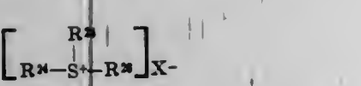
E. R^7 and R^9 are alkylene radicals;

said mordant being ballasted with at least one substituent having at least 8 carbon atoms.



3,271,148
MORDANTING OF ACID DYES

Keith E. Whitmore, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey



No Drawing. Filed July 19, 1962, Ser. No. 211,095
22 Claims. (Cl. 96—29)

11. In a photographic color diffusion transfer process wherein an acid dye is transferred imagewise by diffusion to a mordanting reception layer, the improvement which comprises utilizing as said reception layer a layer compris-

ing a hydrophilic organic colloid containing substantially uniformly dispersed therein finely divided droplets of a crystalloidal, water-immiscible, organic solvent boiling above about 175° C. containing dissolved therein a non-polymeric organic cationic mordant for said acid dye at a ratio of said mordant to said solvent of about 1/.25 to 1/2 by weight, said mordant being selected from the group consisting of compounds having the formula

and

wherein:

A. R^1, R^2, R^5, R^6, R^8, R^{10}, R^{11}, R^{14}, R^{15}, R^{16}, R^{17}, R^{18}, R^{19}, R^{20}, R^{21}, R^{22}, R^{24}, and R^{25} are alkyl radicals,

B. R^3 is selected from the group consisting of

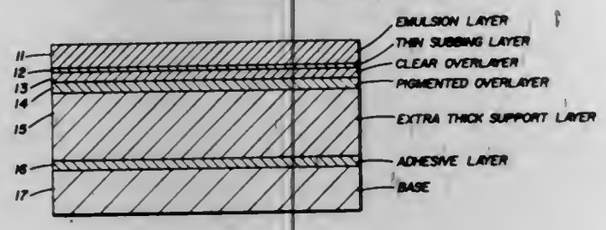
(1) an amino radical,

(2) an alkyl radical, and

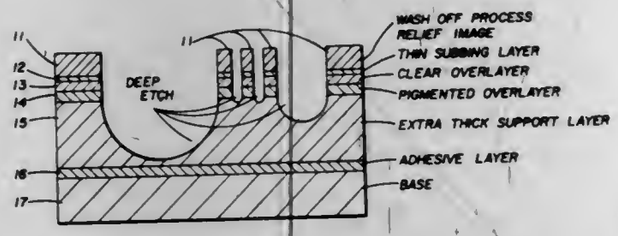
(3) a cyclohexyl radical,

C. R^4, R^{12}, R^{13}, R^{23} and R^{26} are selected from the group consisting of

(1) an alkyl radical, and



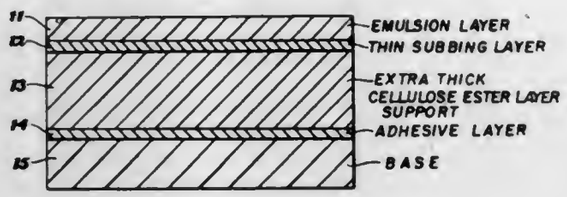
(2) a cyclohexyl radical,



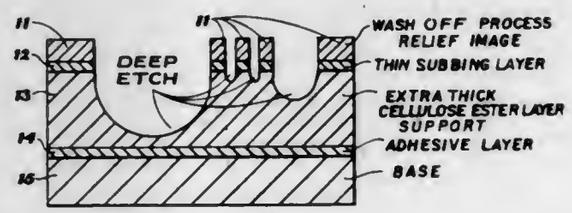
D. X is an acid anion, and

E. R^7 and R^9 are alkylene radicals;

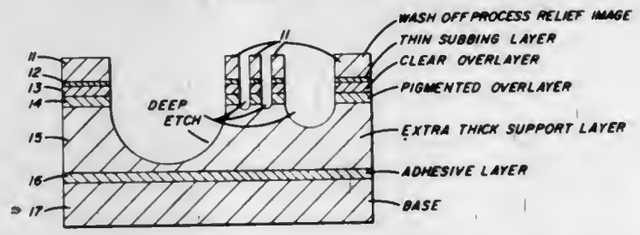
said mordant being ballasted with at least one substituent having at least 8 carbon atoms.



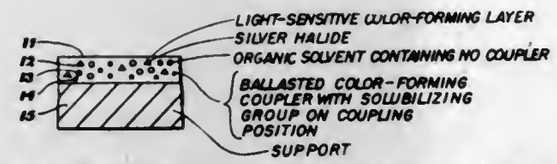
3,271,149
RELIEF PRINTING PLATE
Clemens B. Starck and Frederick J. Jacoby, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Nov. 27, 1964, Ser. No. 414,291
25 Claims. (Cl. 96—35)



1. A photosensitive element for preparing plastic relief printing plates by etching the plastic imagewise with a semisolvent for the plastic, comprising an organic plastic support having a thickness of about 8 to 40 mils, having thereon at least one thin organic plastic overlayer of less solubility in the semisolvent than the support, having thereon a gelatino silver halide, light sensitive emulsion strongly adhered to the overlayer by means of a thin subbing layer no thicker than that having a coverage of about 0.020 g./sq. ft. and capable of being etched imagewise by a semisolvent for the plastic.



3,271,150
PHOTOGRAPHIC PRINTING PLATE
Carlton D. Baxter and Henry C. Staehle, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Apr. 1, 1963, Ser. No. 269,345
20 Claims. (Cl. 96—36.3)



16. A process for preparing printing plates having raised printing surfaces free of undercutting in the support portions thereof which comprises developing with a silver halide tanning developer an exposed substantially unhardened silver halide emulsion attached to a cellulose acetatebutyrate support having a thickness of 0.010 to 0.020-inch by a thin subbing layer no thicker than that having a coverage of about 0.012 g./sq. ft. and capable of being readily etched imagewise by a semisolvent for the cellulose acetatebutyrate, removing the unexposed portions of the emulsion to form a resist image in hardened gelatin, etching the exposed areas of the cellulose acetatebutyrate support by repeated cycles of (1) etching with semisolvent, (2) removing the semisolvent and (3) drying.

3,271,151
PHOTOGRAPHIC RELIEF PRINTING PLATE
Henry C. Staehle and Albert C. Smith, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Feb. 8, 1965, Ser. No. 431,035
26 Claims. (Cl. 96—36.3)

21. A relief printing plate having an image thereon comprising an organic plastic support having a thickness of about 8–40 mils in the image areas, laminated to a base, capable of being readily etched imagewise by a semisolvent for the plastic, having a gelatino-silver image layer containing inert particulate solid matter of a high degree of hardness, adhered to the image areas of the uppermost overlayer by means of a thin subbing layer no thicker than that having a coverage of about 0.020 g./sq. ft. and capable of being readily etched imagewise by said semisolvent for the organic plastic, said plate having the organic plastic etched to a depth of at least 0.005 inch in the deepest of the non-image areas of the organic plastic support by repeated cycles of (1) etching with said semisolvent for the organic plastic, (2) removing the semisolvent and (3) drying to form a relief image with line or dot areas substantially free from undercutting.

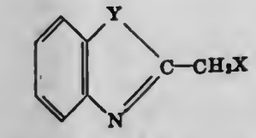
3,271,152
LIGHT-SENSITIVE ELEMENTS FOR COLOR PHOTOGRAPHY AND PROCESS THEREFOR
Wesley T. Hanson, Jr., Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Sept. 4, 1962, Ser. No. 220,979
13 Claims. (Cl. 96—56.5)

12. A process for forming a color image in a hydrophilic colloid silver halide emulsion layer comprising the steps of

(1) imagewise conversion of a molecular dispersion of a nondiffusing hydrophilic color forming coupler compound in said layer, said coupler having a removable water-solubilizing group attached to said coupler on one of the positions (a) a carbon atom in the coupling position and (b) a carbon atom adjacent to the carbon atom in the coupling position through a

radical, and a hydrophobic ballasting group substituted on a non-coupling position of said coupler, to a hydrophobic dye image by reaction with an imagewise distribution of an oxidized primary aromatic amine color developing agent and

(2) solution of the said hydrophobic dye image in contiguous coupler-free hydrophobic high-boiling, water-immiscible organic solvent having a boiling point above about 175° C., that is dispersed in the said layer so that substantially all of the said dye image is removed from reactive contact with the residual coupler which is insoluble in the said solvent and remains in the hydrophilic phase of the said emulsion layer.



3,271,153
PHOTOGRAPHIC PROCEESSING BATHS FOR STABILIZATION PROCESSING
Ronald H. Miller and Martin A. Foos, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
No Drawing. Filed Jan. 18, 1963, Ser. No. 252,305
6 Claims. (Cl. 96—61)

1. A method of rapid processing light-sensitive silver halide emulsion comprising developing an exposed emulsion with a silver halide developer, fixing with a silver halide solvent to remove unexposed silver halide, and stabilizing by imbibing into the emulsion a stabilizing bath containing about 15–40 percent by weight of a mixture of mono- and di-basic salts of phosphoric acid and about 2–20 percent by weight of a sulfite salt.

4. A bath for stabilization of developed and fixed photographic silver halide emulsions comprising about 37 to 83 percent by weight of an aqueous solvent, about 15 to 40 percent by weight of a mixture of mono- and di-basic salts of phosphoric acid and about 2–20 percent by weight of a sulfite salt.

3,271,154
ANTIFOGGING AND STABILIZING AGENTS FOR PHOTOGRAPHY
Fritz Dersch and Millet R. De Angelus, Binghamton, N.Y., assignors to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware
No Drawing. Filed Nov. 30, 1961, Ser. No. 156,151
10 Claims. (Cl. 96—66)

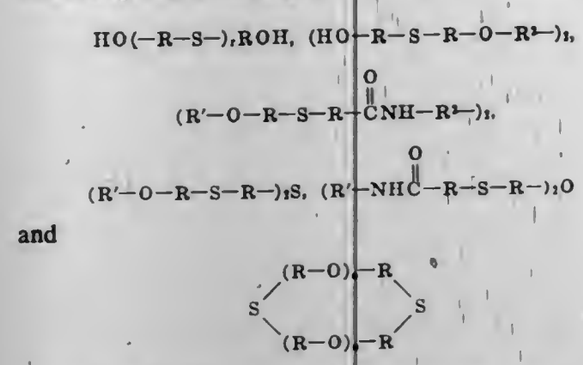
10. A photographic developer containing a developing agent and an antifoggant characterized by the general formula:

wherein X represents a halogeno radical selected from the group consisting of chlorine, bromine and iodine, and Y represents members selected from the group consisting of O, S and NH.

3,271,155
THERMO-DEVELOPABLE DIAZO COATINGS EMPLOYING DICYANDIAMIDE COMPOSITIONS
Claude M. Aebi, Endicott, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
No Drawing. Filed Dec. 27, 1962, Ser. No. 247,513
7 Claims. (Cl. 96—75)

1. A light-sensitive heat-developable diazonium composition comprising a light-sensitive diazonium salt, a diazo coupler, a diazonium stabilizing acid and a dicyandiamide composition selected from at least one member of the group consisting of dicyandiamide, dodecyldicyandiamide, cyclohexyldicyandiamide, o-tolyldicyandiamide, p-tolyldicyandiamide, dicyandiamide formaldehyde, dicyandiamide acetaldehyde, dicyandiamide paraformaldehyde, and dicyandiamide benzaldehyde.

3,271,156
PHOTOGRAPHIC ELEMENT
George W. Sawdey, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Sept. 27, 1965, Ser. No. 494,301
6 Claims. (Cl. 96—84)



1. A photographic element having a dye image protected against ultraviolet radiation by a transparent overcoating containing a non-fluorescing ultraviolet absorber having an acenaphthenotriazole nucleus.

3,271,157
LIGHT-DEVELOPABLE DIRECT-PRINT SILVER HALIDE EMULSIONS
Clarence E. McBride, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
No Drawing. Continuation of abandoned application Ser. No. 222,964, Sept. 11, 1962. This application Apr. 29, 1965, Ser. No. 452,009
20 Claims. (Cl. 96—107)

1. A light-developable, direct-print silver halide emulsion containing silver halide grains formed in the presence of an organic thioether silver halide solvent, an aqueous solution of said thioether at a 0.02 molar concentration being capable of dissolving more than twice the amount of silver chloride than that which can be dissolved by water at 60° C.

3. A light-developable, direct-print silver halide emulsion containing silver halide grains formed in the presence of an organic thioether silver halide solvent, an aqueous solution of said thioether at a 0.02 molar concentration being capable of dissolving more than twice the amount of silver chloride than that which can be dissolved by water

at 60° C., and said thioether having a formula selected from the group consisting of

and

wherein R is an alkylene radical having 1 to 5 carbon atoms, R' is an alkyl radical having 1 to 5 carbon atoms, R^2 is an alkylene radical having 1 to 5 carbon atoms, *r* is an integer of 1 to 3 and *s* is an integer of 1 to 2.

20. A light-developable, direct-print silver halide emulsion containing silver halide grains formed in the presence of lead ions and an organic thioether silver halide solvent, an aqueous solution of said thioether at a 0.02 molar concentration being capable of dissolving more than twice the amount of silver chloride than that which can be dissolved by water at 60° C.

3,271,158
PHOTOGRAPHIC SILVER HALIDE EMULSIONS HAVING HIGH WET DENSITY RETENTION
Norman Allentoff and Louis M. Minsk, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
No Drawing. Filed Aug. 9, 1963, Ser. No. 301,177
5 Claims. (Cl. 96—114)

1. A photographic gelatino-silver halide emulsion containing 5% to 50% by weight based on the said gelatin in said emulsion of a water-soluble polyacrylamide having an inherent viscosity of .1 to .6 as determined at 25° C. in water, said silver halide comprising a substantial amount of silver bromoiodide having .5 to 10 mole percent iodide and a mean grain size of at least .4 micron.

3,271,159
FEED COMPOSITIONS CONTAINING SODIUM N-GLYCOLYLARSANILATE AND METHOD OF USE
Emery W. Dennis and Aaron Arnold, Albany, N.Y., assignors to Sterling Drug Inc., New York, N.Y., a corporation of Delaware
No Drawing. Filed Mar. 26, 1962, Ser. No. 182,647
10 Claims. (Cl. 99—2)

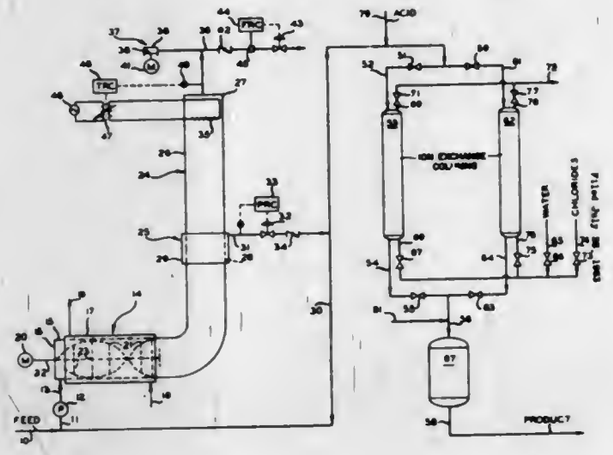
1. A composition for promoting the growth and improving the appearance and feed conversion of poultry without leaving toxic levels of trivalent inorganic arsenic in the tissues of the animals which comprises a poultry feed having dispersed therein as an effective growth-promoting, appearance-improving, and feed conversion-improving ingredient sodium N-glycolylarsanilate.

3,271,160
PROCESS FOR PREPARING FEED FROM UNDECORTICATED OIL FREE SAFFLOWER SEED RESIDUE
George A. Kopas, San Francisco, and John A. Kneeland, Menlo Park, Calif., assignors to Pacific Vegetable Oil Corporation, San Francisco, Calif., a corporation of California
Filed May 27, 1963, Ser. No. 283,400
9 Claims. (Cl. 99—2)

1. A process of preparing a high-protein feed product from the dried undecorticated oil-free solvent-extracted residue of safflower seeds, comprising the steps of

(a) impacting the said residue so as to detach the meat particles from the hull particles and also to break up the meat particles to a greater degree than the hull particles, and

(b) separating a finer portion of higher protein value from a coarser portion of lower protein value.



3,271,161
POULTRY FEED CONTAINING ABOUT 1% DIATOMACEOUS EARTH
John C. Eshleman, Box 9, Greencastle, Pa.
No Drawing. Filed June 22, 1964, Ser. No. 377,099
5 Claims. (Cl. 99—4)

1. A complete poultry feed consisting essentially of a mixture of conventional poultry feed nutrients and additives and about 1% of diatomaceous earth.

3,271,162
PROCESS FOR SEGREGATING LUPULIN FROM DRIED HOPS
Laurence R. Bishop, Mortlake, England, assignor to Watney Combe Reid & Company Limited, London, England
Filed Mar. 20, 1963, Ser. No. 266,654
Claims priority, application Great Britain, Mar. 21, 1962, 10,797/62
2 Claims. (Cl. 99—50.5)

1. A process for segregating lupulin from dried hops, which comprises the steps of disintegrating the hops in a pin mill, and sifting the lupulin from the discarded plant tissue in a turbo-sifter.

3,271,163
REMOVAL OF RADIOACTIVE MATERIAL FROM MILK BY ION EXCHANGE
Emil A. Malick, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Filed Jan. 28, 1963, Ser. No. 254,121
3 Claims. (Cl. 99—60)

1. A method for the removal of radioactive material from milk which comprises passing the milk through a cooling zone and therein cooling the milk to produce a slurry of ice crystals in mother liquor, passing said slurry through a filtering zone from which a stream of mother liquor is withdrawn as a first product stream, passing the crystals and any remaining mother liquor from said filtering zone through a reflux zone and into a melting zone, introducing heat into said melting zone to melt the crystals to obtain a melt, withdrawing a portion of the melt from said melting zone as a second product stream, passing the remainder of the melt countercurrently to the movement of crystals through said reflux zone as reflux

therefor and passing said first product stream through an ion exchange zone, said ion exchange zone containing a material which selectively accepts the ions of radioactive materials contained in said first product stream, recovering milk from said ion exchange zone in a concentrated form and substantially free of radioactive material, and reconstituting the thus recovered concentrated milk from said ion exchange zone to produce milk having a lower concentration of radioactive material than that obtainable by passing unconcentrated milk through said ion exchange zone.

3,271,164
ADDITIVE FOR BAKED GOODS TO RETARD STALING
John Jean Richard Andt, Elmhurst, N.Y., assignor to Stein, Hall & Co., Inc., New York, N.Y., a corporation of New York
No Drawing. Filed Jan. 13, 1964, Ser. No. 337,140
8 Claims. (Cl. 99—90)

1. An additive for baked goods consisting essentially of karaya gum and from 2% to 20%, based on the weight of the additive of a material selected from the group consisting of algins and carrageenans.

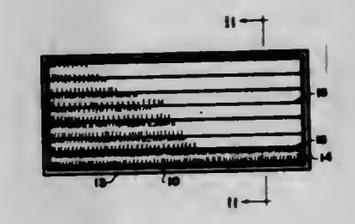
3,271,165
POWDER PRODUCED FROM BUTTER OR OTHER EDIBLE FATS
Poul Martin Trøst Hansen, Cheltenham, Victoria, and Lois Linton-Smith, Lower Plenty, Victoria, Australia, assignors to Commonwealth Scientific and Industrial Research Organization, East Melbourne, Victoria, Australia, a corporation
No Drawing. Filed May 13, 1963, Ser. No. 280,122
19 Claims. (Cl. 99—118)

1. In a method of making an edible fat-containing composition in powder form suitable for use as a shortening material, the steps of homogenizing an edible cream in the form of a fat-in-water dispersion containing non-fat milk solids and at least 35% water, mixing said cream with additional non-fat milk solids and with an edible fat-soluble emulsifying agent in an amount sufficient to cause partial de-emulsification of the final product but not exceeding 25% of the total non-fat solids to form a fat-in-water dispersion system having a fat content comprising at least 80% of the total solids present in the dispersion, spray-drying the mixture without breaking down the structure thereof to form a powder, cooling the spray-dried powder and blending it with at least ½% of a finely divided physiologically acceptable agent to confer free-flowing properties on the powder, the mixing of the emulsifying agent with the other ingredients not involving a homogenizing treatment, whereby a partial de-emulsification takes place when water is added to the dried powder.

3,271,166
COOKING FAT COMPOSITION
Geert Jan Van Leeuwen, Capelle aan den Ijssel, Aart Mijnders, Vlaardingen, and Gerhardus Wilhelmus Boot, Barendrecht, Netherlands, assignors to Lever Brothers Company, New York, N.Y., a corporation of Maine
No Drawing. Filed Aug. 5, 1963, Ser. No. 300,097
Claims priority, application Great Britain, Aug. 10, 1962, 30,765/62
7 Claims. (Cl. 99—118)

1. A substantially water-free composition suitable for use as a cooking fat, said composition being composed substantially of an edible fat containing dispersed therein 0.2 to 8% of whey powder and 0 to *n* percent of milk powder, where *n* is not more than 2% of the composition and not more than the proportion of whey therein, all these percentages being based on the weight of the composition, no other non-fat milk solids being present.

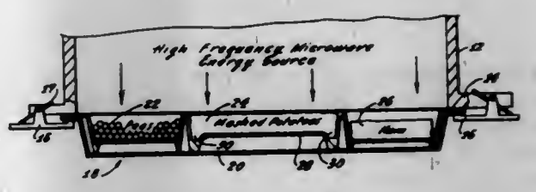
3,271,167
BEEF-TYPE FLAVORING COMPOSITION, SOUP AND GRAVY
Marcel A. Perret, Greenwich, Conn., and John Raymond McMahan, Freeport, N.Y., assignors to Chas. Pfizer & Co., Inc., New York, N.Y., a corporation of Delaware
No Drawing. Filed June 17, 1963, Ser. No. 288,518
6 Claims. (Cl. 99—140)



1. A flavoring composition comprising:

(a) a compound selected from the group consisting of α-ketobutyric acid and its physiologically-acceptable salts thereof;

(b) a compound selected from the group consisting of inosinic acid and physiologically-acceptable salts thereof in an amount to provide from about 4 to about 100 parts by weight based on said α-ketobutyrate; and



(c) a compound selected from the group consisting of glutamic acid and physiologically-acceptable salts thereof in an amount to provide from about 20 to about 1500 parts by weight based on said α-ketobutyrate and from about 5 to about 15 parts by weight based on said inosinate.

3,271,168
HUMIDIFICATION OF SHIRRED ARTIFICIAL SAUSAGE CASINGS
Clarence M. Alsys, 203 Denvale Drive, Danville, Ill.
Filed Nov. 15, 1965, Ser. No. 507,751
17 Claims. (Cl. 99—176)

1. A plurality of shirred artificial sausage casings disposed in layers, said casings having a predetermined initial moisture content, moisture absorbent material disposed in contact with substantially all of said casings and containing sufficient moisture initially to humidify said casings to a predetermined higher moisture content, and a moisture-proof container enclosing said layers of shirred casings and moisture absorbent material.

3,271,169
FOOD PACKAGE FOR MICROWAVE HEATING
Berkley J. Baker, Sunnyvale, and Edward Z. Krajewski, Belmont, Calif., assignors to Litton Precision Products, Inc., a corporation of Delaware
Filed Feb. 1, 1963, Ser. No. 255,640
5 Claims. (Cl. 99—221)

1. A food package for microwave heating applications comprising a container having a base and sides and in-

ternally divided into a plurality of sections for receiving different types of foods, an electrically conducting material of continuous sheet like form being provided at one of the base or sides of the container, a first food portion requiring the application of higher intensity microwave energy located in one of said sections and spaced by a given electrical distance from said conducting material, a second food portion requiring the application of substantially lower intensity microwave energy located in a different section and electrically spaced substantially closer to said conducting material, dielectric support means within said container for spacing said first and second food portions at said different electrical distances, said container adapted to be exposed to microwave energy in a direction through said food portions toward said conducting material whereby said food portions spaced electrically closer to said conducting material are heated to lower temperatures than said food portions spaced further from said conducting material.

3,271,170

TRACTION INCREASER COMPRISING POLYDIHYDROQUINOLINES AND ROSIN

Richard E. Ahlberg, Bay City, and Joseph E. Schrems, Saginaw, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Dec. 30, 1963, Ser. No. 334,609
7 Claims. (Cl. 106—36)

1. A method for increasing the traction of a rubber surface on ice and snow which comprises applying to said rubber surface a liquid composition which consists essentially of a solution in a substantially water-miscible lower aliphatic organic solvent of a material consisting essentially of about 20–100% by weight of polymerized 2,2,4-trimethyldihydroquinoline and about 80–0% of rosin.

3,271,171

GRAY CERAMICS CONTAINING A CALCINED MIXTURE OF ALUMINUM AND VANADIUM COMPOUNDS

Aladar Burgyan, Cleveland, and Werner Votava, Broadview Heights, Ohio, assignors to Ferro Corporation, Cleveland, Ohio

No Drawing. Filed June 16, 1965, Ser. No. 464,541
10 Claims. (Cl. 106—39)

5. As an article of manufacture, a gray fired ceramic body which derives its gray color from a heat stable gray pigment which is the unfused calcination product of a combination of aluminum and vanadium compounds, said gray pigment present in said ceramic body in an amount from about 0.5 to about 15.0 parts thereof based on the weight of said casting body, said pigment deriving its pigmentation effect from the presence therein of the oxide equivalents, respectively, of vanadium, expressed as V_2O_5, in from about 0.5 to about 20 parts by weight, and aluminum, expressed as Al_2O_3, in from about 80 to about 99.5 parts by weight, said parts by weight based on the total pigment composition taken as 100 parts by weight, said color imparted to said article having improved stability and durability.

3,271,172

DOLOMITE BRICK AND METHOD OF MAKING IT

William H. Powers, Franklin Township, Westmoreland County, and Charles K. Russell, Monroeville, Pa., assignors to United States Steel Corporation, a corporation of New Jersey

No Drawing. Filed Mar. 3, 1965, Ser. No. 436,951
4 Claims. (Cl. 106—61)

1. A refractory brick consisting of dead-burned dolomite and strontium oxide, the content of the latter being about 1 to 5 percent.

3,271,173

PREPARATION OF ALUMINA MONOFILAMENTS

Robert J. Lockhart and Eugene Wainer, Shaker Heights, Ohio, assignors to Horizons Incorporated, a corporation of New Jersey

No Drawing. Filed Mar. 31, 1965, Ser. No. 444,442
6 Claims. (Cl. 106—65)

6. A monofilament having a diameter of about 20 microns and consisting essentially of $Li_2O \cdot 5Al_2O_3$ spinel.

3,271,174

PROCESS FOR PREPARING PHOTOGRAPHIC GELATIN

Guenther H. Klinger, Binghamton, N.Y., assignor to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware

Filed Apr. 26, 1963, Ser. No. 276,040
4 Claims. (Cl. 106—125)

1. The process of preparing inert photographic gelatin which contains an active sulfur sensitizer, which comprises desensitizing the gelatin without a substantial change in its physical properties by treating the gelatin containing said sensitizer with 0.01 to 1% by weight, based on the gelatin, of an unsaturated thiolophilic compound capable of forming an addition compound with a mercapto compound and having at least one activated double bond and selected from the group consisting of N-aryl maleimides, N-alkyl maleimides, vinyl ethers, vinyl esters, dihydropyranes, dihydrofuranes, ethylvinylsulfone, divinyl sulfone, 2,5-diethyleneimine-quinone and ortho iodosobenzoic acid to render said sulfur inert.

3,271,175

AZIRIDINYL PHOSPHONITRILE GELATIN HARDENING AGENT

Donald M. Burness and Melvin D. Sterman, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Dec. 4, 1963, Ser. No. 328,102
6 Claims. (Cl. 106—125)

1. A composition of matter comprising gelatin containing in hardening amount an aziridine derivative of a cyclic phosphonitrile in which the aziridine groups are linked to phosphonitrile by N—P bonds.

3,271,176

COMPOSITION OF MATTER COMPOSED OF A CYANOETHYLATED CELLULOSIC MATERIAL AND AN INORGANIC PHOTOCHROMIC MATERIAL

John A. Chopoorian, Stamford, Conn., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed Nov. 21, 1962, Ser. No. 239,324
13 Claims. (Cl. 106—193)

1. A composition of matter consisting essentially of a cyanoethylated cellulosic material having uniformly dispersed throughout the body thereof from about 1.0% to 70%, by weight, based on the weight of said material, of an inorganic photochromic material selected from the group consisting of (A) TiO_2 doped with an oxide selected from the group consisting of Fe_2O_3, FeO, Cr_2O_3, CuO, NiO, MnO_2, Mn_2O_3, mixture of Fe_2O_3 and NiO, a mixture of Fe_2O_3 and CuO, a mixture of FeO and NiO and a mixture of FeO and CuO, (B) Nb_2O_5 doped with an oxide selected from the group consisting of Fe_2O_3, FeO, Cr_2O_3, CuO, V_2O_5, MnO_2 and Mn_2O_5, (C) Al_2O_3 doped with an oxide selected from the group consisting of Cr_2O_3 and V_2O_5, (D) ZnO_2 doped with an oxide selected from the group consisting of CuO and V_2O_5, (E) SnO_2 doped with CuO, (F) ZrO_2 doped with an oxide selected from the group consisting of CuO and NiO, (G) TiO_2 heat-reacted with an oxide selected from the group consisting of MoO_3 and WO_3, (H) ZnO heat-reacted with an oxide selected from the group consisting of MoO_3 and WO_3, (I) ZrO_3 heat-reacted with an oxide selected from the group consisting of MoO_3 and WO_3, (J) SnO_2 heat-reacted with an oxide selected from the group consisting of MoO_3 and WO_3, and (K) GeO_2 heat-reacted with an oxide selected from the group consisting of MoO_3 and WO_3.

3,271,177

WAX COMPOSITIONS AND COATED ARTICLES

George G. Rumberger, Kalamazoo, Mich., assignor to KVP Sutherland Paper Company, Kalamazoo, Mich., a corporation of Delaware

Filed Apr. 30, 1965, Ser. No. 452,329
25 Claims. (Cl. 106—272)

1. A composition suitable for coating and laminating sheet materials consisting essentially of a petroleum wax base in an amount of about 55 to about 96.5 parts, a hydrous adsorbent inorganic powder, capable of a decrease of pore diameter upon dehydration, in an amount of about three to about thirty parts, and a surface activator which is a fatty acid amide having at least one aliphatic group of at least 8 carbon atoms in an amount of about one-half to about fifteen parts, said composition resulting from the admixture of the named ingredients under conditions which operate to expel water of hydration of the hydrous adsorbent powder in the presence of the wax base and the surface activator, and characterized by a thixotropic viscosity of from about 100 to about 10,000,000 centipoises when measured at about 220° F. to about 270° F. with a rotational viscometer at a spindle speed of less than ten r.p.m.

3,271,178

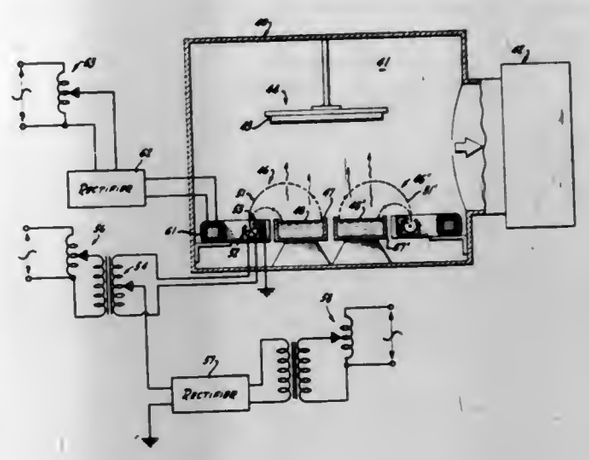
ADHERING LAYER TO POLYESTER FILM

Gale F. Nadeau and Clemens B. Starck, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

Filed Oct. 14, 1965, Ser. No. 497,602
10 Claims. (Cl. 117—7)

1. An aqueous coating composition for use in providing a highly adherent sub layer on a polyester film surface, said coating composition being comprised of, by weight, (1) from about 3 parts to 25 parts of a dihydroxy softening agent of polyester, (2) from about 0.5 part to 3 parts of gelatin, and, (3) from about 0.75 part to 4 parts of a vinylidene chloride copolymer.

7. In a method of preparing a composite film element for use in the manufacture of photographic film products the steps of which comprise (A) orienting a sheet of polyethylene terephthalate film, (B) coating said sheet on at least one surface thereof with an aqueous coating composition comprised of, by weight, (1) from about 3 parts to 25 parts of a dihydroxy softening agent for polyester, (2) from about 0.5 part to 3 parts of gelatin, (3) from about 0.75 part to 4 parts of a vinylidene chloride copolymer, and, (C) heating the coated sheet to provide a well-bonded composite element.



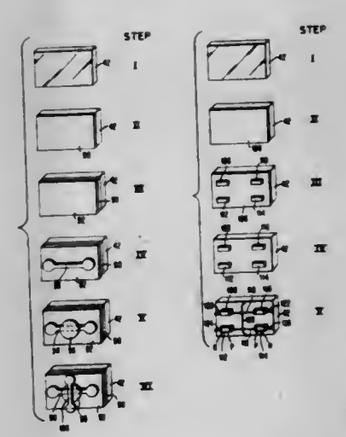
3,271,179

METHOD FOR THE MANUFACTURE OF AN OPTICAL FILTER

Hugh R. Smith, Jr., Piedmont, Calif., assignor to Temescal Metallurgical Corporation, Berkeley, Calif., a corporation of California

Filed Sept. 24, 1962, Ser. No. 225,555
4 Claims. (Cl. 117—33.3)

1. A method for the manufacture of an optical filter which includes a light filtering coating on the surface of an optical substrate comprising, vaporizing at least two materials having different refractive indexes by electron bombardment of the surfaces thereof in a high vacuum to form a vapor mixture of said materials, condensing said



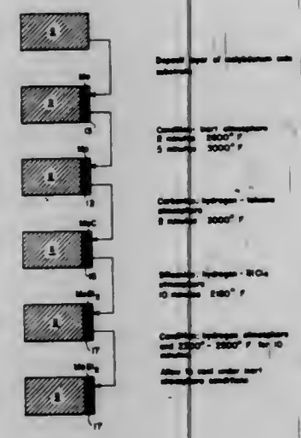
vapor mixture on the surface of an optical substrate to form a coating thereon, and controlling the intensity of the electron bombardment of the surface of said materials in order to control the composition of said vapor mixture.

3,271,180

PHOTOLYTIC PROCESSES FOR FABRICATING THIN FILM PATTERNS

Peter White, Shenorock, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed June 19, 1962, Ser. No. 205,821
13 Claims. (Cl. 117—38)

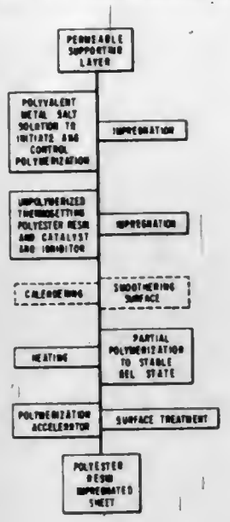


1. A method of forming a thin film of material in a precise geometric pattern upon the surface of a rigid substrate positioned within a chamber comprising the steps of introducing into said chamber a vapor of a material capable of being photolytically reacted; said vapor capable of being photolytically reacted in the gas phase by light of a first predetermined wavelength and when adsorbed upon said substrate surface by light of a second predetermined wavelength; controlling the pressure of said vapor to form an adsorbed layer of said vapor upon said substrate surface; and directing light of said second predetermined wavelength through said chamber and onto said substrate surface to react said adsorbed layer in said geometric pattern; said vapor when reacted forming a thin film of said material on said substrate surface.

3,271,181
METHOD OF COATING CARBONACEOUS BASE TO PREVENT OXIDATION DESTRUCTION AND COATED BASE

Robert A. Jewell and Noel T. Wakelyn, Hampton, Va., assignors to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration

Filed May 29, 1963, Ser. No. 284,266
5 Claims. (Cl. 117—46)



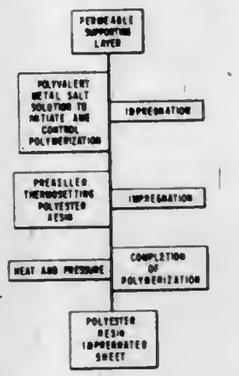
1. An article of manufacture comprising:
a carbonaceous member having
an oxidation protective coating integrally formed on an exposed surface thereof,
said coating being essentially molybdenum disilicide and being formed by (a) depositing a layer of molybdenum onto an exposed surface of said carbonaceous member, (b) conditioning the coated member at an elevated temperature and in an inert gaseous environment, (c) carbonizing said coating under said elevated temperature condition, (d) siliconizing said coating in the presence of an excess of hydrogen while maintaining said elevated temperature condition, (e) further conditioning said coating in the presence of hydrogen in the temperature range of 2300–2500° F. for approximately ten minutes, and (f) cooling the coated base to room temperature in an inert gaseous atmosphere.

3,271,182
PROCESS FOR PRODUCING SHEETS OF REINFORCED POLYESTER RESIN

Pierre Paul William Varlet, Asnieres, France, assignor to Societe Anonyme des Usines Chausson, Asnieres, Seine, France, a corporation of France

Filed Aug. 3, 1962, Ser. No. 214,522
Claims priority, application France, Nov. 26, 1958, 780,144, Patent 1,223,346; Sept. 21, 1959, 805,633, Patent 76,338
15 Claims. (Cl. 117—47)

1. Process for the manufacture of reinforced polyester resin sheets capable of being shaped mechanically, which comprises the steps of first impregnating a supporting layer of a permeable reinforcing material with a solution in a diluent selected from the group consisting of a polyhydric alcohol and a vinyl monomer, of a polyvalent metal salt soluble in said diluent, said polyvalent metal being selected from the group consisting of tin, iron, zinc, boron, cobalt and manganese, said salt being capable of initiating and then controlling the polymerization of said polyester resin upon heating below a predetermined temperature, then impregnating said impregnated reinforcing material with a mixture of an unpolymerized thermosetting polyester resin and a polymerization catalyst therefor not substantially activated by said predetermined temperature and a sufficient amount of an alkylated phenol to inhibit polymerization, then heating said impregnated material to a temperature within the limit of said predetermined temperature to initiate polymerization and to cause said

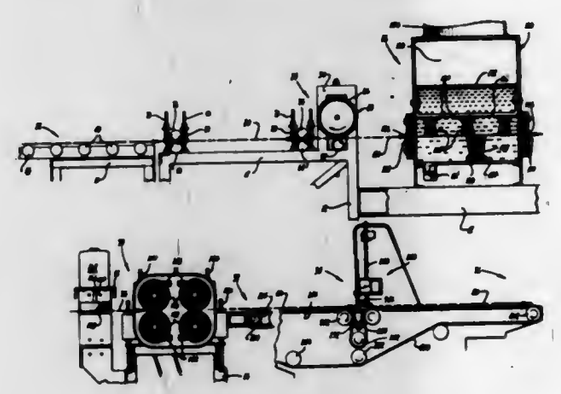


resin to go to a partially polymerized and stable gel state by the action of said polymerization initiating and controlling salt.

3,271,183
PROCESS FOR PRODUCING SHEETS OF REINFORCED POLYESTER RESIN

Pierre Paul William Varlet, Asnieres, France, assignor to Societe Anonyme des Usines Chausson, Asnieres, France, a company of France

Filed Aug. 3, 1962, Ser. No. 214,523
Claims priority, application France, Dec. 3, 1958, 780,703, Patent 1,217,742
15 Claims. (Cl. 117—47)



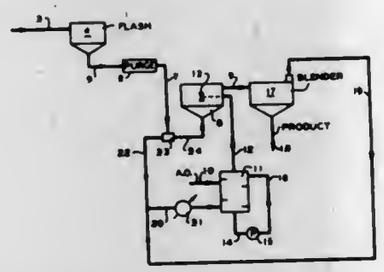
1. Process for the manufacture of reinforced polyester resin sheets capable of being shaped mechanically, which comprises the steps of first impregnating a supporting layer of a permeable reinforcing material with a solution in a diluent comprising at least one member selected from the group consisting of a polyhydric alcohol, a lower aliphatic alcohol, and a vinyl monomer, of a polyvalent metal salt soluble in said diluent, said polyvalent metal being selected from the group consisting of tin, iron, zinc, boron, cobalt and manganese, said salt being capable of initiating and then controlling the polymerization of said polyester resin upon heating below a predetermined temperature, then impregnating said impregnated reinforcing material at least partially with a thermosetting polyester resin which is in a pregelled state in which it is stable at ambient temperature, said resin having been previously brought to said pregelled state by admixing with a catalyst adapted to permit initiating of polymerization, with said polyvalent metal salt solution,

and with a sufficient amount of an alkylated phenol to inhibit further polymerization and to maintain the resin in said pregelled state.

3,271,184
METHOD AND APPARATUS FOR THE CONTINUOUS APPLICATION OF COATINGS TO STRIP MATERIALS

Nicholas V. Poletika and Rodrick E. Black, Fort Bragg, Calif., assignors to Union Lumber Company, San Francisco, Calif., a corporation of California

Filed Sept. 26, 1962, Ser. No. 226,212
17 Claims. (Cl. 117—65.2)



13. In a rapid, continuous method for the application of coating materials to elongated units of lumber without any intermediate drying step, the steps of immersing said units of lumber in successive baths of coating material under conditions of controlled hydrostatic pressure, subjecting the top and bottom surfaces of said units of lumber to brushing while immersed in said coating baths to force the coating material into said top and bottom surface layers, simultaneously wiping the top and bottom surfaces of said units of lumber as they are discharged from said coating baths to remove excess coating material, buffing all coated surfaces of said units of lumber discharged from the last of said coating baths to remove any remaining coating material not adsorbed into and onto the surfaces thereof, and drying the successive units of lumber.

3,271,185
POLYMER STABILIZATION

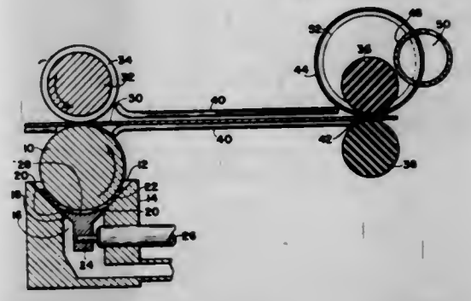
Lyle W. Pollock, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Filed Aug. 1, 1963, Ser. No. 299,225
7 Claims. (Cl. 117—100)

1. In a process for the production of stabilized solid polymer particles wherein said polymer particles are obtained by flash vaporization in a flash zone of a stream containing polymer in a vaporized liquid diluent and removing the resulting vaporized diluent therefrom as effluent, the improvement which comprises uniformly coating the resulting solid polymer particles in said flash zone with an organic antioxidant for said polymer by contacting said polymer particles with a stream comprising vapors of said antioxidant composition and a portion of said vaporized diluent as carrier for the vaporized antioxidant composition.

3,271,186
METHODS FOR MAKING ASBESTOS FIBER PRODUCTS

Thomas H. Sadler, Middlesex, and George P. Reimschussel, Flemington, N.J., assignors to Johns-Manville Corporation, New York, N.Y., a corporation of New York



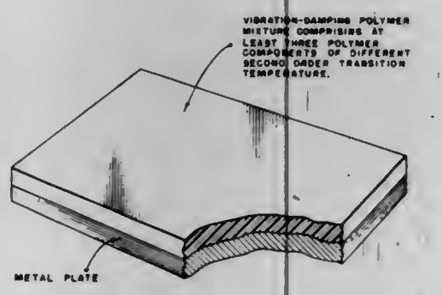
Filed Dec. 23, 1963, Ser. No. 332,566
8 Claims. (Cl. 117—100)

1. Method for manufacturing an asbestos fiber product comprising:
(a) mixing together asbestos fiber and hydromodifier and moving said mixture in a predetermined direction,
(b) adding to the moving mass of asbestos fibers and hydromodifier atomized droplets of water to swell said hydromodifier and to coat at least portions of said asbestos fibers with said water swollen hydromodifier, and
(c) drying and collecting said coated asbestos fibers.

3,271,187
PROCESS FOR CONDITIONING WRINGER ROLLS WHICH TREAT ONE-SIDE-COATED SHEET MATERIAL

Richard J. Chen, Brockton, and Nicholas Gold, Arlington, Mass., assignors to Polaroid Corporation, Cambridge, Mass., a corporation of Delaware

Filed May 17, 1965, Ser. No. 456,417
3 Claims. (Cl. 117—102)



1. A method of treating one side of each of a succession of sheets with a liquid without wetting the opposite sides of said sheets comprising:
applying a liquid to one side of each of a succession of sheets for adsorption into said each sheet;
allowing a portion of said liquid to be absorbed into said each sheet;
removing excess liquid from said one side of said each sheet by moving said one side of said each sheet relative to a pressure roll while pressing said one side of said sheet against said pressure roll by pressing a perforated strip against the opposite side of the sheet and collecting liquid removed from said each sheet between said one side thereof and said pressure roll;
immediately following movement of said each sheet from contact with said pressure roll and prior to movement of the next succeeding sheet into contact with said pressure roll, removing from said pressure roll said liquid collected thereon by rotating said pressure roll against said perforated strip to entrap said liquid in the perforations in said strip; and
expelling said liquid from said perforations.

3,271,188
VIBRATION DAMPING POLYMER MIXTURE ON METAL PLATE

Walter Albert, Lothar Bohn, and Joachim Ebigt, Frankfurt am Main, Hermann Oberst, Hofheim, Taunus, and Horst Pfister, Frankfurt am Main, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main, Germany, a corporation of Germany

Filed Sept. 7, 1960, Ser. No. 54,386
Claims priority, application Germany, Sept. 11, 1959, F 29,363
2 Claims. (Cl. 117—132)

1. A metal plate having on a surface thereof a layer of polymer mixture damping the vibration of said metal plate uniformly over a wide temperature range, the ratio of the mass of said layer of polymer mixture to the mass of said metal plate being from 0.20 to 0.25, said polymer mixture comprising at least three compatible externally unplasticized polymers having second order transition temperatures which differ from one another by from 10° C. to 200° C., the temperature range of vibration damping of said mixture being determined by the two polymer components thereof having the highest and lowest second order transition temperatures, and the uniformity of the damping throughout said temperature range being promoted by the presence of the at least one further polymer component having a second order transition temperature intermediate to said highest and lowest second order transition temperatures.

3,271,189
PROCESS OF TREATING SYNTHETIC FIBERS

Hugo Hofmann, Elizabethton, Tenn., assignor to Beaunit Corporation, a corporation of New York

No Drawing. Filed Mar. 2, 1962, Ser. No. 176,891
2 Claims. (Cl. 117—138.8)

1. As a new article of manufacture, polyester fiberfill with high, substantially permanent resiliency comprising crimped polyester fiberfill having a thin, solid coating of a methylpolysiloxane polymer cross-linked with a methylhydrogenpolysiloxane polymer.

3,271,190
ANTI-BLOCKING COMPOSITIONS AND SHEET MATERIAL TREATED THEREWITH

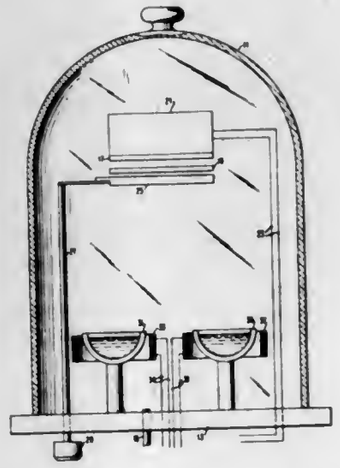
Gale F. Nadeau and Crayton B. Thompson, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Aug. 6, 1962, Ser. No. 214,833
10 Claims. (Cl. 117—138.8)

1. As an article of manufacture a polyester sheet having applied to at least one surface thereof a composition comprising:
(A) an anionic surface active agent and
(B) from 1 part to 10 parts by weight for each part by weight of (A) of a compound selected from the group consisting of resorcinol, orcinol, catechol, pyrogallol, 1-naphthol, 2,4-dinitropbenol, 2,4,6-trinitrophenol, 4-chlororesorcinol, 2,4-dihydroxytolulene, 1,3-naphthalenediol, 1,6-naphthalenediol, acrylic acid, sodium salt of 1-naphthol-4-sulfonic acid, benzyl alcohol, trichloroacetic acid, o-hydroxybenzotrifluoride, m-hydroxybenzotrifluoride, o-fluorophenol, m-fluorophenol, p-fluorophenol, chloral hydrate, o-cresol, and mixtures of two or more.

3,271,191
METHOD OF MAKING MANGANESE FERRITE FILM FROM NITRATE SOLUTION

William L. Wade, Jr., Neptune, N.J., assignor to the United States of America as represented by the Secretary of the Army



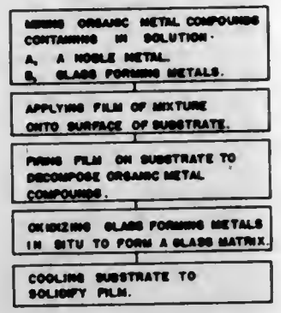
No Drawing. Filed Nov. 8, 1962, Ser. No. 236,459
3 Claims. (Cl. 117—169)

1. The method of making magnetic ferrite films comprising mixing an alcoholic solution of ferric nitrate with an alcoholic solution of metallic nitrate selected from the group consisting of manganese nitrate and manganese nitrate-magnesium nitrate in the stoichiometric proportion necessary to form the ferrite, immersing a substrate into the thus prepared solution, preliminarily firing the coated substrate at 400° C. to 700° C., cooling the coated substrate, repeating the immersion, preliminary firing and cooling steps until the desired amount of magnetic ferrite material is deposited in situ on the substrate, and firing the coated substrate at 800° C. to 1000° C. in an inert atmosphere for one to four hours to align the oxides formed to the spinel structure of the ferrite.

3,271,192
CAPACITORS AND PROCESS FOR MAKING SAME

Rudolf E. Thun, West Hurley, and Fred S. Maddocks, Kingston, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed June 5, 1962, Ser. No. 200,256
11 Claims. (Cl. 117—217)

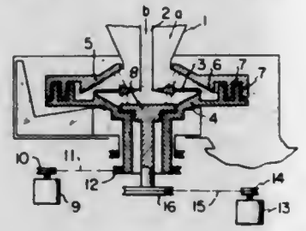


1. A process of producing a capacitor having a high dielectric constant, which comprises:
evaporating in a low pressure vacuum chamber an evaporant heated to a temperature of between 1350° C. and 1750° C., said evaporant consisting essentially of material selected from the group consisting of the rare earth fluorides and oxides and mixtures thereof, in contact with a metal having a high melting point, and condensing said evaporant on a conductive substrate to form a dielectric film over the conductive substrate;
and evaporating a conductive material and condensing the conductive evaporant on said dielectric film to form the conductive member of a capacitor.

3,271,193
ELECTRICAL RESISTANCE ELEMENT AND METHOD OF MAKING THE SAME

Otis F. Boykin, Chicago, Ill., assignor to CTS Corporation, Elkhart, Ind., a corporation of Indiana

Filed Sept. 20, 1962, Ser. No. 225,134
5 Claims. (Cl. 117—227)



1. A method of manufacturing a resistive element comprising the steps of admixing a composition of a thermally decomposable organic metal compound containing at least one of the noble metals in solution and thermally decomposable glass-forming organic metal compounds in solution; applying a film of the composition onto the surface of a high-temperature-resistant, electrically nonconductive base; firing the mixture and the base at from 750–900° C. to thermally decompose the organic metal compounds; and cooling the film and the base to solidify the film.

3,271,194
SOLIDIFICATION OF SACCHARIDE SOLUTIONS

Hideo Oikawa, Yokohama-shi, Japan, assignor to Yokohama Seito Kabushiki Kaisha and Takara Kabushiki Kaisha, Tokyo-to, Japan

Filed July 24, 1964, Ser. No. 384,958
Claims priority, application Japan, Jan. 27, 1964, 39/3,565
3 Claims. (Cl. 127—60)

1. A method for the continuous solidification of sugar solutions which comprises the steps of: introducing solid phase sugar as seed onto a surface of revolution rotating at a high speed rendering said solid phase sugar into a continuous and uniform thin layer on said surface under the action of centrifugal force; introducing a liquid phase sugar onto another surface of revolution also rotating at high speed to render said solution into a continuous thin film, projecting said thin film from the edge of said another rotating surface onto said thin layer of solid phase sugar, mixing said solid and liquid phase sugars; and, simultaneously subjecting said mixed solid and liquid phase sugars to a gas flow to impart solidification thereto.

3,271,195
ELECTRODES AND METHODS OF MAKING SAME

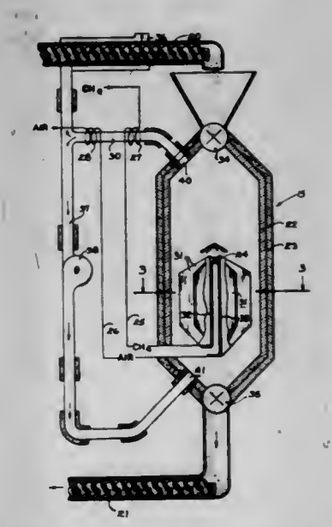
Aldo S. Berchielli, New Hyde Park, N.Y., and Renato Di Pasquale, Rutherford, N.J., assignors to Yardney International Corp., New York, N.Y., a corporation of New York

No Drawing. Filed July 30, 1962, Ser. No. 213,103
5 Claims. (Cl. 136—67)

1. A method of making a composite electrode for a galvanic electrical generator, comprising the steps of:
(a) forming a viscous mixture of an electrochemically active comminuted material, a resinous binder, and between substantially 0.1 and 5% of said material, by weight, of randomly dispersed reinforcing fibers;
(b) shaping and pressing said mixture at room temperature into mechanically strong, stable, thin plates; and
(c) sandwiching a conductive grid provided with an electrode terminal between two of said plates to form an electrode assembly and then pressing the said assembly into a unitary composite electrode.

3,271,196
FUEL CELL ELECTRODES

Harry G. Oswin, Chauncey, N.Y., assignor to Leesona Corporation, Cranston, R.I., a corporation of Massachusetts



No Drawing. Filed Nov. 8, 1961, Ser. No. 150,902
3 Claims. (Cl. 136—86)

1. A fuel cell for the generation of electrical energy directly from a fuel and oxidant comprising an electrolyte, an oxidizing electrode, a fuel electrode, said electrodes being in contact with said electrolyte, and means for providing fuel cell reactants to said electrodes, at least one of said electrodes comprising a structure having elemental lithium uniformly dispersed at least at the surface of a radioactive host metal, said host metal being a member of the group consisting of Group I–B and Group VIII metals of the Mendelyeev's Periodic Table and said lithium being present in an amount of from 10–200 micrograms per square centimeter of surface area of said host metal, the radiation level of the radioactive host metal being in the range of from 1 microcurie to 10 millicuries per square centimeter of electrode surface.

3,271,197
PROCESS FOR PRODUCING ELECTRICITY AND FURNACE

Ernest H. Lyons, Jr., Box 37, Elsah, Ill.

Filed Apr. 24, 1962, Ser. No. 189,784
9 Claims. (Cl. 136—86)

1. In an energy conversion process where a lower metallic oxide is oxidized as an anode in an electrolytic cell with the production of electrical energy and the resultant higher metallic oxide is regenerated, a process wherein
said higher metallic oxide is introduced to and caused to flow downwardly in a regeneration zone wherein a fuel is burned in said zone with oxygen to supply heat for reducing said higher metallic oxide, largely to said lower metallic oxide with the resultant production of oxygen, the combustion products and most

of the produced oxygen being exhausted from said zone at a locus distant from the point where the fuel is burned, and wherein

a major amount of the oxygen so produced is recirculated to said zone and flowed through said zone countercurrently to said oxide and through the point where the fuel is burned, to supply a substantial portion of the oxygen needed for burning said fuel and to conserve the heat produced by burning said fuel and needed to produce the reduction of said higher metallic oxide, whereby the thermodynamic efficiency in said zone is markedly increased.

9. A regeneration oxide-reduction furnace, comprising

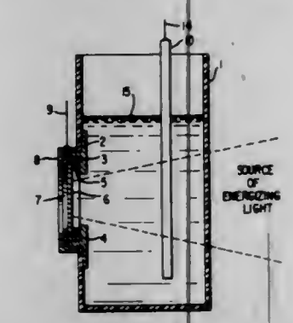
a generally cylindrical well-insulated vertically extending housing having at its upper end a first opening for exhausting combustion products and a second opening for introducing a material to be treated to the upper end of said furnace, said second opening including a valve,

means for feeding said material to said second opening,

a fuel-air nozzle in said housing having fuel and air inlet pipes, said pipes being provided with heat exchange means for heating the incoming fuel and air and for resultant cooling of the regenerated product,

the lower end of said housing including means for removing said material and a recycle opening,

conduit means connecting said first opening to said recycle opening near the bottom of said housing for recycling a portion of the exhaust gases, said conduit means conveying said portion of exhaust gases to said heat exchange means where said exhaust gases help to heat said incoming fuel and air, and



means in heat-exchange relationship with said feeding means, and conduit means for conveying another portion of said exhaust gases from said first opening to said heat exchange means.

3,271,198

ELECTROLYTIC SEMICONDUCTOR PHOTOCELL

Nicholas N. Winogradoff, Yorktown Heights, and Herbert K. Kessler, Mahopac, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Dec. 30, 1960, Ser. No. 79,753
1 Claim. (Cl. 136—89)

A semiconductor photovoltaic cell comprising:

containing means and an optically transparent solution of H_2SO_4 therein,

an element comprising a region of single crystal silicon semiconductor material having two major surfaces, one of said surfaces being etched to substantially reduce recombination of carriers, said element being disposed in said containing means so that said etched surface is in contact with said electrolyte and forms therewith an interface across which exists a surface barrier field, and so that said etched surface is exposable to light transmitted through said electrolyte thereto,

inert platinum electrode in ohmic contact with said electrolyte, and an electrical contact in ohmic contact with said other surface of said semiconductor, said electrode and electrical contact serving as the cell terminals.

3,271,199

SOLID ACID STORAGE BATTERY ELECTROLYTE

Hermann Beste and Alexander Koenig, Frankfurt am Main, Guenther Ryhiner, Bad Soden am Taunus, and Ernst Voss, Frankfurt am Main, Germany, assignors to Varta Aktiengesellschaft, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Filed Jan. 14, 1963, Ser. No. 251,005
Claims priority, application Germany, Jan. 20, 1962, A 39,254; Jan. 23, 1962, A 39,263
4 Claims. (Cl. 136—157)

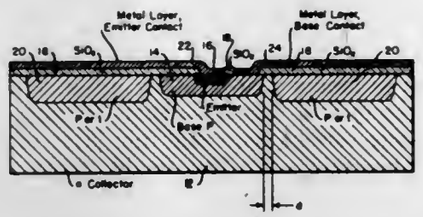
1. A gelled storage battery electrolyte consisting essentially of an aqueous sulfuric acid solution, pectin and colloidal silica, the electrolyte containing at least about .3% of pectin by weight of the sulfuric acid solution.

3,271,200

PROCESS FOR THE PRODUCTION OF SUPERCONDUCTIVE WIRES AND BANDS

Ulrich Zwicker, Aalen, Wurttemberg, Germany, assignor to Metallgesellschaft Aktiengesellschaft, Frankfurt am Main, Germany

No Drawing. Filed June 7, 1963, Ser. No. 286,151
Claims priority, application Germany, June 19, 1962, M 53,256
3 Claims. (Cl. 148—11.5)



1. Method of producing superconductive wires and bands from titanium-niobium alloys composed of 20–45% by weight of niobium and the remainder titanium which comprises cooling down such an alloy from a temperature in the β phase region sufficiently rapidly that such β phase is retained and in addition a martensitic phase but no equilibrium α phase is produced, cold working such cooled alloy to wires and bands and subjecting such cold worked wires or bands to a heat treatment between 250 and 650° C., to cause the supersaturated β and martensitic phases therein to separate out.

3,271,201

PLANAR SEMICONDUCTOR DEVICES

Daniel I. Pomerantz, Lexington, Mass., assignor, by Telegraph Corporation, New York, N.Y., a corporation mesne assignments, to International Telephone and of Maryland

Filed Oct. 30, 1962, Ser. No. 234,108
2 Claims. (Cl. 148—33.3)

2. A planar transistor comprising:

a die of semiconductor material having a collector region of one conductivity type, at least a portion of said collector region being contiguous with a given surface of said die;

a base region of opposite conductivity type inset into said collector region, the surface of said base region being contiguous with said given surface;

an emitter region of said one conductivity type inset into said base region, the surface of said emitter region being contiguous with said given surface;

a layer of insulating material on said given surface having apertures therein to expose given parts of said base and emitter regions;

a metallic layer on said layer of insulating material overlying the contiguous portion of said collector region and contacting a given one of said emitter and base regions through a corresponding one of said apertures; and

an auxiliary region of said opposite conductivity type inset into and surrounded by said collector region, the surface of said auxiliary region being contiguous with said given surface and underlying said metallic layer thereby to reduce the capacitance between said metallic layer and said collector region.

3,271,202

PROCESS FOR PRODUCING SILICON-IRON THIN TAPES

Eleanor A. Freeman, Schenectady, and John L. Walter, Scotia, N.Y., assignors to General Electric Company, a corporation of New York

Filed Dec. 18, 1963, Ser. No. 331,528
3 Claims. (Cl. 148—112)

1. The process for producing high purity silicon-iron thin tapes comprising providing a cold rolled tape of up to 6 mils thickness which compositionally consists of from about 1.5 to 4.0 weight percent silicon, remainder substantially all iron and containing not more than about 0.010 weight percent incidental impurities, annealing the tape at a temperature and for a time sufficient to form integral iron oxide film of up to 3000 A. thickness on the surface thereof, and subjecting the annealed tape to a final anneal in a vacuum no higher than about 1×10^{-4} mm./Hg at temperatures of from about 1100° C. to 1350° C. to develop the (110) [001] crystallographic orientation.

3,271,203

METHOD FOR PRODUCING ORIENTED SILICON-IRON

John L. Walter, Scotia, N.Y., assignor to General Electric Company, a corporation of New York

No Drawing. Filed Oct. 16, 1962, Ser. No. 231,017
1 Claim. (Cl. 148—113)

In the method of producing cube-on-edge grain oriented strip the steps comprising, providing a rolled strip of final thickness, the strip compositionally consisting of from about 1.5 to 5.0 weight percent silicon, balance substantially all iron, and containing not more than about 0.2 weight percent incidental impurities and having no precipitated second phase to restrict grain growth, vapor depositing a continuous layer of silica over the exposed surfaces of the strip, and annealing the strip at a temperature of from about 950° C. to 1100° C. in an environment selected from the group consisting of vacuum no higher than about 10^{-4} mm. Hg and hydrogen having a dew point no higher than about —40° F., the annealing being effected for a time sufficient to orient a majority of the constituent grains in the (110) [001] crystallographic orientation.

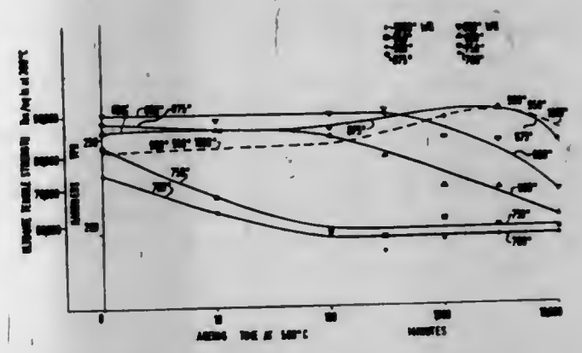
3,271,204

LAMINATED CORES

John P. Glass, Ardmore, Pa., assignor to Litton Industries, Inc., Beverly Hills, Calif., a corporation of Delaware

Filed Nov. 29, 1957, Ser. No. 699,563
28 Claims. (Cl. 148—120)

28. In a method of making a lamination useful in a synchro, the steps comprising taking a ring-shaped lamination composed of 50% nickel and 50% iron, annealing said lamination at 1700° F., compressing selected areas of said lamination, which areas are spaced from each other throughout the lamination, so as to raise the lower knee of its permeability curve at 0.2 gilbert per centimeter of length to 4100 gausses, and to lower the upper knee of its permeability curve to 9,400 gausses at 0.5 gilbert per



centimeter of length, to make the permeability curve of said lamination more linear.

3,271,205

ZIRCONIUM BASE ALLOYS

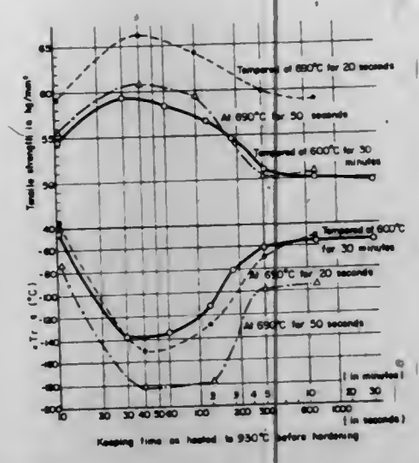
John Winton and Robert Murgatroyd, Warrington, England, assignors to United Kingdom Atomic Energy Authority, London, England

Filed Mar. 23, 1964, Ser. No. 353,790
Claims priority, application Great Britain, Mar. 27, 1963, 12,201/63
5 Claims. (Cl. 148—133)

1. A method for strengthening a zirconium base alloy containing niobium which comprises introducing oxygen into the alloy to give an oxygen content in the range 1000 to 2000 parts per million by weight, raising the alloy to a sufficiently high temperature to effect conversion predominantly to the beta phase quenching the alloy from that temperature, and subsequently ageing the alloy for a period in excess of two hours.

5. A binary alloy of zirconium with 1 to 4% by weight of niobium and having an oxygen content in the range 1000 to 2000 parts per million by weight, such alloy being predominantly of martensitically transformed beta phase with a fine dispersion of a second phase precipitate rich in niobium.

3,271,206



SHORT-TIME HEAT-TREATING PROCESS FOR STEELS

Susumu Goda, Hisashi Gondo, Suehiro Hiyoshi, and Asao Arima, Yawata, Japan, assignors to Yawata Iron & Steel Co., Ltd., Tokyo, Japan

Filed Feb. 26, 1963, Ser. No. 261,182
Claims priority, application Japan, Feb. 28, 1962, 37/7,895
4 Claims. (Cl. 148—143)

4. A heat treating process for steels comprising heating quickly a steel containing 0.10% C., 0.32% Si, 1.13% Mn the rest being Fe and the usual impurities to a temperature of 930° C. in a heating time of less than 100 seconds, holding said steel at said temperature for from 30 seconds to 2 minutes, quenching it so as to produce a fine grain hardened structure, than again heating quickly said steel to a temperature of from 600 to 690° C. in

a heating time of 100 seconds, holding it at said temperature for from 20 seconds to 3 minutes so that carbide

precipitations occur with no appreciable grain growth, and then cooling said steel.

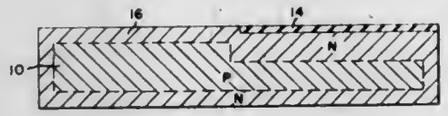
3,271,207
HEAT TREATING PROCESS
Richard Davis, Webster Groves, Mo., assignor to Monsanto Company, a corporation of Delaware
No Drawing. Filed Sept. 25, 1963, Ser. No. 311,304
14 Claims. (Cl. 148—143)

1. In a process for the heat treating of a material selected from glass and a metal to change the physical characteristics thereof the step comprising heating said material to a temperature below its melting temperature and thereafter cooling said material by contacting with a medium comprising chlorinated biphenyl.

3,271,208
PRODUCING AN N+N JUNCTION USING ANTIMONY
John E. Allegretti, East Brunswick, N.J., assignor to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey
Filed Dec. 29, 1960, Ser. No. 85,173
2 Claims. (Cl. 148—175)

1. A method of forming by vapor deposition an N+N single crystal silicon semiconductor body including a substrate layer of single crystal silicon semiconductor material of N-conductivity type having a resistivity up to and including 0.05 ohm-cm. and a vapor-deposited single crystal silicon semiconductor layer of N-conductivity type having a resistivity of at least 1 ohm-cm. thereon, with an abrupt transition region therebetween, comprising the steps of:
(a) providing within a reaction chamber a single crystal silicon semiconductor substrate wafer of N-conductivity type doped with antimony as an impurity element to a resistivity level up to and including 0.05 ohm-cm.,
(b) heating said thus-doped wafer to a deposition temperature,
(c) introducing into said chamber a decomposable vapor including a halogen-containing source compound of silicon semiconductor atoms, and N-conductivity type active impurity atoms therewith to impart a predetermined high resistivity of at least 1 ohm-cm. to said semiconductor atoms, and
(d) contacting said heated wafer with said vapor thereby to form a single crystal N-conductivity type silicon layer on said low resistivity layer having a resistivity corresponding to said impurity atoms in said vapor, and an abrupt transition region between said low resistivity substrate and said high resistivity vapor-deposited layer.

3,271,209
METHOD OF ELIMINATING SEMICONDUCTOR MATERIAL PRECIPITATED UPON A HEATER IN EPITAXIAL PRODUCTION OF SEMICONDUCTOR MEMBERS
Theodor Rummel, Munich, Germany, assignor to Siemens & Halske Aktiengesellschaft, Berlin, Germany, and Munich, Germany, a corporation of Germany
Filed Feb. 19, 1963, Ser. No. 259,582
Claims priority, application Germany, Feb. 23, 1962, S 78,192
10 Claims. (Cl. 148—175)

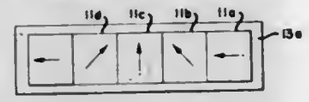


1. In the production process of growing monocrystalline semiconductor layers on substrates of semiconductor material by thermal dissocation of gaseous semiconductor compound and precipitation of the resulting semiconductor substance upon the substrates placed upon and heated by a supporting heater structure consisting at least at its surface of a refractory material different from the semiconductor substance being precipitated and more resistive to reactive agents at high temperatures than the substance being precipitated the method of removing from the heater structure while in situ the semiconductor coating grown upon it during the thermal production process, which comprises heating the structure, between successive runs of the semiconductor layer production and after removal of the substrate from the structure, to reaction temperature in a gas containing halogen atoms to form a gaseous compound of the semiconductor coating, whereby the coating is eliminated from the heater structure.

3,271,210
FORMATION OF P-N JUNCTIONS IN SILICON
Colin Pritchard, Birmingham, England, assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed July 24, 1963, Ser. No. 297,309
5 Claims. (Cl. 148—187)

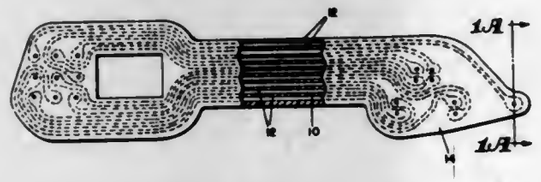
1. A method of diffusing phosphorus into a surface of a P-type silicon substrate which comprises: forming a blackened layer on at least a portion of said silicon surface by a chemical reaction with a hydrofluoric acid solution; exposing said surface with said blackened layer thereon to phosphorus so that atoms of phosphorus diffuse through said blackened layer into said substrate.

3,271,211
PROCESSING SEMICONDUCTIVE MATERIAL
Colin Pritchard, Birmingham, England, and Samuel A. Zeitman, Pittsburgh, Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed July 24, 1963, Ser. No. 297,343
15 Claims. (Cl. 148—187)

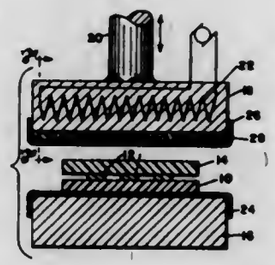


1. The method of diffusing phosphorus into a surface of a silicon substrate which comprises: forming a blackened layer on at least a portion of said silicon surface by an electrolytic reaction with a solution containing at least 50% by volume of concentrated hydrofluoric acid; and then diffusing phosphorus through said blackened layer into said substrate.

3,271,212
EXPLOSIVE WITH TRINITROBENZENE
Hans-Joachim Riedl, Recklinghausen, Hermann Frank, Dulmen, Westphalia, and Walter Sauermilch, Sythen, Westphalia, Germany, assignors to Wasag-Chemie Aktiengesellschaft, Essen, Germany
No Drawing. Filed Aug. 14, 1964, Ser. No. 389,805
Claims priority, application Germany, Aug. 17, 1963, W 35,106
7 Claims. (Cl. 149—92)

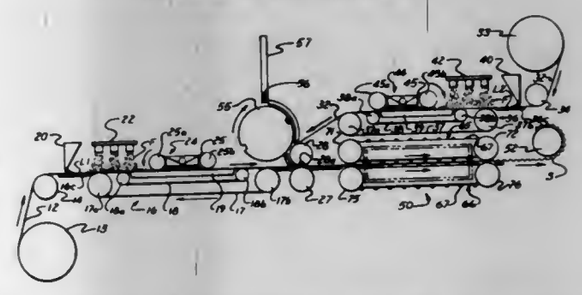


1. A high explosive body consisting essentially of an intimate mixture of a first explosive composition and a second explosive composition, said second explosive composition being selected from the group consisting of (a) mixtures of between about 70 and 90% by weight trinitrobenzene and between about 30 and 10% by weight trinitrotoluene, and (b) mixtures of between about 20 and 80% by weight of trinitrobenzene and between about 80 and 20% by weight of tetryl, said first explosive composition having a significantly higher melting point than said second explosive composition.



3,271,213
METHODS OF MAKING ANIMATION ILLUSTRATORS
Donald N. Yates, 710 Rockwood Drive, Gibsonia, Pa.
Filed Oct. 25, 1962, Ser. No. 233,113
2 Claims. (Cl. 156—3)

1. The method of preparing a polarizing animator comprising the steps of preparing a series of successively angularly oriented sections by coating a section of polarizing film on a clear isotropic support of desired shape and orientation with a chemical resist, removing the portion of film not covered by said resist and assembling said sections in successive angularly oriented position on a support member, said polarizing film sections being carried on separate temporary supports during the coating and removing steps and transferred into side by side relation on a permanent support.



3,271,214
METHOD OF MAKING FLEXIBLE MULTICONDUCTOR WIRING UNITS
Robert W. Tabor, Nashua, N.H., assignor to Sanders Associates, Inc., Nashua, N.H., a corporation of Delaware
Filed Oct. 19, 1960, Ser. No. 63,624
2 Claims. (Cl. 156—52)

1. The method of fabricating a flexible multiconductor wiring unit comprising the steps of:
(a) bonding to a first preformed sheet of thermoplastic insulating resin a complex of thin flat electrical conductors relatively spaced one from another,
(b) covering the conductors with a second preformed sheet of thermoplastic insulating resin,
(c) placing such assembly on a flat unyielding platen, said first preformed sheet of thermoplastic insulating resin being in contact with said platen,
(d) heating said second preformed sheet of thermoplastic insulating resin to a temperature effective to cause softening thereof, and
(e) applying pressure to said heated second preformed sheet of thermoplastic insulating resin by means of a flat porous member having a degree of resilient compressibility, said pressure being at least adequate to cause the second sheet to bond to the opposed surface of the electrical conductors and intrude between the same to weld to the surfaces of the first sheet which are exposed between the conductors.

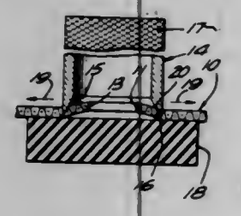
3,271,215
METHOD OF CONTINUOUSLY FORMING REINFORCED RESINOUS SHEET MATERIAL
Paul H. Hoffman, Tampa, Fla., assignor, by direct and mesne assignments, to Roy E. Raney and Charles F. Clark, St. Petersburg and Tampa, Fla., respectively, co-trustees
Filed Feb. 27, 1961, Ser. No. 92,009
3 Claims. (Cl. 156—62.8)

1. A method of continuously forming fiber reinforced sheet material of polymerized resin, said method comprising the steps of moving a first traveling carrier web through a resin and fiber depositing station, forming a mixture of loose fibers and polymerizable resin in a layer supported by said first carrier web by depositing resin and loose fibers on said web, moving a second carrier web through a resin and fiber depositing station, forming a mixture of loose fibers and polymerizable resin in a layer supported by said second carrier web, moving the fiber and resin mixture bearing surfaces of said webs into confronting relation, inserting a rigid member between said confronting webs, pressing the confronting layers of resin-fiber mixture together to form a single layer between said carrier webs having said rigid member embedded therebetween, and applying heat to said webs and said resin-fiber mixture for curing and hardening thereof into finished sheet material.

3,271,216
PRODUCTION OF LOOP PILE TEXTILES
Charles Richard Koller, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Jan. 22, 1963, Ser. No. 253,186
3 Claims. (Cl. 156—72)

1. Method for the production of a porous self-supporting sheet material comprising
(a) providing one or more fibrous bundles each composed of a plurality of contorted filamentary structures which are overlapping and intercontacting throughout the three dimensions of the bundle, said filamentary structures being aligned generally in the same direction throughout the bundle,

(b) pleating said bundles in siusoidal configuration to provide a body having a fiber density below 25 lbs./ft.^{3}, wherein filamentary structures of adjacent pleats of the bundles overlap one another, and wherein said body has two opposing faces defined by closed curved portions of said bundles,



(c) interconnecting at least a major proportion of said filamentary structures at a plurality of spaced points along their lengths throughout the three dimensions of said body while maintained in sinusoidal configuration, and

(d) sectioning the body in a plane intermediate said two opposing faces.

3,271,217
METHOD FOR MENDING HOLES IN FABRICS

Donald L. Mapson, 172 E. Leucadia Road, La Habra, Calif.

Filed Dec. 17, 1962, Ser. No. 245,230
1 Claim. (Cl. 156—98)

A method of mending a small hole in a fabric garment which comprises the steps of stretching said garment fabric uniformly radially from the center of said hole, applying a rotary cutter to said garment to cut a disc of fabric therefrom embracing the area in which said hole appears, providing an undamaged sample of the fabric of said garment, applying the same cutter to said fabric sample to cut an undamaged disc of fabric therefrom inserting said undamaged disc in the opening produced in said garment fabric by cutting said first disc therefrom, pressing a thermo-plastic patch against the reverse face of said undamaged disc and in overlapping relation with said garment fabric, and applying heat to said patch to soften the same and cause it to flow only partially through said fabric disc and the area of said garment fabric engaged thereby whereby solidification of said patch material causes the latter to unite said disc with said garment fabric and bind against unravelling the adjoining cut edges of said garment fabric and said fabric disc.

3,271,218
METHOD OF MAKING PRE-POPPED FILM TRANSPARENCY SLIDES

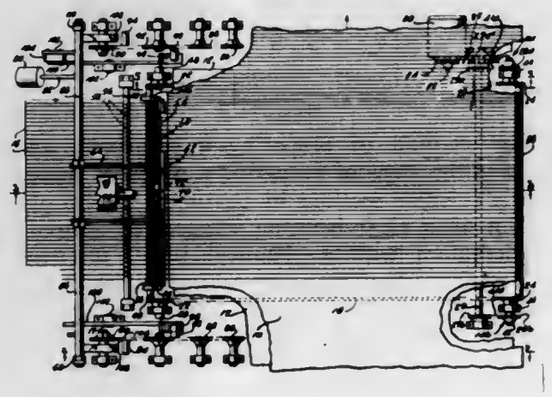
Howard F. Ott and James J. Heffer, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

Filed Apr. 1, 1963, Ser. No. 269,619
5 Claims. (Cl. 156—108)

1. The method of making pre-popped film transparencies from an elongated filmstrip of the type wherein the filmstrip includes a marginal portion along each longitudinal edge and a plurality of centrally located image areas, which comprises the steps of:

(a) progressively bending said marginal portions of said filmstrip in a common direction out of the normal plane of said image areas by feeding said marginal portions of said filmstrip between pairs of cooperating rotatable forming rollers disposed on opposite sides of said transparency;

(b) severing said filmstrip along lines transverse to said filmstrip and intermediate successive areas to obtain separate film transparencies;



(c) mounting each of said film transparencies between a pair of apertured halves of a film mount with the marginal portions of the transparency positioned between the inner surfaces of the halves and the image area in registry with the aperture of each of the halves of the mount; and

(d) securing said mount halves together with said surfaces engaging and applying pressure to said marginal portions whereby the image area of the transparency is stressed and a curvature is imparted thereto.

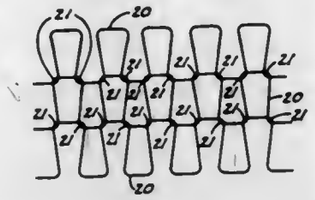
3,271,219
METHOD AND APPARATUS FOR CROSS LAYING REINFORCING STRANDS ON WEB MATERIAL

Franklin G. Nickerson, Jr., Union Beach, and Joseph E. Cameron, Roselle, N.J., assignors to General Gummed Products, Inc., Linden, N.J., a corporation of New Jersey

Filed Aug. 3, 1961, Ser. No. 129,040
22 Claims. (Cl. 156—177)

5. A method of applying a plurality of strand elements to a continuous web comprising directing the individual strands between spaced guide elements to dispose them in parallel spaced relationship, moving an adhesive coated pickup rod member between the guide elements upwardly from below the strands to cause the strands to become engaged with the adhesive coating and to be lifted and carried thereby, thereafter moving the pickup bar with the strands across the web as the web is advanced, depositing the strands on the web by moving the pickup bar down below the plane of the web, and moving a cutting member downwardly against the strands to effect the simultaneous cutting of the opposite ends of the strands below the web and the pressing of the strands downwardly on the web.

3,271,220
CONTACTING FIBER BONDING



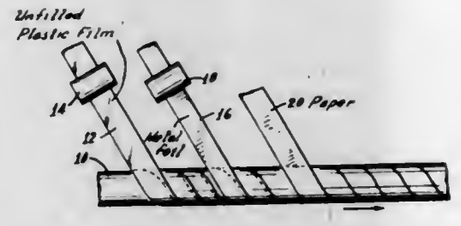
Henry C. Geen, Ann Arbor, Mich., assignor to Chemotronics Incorporated, Ann Arbor, Mich., a corporation of Michigan

Filed Apr. 5, 1963, Ser. No. 270,902
11 Claims. (Cl. 156—180)

1. The method of bonding contacting fibers comprising an organic resin at least at the point of contact of the fibers, which comprises:

(a) mounting a high energy light pulse source such that a light pulse from the light pulse source will irradiate the point of contact of the fibers positioned in spaced relationship to the light pulse source; and

(b) exposing the point of contact of the fibers to a light pulse from the light pulse source of between

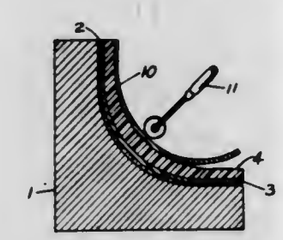


about a few hundred microseconds to about a few milliseconds duration and of sufficient energy to cause bonding of the fibers at the point of contact.

3,271,221
METHOD OF MAKING AN ELECTRICAL CONDENSER

Joseph P. Sheehan, Forest Hills, West Sanford, N.C., assignor to Cornell-Dubilier Electric Corporation, a corporation of Delaware

Original application June 22, 1961, Ser. No. 118,855, now Patent No. 3,185,759, dated May 25, 1965. Divided and this application Aug. 26, 1964, Ser. No. 398,141
6 Claims. (Cl. 156—190)

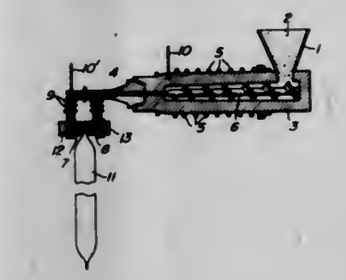


1. The method of making an electrical condenser of a form that includes a condenser body having projecting terminal wires, an enclosing tube and a cured-resin end fill covering each end of said body and sealing each end of said enclosing hollow tube, said method including the steps of forming a tube of an unfilled plastic film that is surface-treated for forming a bond to curable resins, adhering a complete external covering of metal foil to said plastic-film tube, applying a complete external covering of paper to said foil-and-plastic tube, impregnating the resulting tube with a rigidizing resin, and subjecting the impregnated tube to polymerizing conditions.

3,271,222
METHOD FOR PREPARING CORED LAMINATES

Roger Moorman, Gloucester, Va., assignor to Mobjack Manufacturing Company, Incorporated, Gloucester County, Va., a corporation of Virginia

Filed Sept. 20, 1962, Ser. No. 224,995
8 Claims. (Cl. 156—214)



1. The method for preparing a low density sandwich type cored laminate having a core density in the range twenty-five to forty pounds per cubic foot, comprising the steps of preparing a preformed first lamina in contact with the contours of a previously prepared mold surface, applying a mixture comprising a hardenable resin with cellular microparticulate aggregate dispersed therein in the form of a thin layer at least several times the thickness of a single cellular particle upon the surface of said lamina, applying additional dry cellular microparticulate aggregate of substantially the same size range to the surface of said mixture, allowing said dry aggregate to consolidate with said mixture, thereby producing a homogeneous core layer of substantially uniform density throughout its thickness, and applying a covering lamina in contact with the surface of said homogeneous core layer.

3,271,223
METHODS FOR SEALING THERMOPLASTIC RESIN FILM

Michio Sudo, Tokyo, Japan, assignor to Asaki Dow Limited, Tokyo, Japan, a corporation of Japan

Filed June 20, 1963, Ser. No. 289,227
Claims priority, application Japan, Oct. 30, 1962, 37/47,086; Dec. 20, 1962, 37/76,109
5 Claims. (Cl. 156—244)

1. A method for sealing two sheets of thermoplastic material, comprising advancing the two sheets in face-to-face relation, extruding a heated thermoplastic resin in the form of a bead onto the outer surface of at least one of the sheets such that the heated bead advances with the sheets and applying pressure to the sheets immediately adjacent the heated bead to advance the sheets while confining the heated bead to restrict its bounds and cause welding of the sheets together along their mating surfaces by the transfer of heat from the bead.

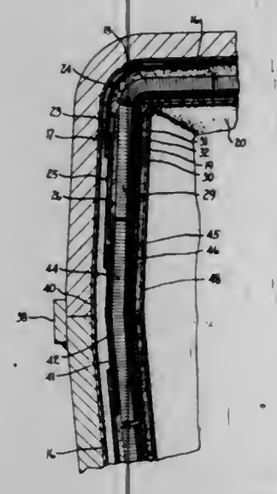
3,271,224
METHOD OF MANUFACTURING HOLLOW BODIES HAVING WALLS OF SANDWICH CONSTRUCTION

Bo Axel Gunnar Bjernekull, Norrkoping, Sweden, assignor to Saab Aktiebolaget, a corporation of Sweden

Filed Feb. 13, 1963, Ser. No. 258,270
3 Claims. (Cl. 156—245)

1. The method of making a hollow body having an opening therein and having walls of sandwich construction comprising a core of edgewise adjacent slabs of cellular material confined between and bonded to inner and outer wall forming layers of resin permeated glass fibers, which method comprises:

(A) separately forming complementary body parts which, in the finished body comprise all of the body except for substantially narrow body wall portions that are integrated with and smoothly connect free edge portions of said complementary body parts to provide continuity between them, proceeding, as to each of said complementary body parts, by



(1) successively laying down one of said wall forming layers, the core, and then the other wall forming layer, with corresponding layers and the cores of the body parts, at the free edge portions thereof, all stepped an appreciable distance in the same direction, so that the core of each body part terminates at a location inter-

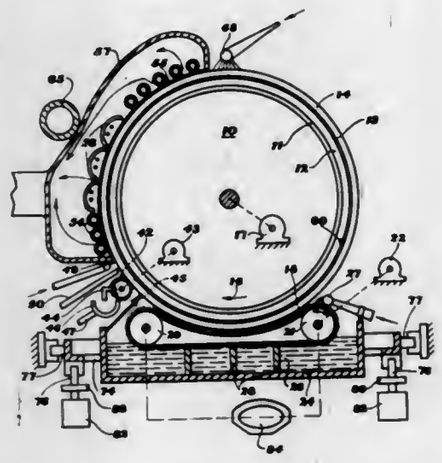
mediate the terminal edges of said layers at the free edge portions of the body parts;

(2) making each of said wall forming layers by laying down laminae of mats of glass fiber impregnated and saturated with a curing resin, with adjacent laminations of each layer stepped in said direction at the free edge portions of the body part a distance sufficient to expose substantial side surfaces of said laminations;

(B) holding the complementary body parts in the positions they are to occupy in the finished body; and

(C) from the side of the body having corresponding wall forming layers spaced apart the greatest distance, integrating the free edge portions of the body parts by

(1) laying down mats to form successive spanning laminae, upon and in flatwise overlapping relation to the stepped and exposed side surfaces at the end portions of the laminae of the corresponding layers at the other side of the body,



(2) laying down spanning slabs of cellular core forming material upon said spanning laminae, in close edge to edge relationship with the free edge portions of the core slabs of the body parts,

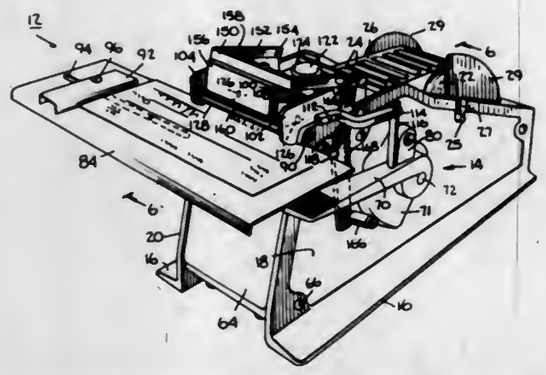
(3) and laying down other mats to form successive spanning laminae, upon and in flatwise overlapping relation to the stepped and exposed side surfaces at the end portions of the laminae at the first designated side of the body, with the first lamination thus applied overlying said spanning core slabs.

3,271,225
LABELING PROCESS
Carl Fritz Walter Wolf, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed June 26, 1963, Ser. No. 290,589
7 Claims. (Cl. 156—315)

1. A process for the production of labeled plastic bottles which comprises the steps of coating a plastic film with a thermo-sensitive adhesive, coating a portion of the thermo-sensitive adhesive with a pressure-sensitive adhesive, heating a thermoplastic bottle to a temperature at least about as high as that necessary to render the thermo-sensitive adhesive active, contacting the heated bottle with the coated plastic film while said bottle is at a temperature above that necessary to render the thermo-sensitive adhesive active, whereby said plastic film becomes attached to said plastic bottle.

3,271,226
ETCHING APPARATUS FOR MAKING A CELLULOSIC PRINTING PLATE
Henry C. Staehle, Lincoln A. Cundall, Cyril A. Horton, and Harold J. Frelier, Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey
Filed Aug. 9, 1963, Ser. No. 300,977
12 Claims. (Cl. 156—345)

1. An etching apparatus for etching in a plurality of bites a relief printing plate including a cellulosic layer having a resist stencil layer thereon, comprising;



a rotatable drum for supporting the plate with the stencil layer facing outward;

a plush belt drivable to scrub the surface of the plate during rotation of said drum and having bristles fine enough to engage each of the exposed areas of the cellulosic layer;

means for wetting said belt with etchant during its scrubbing of the plate for softening the exposed cellulosic areas; and

means for driving said belt at surface velocities different from that of the plate on said drum and in a plurality of directions relative to the surface of the plate so that the softened portions are scrubbed away by the bristles on all sides of each stencil nodule of the stencil layer.

3,271,227
APPARATUS FOR DISPENSING AND APPLYING PRESSURE SENSITIVE LABELS
Fred R. Jaeckel, Jamaica, N.Y., assignor to Normandie Press, Inc., New York, N.Y., a corporation of New York
Filed May 9, 1963, Ser. No. 279,143
11 Claims. (Cl. 156—556)

1. An apparatus for first dispensing and then applying an oblong pressure sensitive label selectively to any one of several predetermined locations wholly within the boundary of an upwardly facing indicia-bearing exposed upper surface of a horizontally disposed stationary oblong sheet document during a cycle of operation, each dimension of the document being greater than a parallel corresponding dimension of the label, said apparatus comprising:

a backing strip upon which the oblong labels are mounted seriatim, each of said labels having a pressure sensitive face adherent to the backing strip and being adapted to be peeled away from said strip,

a supply roll,

a take-up roll,

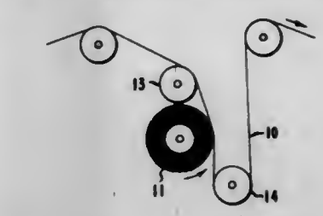
a horizontal linear jutting stripping edge, said backing strip following a fixed path from said supply roll to said take-up roll including a sharp reverse bend over said stripping edge,

drive means moving said backing strip along the fixed paths and through the bend so as to dispense the labels from the strip and so that each label after being dispensed falls freely through a short substantially vertical path to a predetermined situs,

a flat horizontal shelf secured to the apparatus and adapted to support the document close to and below the stripping edge,

means to position the document on the shelf with an edge boundary of the document substantially parallel to the stripping edge and with some portion of the document in vertical free fall alignment with said stripping edge, and so that any predetermined selected one of the several locations on the exposed upper surface of the document is coincident with the predetermined situs, and

regulating means dispensing only one label from the backing strip during a cycle of operation.



3,271,228
REMOISTENABLE ADHESIVE SHEET
Robert S. Ives, Lexington, Mass., assignor to Gurdon S. Worcester, Gloucester, Mass.
Filed Oct. 14, 1963, Ser. No. 315,832
4 Claims. (Cl. 161—151)

1. A remoistenable adhesive sheet comprising a flexible base web, a layer of water soluble adhesive on the base, said adhesive being in tacky, flexible state, and a thin, flexible fibrous layer at least partially covering said adhesive layer, the inner side of said fibrous layer being imbedded in said adhesive layer, said adhesive layer extending only partially toward the outer side of said fibrous layer, and said fibrous layer being readily penetrable by softened adhesive from the inside to the outside of said fibrous layer, whereby said fibrous layer prevents blocking of a plurality of said sheets when stored in superposition, while permitting said adhesive layer to be easily activated for adhering a sheet to a surface.

3,271,229
SURFACE TREATMENT OF ORGANIC THERMOPLASTIC FILM AND PRODUCT
Victor M. Grabovez, Columbus, Ohio, assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Nov. 5, 1963, Ser. No. 321,566
8 Claims. (Cl. 161—164)

1. As a new article of manufacture an organic thermoplastic film having a buffed surface, said surface having at least 1×10^6 asperities per square inch of surface, said asperities having a maximum average height of 5 microinches; said surface further characterized by microscopic

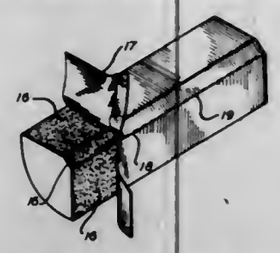
orange peel structure, a surface haze of less than 6%, and a coefficient of friction of less than 0.6.

3,271,230
BONDED PLASTIC SEGMENTS
Robert J. Johnson, Chicago, and Thomas W. Findley, La Grange, Ill., assignors to Swift & Company, Chicago, Ill., a corporation of Illinois
No Drawing. Filed Sept. 4, 1962, Ser. No. 221,359
14 Claims. (Cl. 161—184)

1. An article comprising a plurality of nylon segments bonded together by means of an adhesive phase, said adhesive phase comprising a polymeric resin formed by reacting 100 parts of a nonterminal-oxirane-containing fatty material having at least one 8–22 carbon chain and containing at least four oxirane groups per molecule, said material selected from the group consisting of oxirane substituted higher fatty acid esters, oxirane substituted higher alcohol esters, and oxirane substituted higher fatty acid amides of polyamines, with 1 to 20 parts of a lactam and 0.5 to 40 parts of a polyamine under temperature and time conditions sufficient to open the lactam ring.

3,271,231
AIR-LAID, FLEXIBLE, SELF-SUPPORTING SHEET
William A. Moggio, Millersville, Moses Sparks, Jr., Manheim Township, Lancaster County, and Robert M. Miller, Lancaster, Pa., assignors to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania
No Drawing. Filed June 15, 1962, Ser. No. 202,723
10 Claims. (Cl. 161—150)

7. A tough, self-supporting, flexible, air-laid fibrous sheet having a fused, smooth surface on one side and a fused, relatively rough surface on the other side comprising a cellulose acetate containing fibrous mixture plasticized with 2%–8% by weight plasticizer for said cellulose acetate fibers, said fibrous mixture comprising 20%–50% by weight cellulose acetate fibers having a length in the range of 1½ to 2 inches and a denier in the range of 40–60, said 40–60 denier fibers being concentrated on said roughened side, 20%–50% by weight cellulose acetate fibers having a length in the range of ½ to 2 inches and a denier in the range of 5.5–35, said 5.5–35 denier fibers being concentrated on said smooth side, at least 10% by weight cellulosic fibers having a length in the range of ½ to 3 inches, any remaining balance of the fibers being selected from the group consisting of said cellulosic fibers, 5.5–35 denier cellulose acetate fibers, and mixtures thereof.



3,271,232
WINDOW PANE MOLDING
James M. Moore, West Keansburg, N.J. (Rte. 5, Box 198, Keyport, N.J.)
Filed Dec. 16, 1963, Ser. No. 330,862
1 Claim. (Cl. 161—175)

A window pane molding comprising:

(a) an elongated member,

(b) a pair of contact surfaces on said member disposed at right angles to each other,

(c) a chamfered surface joining the contact surfaces, the contact surfaces and the chamfered surface lying on the reflex angle side of the member,
(d) pressure sensitive adhesive on the contact surfaces,

(e) a protective sheet extending over the contact surfaces and the chamfered surface and detachably secured to the adhesive on the contact surfaces, and
(f) a row of perforations in the sheet along an edge defined by the intersection of one of the contact surfaces and the chamfered surface.

3,271,233
LAMINATED SAFETY GLASS
Edward Lavin, Longmeadow, and George E. Mont, Springfield, Mass., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Filed Sept. 21, 1965, Ser. No. 489,038
19 Claims. (Cl. 161—199)

10. An improved laminated safety-glass comprising two layers of glass bonded to a plasticized polyvinyl acetal interlayer; said interlayer having a moisture content of 0.2 to 0.8% by weight and containing sufficient alkali and alkaline earth metal salts of substituted acetic acids wherein the substituted acetic acid portion is selected from the group consisting of glycine, glycolic acid, phenylacetic acid, chloroacetic acid and phenoxymethyl acetic acid to produce an alkalinity titer of at least 3.

3,271,234
LAMINATED SAFETY GLASS
Edward Lavin, Longmeadow, and George E. Mont, Springfield, Mass., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Filed Sept. 21, 1965, Ser. No. 489,049
17 Claims. (Cl. 161—199)

9. An improved laminated safety-glass comprising two layers of glass bonded to a plasticized polyvinyl acetal interlayer; said interlayer having a moisture content of 0.2 to 0.8% by weight and containing sufficient salts of organic acids to produce an alkalinity titer of at least 10, said salts being a mixture of at least one metal acetate and at least one metal salt of a substituted acetic acid wherein the substituted acetic acid portion is selected from the group consisting of glycine, glycolic acid, chloroacetic acid, phenylacetic acid, and phenoxymethyl acetic acid, wherein, in each instance, the metal portion is independently selected from the group consisting of alkali metals and alkaline earth metals, said mixture containing sufficient metal acetate to produce an alkalinity titer of at least about 5 and up to about 95% of the total alkalinity titer.

3,271,235
LAMINATED SAFETY GLASS
Edward Lavin, Long Meadow, George E. Mont, Springfield, and Aubrey F. Price, South Hadley, Mass., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Filed Sept. 21, 1965, Ser. No. 489,071
17 Claims. (Cl. 161—199)

9. An improved laminated safety-glass comprising two layers of glass bonded to a plasticized polyvinyl acetal interlayer; said interlayer having a moisture content of 0.2 to 0.8% and containing sufficient metal alkyl carboxylate to produce an alkalinity titer of 10 to 100, said metal alkyl carboxylate being a mixture of potassium alkyl carboxylate and at least one other metal alkyl carboxylate wherein the metal portion is selected from the group consisting of Groups II–A, I–B, II–B, IV–A, VII–B and VIII of the Periodic Table, and the alkyl carboxylate portion is selected from the group consisting of formate, acetate, propionate and butyrate, said mixture containing sufficient potassium alkyl carboxylate to produce an alkalinity titer of at least about 5 and up to 96% of the total alkalinity titer.

3,271,236
METHOD AND APPARATUS FOR THE ELECTRICAL LOOSENING OF THE BOND BETWEEN A PIPE AND A MANDREL DURING THE WINDING OF THE PIPE ON THE MANDREL
William La Badie, New Brunswick, N.J., assignor to Johns-Manville Corporation, New York, N.Y., a corporation of New York
Filed Oct. 31, 1963, Ser. No. 320,287
9 Claims. (Cl. 162—122)

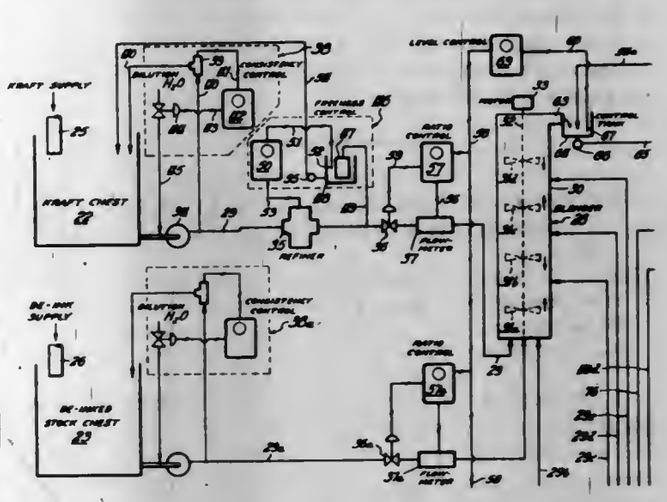
1. A method for manufacturing a pipe comprising:
(a) supporting a mandrel having an electrically conductive surface for rotation about its axis,
(b) winding a sheet of electrically conductive material around said mandrel during the rotation thereof to form a pipe comprising a plurality of laminations on said mandrel,
(c) applying pressure during said winding operation causing said pipe to bond to said mandrel, and
(d) passing an electric current through said pipe and said electrically conductive surface of said mandrel after at least one lamination has been formed on and bonded to said mandrel and during at least a portion of the winding of the remaining portion of said sheet on said mandrel to loosen said bond between said mandrel and said pipe.

3,271,237
PROCESS FOR THE PRODUCTION OF A FIBROUS POLYAMIDE LAMINAR STRUCTURE
Erwin Sommer and Klaus Gerlach, Obernau am Main, and Klaus Boehme, Erlenbach am Main, Germany, assignors to Vereinigte Glanzstoff-Fabriken AG., Wuppertal-Elberfeld, Germany
No Drawing. Filed Sept. 15, 1964, Ser. No. 396,729
Claims priority, application Germany, Sept. 17, 1963, V 24,598
9 Claims. (Cl. 162—146)

1. A process for the production of a fibrous polyamide laminar structure on a papermaking machine which comprises: waterlaying polyamide fibers from an aqueous dispersion onto the foraminous support of the papermaking machine, said fibers consisting essentially of (A) 10 to 100% by weight of a copolyamide of caprolactam: hexamethylene adipamide in a weight ratio of about 2:3 to 3:1 and (B) 90 to 0% by weight of a polyamide selected from the group consisting of polycaprolactam and polyhexamethylene adipamide; removing water from the fibers to form a non-woven waterlaid web; and heating the waterlaid web in a moist state to a temperature sufficient to soften the copolyamide fibers and cause them to become adherent.

3,271,238
METHOD OF ADDING FIRE RETARDANT CHEMICALS TO A FIBER BOARD WHILE ON THE FORMING WIRE
Ralph H. Bescher, Pittsburgh, Pa., assignor to Koppers Company, Inc., a corporation of Delaware
Filed June 3, 1964, Ser. No. 372,353
2 Claims. (Cl. 162—159)

1. Process for the production of a fire retardant artificial board that is made from wood fibers which comprises:
conveying a suspension of wood fibers in water onto a moving wire belt,
removing by suction a major portion of said water from said wood fibers so that the wood fibers become entangled to form a continuous layer,
thereafter flooding said layer with a concentrated aqueous solution of fire retardant chemicals so that a pool about one-half inch deep of said solution and being about 2 to 4 pounds of water per pound of dry fiber forms on said layer,
drawing said solution through said layer by suction so that said wood fibers retain an amount of about 5% to 15% by weight of said fire retardant chemicals to become fire retardant, and
recovering said concentrated solution so passed through said layer for use for flooding additional layers of said wood fibers.



3,271,239
PROCESS OF FORMING A WATER-LAID FIBROUS ARTICLE CONTAINING A C_2–C_3 POLYALKYLENE RESIN
Lloyd Hornbostel, Jr., Beloit, Wis., assignor to Beloit Corporation, Beloit, Wis., a corporation of Wisconsin
No Drawing. Filed Jan. 23, 1964, Ser. No. 339,575
5 Claims. (Cl. 162—169)

1. A method of forming a molded fibrous pulp article, which comprises
(a) forming a dilute aqueous stock suspension of cellulosic fibers
(b) depositing C_2–C_3 polyalkylene polymeric resin in discrete particulate form on the fibers in such stock;
(c) forcing the resin-containing stock through a porous forming surface to deposit a resin particle filled fibrous pulp article on such surface;
(d) forcing drying gas of at least 100° F. below the softening temperature of the resin through said article and the porous surface carrying the same to substantially dewater the article to at least 90% bone dryness under time-temperature conditions less than those required to fuse the resin; and
(e) subjecting the dewatered article to time-temperature-pressure-shaping conditions of from approximately 300 to 500 p.s.i. and from approximately 300° to 400° F. and for a time sufficient to fuse the resin to form a fiber-filled resin matrix of predetermined configuration.

3,271,240
PROCESS OF SIZING WATER-LAID SHEETS WITH A CATIONIC ASPHALT EMULSION
William J. Kari, Lafayette, Ernest M. Lorenzini, Menlo Park, and Lloyd C. Wingerd, Berkeley, Calif., assignors to Chevron Research Company, a corporation of Delaware
Filed Nov. 20, 1962, Ser. No. 238,928
7 Claims. (Cl. 162—171)

1. A process for the manufacture of sized sheets of paper and board from a cellulosic fibrous material, said process consisting essentially of the steps of forming an aqueous pulp of said fibrous material of a consistency from about 0.1 to about 6.0% of fibrous solids and thoroughly intermixing with and throughout said aqueous pulp a cationic oil-in-water type emulsion of asphalt characterized by a penetration of from about 0 to about 30 at 77° F. (ASTM D5–52) and a softening point of about 170 to about 260° F. (ASTM D36–26), said asphalt being emulsified in water with the aid of an oil-soluble, cation-active, emulsifying salt of an alkylene diamine of the general formula $RNHR'NH_2$ wherein R is an acyclic hydrocarbon group of from 8 to 20 carbon atoms and R' is an alkylene group of from 2 to 3 carbon atoms.

3,271,241
STOCK SUPPLY SYSTEM FOR PAPERMAKING MACHINES INCLUDING CONTROL OF STOCK CONSISTENCY AND STOCK FLOW
Kenneth I. Mummé, Neenah, Wis., assignor to Kimberly-Clark Corporation, Neenah, Wis., a corporation of Delaware
Filed Dec. 10, 1962, Ser. No. 243,678
8 Claims. (Cl. 162—353)

5. In papermaking apparatus, the combination of a plurality of chests for different types of papermaking stock including a chest for kraft stock, a papermaking machine, a main conduit connected with the papermaking machine for supplying stock to the machine, an auxiliary conduit for connecting each of said chests with said main conduit, means for pumping stock through each of said auxiliary conduits to said main conduit so that the various types of stock from said chests are mixed as stock moves through said main conduit to said machine, means responsive to the rate of stock flow through said main conduit, means for controlling the rate of stock flow through each of said auxiliary conduits and being under the control of said flow responsive means so as to decrease the rate of flow through each of said auxiliary conduits as the rate of stock flow through said main conduit increases, means for controlling the consistency of stock in each of said auxiliary conduits to a regulated value, means including a refiner for controlling the freeness of the stock flowing through the said auxiliary conduit which is connected to said kraft chest, and means including another refiner for controlling the freeness of the composite stock flowing through said main conduit to said papermaking machine.

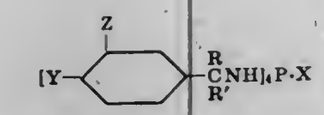
3,271,242
STABLE CHLORINE DIOXIDE COMPOSITION AND METHOD OF MAKING SAME
Thomas P. McNicholas, Johnston, R.I., assignor to Alexander R. Reed III, Agawam, Mass., Leon R. Noel, North Adams, Mass., and Alexander C. Politis, Pittsfield, Mass.
No Drawing. Filed Mar. 29, 1963, Ser. No. 269,171
9 Claims. (Cl. 167—17)

1. The method of making a stable chlorine dioxide composition which comprises, heating an aqueous soluton of chlorine dioxide and a hydrogen peroxide compound to a temperature range sufficiently high to drive off any free peroxide in the solution but too low to drive off the chlorine dioxide, and maintaining the solution at a temperature within said range until substantially all the free peroxide is driven off.

3,271,243
STABLE CONCENTRATED BACTERIAL INSECTICIDE SUSPENSIONS

Helmuth Cords and Robert A. Fisher, Bakersfield, Calif., and John D. Briggs, Westerville, Ohio, assignors to International Minerals & Chemical Corporation, a corporation of New York

No Drawing. Filed Mar. 13, 1963, Ser. No. 264,774
24 Claims. (Cl. 167—22)



12. A stable bacterial insecticide concentrate comprising (a) a non-dried cell sludge recovered from a final whole culture derived from culturing an insecticidal-producing spore-forming microorganism of the type which both sporulates and also forms crystals in an aqueous nutrient medium, the pH of said sludge having been adjusted to lie within the range of about 3.5 to 4.5, and (b) a liquid oleaginous material.

3,271,244
METHOD OF CONTROLLING BACTERIA AND FUNGI WITH PHOSPHORIMIDIC TRIAMIDE SALTS

Harold F. Wilson, Moorestown, N.J., and Robert L. Skiles, Warminster, Pa., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Filed May 3, 1965, Ser. No. 452,892
8 Claims. (Cl. 167—30)

1. A method for controlling phytopathogenic fungi and bacteria comprising applying to the loci to be protected in an effective amount a fungicidal and bactericidal composition comprising a carrier and a phosphorimidic triamide salt having the formula

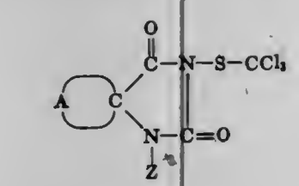
wherein

R and R' are individually selected from the class consisting of hydrogen and methyl,

Y is selected from the class consisting of hydrogen, chlorine, bromine, lower alkyl and lower alkoxy;

Z is hydrogen; and when

Y is hydrogen, Z is selected from the group consisting of hydrogen, bromine, chlorine, lower alkyl and lower alkoxy; and



X is a salt-forming anion.

3,271,245
N-TRICHLOROMETHYLTHIOHYDANTOINS FOR FUNGICIDAL COMPOSITIONS AND METHODS

Richard James Campbell-Davys Cremlyn, Binfield, and Richard Stewart Elias, Michael Joseph Augustine Geoghegan, and John Theodore Braunholtz, Bracknell, England, assignors to Imperial Chemical Industries Limited, London, England, a corporation of Great Britain

No Drawing. Original application Nov. 3, 1960, Ser. No. 66,911, now Patent No. 3,177,224, dated Apr. 6, 1965. Divided and this application Oct. 5, 1964, Ser. No. 401,640
Claims priority, application Great Britain, Nov. 10, 1959, 38,144/59
13 Claims. (Cl. 167—33)

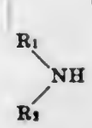
1. A fungicidal composition comprising, as the essential active ingredient, a fungicidally effective amount of a hydantoin compound of the formula:

wherein the group A together with its adjacent carbon atom constitutes an alicyclic ring selected from the group consisting of cyclopentane, cyclohexane and cycloheptane; and Z is selected from the group consisting of hydrogen, acetyl and nitro, in admixture with a major amount of an inert, fungicidal carrier therefor.

3,271,246
METHOD OF CONTROLLING SEA LAMPREY

John H. Howell and Everett L. King, Jr., Cheboygan, Mich., assignors to the United States of America as represented by the Secretary of the Interior

No Drawing. Filed Jan. 6, 1964, Ser. No. 336,079
15 Claims. (Cl. 167—46)



1. A method for controlling *Petromyzon marinus* lamprey comprising establishing, in cold water aquatic environments tributary to the Great Lakes of North America containing the *Petromyzon marinus* larvae and habitable by fresh water trout, a concentraion of at least about 0.07 part per million of a water dispersible lamprecidal composition that is lethal to the larvae without more than twenty-five percent trout mortality, said lamprecidal composition comprising 2',5-dichloro-4'-nitrosalicylanilide.

3,271,247
BIRD REPELLENT COMPOSITIONS

Andrew J. Reinert, Ernest A. Zuech, and Kenneth E. Cantrel, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Filed Dec. 14, 1964, Ser. No. 418,287
8 Claims. (Cl. 167—46)

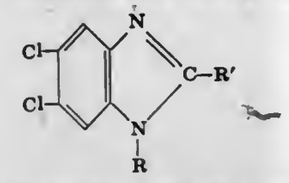
1. A method of repelling birds which comprises applying to a locus from which birds are to be repelled the mineral acid-insoluble portion of the reaction product obtained by contacting a conjugated diolefin selected from the group consisting of 1,3-butadiene, isoprene, piperylene, 1-phenyl-1,3-butadiene, and 2,3-dimethyl-1,3-butadiene with a compound having the formula

wherein R_1 is selected from the group consisting of hydrogen, alkyl, aryl, aralkyl, alkaryl, cycloalkyl, and combinations thereof, and R_2 is selected from the group consisting of hydrogen, alkyl, aryl, aralkyl, alkaryl, cycloalkyl and combinations thereof, and wherein the total number of carbon atoms represented by R_1 and R_2 does not exceed 12, said contacting being conducted under conditions sufficient to produce said reaction product.

3,271,248
PHARMACEUTICAL COMPOSITIONS CONTAINING AMINE MERCAPTO-SUCCINATES

Jean A. Renault and Eugène L. Lerol, Paris, France, assignors to Societe Civile de Recherches et d'Applications Scientifiques, Seine, France, a French civil society

No Drawing. Filed July 17, 1961, Ser. No. 124,354
Claims priority, application Great Britain, July 25, 1960, 25,802/60
2 Claims. (Cl. 167—52)



2. A pharmaceutical composition having detoxicant properties comprising, as an essential ingredient therein, an effective amount of at least one member selected from the group consisting of the neutral and acid mercapto-succinates of -1-2-diaminoethane, of -1-diethylamino-2-hydroxy-ethane, of -1-phenyl-2-amino-ethane, of -(d,l)-1-phenyl-1-amino-ethane, of diphenyl-aminomethane, of -1-oxo-1-phenyl-2-methylamino-propane, and ephedrine, together with an appropriate carrier.

3,271,249
DIHALOBENZIMIDAZOLES FOR POULTRY DISEASE TREATMENT

John Martin Clegg, Upper Montclair, and Bernard Bean Brown, Westfield, N.J., assignors to S. B. Penick & Co., Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed June 24, 1963, Ser. No. 290,165
12 Claims. (Cl. 167—53.1)

8. The method for combatting and controlling the avian protozoan diseases coccidiosis and histamoniasis which comprises administering to poultry a composition containing an amount necessary to combat and control coccidiosis and histamoniasis in poultry of a compound chosen from the class of benzimidazoles having the formula

where R and R' are selected from the group consisting of hydrogen, lower alkyl, hydroxy-lower-alkyl, di-lower-alkyl-amino-lower-alkyl, mercapto-lower-alkyl, benzyl, phenethyl and diphenylmethyl, and their pharmacologically acceptable quaternary ammonium and acid addition salts.

3,271,250
THERAPY AND CONTROL OF ATHEROSCLEROTIC DISEASES

Ken-Ichi Kanazawa, Kamikotoen, Nishinomiya, and Taizo Matsukawa and Yoshitomo Aramaki, Suita, all of Japan, assignors to Takeda Chemical Industries, Ltd., Osaka, Japan

Filed Nov. 15, 1961, Ser. No. 152,515
Claims priority, application Japan, Nov. 17, 1960, 35/45,838
9 Claims. (Cl. 167—65)

1. A method of controlling atherosclerosis in a patient subject to high blood cholesterol level which consists in administering to the patient an effective amount of a member selected from the group consisting of cholestane-3,5,6-triol, cholestane-3,5,6-triol 3,6-diformate, cholestane-3,5,6-triol 3-hemisuccinate and alkaline salts thereof.

3,271,251
GERM-COUNTERACTING COMPOSITIONS

John A. Vaichulis, 7204 S. Campbell Ave., Chicago 29, Ill.

No Drawing. Filed June 24, 1963, Ser. No. 290,172
9 Claims. (Cl. 167—65)

1. A composition effective to inhibit tubercle bacilli, said composition consisting essentially of an aqueous solution of a hydrazine derivative of isonicotinic acid, penicillin, sodium benzoate, and a non-toxic acidic material, said solution having a pH between 6 and 7.

3,271,252
ANTI-INFLAMMATORY COMPOSITIONS COMPRISING 16α - CHLOROMETHYL-$\Delta^{1,4}$-PREGNADIENE-11β,21-DIOL-3,20-DIONE

Ulrich Kerb and Klaus Kieslich, Berlin-Charlottenburg, and Rudolf Wiechert, Berlin-Lichterfelde, Germany, assignors to Schering A.G., Berlin, Germany

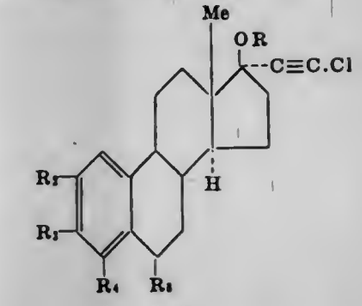
No Drawing. Filed Oct. 1, 1963, Ser. No. 312,878
Claims priority, application Germany, Oct. 20, 1962, 32,212
14 Claims. (Cl. 167—65)

14. Anti-inflammatory composition, comprising a pharmaceutical carrier having distributed therethrough an amount sufficient to have an effective anti-inflammatory action of a compound selected from the group consisting of 16α-chloromethyl-$\Delta^{1,4}$-pregnadiene - 11β,21-diol-3,20-dione and lower aliphatic carboxylic acid 21-esters thereof.

3,271,253
ANTIBIOTIC OSSAMYCIN AND METHOD OF PREPARING SAME

Kenneth E. Price, Fayetteville, and Henry Schmitz, Syracuse, N.Y., assignors to Bristol-Myers Company, New York, N.Y., a corporation of Delaware

Filed Nov. 19, 1964, Ser. No. 412,372
5 Claims. (Cl. 167—65)



1. A composition of matter designated as ossamycin, said composition being characterized by ready solubility in ethyl alcohol and ethyl acetate, and slight solubility in water, and exhibiting in the pure state white crystals, a melting point of 175–180° C., a molecular weight of 917 by thermoelectric determination, an elemental analysis as follows: 64.70% carbon, 9.45% hydrogen, 1.50% nitrogen and 24.35% oxygen (by difference), an optical rotation of $[\alpha]_D^{25}=+8$ (c.=1 in chloroform), an ultraviolet absorption spectrum in chloroform exhibiting a maximum of 244 mμ, an ultraviolet spectrum in concentrated sulfuric acid exhibiting a maxima at 385 and 282 mμ with absorptivities of 6.0 and 26.0 respectively, and an infrared absorption spectrum in potassium bromide as shown in the drawing.

3,271,254
17α-CHLORETHYNYL-17β-ALKOXY STEROIDS AND PROCESS FOR THEIR PREPARATION

Colin Michael Burgess, Peter Feather, and Vladimir Petrow, London, England, assignors to The British Drug Houses Limited

No Drawing. Filed Aug. 22, 1963, Ser. No. 303,935
Claims priority, application Great Britain, Aug. 24, 1962, 32,638/62
24 Claims. (Cl. 167—74)

8. A compound selected from the group consisting of compounds of the formula:

wherein,

R is an alkyl group containing not more than 5 carbon atoms,

R_2 is selected from the group consisting of hydrogen, methyl and chloro,

R_3 is selected from the group consisting of hydrogen and —OR_1 where R_1 is selected from the group consisting of lower alkyl, cyclic alkyl, benzyl and tetrahydropyranyl,

R_4 and R_5 are selected from the group consisting of methyl and hydrogen; and corresponding compounds having unsaturation at C_8, C_9 and C_{14}, and C_9 and C_{11}.

21. A pharmaceutical preparation in dosage unit form comprising 17α - chlorethynyl-3,17β-dimethoxy-oestra-1,3,5,(10)-triene in admixture with lactose, magnesium stearate and starch.

3,271,255
EXTRACTION PROCESS AND PRODUCT OF HOLOTHURIOIDEA

Shigetoshi Shimada, 4–138 Kohamanaka, Sumiyoshi-ku, Osaka, Japan

Filed Nov. 18, 1963, Ser. No. 324,496
Claims priority, application Japan, Nov. 30, 1962, 37/54,120
14 Claims. (Cl. 167—74)

1. A process for preparing an extract of Holothurioidea comprising treating said Holothurioidea with a lipophilic

organic solvent and removing material soluble therein from a first insoluble residue, treating said first insoluble residue with water and removing material soluble therein from a second insoluble residue, and treating said second insoluble residue with a hydrophilic organic solvent selected from the group consisting of methanol and ethanol and removing material insoluble therein from said extract.

3,271,256
CHLOROFORM IN HARD CANDY

Robert R. Frey, Greensboro, N.C., assignor to Richardson-Merrell Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Mar. 21, 1963, Ser. No. 266,799
15 Claims. (Cl. 167—82)

1. A method of incorporating chloroform in hard candy which comprises the steps of preparing a plastic mass of hard candy at a temperature above the boiling point of chloroform containing plasticizers comprising from 0.5 percent to 5.0 percent of water and 5 to 20 percent by weight of a nonhygroscopic polyethylene glycol; then working chloroform into said plastic candy mass at temperatures within the range of 120° F to 165° F.

3,271,257
CYTODIAGNOSIS OF RUPTURED FETAL MEMBRANES

Hervy E. Averette, Jr., 4010 SW. 10th St., Miami, Fla.

Filed Oct. 10, 1963, Ser. No. 315,224
7 Claims. (Cl. 167—84.5)

7. A method of testing for ruptured fetal membranes comprising fixing a vaginal smear, said vaginal smear having been obtained from a pregnant patient, staining the fixed smear with a dye which identifies vernix caseosa cells if they are present in said smear, said dye being selected from the group comprising pinacyanol chloride and pinacyanol iodide, terminating the staining by washing excess dye from said smear, and examining the washed smear under a microscope to determine if vernix caseosa cells are present in said smear.

3,271,258
MELAMINE AND DICYANDIAMIDE AS DEPILATORY ACCELERATORS

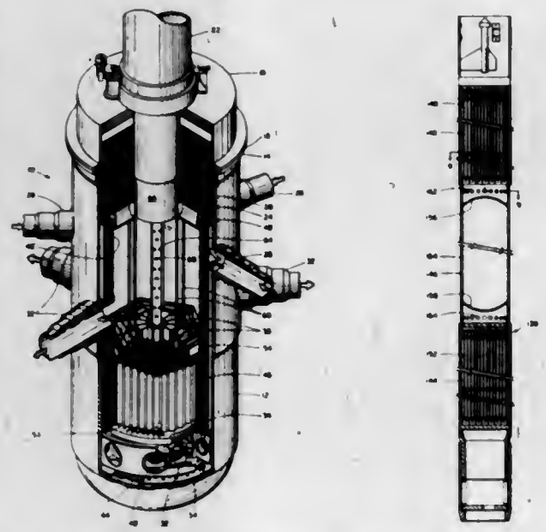
Charles Zviak, Franconville, and Jean Ronet, Le Blanc-Mesnil, France, assignors to Société Anonyme dite: L'Oreal, a corporation of France

No Drawing. Filed June 19, 1963, Ser. No. 288,908
Claims priority, application France, June 22, 1962, 901,682
8 Claims. (Cl. 167—89)

1. A depilatory composition comprising:
(a) one part of at least one substance selected from the group consisting of thioglycolic acid, calcium thioglycolate, strontium thioglycolate, thiolactic acid, calcium thiolactate and strontium thiolactate, and
(b) one-half to two parts of an accelerator comprising at least one substance selected from the group consisting of melamine and dicyandiamide;
(c) said composition having a pH of substantially 12 when mixed with water.

3,271,259
SYNTHETIC LAVANDIN OIL

Harry C. Saunders, Nutley, N.J., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware



No Drawing. Filed Oct. 22, 1965, Ser. No. 502,397
4 Claims. (Cl. 167—94)

1. A synthetic lavandin oil comprising an admixture of 3a,4,5,6,7,7a-hexahydro-4,7-methanoindene substituted in one of the 5 and 6 positions with an oxo group and 5 - vinyl - 5 - acetoxy 2,3,3a,4,5,6,7,7a-octahydro-4,7-methanoindene.

3,271,260
LIQUID METAL FAST BREEDER REACTOR

Lawrence C. Noderer, Windsor, Conn., assignor to the United States of America as represented by the United States Atomic Energy Commission

Filed May 20, 1964, Ser. No. 369,029
6 Claims. (Cl. 176—18)

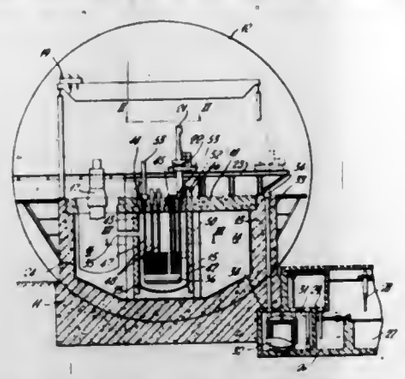
1. A liquid metal cooled fast breeder nuclear reactor comprising:
(a) a reactive core containing fissile material;
(b) a blanket region surrounding said core containing fertile material; and
(c) a zone between said core and said blanket region containing means to reduce the absorption of neutrons passing from the reactive core to said blanket region, said means being surrounded within said zone by axial regions of fuel and fertile material mixtures.

3,271,261
ORGANIC MODERATED NUCLEAR REACTOR AND CONTROL METHOD THEREFOR

Sidney Visner, West Hartford, Conn., assignor to Combustion Engineering, Inc., Windsor, Conn., a corporation of Delaware

Filed Dec. 27, 1963, Ser. No. 333,884
13 Claims. (Cl. 176—20)

1. A nuclear reactor comprising a quantity of a fissionable material, a quantity of moderator proximate to said fissionable material, said moderator comprising a hydrocarbon and a fluoronated polyphenyl, and means for regulating the ratio of said hydrocarbon to said fluoronated polyphenyl during operation to maintain criticality.



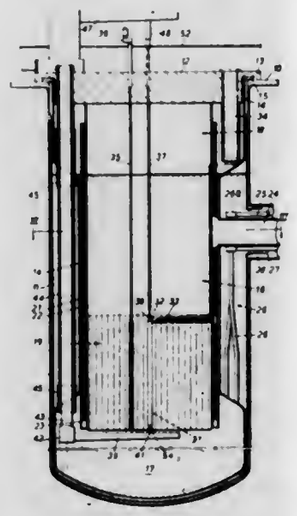
3,271,262
NUCLEAR REACTOR WITH IMPROVED FUEL HANDLING FACILITY

William George Hutchinson, Leslie Charles Cole, and Peter Liptrot Riley, Warrington, England, assignors to United Kingdom Atomic Energy Authority, London, England

Filed Mar. 11, 1964, Ser. No. 351,097
Claims priority, application Great Britain, Mar. 22, 1963, 11,421/63
7 Claims. (Cl. 176—30)

1. A nuclear reactor comprising a cylindrical reactor vessel, fuel element support structure within the vessel to define a core zone eccentric with respect to the vessel and a storage zone alongside the core zone, an outer rotary shield to close the upper end of the reactor vessel,

an inner rotary shield carried in the outer shield for rotation about an axis which is eccentric with respect to the outer shield, a transfer mechanism carried eccentrically by the inner shield which mechanism is movable over

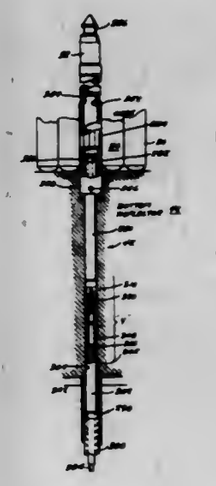


the aforesaid zones by rotation of the inner and outer shields, and a control face provided on one of the shields from which to suspend core reactivity control mechanisms, the shields having an operational position in which the control face is located over the core zone.

3,271,263
NUCLEAR REACTOR WITH IMPROVED FUEL HANDLING APPARATUS

Alexander Gilchrist Frame, Wilmslow, Horace Frank Parker, Culcheth, Warrington, John Stacey, Bolton, and Peter Liptrot Riley, Culcheth, Warrington, England, assignors to United Kingdom Atomic Energy Authority, London, England

Filed June 17, 1964, Ser. No. 375,867
Claims priority, application Great Britain, June 25, 1963, 25,188/63
3 Claims. (Cl. 176—30)



1. Nuclear fuel handling apparatus for charging fuel units into a nuclear reactor core housed in a reactor vessel, the apparatus comprising an upright shaft displaceable axially and rotatably in the vessel, a radial arm carried by the shaft adjacent its lower end for sweeping through an arc below the core, a fuel unit carrier supported by and traversable lengthwise of the arm, and means for controlling, externally of the vessel, the position of the fuel unit carrier, such means including a member which extends radially of the shaft axis and has a connection to the shaft for maintaining the radial arm coplanar with the member on displacement of the latter, a key carried by and traversable lengthwise of the member, and linkage to cause traverse of the key to be reflected by a corresponding traverse of the fuel unit carrier, whereby for any position of the key the carrier is positioned in alignment therewith.

3,271,264
NEUTRONIC REACTOR WITH IMPROVED RELEASE MECHANISM BETWEEN CONTROL ROD AND ASSOCIATED DRIVE

Peter Fortescue, La Jolla, and David Nicoll, Del Mar, Calif., assignors, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission

Application Apr. 22, 1964, Ser. No. 367,274, now Patent No. 3,180,800, dated Apr. 27, 1965, which is a division of application Ser. No. 775,578, Nov. 21, 1958, now Patent No. 3,138,535, dated June 23, 1964. Divided and this application Nov. 13, 1964, Ser. No. 417,261
3 Claims. (Cl. 176—36)

1. In combination with a neutronic reactor of the type having a pressure vessel, a core within the vessel including a plurality of vertically extending fuel and control rod channels arranged about the reactor axis in parallel relation thereto, pick-up means for withdrawing fuel elements and control rods from the core to a position thereabove within the vessel, and control rod actuating means for effecting vertical movement of each of said control rods within said core including an axially movable, vertical tubular member positionable within the control rod channel in supporting relation to one of said control rods, means for releasably locking said tubular member and control rod together, said locking means comprising an extending axial section of reduced diameter on the end of the control rod including an annular outer groove thereon, a sleeve member carried at the upper end of said tubular member for axial movement relative thereto in enclosing relation to said rod section and including a plurality of circumferentially disposed transverse recesses, a ball carried in each of said recesses for movement relative to a position of partial extension within the interior of said sleeve for locking engagement with said annular groove provided in said rod section, a collar disposed in encircling relation to said sleeve member and including an internal annular recess adapted to receive said balls, and means for moving said collar relative to said sleeve to effect transverse movement of said balls and thereby selectively lock and release said control rod relative to said actuating means.

3,271,265
FUELS FOR NUCLEAR REACTORS

Peter Murray, Abingdon, and John Brian Sayers, Didcot, England, assignors to United Kingdom Atomic Energy Authority, London, England

No Drawing. Filed May 22, 1964, Ser. No. 369,607
Claims priority, application Great Britain, June 11, 1963, 23,210/63
10 Claims. (Cl. 176—69)

1. A fuel material for a nuclear reactor comprising a dispersion of mixed zirconium and plutonium dioxides

in a matrix formed of a zirconium-based alloy having a low neutron-capture cross section rendering said alloy suitable for use as a matrix for reactor fuel.

9. A fuel element for a nuclear reactor comprising a fuel material in a cladding material in which the fuel material comprises a dispersion of mixed zirconium and plutonium dioxides in a matrix formed of a pressurized water corrosion resistant zirconium-based alloy having a low neutron-capture cross section rendering said alloy suitable for use as a matrix for reactor fuel and the cladding material is the same zirconium-based alloy as the matrix.

3,271,266

PROCESS FOR CULTIVATING MICROORGANISMS ON A HYDROCARBON FEEDSTOCK EMPLOYING A CARBOHYDRATE PRETREATMENT FEEDSTOCK

Bernard Maurice Laine and Jean Antoine Filosa, Lavera, France, assignors to The British Petroleum Company Limited, London, England, a British joint-stock corporation

No Drawing. Filed Dec. 16, 1963, Ser. No. 330,524
Claims priority, application Great Britain, Dec. 31, 1962, 49,052/62
10 Claims. (Cl. 195—3)

1. A process which comprises, in a pretreatment stage, cultivating a carbohydrate consuming yeast in the presence of a pretreatment feedstock comprising a carbohydrate and thereafter, in a growth stage, cultivating the yeast so obtained in the presence of a growth feedstock comprising a straight chain hydrocarbon.

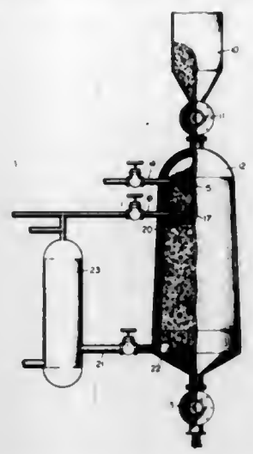
3,271,267

BIOCHEMICAL SYNTHESIS OF INDUSTRIAL GUMS

Ralph O. Weber, St. Paul, and Francis E. Horan, Minneapolis, Minn., assignors to Archer-Daniels-Midland Company, Minneapolis, Minn., a corporation of Delaware

Filed July 29, 1964, Ser. No. 385,943
20 Claims. (Cl. 195—31)

1. An improved process for making water-soluble gum which comprises inoculating an aqueous culture medium containing cereal grain flour and buffer salt and having a weight ratio of carbohydrate to protein of from 7/1 to 15/1 with a fermenting microorganism of the gum producing plant pathogen genus Xanthomonas, at least 50 weight percent of said carbohydrate being provided by said cereal grain flour, initially adjusting the pH to a point within the range of 7 to 8.5, mechanically agitating and aerating the mixture while effecting fermentation of the culture medium at a temperature in the range of about 21° C. to 35° C. to thereby produce a solution of water soluble gum having a solution viscosity within the range of about 4,000 to about 12,000 centipoises at a final pH within the range of from 5 to 7, and thereafter recovering said gum.



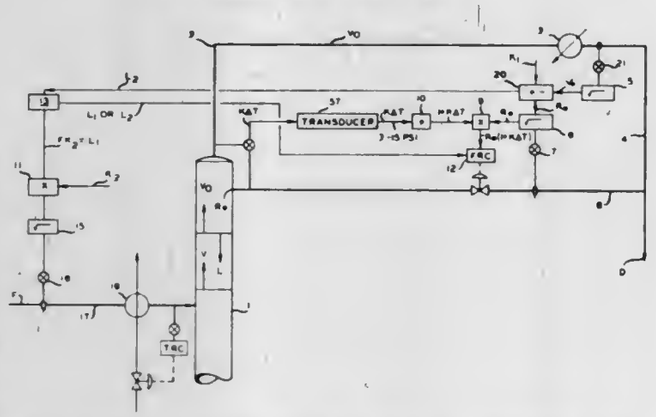
3,271,268

PROCESS OF CALCINING COKE

Victor D. Allred, Littleton, Colo., assignor to Marathon Oil Company, Findlay, Ohio, a corporation of Ohio

Filed Jan. 21, 1963, Ser. No. 252,732
The portion of the term of the patent subsequent to July 21, 1981, has been disclaimed
16 Claims. (Cl. 201—20)

1. A continuous process for calcining coke comprising in combination the steps of passing coke particles as a moving bed cocurrently into a combustion zone with an amount of oxidant stoichiometrically insufficient to cause complete combustion of the coke under conditions such that only a minor portion of the coke is oxidized, the remaining coke being calcined, without substantial oxidation, by heat imparted from the combustion; and thereafter passing both the solid and gaseous products from



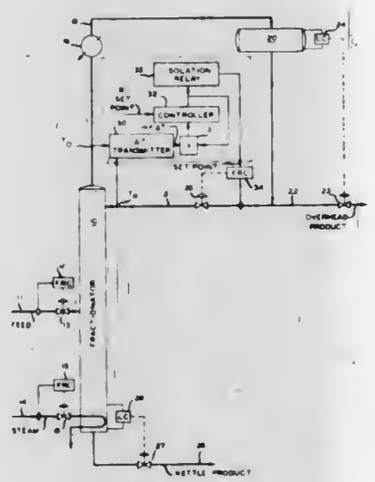
said combustion zone through a zone containing insufficient oxidant to support combustion.

3,271,269

CONTROL SYSTEM FOR FRACTIONAL DISTILLATION

Harry L. Walker, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Filed Dec. 26, 1961, Ser. No. 161,935
1 Claim. (Cl. 202—160)



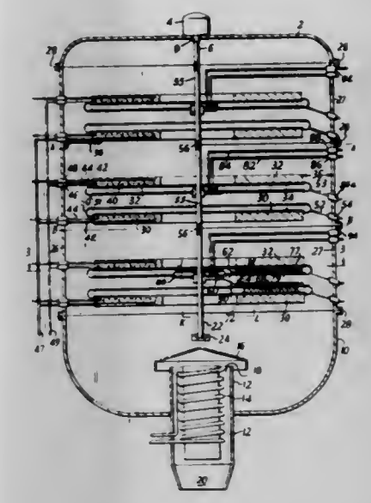
Apparatus for controlling flooding in a fractional distillation column which comprises, in combination, a distillation column, means for introducing feed to said column, means to remove liquid from a first zone in said column, means to remove vapor from a second zone in said column, means to condense said vapor, means to introduce condensed vapor back into said second zone in said column as reflux, first transmitting means to measure the rate of flow of said condensed vapor from said column and to establish a first signal representative thereof, square root extracting means communicating with said first transmitting means and a computing means to establish a second signal representative of the rate of flow of condensed vapor from said column and to introduce said second signal to said computing means which provides a first value representative of the maximum allowable internal reflux without flooding, second transmitting means in operable association with said means to introduce reflux to measure the rate of reflux to said column and to establish a third signal representative thereof, square root extracting means in operable association with said second transmitting means and said computing means to receive said third signal and to introduce said third signal to said computing means, third transmitting means to measure the rate of flow of feed to said column and to establish a fourth signal representative thereof, square root extracting means in operable association with said third transmitting means and a multiplying means to receive said fourth signal and to introduce same to said multiplying means, said multiplying means adapted to multiply said fourth signal by the predetermined reflux-to-feed ratio required to obtain the desired distillation and to produce a second value representative of the internal reflux required to make the desired separation, fourth transmitting means to measure said first and second values and to establish a fifth signal representative of the smaller of said first and second values, and flow recorder controller means in operable association with said fourth transmitting means and responsive to said fifth signal to regulate flow control means operably associated with said means to introduce condensed vapors back into said second zone.

3,271,270

CONTROL OF INTERNAL REFLUX IN A FRACTIONAL DISTILLATION PROCESS AND SYSTEM

Dale E. Lupfer and Merlon L. Johnson, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

Filed Jan. 12, 1962, Ser. No. 165,965
4 Claims. (Cl. 202—160)



1. In a fractionation system that includes a fractionation column, means to introduce a feed mixture to be separated into said column, first conduit means connected to said column to remove a vapor stream from the upper region of said column, cooling means connected to said first conduit means to condense at least a portion of the vapor stream removed from said column, and second conduit means connected between said first conduit means and said column to return a portion of the resulting condensate to said column as external reflux, a control system comprising first temperature sensing means positioned to sense the temperature T_O of said vapor removed from said column; second temperature sensing means positioned to sense the temperature T_R of said condensate returned to said column as external reflux; means responsive to said first and second temperature sensing means to establish a first signal representative of $1+K\Delta T$, where K is a constant equal to the specific heat of said external reflux divided by the heat of vaporization of liquid in the top of said column and ΔT is T_O-T_R; signal multiplying means having first and second inputs and an output; means to apply said first signal to said first input; controller means having a signal input and a set point input with the signal applied to said set point input being representative of the desired value of internal reflux; means connecting said output of said multiplying means to said signal input of said controller means, said controller means being adapted to compare the signal applied to its set point input with the signal applied to its signal input and produce responsive to such comparison an output signal representative of the value of external reflux necessary to maintain the internal reflux substantially equal to said desired value; means independent of the actual flow of external reflux to apply the output signal of said controller means to said second input of said multiplying means; and means responsive to said output signal of said controller means to regulate the rate of flow of said external reflux through said second conduit means.

3,271,271

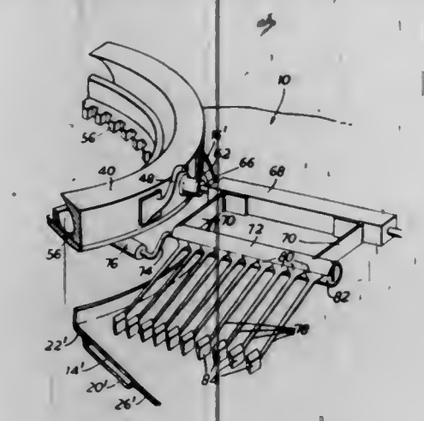
MOLECULAR STILL HAVING STATIONARY EVAPORATOR AND CONDENSER SURFACES

Peter Ridgway Watt, Reigate, Surrey, England, assignor to Vitamins Limited, London, England, a British company

Filed May 8, 1962, Ser. No. 193,259
Claims priority, application Great Britain, May 12, 1961, 17,441/61
8 Claims. (Cl. 202—173)

1. Molecular distillation apparatus comprising a plurality of stationary, heatable, vertically-spaced, upwardly-facing evaporator surfaces, a stationary, coolable, downwardly facing condenser surface disposed above each evaporator surface, wiping means movable over each evaporator and condenser surface and arranged to displace a liquid film on such surfaces towards the outer periphery of each surface, means for transferring distillate from the outer periphery of each condenser surface to the next higher evaporator surface, and means for transferring residual distilland from the outer periphery of each evaporator surface to the next lower evaporator surface.

3,271,272



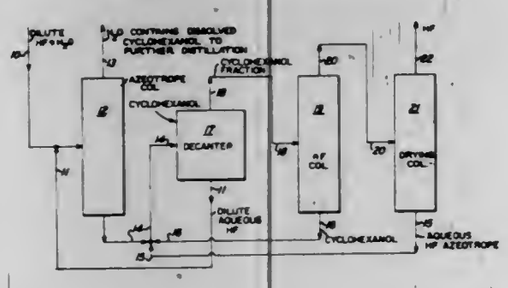
VIBRATORY WIPING DISTILLATION APPARATUS

Peter Ridgway Watt, Reigate, Surrey, England, assignor to Vitamins Limited, London, England, a British company

Filed Dec. 19, 1962, Ser. No. 245,757
Claims priority, application Great Britain, Dec. 29, 1961, 46,680/61
18 Claims. (Cl. 202—236)

1. A wiper assembly for wiping a surface, which comprises a vibratable support member, a plurality of wiper members resiliently mounted on said support member, drive means for causing relative movement of said support member and said surface with said wiper members in wiping contact with the surface, and vibrator means

for imparting vibratory motion to the support member with a component of such vibration perpendicular to the direction of relative movement of said support member and said surface and each wiper member having a wiping edge disposed obliquely to such direction of relative movement.



3,271,273

DISTILLATION PROCESS FOR RECOVERING ANHYDROUS HYDROGEN FLUORIDE

Sherwood N. Fox, Stamford, Conn., and Martin B. Sherwin, Jackson Heights, N.Y., assignors to Halcon International, Inc., a corporation of Delaware

Filed Feb. 13, 1963, Ser. No. 258,284
10 Claims. (Cl. 203—12)

1. A process for recovering anhydrous hydrogen fluoride by distillation which comprises forming a two phase mixture thereof with water and a water immiscible oxygenated organic liquid selected from the group consisting of n-butanol, methyl isopropyl ketone, methyl isobutyl ketone, n-hexanol, or cyclohexanol, each phase containing some of the hydrogen fluoride, recovering anhydrous hydrogen fluoride as overhead by distillation from the organic liquid phase, removing water from the aqueous phase by distillation to form an aqueous hydrofluoric acid azeotrope as bottoms and returning the latter to the step of forming the separate liquid phases.

3,271,274

ELECTRODEPOSITION OF A TERNARY ALLOY OF NICKEL, IRON AND MOLYBDENUM

Guy Di Guilio, Philadelphia, Pa., Joseph S. Mathias, Riverton, N.J., and Edwin F. Schneider, Jenkintown, Pa., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 31, 1962, Ser. No. 234,518
8 Claims. (Cl. 204—43)

8. The method of electrolytically depositing thin magnetic nickel-iron-molybdenum films having the composition 60–77%, 13–24% and 10–16%, respectively, from an aqueous plating bath including Ni^{++}, Fe^{++} and MoO_4^{--}, said method being particularly characterized in that the Fe^{++}/Ni^{++} normality ratio in said bath ranges from about 0.03 up to 0.06, the MoO_4^{--}/Ni^{++} normality ratio in said bath ranges from about 0.016 up to about 0.036, the pH range of said bath is maintained between about 3 and about 6, the current density employed in said bath ranges from about 6 ma. up to about 12 ma. for each $cm.^2$ of plating surface and wherein an external magnetic field is applied to the film being plated along the plane of the film.

3,271,275

ELECTRODEPOSITION OF A MAGNETIC TERNARY ALLOY OF IRON-NICKEL-ARSENIC

Guy Di Guilio, Philadelphia, Pa., and Joseph S. Mathias, Riverton, N.J., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 31, 1962, Ser. No. 234,519
10 Claims. (Cl. 204—43)

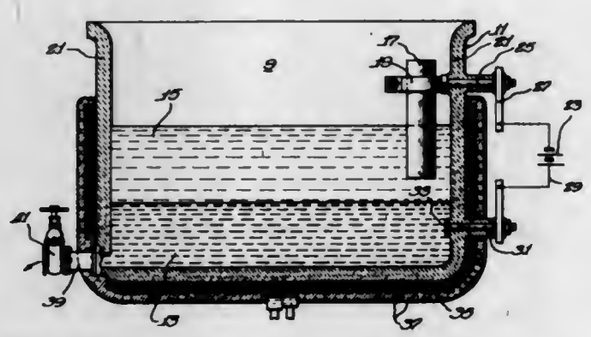
3. The method which comprises electrolytically depositing thin magnetic Ni-Fe-As films upon a substrate to be coated by passing current through an aqueous acidic plating bath to electrolytically deposit said film on said substrate, said bath consisting essentially of Ni^{++}, Fe^{++} and AsO_2^- ions, the concentration of said ions in said bath being such that the Fe^{++}/Ni^{++} normality ratio ranges from about 0.020 to about 0.032, and the AsO_2^-/Ni^{++} normality ratio ranges from about 0.0009 to about 0.0047, the pH of the bath being between about 2 and 5.

3,271,276

ELECTRODEPOSITION OF QUATERNARY MAGNETIC ALLOY OF IRON, NICKEL, ANTIMONY AND PHOSPHORUS

Guy Di Guilio, Philadelphia, and Walter O. Freitag, Conshohocken, Pa., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 31, 1962, Ser. No. 234,520
8 Claims. (Cl. 204—43)



1. The method which comprises electrolytically depositing thin magnetic Ni-Fe-P-Sb films onto a substrate to be coated by passing current through an aqueous acidic plating bath consisting essentially of Ni^{++}, Fe^{++}, $H_2PO_2^-$, and SbO^+ ions, the concentration of said ions in said bath being particularly characterized in that the Fe^{++}/Ni^{++} normality ratio ranges from 0.017 to 0.028, the SbO^+/Ni^{++} normality ratio ranges from .00009 to .00027, and the $H_2PO_2^-/Ni^{++}$ normality ratio ranges from .0011 to .0034.

3,271,277

REFRACTORY METAL PRODUCTION

Leonard F. Yntema, R.R. 1, Box 9–A, Wadsworth, Ill.

Filed Apr. 30, 1962, Ser. No. 191,209
12 Claims. (Cl. 204—64)

1. An electrolytic process for the production of purified refractory metals, which process comprises the steps of dissolving a refractory metal oxide in a molten alkali halide electrolyte in an electrolysis zone maintained at an electrolysis temperature between about 500° C. and about 700° C., reducing said oxide in said electrolysis zone at said electrolysis temperature to the corresponding refractory metal, depositing said refractory metal in particulate form into a molten metal cathode in said zone, and separating said particulate refractory metal from said cathode by distilling off said cathode metal, said cathode metal comprising metal other than mercury having a negligible mutual solubility with said refractory metal and said molten electrolyte, said cathode metal having a low vaporization point at said electrolysis temperature and having a melting point substantially below that of said refractory metal.

3,271,278

ELECTROLYTIC REDUCTIVE COUPLING OF AROMATIC COMPOUNDS

Manuel M. Baizer, St. Louis, Mo., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed July 2, 1965, Ser. No. 469,350
16 Claims. (Cl. 204—72)

1. The method of producing reduced coupled products of olefinic compounds selected from the group consisting of pyridyl ethylenes having a pyridyl group bonded at the 2- or 4-position, alpha, beta-olefinic ketones, carboxylates, carboxamides, nitriles, phosphonates, phosphinates, phosphine oxides and sulfones with an aryl ethylene having a ring of the aryl moiety bonded directly to the ethylene which comprises subjecting a solution of said olefinic compounds and said aryl ethylene to electrolysis in contact with a cathode and separating the reduced, coupled product from the catholyte.

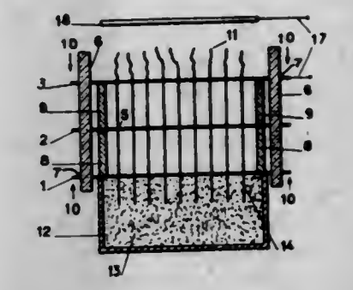
3,271,279

ELECTRODEPOSITION OF COPPER FROM CHROMIUM-CONTAINING SOLUTION

John G. Poor, Otisco, N.Y., assignor to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed June 18, 1962, Ser. No. 202,969
10 Claims. (Cl. 204—108)

1. A method for the plating out of copper from an aqueous solution containing at least about 20 grams per liter of dissolved copper, at least about 50 grams per liter of dissolved chromium, measured as CrO_3, no more than about 10 grams per liter of which is in the hexavalent form and at least about 25 grams per liter of free H_2SO_4, which comprises subjecting the solution to a cathodic current at a temperature of about 30 to 75° C. while agitating the solution and forming a coherent high purity copper deposit, said plating out being continued until the aqueous solution contains less than about 5 grams per liter of copper, and said cathodic current having a density no greater than about 5 amperes per square foot when the solution contains no more than about 5 grams per liter of dissolved copper.



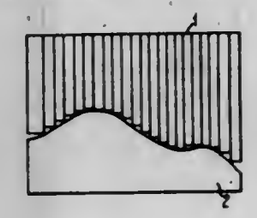
3,271,280

METHOD FOR MANUFACTURING COLD-EMISSION CATHODES

Arvind M. Shroff, Paris, France, assignor to CSF-Compagnie Generale de Telegraphie Sans Fil, Paris, France

Filed June 4, 1963, Ser. No. 285,404
Claims priority, application France, June 29, 1962, 902,437
8 Claims. (Cl. 204—142)

1. A method for manufacturing cold-emission cathodes having a plurality of substantially parallel point-ended metal rods, comprising the steps of: passing said rods through the holes in a grid-like structure the diameter of said holes being slightly larger than the diameter of said rods; fixing said rods to a support; immersing the assembly of said support, rods and grid-like structure in an electrochemical bath; and applying an electrochemically acting voltage between said rods and said grid-like structure until said rods are simultaneously cut to the same length and tapered to thereby produce the said pointed ends thereof.

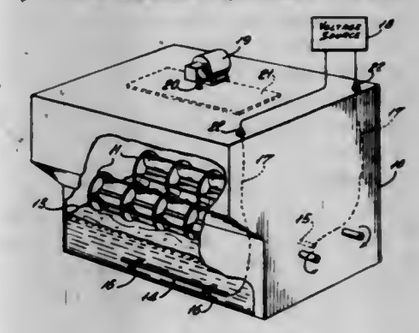


3,271,281

METHOD OF MAKING A TOOL FOR ELECTRO-CHEMICAL MACHINING

Dennis Cockburn Brown and Eric Winston Dickson, Warwickshire, England, assignors to Associated Engineering Limited, Leamington Spa, Warwickshire, England, a British company

Filed Mar. 8, 1962, Ser. No. 178,418
Claims priority, application Great Britain, Mar. 8, 1961, 8,492/61
10 Claims. (Cl. 204—143)



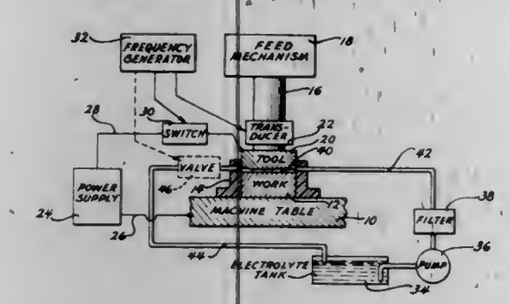
1. The method of making a tool for the electrochemical machining of complex cavities which consists in bringing a plurality of electrically conductive components together in parallel relationship so that each of said components has one end engaged by a die having the shape of a complex surface to be formed, whereby said ends of said components are positioned to conform to this shape, and securing the said components together.

3,271,282

PROCESS FOR ETCHING PHOTO-ENGRAVING COPPER

Paul F. Borth, Park Forest, Ill., assignor to Photo-Engravers Research, Inc., Savannah, Ga., a corporation of Georgia

Filed June 18, 1963, Ser. No. 288,802
10 Claims. (Cl. 204—143)



1. In a process for etching photo-engraving copper by contacting said copper with an aqueous ferric chloride solution containing a formamidine disulfide passivating

agent, the improvement which comprises impressing a potential difference of from about 3 to about 50 volts across the etching bath so as to enhance the effectiveness of the passivating agents.

4. In a process for etching a photo-engraving copper having a portion of its surface masked with a resistant coating, wherein the etching is effected by contacting the photo-engraving copper with an aqueous ferric chloride etching solution containing a passivating agent selected from the group consisting of (1) formamidine disulfide compounds, and (2) amine compounds selected from the group consisting of alkyl amines and alkanol amines in combination with formamidine disulfide compounds, the improvement which comprises impressing a voltage differential of from about 3 to about 50 volts across the etching bath while contacting the photo-engraving copper with the etching solution.

3,271,283
METHODS AND APPARATUS FOR ELECTROCHEMICAL SHAPING OF A WORKPIECE
John E. Clifford, Columbus, Ohio, and Kempes F. Trager, Detroit, Mich.; said Clifford assignor, by mesne assignments, to The Steel Improvement and Forge Company, Cleveland, Ohio, a corporation of Ohio, and said Trager assignor to Ex-Cell-O Corporation, Detroit, Mich.
Filed Oct. 28, 1963, Ser. No. 319,166
8 Claims. (Cl. 204—143)

1. Apparatus for electrochemically shaping the surface of an electrically conductive workpiece to a predetermined three-dimensional contour comprising:

an electrically conductive tool provided with a working face having a contour, shape and area corresponding substantially to the contour, shape and area with which the workpiece is to be provided;

feeding means for advancing said tool toward said workpiece at a substantially constant velocity corresponding to the rate of removal of material from said workpiece so as to prevent contact between said tool and said workpiece;

means for oscillating said tool in the same direction as the direction of advance of said tool, the amplitude of said tool oscillations being such as to avoid contact between said tool and said workpiece;

means for confining an electrically conductive electrolyte in a confined space within the gap between said tool and said workpiece;

means for flowing said electrolyte through said confined space within the gap between said tool and said workpiece;

means for interrupting said flow of electrolyte through said confined space within the gap in synchronism with the oscillations of said tool at a predetermined time at least shortly before said tool reaches a position of minimal spacing from the workpiece; and

means for reestablishing the flow of electrolyte in synchronism with said oscillations at a predetermined time at most shortly after the tool has reached said position of minimal spacing from the workpiece;

and means connecting said tool and said workpiece in an electrical circuit to effect passage of current in a manner as to make said tool cathodic in relation to said workpiece only when said flow of electrolyte is interrupted.

7. A method for electrochemically shaping the surface of an electrically conductive workpiece to a predetermined three-diemnsional contour comprising:

disposing in close proximity to the workpiece an electrically conductive tool provided with a working face having a contour, shape and area corresponding substantially to the contour, shape and area with which the workpiece is to be provided;

advancing said tool toward said workpiece at a substantially constant velocity corresponding to the rate of removal of material from said workpiece so as to prevent contact between said tool and said workpiece;

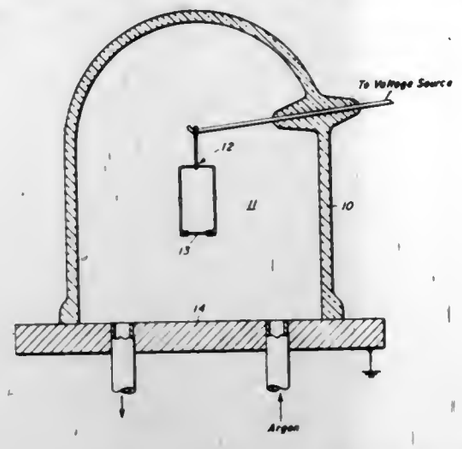
oscillating said tool in the same direction as the direction of advance thereof, the amplitude of said tool oscillations being such as to avoid contact between said tool and said workpiece;

flowing an electrolyte through a confined space within the gap between said tool and said workpiece;

interrupting said flow of electrolyte through said confined space within the gap in synchronism with the oscillations of said tool at a predetermined time at least shortly before said tool reaches a position of minimal spacing from the workpiece;

reestablishing said flow of electrolyte in synchronism with said oscillations at a predetermined time shortly after said tool has reached said position of minimal spacing from said workpiece;

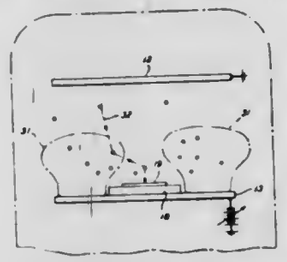
connecting said tool and said workpiece in an electrical circuit to effect passage of current as said flow of electrolyte is interrupted; and



disconnecting said circuit from said tool and said workpiece after a predetermined time.

3,271,284
METHOD OF TREATING GALVANIZED SHEET TO INHIBIT STAINING
Paul R. Carter, Monroeville Borough, and Lawrence E. Helwig, Hampton Township, Allegheny County, Pa., assignors to United States Steel Corporation, a corporation of Delaware
No Drawing. Filed Oct. 29, 1963, Ser. No. 319,659
1 Claim. (Cl. 204—145)

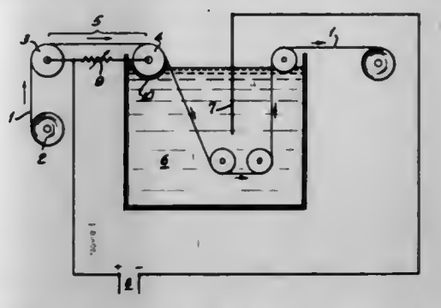
In the treatment of galvanized sheet steel to inhibit staining in storage under humid conditions by immersing it in a dilute water solution of a salt selected from the group consisting of sodium chromate and sodium dichromate, the step of preliminarily treating the sheets by electrolysis as a cathode in a dilute water solution of tri-sodium phosphate to the extent of at least 300 coulombs per square foot.



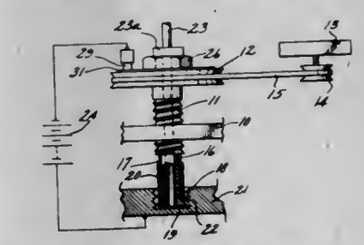
3,271,285
METHOD FOR SPUTTERING NIOBIUM OR TANTALUM THIN FILMS
Raymond E. Skoda, Scotia, N.Y., assignor to General Electric Company, a corporation of New York
Filed Oct. 17, 1963, Ser. No. 316,917
1 Claim. (Cl. 204—192)

A method of sputtering superconductive films of niobium or tantalum on to a supporting substrate comprising, positioning a perforate cathode having at least one opening the axis of which is substantially perpendicular to the substrate and which is constructed of a metal selected from the group consisting of niobium and tantalum within an enclosed chamber, providing an anode operatively spaced from the cathode, locating a suitable substrate within the enclosed chamber between the cathode and the anode, introducing a supply of argon into the enclosed chamber, and energizing the perforate cathode

with direct current whereby the substrate is hit simultaneously by ionized argon and cathode metal to form a superconductive film.



3,271,286
SELECTIVE REMOVAL OF MATERIAL USING CATHODIC SPUTTERING
Martin P. Lepselter, Franklin Park, N.J., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Feb. 25, 1964, Ser. No. 347,173
2 Claims. (Cl. 204—192)

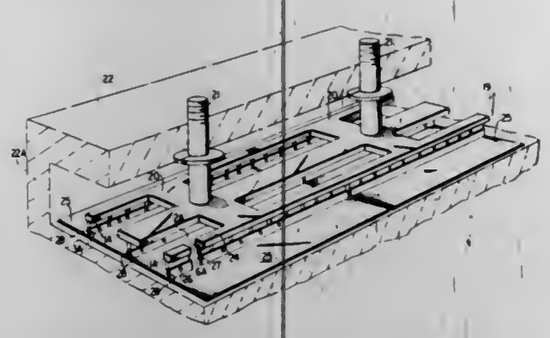


1. A method for the selective removal of material from the surface of a substrate having a dielectric coating thereon, comprising effecting a glow discharge in a low pressure gaseous ambient between an anode and a cathode whereby an ionized gaseous plasma is formed in said glow discharge, electrically isolating an area of the surface of said cathode facing said anode larger than the cross sectional area of said substrate, but having the peripheral portions of said cathode in electrical communication with said discharge, and mounting said substrate between said anode and said electrically isolated area of said cathode so that no voltage drop occurs through said dielectric coating whereby said glow discharge is restricted to the region peripheral to said surface so that ions are impacted on said surface removing material therefrom.

3,271,287
APPARATUS FOR ANNEALING AND ELECTROLYTICALLY TREATING METALLIC STRIP
Wolfgang Post, Singen am Hohentwiel, Germany, assignor to Swiss Aluminium Ltd., Chippis, Switzerland, a joint-stock company of Switzerland
Filed Nov. 27, 1962, Ser. No. 240,372
Claims priority, application Switzerland, Nov. 28, 1961, 13,827/61
3 Claims. (Cl. 204—210)

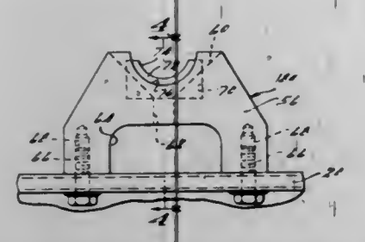
1. An apparatus for treating metal, comprising an electrolytic treatment tank for containing an electrolyte for the electrolytic treatment of the metal, means for continuously advancing a continuous length of metal lengthwise through the electrolyte in said tank, two electrical contact points at the entrance side of said electrolytic tank in electrical contact with said metal and spaced therealong to define an annealing zone therebetween, and an incomplete electric circuit comprising a source of electric current having two terminals of opposite polarity, an electrode dipping into said electrolyte, an electrical connection between one of said terminals and said electrode, an electrical connection between the other terminal and the contact point furthest from the entrance side of the tank, and a variable resistance between said contact points in parallel with the section of the metal between said contact points while said metal is extending between said contact points, said circuit being completed by the continuous length of metal passing over the two electrical contact points and through the electrolyte.

3,271,288
ELECTROLYTIC DRILLING AND TAPPING APPARATUS
Joseph H. Crawford, Cincinnati, and William H. Peters, Loveland, Ohio, assignors to General Electric Company, a corporation of New York
Filed Dec. 1, 1960, Ser. No. 72,890
1 Claim. (Cl. 204—212)



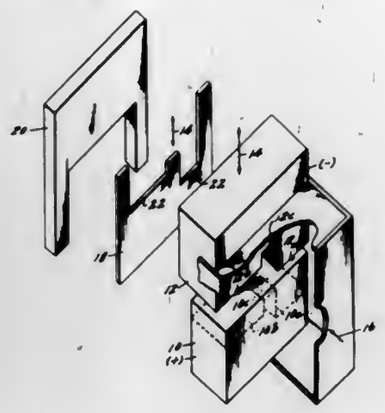
In an apparatus for the drilling and tapping of holes in a workpiece by the passage of electric current through an electrolyte between the apparatus and the workpiece, an elongated cathode having a radially extending thread-forming projection at a tip end thereof, a layer of insulation over the portions of said cathode exposed to electrolyte except for the tip surface and thread-forming projection, a conducting sleeve overlying said layer of insulation, means for moving said cathode along its longitudinal axis and rotating said cathode around said axis, and means for introducing electrolyte to the tip portion of said cathode.

3,271,289
MERCURY CATHODE ELECTROLYTIC CELL HAVING AN ANODE WITH HIGH CORROSION-RESISTANCE AND HIGH ELECTRICAL AND HEAT CONDUCTIVITY
Georg Messner, Milan, Italy, assignor to Oronzio de Nora Impianti Elettrochimici, Milan, Italy
Filed Oct. 10, 1963, Ser. No. 315,181
Claims priority, application Germany, July 22, 1959, O 6,894
4 Claims. (Cl. 204—219)



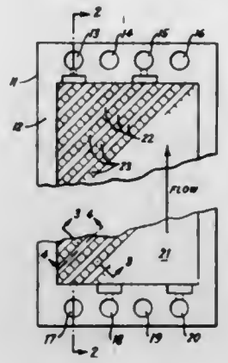
1. In combination with an electrolytic cell having four sides, a base and a cover, means to introduce an electrolyte solution into said cell, means to flow mercury over

said base, and means to provide anodic and cathodic current to said cell; an anode assembly comprising copper supporting means depending from said cover and acting as conductive members, a substantially horizontal copper anode support plate, having openings therethrough connected to said depending copper conductive members, titanium connecting means attached to the lower face of



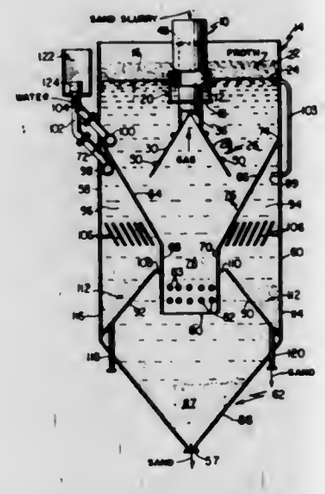
said horizontal copper anode support plate and depending therefrom, anode plates attached to said titanium connecting means and spaced from said horizontal copper anode support plate, said anode plate being substantially parallel to said base, and a non-conductive, non-corrosive covering over said supporting means and the joint between said connecting and supporting means.

3,271,290
CATHODE AGITATOR DEVICE
Leon J. Pianowski, Detroit, Mich., assignor to The Udylite Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 13, 1962, Ser. No. 244,358
8 Claims. (Cl. 204—222)



1. In an electrotreating apparatus including a supporting frame positioned at a treating station and an electrified rod reciprocably mounted on the frame for electrifying and reciprocably moving workpieces suspended therefrom, the improvement comprising a pair of bearings mounted in longitudinally spaced aligned relationship on the frame for slidably supporting the end portions of the rod, each of said bearings comprising a housing composed of an electrically nonconductive material and including a bearing face formed with a pair of longitudinally spaced end walls separated by a longitudinally extending inwardly directed cavity, a bearing pad composed of a solid self-lubricating material removably seated in said cavity having its outwardly directed bearing surface formed with a longitudinally extending groove for slidably receiving the rod, the longitudinal end edges of said bearing pad terminating at a point spaced from the inner surfaces of said end walls defining therewith a pair of longitudinally spaced residue cavities for receiving the wear-abrasion products of said bearing pad and the rod, coacting means on said bearing pad and said housing for retaining said bearing pad in appropriate spaced relationship from the said end walls, and coacting means on said housing for securing each of said bearings in a fixed position on the frame.

3,271,291
ELECTROCHEMICAL MACHINING APPARATUS WITH ELECTROLYTE FLOW CONTROL MEANS
Joseph Howard Crawford and Philip Allen Cappel, Cincinnati, Ohio, assignors to General Electric Company, a corporation of New York
Filed Dec. 3, 1962, Ser. No. 241,585
2 Claims. (Cl. 204—224)

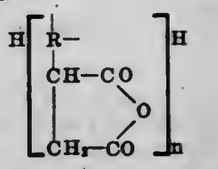


1. Electrochemical machining apparatus for use in producing an article surface from an electrically conductive workpiece including a work surface, in combination:
a cathode-tool having a three dimensional tool surface substantially different in surface contour from that of the work surface of the workpiece prior to electrochemical machining operation, the tool surface including at an edge an exit tool profile portion;
a workpiece support means to position the work surface of the workpiece in juxtaposition with the tool surface to define an electrochemical machining gap;
means for moving the cathode-tool and the workpiece support means one toward the other to maintain the gap;
chamber means to provide an electrolyte enclosure for filling the gap and for directing electrolyte through the gap toward the exit tool profile portion;
an electrolyte source;
means connecting the chamber means with the electrolyte source to circulate electrolyte through the chamber means;
weir means including a weir profile edge portion relating in shape to the exit tool profile portion;
means for supporting the weir means to position the weir profile edge portion in spaced apart relationship with and substantially opposite the exit tool profile portion of the cathode-tool during electrochemical machining operation to maintain an exit gap between the exit tool profile portion and the weir profile edge portion through which electrolyte is discharged from the electrochemical machining gap;
shutter means having a shutter edge portion forming one boundary of an opening in the shutter means;
means for supporting the shutter means adjacent the weir means and for positioning the shutter edge portion with respect to the exit gap formed by the exit tool profile portion and the weir profile edge portion, during relative movement between the exit gap and the shutter edge portion, to control flow of electrolyte from the exit gap as a function of the article surface to be produced;
an electrical power source of predominantly direct current; and
electrical conductor means connected between the cathode-tool and the workpiece whereby the cathode-tool is predominantly negative and the workpiece is predominantly positive during electrochemical machining.

3,271,292
ION EXCHANGE MEMBRANES AND SPACERS AND PROCESS OF MAKING THEM
Paul Kollsman, 100 E. 50th St., New York 22, N.Y.
Filed Nov. 8, 1960, Ser. No. 68,065
10 Claims. (Cl. 204—263)

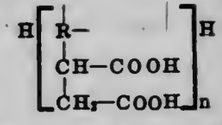
1. An ion conductive membrane spacer of substantially lattice type form composed of anion exchange resin particles and cation exchange particles, both types of particles being in random arrangement, and predominantly in the shape of fibers having a length exceeding three times their mean diameter.

3,271,293
PROCESS AND APPARATUS FOR STRIPPING SOLIDS FROM BITUMINOUS SAND
Lincoln Clark, Newport Beach, Calif., assignor, by direct and mesne assignments, of thirty percent to Cities Service Athabasca, Inc., Edmonton, Alberta, Canada, a corporation of Delaware, thirty percent to Imperial Oil Limited, a corporation of Canada, thirty percent to Atlantic Richfield Company, a corporation of Pennsylvania, and ten percent to Royalite Oil Company Limited, a corporation of Canada
Filed May 3, 1963, Ser. No. 277,922
9 Claims. (Cl. 208—11)



1. A process for separating bitumen from bituminous sand slurry which comprises passing a bituminous sand slurry into a body of water, guiding material in said bituminous sand including bitumen heavier than water downwardly through a column of water having a decreased cross-section, passing a flotation gas upwardly through said column within the area of decreased cross-section below the slurry entrance, said gas rising and contacting the downwardly flowing bitumen and floating a portion thereof upwardly, entrapping the rising gas and bitumen in a confined area below the top of the water column, conducting the entrapped gas and bitumen upwardly above above and out of contact with the water in said column and permitting the gas to vent thereabove.

3,271,294
HYDROISOMERIZATION PROCESS
Joseph Matthew Kelley, 1321 E. Broad St., Westfield, N.J.
No Drawing. Filed Oct. 26, 1962, Ser. No. 234,010
2 Claims. (Cl. 208—46)



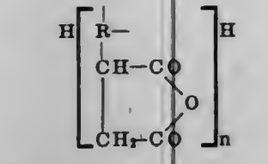
1. A method for treating a naphtha feed containing at least 10 percent by volume of olefinic materials wherein process conditions are optimized to produce as a principal product a middle distillate boiling in the range of 300° to 600° F., which comprises passing said naphtha feed over a hydrocracking catalyst base containing from 1 to 20 percent by weight of $CoMoO_4$ deposited thereon, the feed rate of said hydrocarbon being from 0.1 to 10 v./v./hr. at a hydrogen pressure of from 0 to 2000 p.s.i.g. and a temperature of from 350° to 500° F., said treatment being conducted in the presence of from 100 to 5000 standard cubic feet of hydrogen per barrel of said naphtha feed.

3,271,295
PROCESS OF HEAT TRANSFER
Gerardo A. Gonzalez, Philadelphia, Pa., assignor to Betz Laboratories, Inc., Philadelphia, Pa., a corporation of Pennsylvania
No Drawing. Filed Feb. 23, 1965, Ser. No. 434,618
10 Claims. (Cl. 208—48)

1. A process for preventing heat transfer reduction in a metal conductor, through which passes a hydrocarbon at a temperature between 200 and 1100° F., which comprises adding to said hydrocarbon between 1 and 200 parts per million by volume of a reaction product of
(a) a member of the group consisting of alkyl-substituted and alkenyl-substituted succinic anhydrides having the formula:

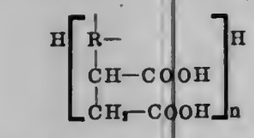
and alkyl-substituted and alkenyl-substituted succinic acids having the formula:

where n is an integer between 1 and 5 inclusive, and R is a group of the class consisting of alkyl and alkenyl groups having between 30 and 200 carbon atoms in the hydrocarbon chain; and
(b) a polyamine of the formula:



where n is an interger between 2 and 10 inclusive, x is an integer between 1 and 10 inclusive and C_nH_{2n} is a straight chain hydrocarbon, the proportions of polyamine varying from ½ to 2 equivalents per equivalent of succinic compound.

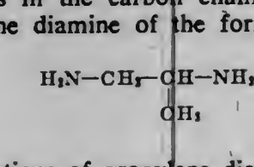
3,271,296
PROCESS OF HEAT TRANSFER
Gerardo A. Gonzalez, Philadelphia, Pa., assignor to Betz Laboratories, Inc., Philadelphia, Pa., a corporation of Pennsylvania
No Drawing. Filed Mar. 1, 1965, Ser. No. 436,369
4 Claims. (Cl. 208—48)



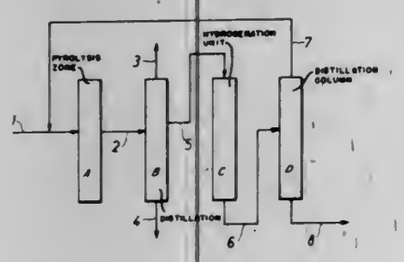
1. A process for preventing heat transfer reduction in a metal conductor, through which passes a hydro-

carbon of the group consisting of naphthas, gas oils, crude oils, residuum, light distillate, gasoline or mixtures thereof, at a temperature between 200 and 1100° F., which comprises adding to said hydrocarbon chain group between 1 and 200 parts per million by volume of a reaction product of

(a) a member of the group consisting of alkyl substituted and alkenyl substituted succinic anhydrides having the formula:



and alkyl substituted and alkenyl substituted succinic acids having the formula:



wherein *n* is an integer between 1 and 5 inclusive, and R is a group of the class consisting of alkyl and alkenyl groups having between 30 and 200 carbon atoms in the carbon chain; and

(b) propylene diamine of the formula:

the proportions of propylene diamine varying from one-half of 2 equivalents per equivalent of succinic compound.

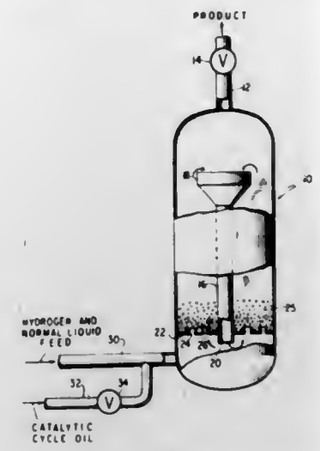
3,271,297
RECYCLE OF MONOOLEFINES TO A HYDROCARBON PYROLYSIS PROCESS
Walter Krönig, Hans-Joachim Müller, and Karl-Heinz Vöpel, Leverkusen, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany
Filed Dec. 11, 1961, Ser. No. 158,569
Claims priority, application Germany, Dec. 15, 1960, F 32,763
5 Claims. (Cl. 208—67)

1. In a process for the pyrolysis of liquid hydrocarbons wherein a feed stock is subjected to pyrolysis to produce a cracked gasoline containing monoolefins and diolefins and aromatic compounds, the improvement which comprises subjecting the cracked gasoline to a hydrogenation treatment to convert diolefins of the cracked gasoline to monoolefins without substantial hydrogenation of monoolefins, separating monoolefins from the product of hydrogenation to provide to a monoolefin fraction and an aromatic fraction, and introducing said monoolefin fraction into the pyrolysis.

3,271,298
THERMAL CRACKING OF PARAFFINS TO AROMATICS
Clarence L. Dulaney and Marvin Lee Owens, Jr., Texas City, Tex., assignors to Monsanto Company, a corporation of Delaware
No Drawing. Filed Feb. 28, 1963, Ser. No. 261,878
10 Claims. (Cl. 208—106)

1. A process for increasing the production of aromatic hydrocarbons from the thermal cracking of paraffin hydrocarbons which comprises adding 0.1 to 10 mol percent of a hydrocarbon selected from the group consisting of hydrocarbon substituted aromatic hydrocarbons, partially saturated cyclic hydrocarbons and saturated cyclic hydrocarbons to a non-catalytic thermal cracking zone concurrently with a paraffin hydrocarbon feed containing less than 1% of non-paraffin hydrocarbons, said cracking zone being maintained at a temperature of 400–900° C. and a pressure of atmospheric to 1000 p.s.i.g.

3,271,299
COMPOSITIONS CONTAINING STABLE ALUMINUM PHOSPHATE GEL AND METHODS OF USING SAME
Kenneth K. Kearby, Watchung, N.J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Original application Sept. 3, 1959, Ser. No. 837,807. Divided and this application Sept. 2, 1964, Ser. No. 394,006
24 Claims. (Cl. 208—114)



18. A method of cracking higher boiling hydrocarbons to lower boiling hydrocarbons which comprises contacting hydrocarbon oil feed at a cracking temperature for a sufficient time to crack said hydrocarbon oil feed with a catalyst comprising at least 50% of an aluminum phosphate hard stable gel made from a true vibrant aluminum phosphate hydrogel and which has an initial surface area above about 250 m.²/gram after calcining said true vibrant aluminum phosphate hydrogel.

3,271,300
SILICA-ALUMINA-MAGNESIA-MAGNESIUM FLUORIDE CATALYST AND PROCESS
Richard W. Baker, Ellicott City, James J. Blazek, Reisterstown, and Frank G. Ciapetta, Silver Spring, Md., assignors to W. R. Grace & Co., New York, N.Y., a corporation of Connecticut
No Drawing. Filed May 11, 1964, Ser. No. 366,596
12 Claims. (Cl. 208—120)

7. A process for cracking heavy petroleum fractions to produce an increased proportion of high octane gasoline and light fuel oils with a minimum production of coke which comprises contacting said fraction at temperatures above about 800° F. with a silica-alumina-magnesia-magnesium fluoride cracking catalyst containing from about 0.2 to 57.0% alumina, from about 28.3 to .4% magnesia, and from about 14.0 to .1% magnesium fluoride, the balance of the catalyst composition being essentially silica.

3,271,301
HYDROGENATION PROCESS
Richmond B. Galbreath, Fanwood, N.J., assignor to Cities Service Research and Development Company, New York, N.Y., a corporation of New Jersey
Filed Feb. 3, 1964, Ser. No. 341,941
4 Claims. (Cl. 208—143)

1. A continuous process for hydrogenating hydrocarbon oil which comprises maintaining a reaction zone containing a mass of particulate hydrogenation catalyst under hydrogen pressure and elevated temperature, alternately feeding residual oil at least 50 volume per cent of which boils above 650° F. and catalytic cycle oil having between about 30 and about 50 volume percent aromatics into said reaction zone upwardly in the liquid phase through the catalyst mass and expanding the volume of the mass by about 10% to about 300% as compared to its settled volume and hydrogenating said oils, and wherein the quantity of cycle oil fed to the reactor is between about one-third and one one-hundredth the quantity of residual oil fed to the reactor.

3,271,302
MULTIPLE-STAGE HYDROREFINING OF PETROLEUM CRUDE OIL
William K. T. Gleim, Island Lake, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware
No Drawing. Filed June 17, 1964, Ser. No. 375,948
7 Claims. (Cl. 208—264)

1. A process for hydrorefining a hydrocarbon charge stock which comprises the steps of:

(a) treating said charge stock, in the absence of a catalytic composite, with a gaseous mixture of hydrogen and hydrogen sulfide; and

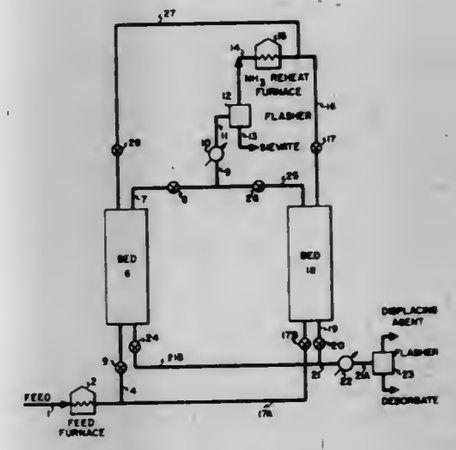
(b) reacting at least a portion of the resulting treated product effluent with hydrogen, in a reaction zone containing a hydrorefining catalytic composite.

3,271,303
PROCESS FOR DISPLACING AGENT CONTAINMENT
William R. Epperly, Murray Hill, and Charles W. Tyson, Jr., Westfield, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware
Filed Dec. 24, 1962, Ser. No. 246,940
10 Claims. (Cl. 208—310)

1. A method of separating n-paraffins from a feed stream comprising n-paraffins and other saturated hydrocarbons which comprises in combination:

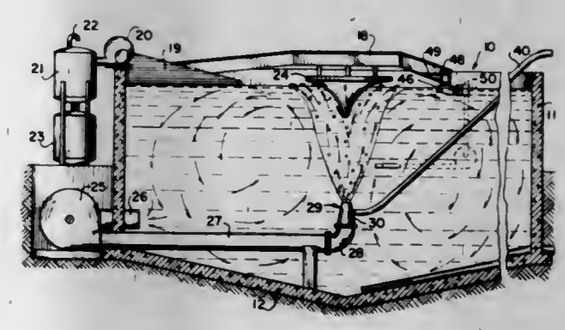
(a) introducing said feed stream comprising n-paraffins and other saturated hydrocarbons into a first adsorbent zone wherein said zone contains adsorbed displacing agent and said adsorbent is composed of molecular sieves having a pore size of about 5 A,

(b) displacing at least a portion of said displacing agent from said first adsorbent zone with said feed while adsorbing at least a portion of n-paraffins from said feed stream,



(c) conveying said displaced displacing agent to a second adsorbent zone containing adsorbed n-paraffins, wherein said zone also contains molecular sieves having a pore size of about 5 A,

(d) removing at least a portion of said adsorbed n-paraffins from said second zone by desorbing with said displacing agent from said first adsorbent while permitting less than 3% of said displacing agent to exit from said second adsorption zone,



(e) introducing said feed into said second adsorption zone, and

(f) repeating the above cycle of said displacing, conveying, recovering and introducing.

8. A method of separating aromatic hydrocarbons from a feedstream comprising aromatic hydrocarbons and non-aromatic hydrocarbons which comprises in combination: (a) introducing said feedstream into a first adsorbent zone wherein said zone contains adsorbed displacing agent and said adsorbent is composed of type X molecular sieve, (b) displacing at least a portion of said displacing agent from said first adsorbent zone with said feed while adsorbing at least a portion of said aromatic hydrocarbons from said feedstream, (c) conveying said displaced displacing agent to a second adsorbent zone containing adsorbed aromatics, wherein said zone also contains type X molecular sieve, (d) removing at least a portion of said adsorbed aromatics from said second zone by desorbing with said displacing agent from said first adsorbent while permitting less than about 3% of said displacing agent to exit from said adsorption zone, (e) introducing said feed into said second adsorption zone and (f) repeating the above cycle of said displacing, conveying, recovering and introducing.

3,271,304
VENTURI AERATOR AND AERATING PROCESS FOR WASTE TREATMENT
Joe M. Valdespino, Orlando, Fla., and Clifford B. Cox, Chicago, Ill., assignors to Pacific Flush Tank Company, Chicago, Ill., a corporation of Illinois
Filed June 26, 1964, Ser. No. 378,320
17 Claims. (Cl. 210—15)

10. The method of introducing air under atmospheric pressure into a body of liquid contained in a tank compris-

ing the steps of removing liquid from said tank, pumping the removed liquid through an elbow to change its direction of flow, then through a swirling mechanism to impart a swirling motion to said liquid and then forcing the swirling liquid through a venturi type aspirator having a high pressure inlet portion, a constricted throat portion and a negative pressure discharge portion having an outlet, providing an orifice between said outlet and said throat portion in communication with said discharge portion of said aspirator, connecting said orifice to a source of air under atmospheric pressure, and discharging said liquid from said aspirator directly into the body of liquid, whereby the negative pressure created in said discharge portion will draw air through said orifice and entrain said air in the liquid being discharged from said aspirator.

3,271,305
TEXTILE TREATMENTS AND TREATED TEXTILES

Thomas C. Allen, High Point, N.C., and Harold J. Watson, Danville, Va., assignors to Dan River Mills, Incorporated, Danville, Va., a corporation of Virginia

No Drawing. Original application Sept. 1, 1961, Ser. No. 135,448, now Patent No. 3,215,719, dated Nov. 2, 1965. Divided and this application Sept. 15, 1964, Ser. No. 401,756

18 Claims. (Cl. 252—8.6)

1. Process for providing a lasting fragrance to cellulosic textiles comprising impregnating said textile with a silicon compound from the class consisting of silanes and siloxanes, said silicon compound having at least one hydrolyzable organic oxy group bonded to silicon through a silicon to oxygen to carbon linkage, said organic oxy group forming a fragrant essential alcohol upon hydrolysis, and drying the impregnated textile, said dried, impregnated textile being capable of thereafter successively forming said fragrant essential alcohol by subjecting said dried impregnated fabric to moisture to hydrolyze some of said organic oxy groups.

3,271,306
METHOD FOR PREVENTING THE FORMATION OF INSOLUBLE IRON COMPOUNDS

Enrico G. Capriati, Texas City, and David T. Oakes, Dickinson, Tex., assignors to Monsanto Company, a corporation of Delaware

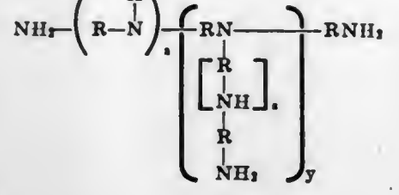
No Drawing. Filed Nov. 6, 1963, Ser. No. 321,811

8 Claims. (Cl. 252—8.55)

1. The method of preventing the formation of water-insoluble $Fe(OH)_3$ in aqueous systems in the presence of iron capable of forming said $Fe(OH)_3$ which comprises adding to said aqueous system 25 to 1000 p.p.m. of a haloalkyl phosphonic acid of no greater than 6 carbon atoms.

5. The method of preventing the formation of water-insoluble $Fe(OH)_3$ in subterranean petroleum-bearing formations during the secondary recovery of petroleum by water flooding, said method comprising adding 25 to 1000 p.p.m. of a haloalkyl phosphonic acid containing no greater than 6 carbon atoms to the secondary recovery injection water.

3,271,307
OIL WELL TREATMENT

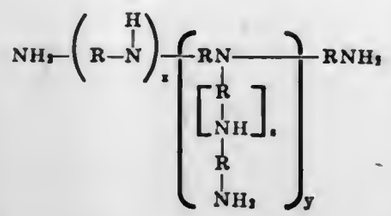


Woodrow J. Dickson, La Habra, and Fred W. Jenkins, Buena Park, Calif., assignors to Petrolite Corporation

No Drawing. Original application Aug. 4, 1960, Ser. No. 47,386, now Patent No. 3,200,106, dated Aug. 10, 1965. Divided and this application Aug. 6, 1963, Ser. No. 300,152

40 Claims. (Cl. 252—8.55)

1. A process for injecting water into an underground formation characterized by employing an aqueous solution of a compound selected from the group consisting of



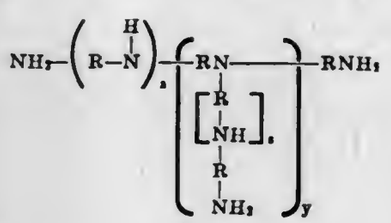
(1) a branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the formula

wherein

R is an alkylene group having at least two carbon atoms,
x is an integer of 4 to 24,
y is an integer of 1 to 6, and
z is an integer of 0–6,

(2) an acylated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the formula

wherein



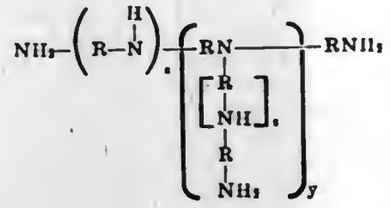
R is an alkylene group having at least two carbon atoms,
x is an integer of 4 to 24,
y is an integer of 1 to 6, and
z is an integer of 0–6,

formed by reacting, at a temperature of from about 120° to about 300° C., said polyalkylenepolyamine with a compound selected from the group consisting of

(i) a carboxylic acid having 7–39 carbon atoms and

(ii) a precursor of said carboxylic acid capable of forming said acid in said reaction,

(3) an oxyalkylated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the formula

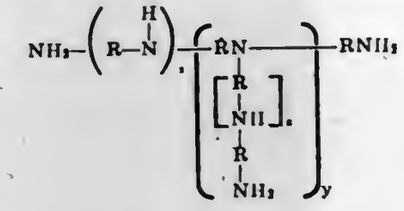


wherein

R is an alkylene group having at least two carbon atoms,
x is an integer of 4 to 24,
y is an integer of 1 to 6, and
z is an integer of 0–6,

formed by reacting, at a temperature of from about 80° C. to about 200° C. and a pressure of from about 10 p.s.i. to about 200 p.s.i., said polyalkylenepolyamine with an alkylene oxide having at least 2 carbon atoms,

(4) an alkylated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the formula

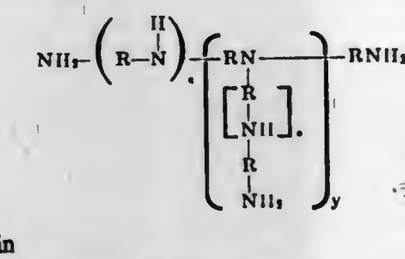


wherein

R is an alkylene group having at least two carbon atoms,
x is an integer of 4 to 24,
y is an integer of 1 to 6, and
z is an integer of 0–6,

formed by reacting, at a temperature of from about 100° C. to about 250° C., said polyalkylenepolyamine with a hydrocarbon halide alkylating agent having 1 to 30 carbon atoms,

(5) an olefinated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the formula



wherein

R is an alkylene group having at least two carbon atoms,
x is an integer of 4 to 24,
y is an integer of 1 to 6, and
z is an integer of 0–6,

formed by reacting, at a temperature of from about 70° C. to about 100° C., said polyalkylenepolyamine with an olefinating agent selected from the group consisting of acrylonitrile, styrene, butadiene, vinyl ethers and vinyl sulfones,

(6) a Schiff base reaction product of a branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the formula

wherein

R is an alkylene group having at least two carbon atoms,
x is an integer of 4 to 24,
y is an integer of 1 to 6, and
z is an integer of 0–6,

formed by reacting said polyalkylenepolyamine with a compound selected from the group consisting of aldehydes and ketones,

(7) an acylated, then oxyalkylated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the hereinabove recited formula, formed by reacting, at a temperature of from about 125° C. to about 300° C., said polyalkylenepolyamine with an acylating agent selected from the group consisting of (i) a carboxylic acid having 7–39 carbon atoms and (ii) a precursor of said carboxylic acid capable of forming said acid in said reaction, and then reacting said acylated polyalkylenepolyamine, at a temperature of from about 80° C. to about 200° C. and a pressure of from about 10 p.s.i. to about 200 p.s.i., with an alkylene oxide having at least 2 carbon atoms,

(8) an oxyalkylated, then acylated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the hereinabove recited formula, formed by reacting, at a temperature of from about 80° C. to about 200° C. and a pressure of from about 10 p.s.i. to about 200 p.s.i., said polyalkylenepolyamine with an alkylene oxide having at least 2 carbon atoms and then reacting said oxyalkylated polyalkylenepolyamine, at a temperature of from about 120° C. to about 300° C., with an acylating agent selected from the group consisting of (i) a carboxylic acid having 7–39 carbon atoms and (ii) a precursor of said carboxylic acid capable of forming said acid in said reaction,

(9) an alkylated, then acylated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the hereinabove recited formula, formed by reacting, at a temperature of from about 100° C. to about 250° C., said polyalkylenepolyamine with a hydrocarbon halide alkylating agent having 1–30 carbon atoms, and then reacting said alkylated polyalkylenepolyamine, at a temperature of from about 120° C. to about 300° C., with an acylating agent selected from the group consisting of (i) a carboxylic acid having 7–39 carbon atoms and (ii) a precursor of said carboxylic acid capable of forming said acid in said reaction,

(10) an acylated, then alkylated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the hereinabove recited formula, formed by reacting at a temperature of from about 120° C. to about 300° C., said polyalkylenepolyamine with an acylating agent selected from the group consisting of (i) a carboxylic acid having 7–39 carbon atoms and (ii) a precursor of said carboxylic acid capable of forming said acid in said reaction, and then reacting said acylated polyalkylenepolyamine, at a temperature of from about 100° C. to about 250° C., with a hydrocarbon halide alkylating agent having 1–30 carbon atoms,

(11) an oxyalkylated, then alkylated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the hereinabove recited formula, formed by reacting, at a temperature of from about 80° C. to about 200° C. and a pressure of from about 10 p.s.i. to about 200 p.s.i., said polyalkylenepolyamine with an alkylene oxide having at least 2 carbon atoms, and then reacting said oxyalkylated polyalkylenepolyamine, at a temperature of from about 100° C. to about 250° C., with a hydrocarbon halide alkylating agent having 1–30 carbon atoms,

(12) a Schiff base reaction product of an acylated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the hereinabove recited formula, formed by reacting, at a temperature of from about 120° C. to about 300° C., said polyalkylenepolyamine with an acylating agent selected from the group consisting of (i) a carboxylic acid having 7–39 carbon atoms and (ii) a precursor of

said carboxylic acid capable of forming said acid in said reaction, and then reacting said acylated polyalkylenepolyamine with a compound selected from the group consisting of aldehydes and ketones,

(13) a Schiff base reaction product of an alkylated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the hereinabove recited formula, formed by reacting, at a temperature of from about 100° C. to about 250° C., said polyalkylenepolyamine with a hydrocarbon halide alkylating agent having 1–30 carbon atoms, and then reacting said alkylated polyalkylenepolyamine with a compound selected from the group consisting of aldehydes and ketones,

(14) an oxyalkylated Schiff base reaction product of a branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the hereinabove recited formula, formed by reacting said polyalkylenepolyamine with a compound selected from the group consisting of aldehydes and ketones to form said Schiff base reaction product and then reacting said Schiff base reaction product, at a temperature of from about 80° C. to about 200° C. and a pressure of from about 10 p.s.i., to about 200 p.s.i., with an alkylene oxide having at least 2 carbon atoms,

(15) an acylated, then olefinated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the hereinabove recited formula, formed by reacting, at a temperature of from about 120° C. to about 300° C., said polyalkylenepolyamine with an acylating agent selected from the group consisting of (i) a carboxylic acid having 7–39 carbon atoms and (ii) a precursor of said carboxylic acid capable of forming said acid in said reaction, and then reacting said acylated polyalkylenepolyamine, at a temperature of from about 70° C. to about 100° C., with an olefinating agent selected from the group consisting of acrylonitrile, styrene, butadiene, vinyl ethers and vinyl sulfones, and

(16) an alkylated, then olefinated branched polyalkylenepolyamine containing at least three primary amino groups and at least one tertiary amino group and having the hereinabove recited formula, formed by reacting, at a temperature of from about 100° C. to about 250° C., said polyalkylenepolyamine with a hydrocarbon halide alkylating agent having from 1–30 carbon atoms, and then reacting said alkylated polyalkylenepolyamine, at a temperature of from about 70° C. to about 100° C., with an olefinating agent selected from the group consisting of acrylonitrile, styrene, butadiene, vinyl ethers and vinyl sulfones.

3,271,308

PACKING MATERIAL AND METHOD AND APPARATUS UTILIZING SAID PACKING MATERIAL

Theodore L. Veit and Richard W. Watson, Palmyra, N.Y., assignors to Garlock Inc., Palmyra, N.Y., a corporation of New York

Filed May 17, 1960, Ser. No. 29,682
6 Claims. (Cl. 252—13)

4. A packing material consisting essentially of a mineral fiber in an amount sufficient to impart body to the packing material, solid lubricant in an amount sufficient to provide for lubrication in use, and binder for the mineral fiber and solid lubricant in an effective amount, said binder being a material selected from the group consisting of butyl rubber, polyisobutylene, and polybutene, and being volatile and upon volatilization leaving the mineral fiber and solid lubricant in compressible condition.

3,271,309

GREASE COMPOSITIONS

Gerard P. Caruso, New Orleans, La., assignor to Shell Oil Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed July 17, 1964, Ser. No. 383,503
20 Claims. (Cl. 252—21)

9. A grease composition consisting essentially of a lubricating base oil gelled to grease consistency by means of an oleophilic clay product, which has been rendered oleophilic by treatment of a clay having a base exchange capacity of 25–100 milliequivalents per 100 grams with an organic ammonium base, minor proportions each of an essentially water-insoluble metal carbonate having a Mohs hardness of 1–5 and a thermal decomposition of no less than 250° C. and a sulfide of the group consisting of molybdenum sulfide, amorphous antimony sulfides and mixtures thereof, the combined carbonate and sulfide being sufficient to improve substantially the extreme-pressure properties of the grease, and 0.1–0.75% by weight of a lead naphthenate.

3,271,310

METAL SALTS OF ALKENYL SUCCINIC ACID

William M. Le Suer, Cleveland, Ohio, assignor to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Filed Sept. 8, 1964, Ser. No. 395,031
7 Claims. (Cl. 252—35)

1. A metal salt of a hydrocarbon-substituted succinic acid having at least about 50 aliphatic carbon atoms in the hydrocarbon substituent, the metal of said metal salt being selected from the class consisting of Group I metals, Group II metals, aluminum, lead, tin, cobalt, and nickel.

7. A lubricating composition comprising a major proportion of a lubricating oil and from about 0.1% to about 20% by weight of a metal salt of claim 1.

3,271,311

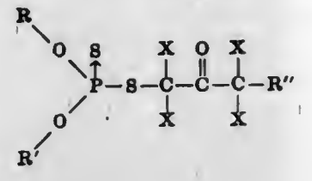
LUBRICANT

Arnold J. Morway, Clark, and Albert J. Bodner, Linden, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Filed Oct. 8, 1963, Ser. No. 314,630
5 Claims. (Cl. 252—39)

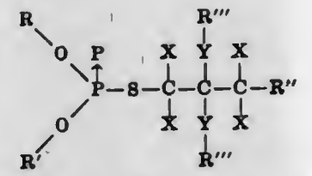
1. A lubricant having a tendency to increase in viscosity on heating and decrease in viscosity on cooling under low rates of shear, comprising a major amount of lubricating oil and alkaline earth metal salt of about 1.0 to 25.0 wt. percent of acetic acid, about 0.1 to 10.0 wt. percent C_{14} to C_{30} fatty acid having a Wijs iodine number of 35 to 75 and a saponification number of 150 to 250, and about .2 to 10.0 wt. percent of an amorphous polyisobutylene having a molecular weight of about 600 to about 1400 Staudinger, wherein all of said weight percents are based upon the total weight of the composition.

2. A lubricant according to claim 1, wherein said lubricating oil is mineral lubricating oil, said alkaline earth metal is calcium, and said C_{14} to C_{30} fatty acid is C_{14} to C_{20} fatty acid.



3,271,312

STABILIZATION OF ORGANIC SUBSTANCES



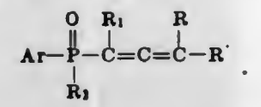
Henryk A. Cyba, Evanston, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Original application Nov. 19, 1962, Ser. No. 238,773. Divided and this application Feb. 12, 1965, Ser. No. 432,404
6 Claims. (Cl. 252—46.7)

1. Organic material selected from the group consisting of hydrocarbons, lubricating oils and greases containing a stabilizing concentration of an inhibitor having a structural formula selected from the group consisting of:

and

where O is oxygen, S is sulfur, P is phosphorus, C is carbon, R and R′ are selected from the group consisting of hydrogen and alkyl radicals, R″ is selected from the group consisting of hydrogen, alkyl, halogen and O,O-dialkyldithiophosphatyl radicals, X is selected from the group consisting of hydrogen and halogen radicals, Y is selected from the group consisting of oxygen and sulfur, and R‴ is selected from the group consisting of hydrogen and alkyl radicals, said alkyls each containing from 1 to about 20 carbon atoms.



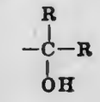
3,271,313

LUBRICANTS CONTAINING ALLENIC PHOSPHINYL COMPOUNDS

Armand P. Boisselle, Timberlake, Ohio, assignor to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

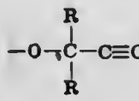
No Drawing. Filed Nov. 24, 1964, Ser. No. 413,614
8 Claims. (Cl. 252—49.8)

1. A lubricating composition comprising a major proportion of a lubricating oil and from about 0.01% to about 5% by weight of an allenic phosphinyl compound having the structural formula



wherein

(a) Ar is an aryl radical selected from the group consisting of phenyl, naphthyl, alkylphenyl, alkylnaphthyl, halophenyl, nitrophenyl and alkoxyphenyl;



(b) R is selected from the class consisting of hydrogen, lower alkyl, and lower cycloalkyl radicals;

(c) R_1 is selected from the class consisting of hydrogen, lower alkyl and

radicals;

(d) and R_2 is selected from the class consisting of Ar and

radicals.

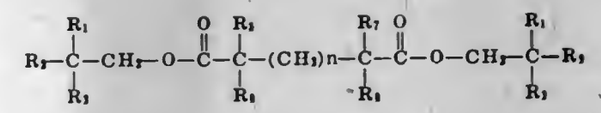
3,271,314

2,6-DIISOPROPYLPHENOL

George G. Ecke, Penn Hills Township, and Alfred J. Kolka, Pittsburgh, Pa., assignors to Ethyl Corporation, New York, N.Y., a corporation of Virginia

No Drawing. Filed Dec. 4, 1958, Ser. No. 778,063
2 Claims. (Cl. 252—52)

2. A lubricating oil normally tending to undergo oxidative deterioration containing a small antioxidant quantity, up to 5 percent, of 2,6-diisopropylphenol.



3,271,315

USE OF HINDERED ESTERS OF CARBOXYLIC ACIDS AS RADIATION RESISTANT LUBRICANTS

Leo J. McCabe, Glassboro, N.J., assignor to Continental Oil Company, Ponca City, Okla., a corporation of Oklahoma

No Drawing. Filed Nov. 1, 1963, Ser. No. 320,829
The portion of the term of the patent subsequent to June 14, 1983, has been disclaimed
6 Claims. (Cl. 252—56)

1. The method of lubricating machine elements subjected to atomic radiation comprising contacting said elements with a lubricating fluid having improved radiation stability and consisting essentially of a material having the formula

where R_1 and R_3 are alkyl groups containing not greater than 3 carbon atoms in each; R_2 is an acyclic alkyl group containing from 2 to 8 carbon atoms and may contain a single branch of not more than 2 carbon atoms; R_5, R_6, R_7, and R_8 are acyclic alkyl groups containing from 2 to 4 carbon atoms each; and n is an integer varying from 2 to 6.

3,271,316

METHOD OF MANUFACTURING FERROMAGNETIC OXIDES

Toru Inoue, 356 Soshigaya 2-chome, Tokyo, Japan, and Shuichi Iida, 14A–250 Mt. Vernon Place, Newark, N.J.

Filed June 11, 1965, Ser. No. 463,320
Claims priority, application Japan, Jan. 27, 1961, 36/2,195; Jan. 30, 1961, 36/2,616; Mar. 23, 1961, 36/9,468
8 Claims. (Cl. 252—62.5)

1. A method of manufacturing an iron-containing ferromagnetic oxide without disaccommodation which comprises preparing an iron-containing ferromagnetic oxide by a controlled atmosphere heat treatment, placing the resultant ferromagnetic oxide in an air-tight container with an oxygen absorbing agent in an amount which is less than 10^{-3}, and the tolerance of which is less than 5×10^{-4}, in terms of the proportion of the amount of the oxygen capable of absorbing to the total amount of the oxygen content of said ferromagnetic oxide; evacuating the interior of the container; sealing the container; heating the sealed container to an annealing temperature; annealing the ferromagnetic oxide under the action of said agent; and cooling the container to room temperature.

3,271,317

SILICATED SODIUM HYDROXIDE

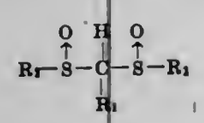
Joseph V. Otrhalek, Dearborn, and Paul E. Luoma, Grosse Ile, Mich., assignors to Wyandotte Chemicals Corporation, Wyandotte, Mich., a corporation of Michigan

No Drawing. Filed Dec. 24, 1963, Ser. No. 333,204
4 Claims. (Cl. 252—135)

1. A process for the preparation of silicated caustic soda comprising heating caustic soda liquor containing from about 50 to 75% sodium hydroxide at above a temperature of 200° F. to obtain a concentrate containing 69 to 76% sodium hydroxide and 31–24% water, adding

finely divided silica in an amount of from about 5 to 20% by weight based on the caustic soda liquor, boiling the reaction mass for about 1.5 to 4.5 hours to a final boiling point of about 355° F., and cooling the reaction mass to obtain a homogeneous frozen product comprising anhydrous sodium silicate having a particle size of less than 50 microns frozen in a matrix of a hydrate of sodium hydroxide containing no more than 1 mol of water per mol of sodium hydroxide.

3,271,318



SULFOXIDE DETERGENT

Jim S. Berry, Springfield Township, Hamilton County, and Warren I. Lyness, Mount Healthy, Ohio, assignors to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio

No Drawing. Original application Nov. 14, 1962, Ser. No. 237,715. Divided and this application July 28, 1965, Ser. No. 482,978

3 Claims. (Cl. 252—138)

1. An alkaline detergent composition consisting essentially of a 1,1-bis-sulfoxide compound having the formula:

wherein R_1 is an alkyl group containing from about 8 to about 16 carbon atoms; R_2 and R_3 are alkyl groups containing 1 to 2 carbon atoms and an alkaline builder salt selected from the group consisting of water soluble inorganic builder salts, water soluble organic alkaline sequestrant builder salts and mixtures thereof, the ratio of said sulfoxide compound to said builder salt being in the range of about 4:1 to about 1:20.

3. The composition of claim 1 wherein said alkaline builder salt is sodium tripolyphosphate.

3,271,319

WATER STAIN REMOVER

Carl H. B. Morrison, 4045 S. Cherry Ave., Fresno 6, Calif.

No Drawing. Filed Jan. 9, 1963, Ser. No. 250,233

2 Claims. (Cl. 252—142)

1. A fluid water stain remover having a Saybolt Universal viscosity of about 200 to 1500 seconds at 100° F. suitable for application to glass and glazed surfaces spotted by the action of water droplets, which comprises the following ingredients in solution:

	Percent
Hydrofluoric acid	8
Carboxy methyl cellulose	0.8
Sodium octyl sulfate	0.2
Water	91

3,271,320

POLONIUM RECOVERY

Raymond H. Moore, Kennewick, Wash., assignor to the United States of America as represented by the United States Atomic Energy Commission

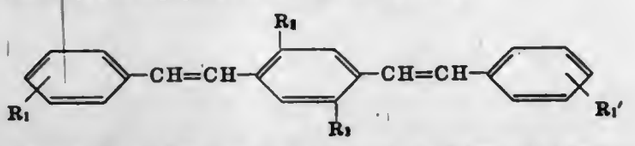
No Drawing. Filed Mar. 26, 1965, Ser. No. 443,114

3 Claims. (Cl. 252—301.1)

1. A method of recovering polonium values from a solution in bismuth metal, comprising melting said solution; adding cerium metal to said solution, whereby cerium bismuthide is precipitated and said polonium values are carried by said cerium bismuthide; and separating the polonium-containing cerium bismuthide from bismuth metal.

3,271,321

RESINS HOMOGENEOUSLY BRIGHTENED WITH BIS-STYRYLBENZENES



Walter Stilz and Horst Pommer, Ludwigshafen (Rhine), Erika Wolff, Heidelberg, and Heinz Fessmann, Ludwigshafen (Rhine), Germany, assignors to Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen am Rhine, Germany

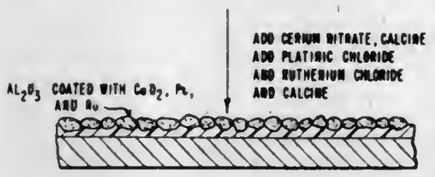
No Drawing. Filed June 20, 1960, Ser. No. 37,058

Claims priority, application Germany, June 24, 1959, B 53,723

20 Claims. (Cl. 252—301.2)

1. An optically brightened synthetic organic polymer in which there is homogeneously incorporated a substituted 1,4-bis-styrylbenzene of the formula:

wherein R_1 and R_1' each represents a substituent selected from the group consisting of —CN, —COOH, —COO—alkyl, —COO—cyclohexyl, —$CONH_2$, —CONH—alkyl, —CONH—cyclohexyl and —CON=$(alkyl)_2$ wherein the alkyl groups contain 1 to 4 carbon atoms, and wherein R_2 and R_3 each represents a substituent selected from the group consisting of hydrogen, alkyl, alkoxy and halogen, said R_2 and R_3 being limited to substituents which impart a maximum ultraviolet absorption value of not higher than 380 millimicrons and a fluorescence spectrum value between about 390 and 450 millimicrons, said values being measured as bands of maximum extinction in dioxane.



3,271,322

CATALYTIC SURFACE

Alvin B. Stiles, Welshire, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Filed June 30, 1964, Ser. No. 379,161

4 Claims. (Cl. 252—428)

1. A catalytic surface which consists essentially of a film of polytetrafluoroethylene, particulate carrier, and a catalyst, the catalyst being supported upon the said carrier and the supported catalyst being carried upon a surface and partially embedded in said film.

3,271,323

SILICATE MINERALS HAVING INCREASED SURFACE AREA AND ABSORPTION PROPERTIES AND METHOD OF PREPARATION THEREOF

Osgood J. Whittemore, Jr., Princeton, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

No Drawing. Filed Apr. 3, 1961, Ser. No. 100,031

16 Claims. (Cl. 252—432)

1. A method for the production of high surface area ceramics which comprises mixing together a silicate mineral with a boron compound selected from the group consisting of boric acid, boric oxide, calcium borate, and sodium tetraborate, firing the mixture at a temperature of from 600° C. to a temperature below that of complete fusion of the composition and for from about 1 to 60 hours, and leaching the fired product to substantially remove any water soluble residue, whereby the absorption and surface area of the silicate mineral are substantially increased.

3,271,324

CATALYST COMPOSITION CONSISTING OF COPPER OXIDE-IRON OXIDE ON ALUMINA

Ruth E. Stephens, Detroit, Daniel A. Hirschler, Jr., Birmingham, and Frances W. Lamb, Detroit, Mich., assignors to Ethyl Corporation, New York, N.Y., a corporation of Virginia

No Drawing. Filed June 1, 1962, Ser. No. 199,232

The portion of the term of the patent subsequent to Dec. 27, 1982, has been disclaimed

1 Claim. (Cl. 252—466)

A catalyst composition especially adapted to substantially oxidize the unburned hydrocarbons and carbon monoxide constituents of the exhaust gas of internal combustion engines, said composition consisting essentially of a major proportion of a transitional alumina and from 0.5 to about 25 percent by weight of copper oxide and from 0.5 to about 10 percent by weight iron oxide.

3,271,325

CATALYTIC COMPOSITIONS FOR USE IN STEAM REFORMING OF HYDROCARBONS

Phineas Davies, Norton-on-Tees, and Cecil Michael Stone, Reigate, Surrey, England, assignors to Imperial Chemical Industries Limited, London, England, a corporation of Great Britain

No Drawing. Filed Sept. 6, 1962, Ser. No. 221,898

Claims priority, application Great Britain, Sept. 11, 1961, 32,491/61

19 Claims. (Cl. 252—466)

1. A precursor composition for an alumina containing material, for use in catalysts, consisting essentially of a hydrate of alumina, aluminum, and a compound of a metal selected from the group consisting of aluminum and metals of Groups I, II and VIII of the Periodic Table.

8. An alumina containing material which is the heat reaction product obtained by heating a precursor composition consisting essentially of a hydrate of alumina, aluminum, and a compound of a metal selected from the group consisting of aluminum and metals of Groups I, II and VIII of the Periodic Table to a temperature of between 400° C. and 850° C. whereby the alumina hydrate and aluminum are at least partly converted to gamma alumina.

9. A steam reforming catalyst composition consisting essentially of an alumina containing material which is the heat reaction product obtained by heating a precursor composition consisting essentially of a hydrate of alumina, aluminum, and a compound of a metal selected from the group consisting of aluminum and metals of Groups I, II and VIII of the Periodic Table to a temperature of between 400° C. and 850° C. whereby the alumina hydrate and aluminum are at least partly converted to gamma alumina, and a catalytic material selected from the group consisting of nickel containing materials, platinum group metal containing material, and nickel and platinum group metal containing materials.

12. A process for preparing an alumina containing material which comprises heating a precursor composition consisting essentially of a hydrate of alumina, aluminum, and a compound of a metal selected from the group consisting of aluminum and metals of Groups I, II and VIII of the Periodic Table to a temperature of between 400° C. and 850° C.

14. A process for preparing an alumina containing material which process comprises mixing together a hydrate of alumina aluminum, and a compound selected from the group consisting of alkali metal and alkaline earth metal compounds, shaping the mixture and heating the shaped material to a temperature of between 600° C. and 800° C.

16. A process for preparing a catalyst composition comprising the steps of mixing together an alumina hydrate, aluminum and a compound of a metal selected from the group consisting of alkali metal and alkaline earth metal oxides, hydroxides and carbonates to provide a precursor composition, shaping said precursor composition and then heating in the presence of water to a temperature between 400° C. and 850° C. to provide an alumina containing material, wherein said alumina hydrate and aluminum are at least partially converted to gamma alumina, then impregnating said alumina containing material with a solution of a compound of a metal of Group VIII of the Periodic Table, and drying said impregnated alumina containing material to provide said catalyst composition.

3,271,326

FLAME SPRAYING OF CATALYTICALLY ACTIVE PULVERIZED METAL OXIDES ON SUPPORTS

Albert J. Forney, Coraopolis, and Joseph J. Demeter, Charleroi, Pa., assignors to the United States of America as represented by the Secretary of the Interior

No Drawing. Filed July 22, 1963, Ser. No. 296,870

3 Claims. (Cl. 252—466)

1. A process for producing a catalytic structure composed of a coating of a catalytically-active elemental metal on an inert support material, the metal being selected from the group consisting of nickel, iron, cobalt, molybdenum, tungsten, silver, vanadium, chromium and manganese, comprising

(a) flame spraying a feed material composed of a powdered oxide of said metal onto said support to form an oxide coating thereon;

(b) contacting said coating with a reducing gas to remove the oxygen therefrom and form pores in the coating thereby forming said catalytically-active coating on said support.

3,271,327

PREPARATION OF SUPPORTED PALLADIUM CATALYSTS

James E. McEvoy, Morton, and Harold Shalit, Drexel Hill, Pa., assignors to Air Products and Chemicals, Inc., Philadelphia, Pa., a corporation of Delaware

No Drawing. Filed May 29, 1963, Ser. No. 283,956

3 Claims. (Cl. 252—472)

1. The method of producing supported hydrated palladium oxide catalysts having peripheral distribution of palladium oxide on substantially non-porous support material, comprising neutralizing an aqeuous solution of palladium chloride and hydrochloric acid to a pH between 4 to 6.5 by the addition of a base, contacting the substantially non-porous support material with the neutralized solution, holding the treated support material for wet aging at a temperature between 70 to 85° F. and then drying the resulting supported catalyst at a temperature below 140° F.

3,271,328

POLYMERIZATION OF EPOXIDES IN THE PRESENCE OF ALUMINUM ALKYLATE AS CATALYST

Fred N. Hill, South Charleston, W. Va., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Filed July 30, 1957, Ser. No. 675,023

2 Claims. (Cl. 260—2)

1. A process for the production of a solid polymer of ethylene oxide which comprises polymerizing ethylene oxide at about 25° C. to 150° C. in the presence of a catalytic quantity of aluminum C_1–C_4 alkylate.

3,271,329

METHOD FOR PRODUCING POLYMERS DERIVED FROM PHOSPHITES AND GLYCOLS

Harry W. Coover, Jr., and Richard L. McConnell, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Sept. 19, 1958, Ser. No. 761,934
5 Claims. (Cl. 260—2)

1. A method for producing high molecular weight organo-phosphorus polymers which comprises transesterifying at a temperature within the range of 0–350° C. substantially equimolar proportions of hydrogen phosphite compound and dihydroxy compound in a reaction mixture selected from the class consisting of

(A) reaction mixtures that comprise

(1) a hydrogen phosphite compound having the formula

$$(RO)_2P(O)H$$

wherein R is alkyl containing 1 to 4 carbon atoms and

(2) a dihydroxy compound selected from the class consisting of

(a) 1,4-cyclohexanedialkanols in which the alkanol groups contain 1–4 carbon atoms,

(b) polyethylene glycols

(c) 2,2,4,4 - tetramethyl - 1,3 - cyclobutanediol, and

(d) 2,5- and 2,6-norcamphane dialkanols in which each alkanol group contains 1–4 carbon atoms and

(B) reaction mixtures that comprise

(1) diphenyl hydrogen phosphite and

(2) a dihydroxy compound selected from the class consisting of

(a) 1,4-cyclohexanedialkanols in which the alkanol groups contain 1–4 carbon atoms,

(b) alkanediols containing 4–8 carbon atoms in which the hydroxy groups are separated by more than 3 carbon atoms,

(c) polyethylene glycols,

(d) 2,2,4,4 - tetramethyl-1,3-cyclobutanediol, and

(e) 2,5- and 2,6-norcamphane dialkanols in which each alkanol group contains 1–4 carbon atoms

(f) 4,4'-alkylidene diphenols in which the alkylidene group contains 1–4 carbon atoms, and

(g) hydroquinone.

3,271,330

HIGH MOLECULAR WEIGHT PHOSPHONITRILE FLUOROESTERS

Roger L. Evans, Mendota Heights, Minn., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware

No Drawing. Filed Nov. 15, 1963, Ser. No. 323,918
8 Claims. (Cl. 260—2)

1. A solid, high molecular weight, vulcanizable, millable, plastic, water-stable, non-distillable, light colored phosphonitrile polymer having repeating units of the formula:

wherein each X is each selected from the class consisting of halogen and fluoroalkoxy radicals having the formula:

$$Z(CF_2)_n(CH_2)_m—O—$$

wherein Z is selected from the class consisting of hydrogen, fluorine and methylol, n is an integer of at least 1, m is an integer from 1–18 and n plus m is 2–19, at least 40 percent of the X groups being fluoroalkoxy radicals.

3,271,331

PHENOLIC FOAMS STABILIZED BY SILOXANE-OXYALKYLENE COPOLYMERS

Hans H. Ender, Buffalo, N.Y., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Oct. 10, 1963, Ser. No. 315,352
18 Claims. (Cl. 260—2.5)

1. A mixture suitable for use in producing a foamed phenol-aldehyde resole resin, said mixture comprising:

(A) a phenol aldehyde resole resin and

(B) a siloxane-oxyalkylene copolymer as foam stabilizer for the foamed phenol-aldehyde resole resin, said copolymer consisting essentially of (a) at least one siloxane chain consisting essentially of at least two siloxane units represented by the formula:

$$R_bSiO_{\frac{4-b}{2}}$$

wherein R is a member selected from the group consisting of the monovalent hydrocarbon groups, the divalent hydrocarbon groups, the hydroxy-substituted divalent hydrocarbon groups and the divalent hydrocarbon groups linked to carbonyl groups and b has a value from 1 to 3 inclusive, said siloxane chain containing at least one of said siloxane units wherein at least one R group is a divalent group, as defined above which links the siloxane chain to an oxyalkylene chain as defined below by a carbon to silicon bond, and (b) at least one oxyalkylene chain consisting essentially of at least one oxyalkylene group represented by the formula —R'O—, wherein R' is an alkylene group, said copolymer being present in the mixture in an amount of from 1 part to 10 parts by weight per 100 parts by weight of the resole resin.

3,271,332

SILOXANE FOAM

Herbert M. Bond, Stillwater Township, Washington County, and Jun Tomita, St. Paul, Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware

No Drawing. Continuation of application Ser. No. 144,856, Oct. 13, 1961. This application Dec. 7, 1964, Ser. No. 416,605
8 Claims. (Cl. 260—2.5)

1. A fluid, low-viscosity siloxane composition which autogenously foams and cures at room temperature on the addition of a basic vulcanization catalyst, exhibiting high tack and adhesive properties during such autogenous action to provide a resulting heat- and cold-resistant, flexible, tough, resilient, tack-free, foamed structural product, said fluid composition comprising a mixture of (1) between 60 and 80 parts of a diorganopolysiloxane fluid gum essentially free of hydroxyl termination, having a viscosity of between 1,000 and 50,000 cps. at 25° C., and having the general formula

$$R_nSiO_{\frac{4-n}{2}}$$

where R is a monovalent organic radical, at least 85% of said radicals being methyl, and n has an average value of 1.9 to 2.1, and (2) between 40 and 20 parts of a benzene-soluble silicone resin composed essentially of $R_3SiO_{1/2}$ units and SiO_2 units, where R is a monovalent organic radical, at least 90% of said radicals being methyl, and where the ratio of $R_3SiO_{1/2}$ units to SiO_2 units in said resin is between about 0.7 and 0.96 inclusive, said composition additionally including, for every 100 parts of said mixture, (3) sufficient methyl hydrogen polysiloxane to provide between 0.017 and 0.17 part by weight of silanic hydrogen, any organic radicals other than methyl in said methyl hydrogen polysiloxane being those which offer substantially no steric hindrance to removal of silanic hydrogen from its silicon atom bond in said methyl hydrogen polysiloxane, said composition being foamed and cured at room temperature on the addition of between 0.1 to 2 parts by weight of a basic vulcanization catalyst active to split off silanic hydrogen from its attachment to a silicon atom of said methyl hydrogen polysiloxane.

3,271,333

SELF-EXTINGUISHING ALKENYL AROMATIC POLYMERS

Jacob Eichhorn, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Michigan

No Drawing. Filed Mar. 28, 1963, Ser. No. 268,598
5 Claims. (Cl. 260—2.5)

1. A self-extinguishing alkenyl aromatic polymer composition containing a halogenated organic compound as a self-extinguishing agent wherein said composition contains from about 0.1 percent to about 2.0 percent by weight of α,α'-diphenyl-α-methoxybibenzyl as a synergist for said self-extinguishing agent.

3,271,334

PROCESS FOR THE PRODUCTION OF CROSS-LINKED COMPOUND POLYMERS OF POLY-ACROLEIN

Werner Kern, Rolf Schulz, and Irmela Löflund, Mainz (Rhine), Germany, assignors to Deutsche Gold- und Silber-Scheideanstalt vormals Roessler, Frankfurt am Main, Germany

No Drawing. Filed Sept. 4, 1963, Ser. No. 306,611
Claims priority, application Germany, Oct. 4, 1958, D 29,076
9 Claims. (Cl. 260—8)

8. The product of a reaction of an infusible macromolecular homopolymer of acrolein having a molecular weight of at least 10,000 produced in the presence of a free radical polymerization catalyst dissolved in an aqueous solution of sulfurous acid having a pH between 1 and 5 with a polymeric compound selected from the group consisting of natural and synthetic polymeric compounds which are macromolecular and contain more than four groups per macromolecule which are reactive with aldehyde groups selected from the group consisting of OH, SH, NH_2, NH, NH_2—NH and activated CH_2 groups at a temperature between 0° and 200° C.

3,271,335

MANUFACTURE OF CELLULOSIC BOARD AND NOVEL ADHESIVE SYSTEM THEREFOR

Logan C. Bostian, Morris Township, Morris County, and Malcolm H. Heffner, Whippany, N.J., assignors to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed May 20, 1963, Ser. No. 281,823
18 Claims. (Cl. 260—17.2)

1. The method for manufacture of pressed wood particle board which comprises forming stock of water-moistened wood particles intimately mixed with about 4 to 20 percent by dry weight of the wood particles of bonding material comprising the combination of: (a) about 10–60 percent of a chlorinated low pressure, linear polyethylene resin containing about 25–65 percent by weight chlorine, and (b) about 40–90 percent of a water-soluble formaldehyde resin selected from the group consisting of urea-formaldehyde and phenol-formaldehyde, and thereafter comprising said stock and heating to at least partially cure said formaldehyde resin and form said stock into pressed wood particle board.

2. The method for manufacture of pressed wood particle board which comprises forming stock of water-moistened wood particles intimately mixed with about 4 to 20 percent by dry weight of the wood particles of bonding material comprising the combination of: (a) about 10–60 percent of an oxidized chlorinated low pressure, linear polyethylene resin containing about 25–65 percent by weight chlorine, and (b) about 40–90 percent of a water-soluble formaldehyde resin selected from the group consisting of urea-formaldehyde and phenol-formaldehyde, and thereafter compressing said stock at elevated temperature between about 150° C. to 250° C. to form said stock into pressed wood particle board.

3,271,336

VINYL ESTER COPOLYMERS

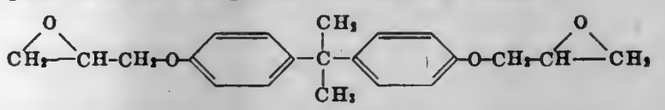
Henry Warson, Olton, Solihull, and Douglas Stuart William Dargan, Wylde Green, Sutton Coldfield, England, assignors to Dunlop Rubber Company Limited, a British company

No Drawing. Filed July 25, 1963, Ser. No. 297,666
Claims priority, application Great Britain, Aug. 3, 1962, 29,895/62
12 Claims. (Cl. 260—17.4)

1. A copolymer of a vinyl ester and not more than 0.3% based on the total weight of monomers of the condensation reaction product of acrolein with a polyhydric alcohol having at least three hydroxy groups in the molecule.

3. A method for the production of a copolymer which comprises heating an aqueous emulsion of a vinyl ester and not more than 0.3% based on the total weight of monomers of the condensation reaction product of acrolein with a polyhydric alcohol having at least three hydroxy groups in the molecule.

9. A method according to claim 3 wherein the said aqueous emulsion incorporates a dispersing colloid.



3,271,337

OXETANE POLYMERS STABILIZED WITH AN EPOXIDE AND A STERICALLY HINDERED PHENOLIC COMPOUND

Robert F. Goddu, Kennett Square, Pa., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed May 28, 1963, Ser. No. 283,701
2 Claims. (Cl. 260—18)

1. A polymeric composition consisting esentially of a mixture of a polymer of 3,3-bis(chloromethyl) oxetane and, as a heat and light stabilizer therefor, from about 0.1 to 10% by weight of the polymer of 2,4,6-tris(4-hydroxy-3,5,-di-t-butyl benzyl) mesitylene, and, as a co-stabilizer therefor, from about 0.01 to 4.0% by weight of the polymer of an epoxide compound selected from the group consisting of epoxidized soybean oil, epoxidized cottonseed oil, epoxidized linseed oil, the reaction product of epichlorohydrin and 2,2-bis(4-hydroxyphenyl) propane, said reaction product having the formula

phenoxy propylene oxide, cyclohexene oxide, 1,2-epoxy hexadecene, glycidyl octyl ether, 9,10-epoxy butyl stearate, phenyl methyl glycidol, epoxy acetoxy stearin, dipentene diepoxide, vinyl cyclohexene diepoxide, and dicyclopentadiene diepoxide.

3,271,338

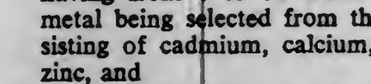
POLYVINYL HALIDE STABILIZERS COMPRISING SULFUR-CONTAINING COMPOUNDS AND METAL SALTS OF EPOXIDIZED FATTY ACIDS

Peter Klemchuk, Yorktown Heights, and Martin Dexter, White Plains, N.Y., assignors to Geigy Chemical Corporation, Greenburgh, N.Y., a corporation of Delaware

No Drawing. Filed Nov. 27, 1961, Ser. No. 155,191
17 Claims. (Cl. 260—23)

1. Composition of matter which comprises a major proportion of polyvinyl chloride and a minor proportion of a stabilizer system comprising in a ratio of substantially 1:1 by weight:

(1) a member selected from the group consisting of



(a) a metal salt of an aliphatic carboxylic acid having at least one epoxy ring therein, said carboxylic acid containing from 8 to 18 carbon atoms and said metal being selected from the group consisting of cadmium, calcium, barium and zinc, and

(b) a mixture of

(i) a metal salt of an aliphatic carboxylic acid having from 8 to 18 carbon atoms, said metal being selected from the group consisting of cadmium, calcium, barium and zinc, and

(ii) an organic carboxylic acid ester having from 8 to 36 carbon atoms and at least one epoxy group therein and

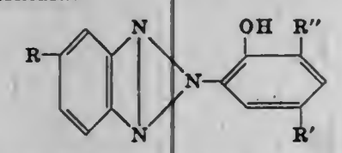
(2) a compound of the formula:

wherein

R is a member selected from the group consisting of primary alkyl having from 8 to 18 carbon atoms, monoalkylphenyl and phenyl

R′ is a member selected from the group consisting of hydrogen and lower alkyl, and

M is a member selected from the group consisting of cadmium, calcium, barium and zinc.



3,271,339

POLYOLEFIN STABILIZERS COMPRISING ESTERS OF THIODIETHYLENEGLYCOL AND HYDROXYPHENYL BENZOTRIAZOLES

Vittorio Cappuccio, Alberto Bouvicini, and Cornelio Caldo, Terni, Italy, assignors to Montecatini Società Generale per l'Industria Mineraria e Chimica, Milan, Italy

No Drawing. Filed Feb. 12, 1963, Ser. No. 257,857
Claims priority, application Italy, Feb. 13, 1962, 2,825/62
13 Claims. (Cl. 260—23)

1. A stabilized polymeric composition consisting essentially of a poly-alpha-olefin and from about 0.02 to 2.0% by weight of said poly-alpha-olefin of a stabilizing mixture consisting of about 20 to 60% by weight of said stabilizing mixture of an aliphatic thioester wherein the aliphatic radical contains 8–30 carbon atoms, said thioester being an ester of thiodiethyleneglycol; at least 1% by weight of said stabilizing mixture of a substituted phenolic compound; and about 20 to 60% by weight of said stabilizing mixture of an hydroxybenzotriazolic compound having the general formula:

wherein R is selected from the group consisting of a halogen, hydrogen, a hydroxy group, an alkyl radical, and an aryl radical, and R′ and R″ are selected from the group consisting of an alkyl radical, an aryl radical, and hydrogen.

12. The stabilized polymeric composition of claim 1 which further contains at least 0.3% of calcium stearate.

3,271,340

OLEFIN POLYMERS MODIFIED WITH POLYPROPYLENE WAX

Newton H. Shearer, Jr., James E. Guillet, and Harry W. Coover, Jr., Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Dec. 30, 1960, Ser. No. 79,516
18 Claims. (Cl. 260—28.5)

1. An α-olefin polymer blend exhibiting improved physical properties consisting essentially of (1) solid hydrocarbon polymer of an α-olefin containing 3–10 carbon atoms, said polymer having a density of at least 0.80, a melting point in the range of about 45° to about 350° C. and an inherent viscosity in the range of about .9 to about 5 in Tetralin at 145° C. and (2) about 3 to about 50% by weight, based on the composition, of polypropylene wax having a density of at least 0.88, a melting point in the range of about 130° to about 180° C. and an inherent viscosity in the range of about .05 to about .5 in Tetralin at 145° C.

3,271,341

AQUEOUS COLLOIDAL DISPERSIONS OF POLYMER

William Emmett Garrison, Jr., Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Aug. 7, 1961, Ser. No. 129,526
21 Claims. (Cl. 260—29.6)

1. In the polymerization of a monoethylenically unsaturated monomer composition in an aqueous medium to obtain a colloidal dispersion of polymer employing a water-soluble polymerization initiator, the step of carrying out the polymerization in the presence of an ionizable dispersing agent, said dispersing agent being a compound having a solubility of at least 0.1% at 100° C. and having the general formula

where X is a member of the class consisting of fluorine and the perfluoromethyl radical, *m* is a positive integer from 1 to 5 inclusive, *n* is a positive integer from 0 to 10 inclusive, and A is a hydrophilic radical selected from the class consisting of hydrogen, ammonium radical, alkali metals, and substituted ammonium radicals.

3,271,342

COMPOSITION COMPRISING A SALT OF A STYRENE-MALEIC ACID COPOLYMER AND A POLYURETHANE

Hans H. Kuhn, Edgar Dare Bolinger, and Emile E. Habib, Spartanburg, S.C., assignors to Deering Milliken Research Corporation, Spartanburg, S.C., a corporation of Delaware

No Drawing. Filed Feb. 4, 1963, Ser. No. 256,153
7 Claims. (Cl. 260—29.6)

1. A flexible, film-forming, water-soluble composition comprising a mixture of

(a) a film-forming water-soluble partial metal salt of a styrene-maleic acid copolymer, having a pH between about 4 and 9, and

(b) a film-forming water-soluble polyurethane which is the reaction product of a diisocyanate and a polyalkylene ether glycol,

in a proportion of (a) to (b) of from about 9:1 to 1:9.

3,271,343

FLAME-RESISTANT ACRYLONITRILE POLYMER COMPOSITIONS CONTAINING POLYEPIHALOHYDRINS AND CALCIUM PHOSPHATES

Fred J. Lowes, Jr., Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Jan. 21, 1964, Ser. No. 339,073
17 Claims. (Cl. 260—29.6)

1. Composition comprising a spinnable dispersion of (1) a fiber-forming acrylonitrile polymer which contains in the polymer molecule at least about 85 weight percent of acrylonitrile, any balance being another monoethylenically unsaturated monomer that is copolymerizable with acrylonitrile and, (2) between about 15 and 20 weight percent based on the weight of said fiber-forming polymer, of a flameproofing mixture comprised of (a) at least 5 weight percent of a substantially water-insoluble polyepihalohydrin, said polyepihalohydrin being essentially devoid of functional epoxy groups and having a viscosity at 100° F. of between about 300 and 4000 centistokes and (b) a substantially water-insoluble calcium phosphate, the ratio of polyepihalohydrin to calcium phosphate being from about 0.5:1 to 5:1.

3,271,344

FLAME-RESISTANT ACRYLONITRILE POLYMER COMPOSITIONS CONTAINING POLYEPIHALOHYDRINS AND ANTIMONY OXIDE

Fred J. Lowes, Jr., Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Jan. 21, 1964, Ser. No. 339,075
17 Claims. (Cl. 260—29.6)

1. Composition comprising a spinnable dispersion of (1) a fiber-forming acrylonitrile polymer which contains in the polymer molecule at least about 85 weight percent of acrylonitrile, any balance being another monoethylenically unsaturated monomer that is copolymerizable with acrylonitrile and (2) between about 10 and 20 weight percent based on the weight of said fiber-forming polymer, of a flameproofing mixture comprised of (a) at least 2.5 weight percent of a substantially water-insoluble polyepihalohydrin, said polyepihalohydrin being essentially devoid of functional epoxy groups and having an average molecular weight less than about 1200 and a viscosity at 100° F. of between about 300 and 4000 centistokes and (b) antimony oxide, the ratio of polyepihalohydrin to antimony oxide being from about 1:5 to 5:1.

3,271,345

ADHERING LAYERS TO POLYESTER FILM

Gale F. Nadeau, Clemens B. Starck, and Frederick J. Jacoby, all of Rochester, N.Y., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

Filed Oct. 14, 1965, Ser. No. 497,603
6 Claims. (Cl. 260—29.6)

1. An aqueous coating composition for use in subbing polyester film support comprising (1) from 1 to 7 parts by weight of an adherent copolymer prepared from 35% to 96% of a monomer selected from the group consisting of vinyl chloride and vinylidene chloride, from 0.5% to 25% of an ethylenically unsaturated monomeric copolymerizable carboxylic acid compound wherein said carboxylic acid compound is selected from the group consisting of itaconic acid, citraconic acid, mesaconic acid, acrylic acid, α-methacrylic acid, maleic acid, fumaric acid and the anhydrides and lower alkyl half-esters of those acids which are dibasic, 0% to 65% by weight of an acrylic ester of a lower alkanol, and (2) from 0.1 to 5 parts by weight of a dihydroxy aromatic compound selected from the group consisting of resorcinol, orcinol, 4-chloro-resorcinol, 1,3-naphthalene diol, 1,6-naphthalene diol, catechol, 2,4-dihydroxy toluene and mixtures thereof.

3,271,346

PROCESS FOR PRODUCING ELASTIC POLYURETHANE YARN

Ryoichi Wakasa, Tokyo, Atsushi Shibata, Urawa-shi, and Jukichi Ohmura and Isamu Suzuki, Tokyo, Japan, assignors to Asahi Kasei Kogyo Kabushiki Kaisha, Osaka, Japan, a corporation of Japan

No Drawing. Filed July 5, 1963, Ser. No. 293,184
Claims priority, application Japan, July 7, 1962, 37/28,465
8 Claims. (Cl. 260—30.8)

1. A process for producing an elastic polyurethane yarn which comprises adding a solvent selected from the group consisting of dimethylformamide, dimethylacetamide, and dimethylsulfoxide to a prepolymer produced by reacting a diol polymer selected from the group consisting of polyethers, polyesters, polylactones and poly(oxyalkylene-carboxyalkylene), each of which has terminal hydroxyl groups, with an organic diisocyanate in an amount of 150 to 300 mole percent, based on the diol polymer, and with 3 to 30 moles of water per 100 moles of the diisocyanate to form a homogeneous solution, adding water to said solution at room temperature to bring said homogeneous solution to a gel state, heating the resulting gel at a temperature between 120° and 180° C. to obtain a solution state and then subjecting the solution to spinning.

3,271,347

PRINTING INK BASED ON ACRYLIC OR METHACRYLIC ACID COPOLYMERS AND POLYOXYETHYLENE

Elihu J. Aronoff, Glen Oaks, N.Y., and Paul D. Whyzmuzis, Clifton, N.J., assignors to Interchemical Corporation, New York, N.Y., a corporation of Ohio

No Drawing. Filed Jan. 31, 1964, Ser. No. 341,744
11 Claims. (Cl. 260—31.4)

1. An acrylic acid copolymeric ink composition comprising (1) pigment dispersed in (2) a volatile organic solvent solution of (3) a copolymer or from 4 to 25% of an acrylic acid selected from the group consisting of acrylic acid and methacrylic acid and the remaining monomeric material comprising a member selected from the group consisting of vinylidene chloride and acrylic ester material having the formula

where R is a member selected from the group consisting of hydrogen methyl and ethyl and R′ is an alkyl radical of from 1 to 6 carbons said vinylidene chloride member being at least 70% of the copolymer and said acrylic ester member being at least 90% of the copolymer and (4) polyoxyethylene containing from 2 to 12 oxyethylene groups for each carboxyl group present in the acrylic acid copolymer.

3,271,348

FUSED EPOXY RESIN-MONOAMINE COMPOUND AS PROCESSING AID IN PIGMENTED NYLON

Augustinus Ludovicus Henricus Hartong, Deventer, Netherlands, assignor to American Enka Corporation, Enka, N.C., a corporation of Delaware

No Drawing. Filed Jan. 17, 1962, Ser. No. 166,914
Claims priority, application Netherlands, Feb. 3, 1961, 260,804
3 Claims. (Cl. 260—32.6)

1. A process for uniformly incorporating pigments in polycaprolactam comprising forming a dispersion of finely divided pigment particles in a fused mixture of a compound or a mixture of compounds selected from the group of saturated primary, secondary and tertiary aliphatic monoamines having at least 14 carbon atoms and an epoxy resin having a molecular weight of from 300 to 3800 prepared by reacting epichlorohydrin with diphenylol propane in proportion of 2 to 3 parts of the epoxy resin per 4.5 parts of amine, and adding and mixing the resulting pigmenting dispersion to a polycaprolactam melt in amounts such that no more than 5% by weight of said amine based on the weight of polycaprolactam is included in said melt.

3,271,349

POLYSTYRENE METHODS AND PRODUCTS

Harold A. Levey, 812733 Oleander St., and Edward S. Fonda, % Alabama Chemical Co., 2721 Decatur, both of New Orleans, La.

No Drawing. Filed July 18, 1963, Ser. No. 296,099
5 Claims. (Cl. 260—33.6)

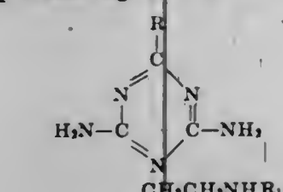
1. A method of removing objectionable odors from polystyrene containing malodorous styrene bottoms comprising

diluting said styrene bttoms in a solvent to form a solution having 10%–85% solids content and thoroughly mixing said solution with an oxidizing agent solution having a density different from the density of said first-mentioned solution, for a period of time sufficient to remove undesirable odors from said styrene bottoms substantially at room temperature,

said oxidizing agent being selected from the group consisting of hydrogen peroxide, sodium hypochlorite and sodium perborate,

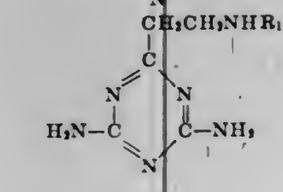
permitting said first-mentioned solution to separate from said oxidizing agent solution to form two distinct layers,

and decanting said oxidizing agent solution from said first-mentioned solution.



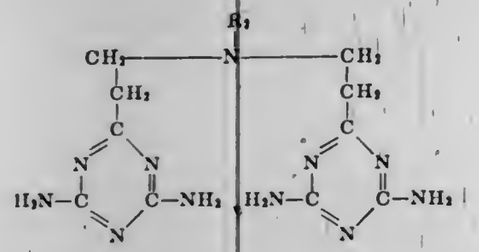
3,271,350
EPOXY RESIN COMPOSITION COMPRISING (1) PARTIAL REACTION PRODUCT OF EPOXY RESIN AND GUANAMINE AND (2) UNREACTED EPOXY RESIN

Leonard R. Vertnik, Minneapolis, Minn., assignor to General Mills, Inc., a corporation of Delaware



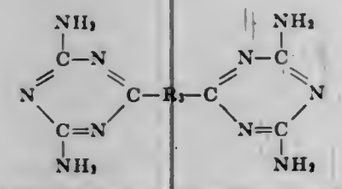
No Drawing. Filed May 28, 1963, Ser. No. 283,713
20 Claims. (Cl. 260—32.8)

1. The process of preparing a curable composition from at least one epoxy resin having terminal epoxide groups and an epoxy equivalent weight of from about 140 to about 2000 and a sufficient amount of a guanamine to cure said epoxy resin to an infusible and insoluble polymer, the weight ratio of the guanamine to the epoxy resin being in the range of about 5:95 to 75:25, comprising (I) reacting about 50 to 95% by weight of the epoxy resin with the guanamine, (II) terminating the reaction when about 5 to 90% complete and (III) adding the remaining 5 to 50% by weight of the epoxy resin to the partial reaction product, said guanamine being selected from the group consisting of



(A)

(B)



(C)

and

(D)

where R is selected from the group consisting of the phenyl radical and aliphatic hydrocarbon groups containing 4 to about 21 carbon atoms, R_1 and R_2 are aliphatic hydrocarbon groups containing 4 to about 21 carbon atoms and R_3 is a divalent hydrocarbon group containing 4 to about 42 carbon atoms.

12. The curable composition prepared by the process of claim 1.

19. A solvent solution of the curable composition of claim 12.

20. The solution of claim 19 wherein the solvent is selected from the group consisting of alkyl ethers of ethylene glycol, methyl ethyl ketone, acetone, trichloroethylene and mixtures thereof.

3,271,351
POLYETHYLENE OXIDES AS BINDERS IN ASBESTOS PACKINGS

George P. Leistensnider, Somerville, N.J., assignor to Johns-Manville Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed Nov. 1, 1961, Ser. No. 149,163
2 Claims. (Cl. 260—37)

1. A flexible molded composition packing consisting essentially of, within the approximate ranges, the following ingredients on a dry weight basis: 19 to 24.5% solid lubricating filler selected from the group consisting of graphite, mica, and mixtures thereof, up to 5% sodium nitrite inhibitor, 0.1 to 2% high molecular weight water soluble poly(ethylene oxide) resin, and the remainder asbestos fiber.

3,271,352
POLYURETHANE COATING FROM MIXED POLYURETHANE POLYMERS

Marvin Alfred Weinberg, Metuchen, N.J., assignor to Johnson & Johnson, a corporation of New Jersey

No Drawing. Filed Mar. 9, 1965, Ser. No. 438,395
3 Claims. (Cl. 260—37)

1. A varnish composition comprising a varnish base comprising the combination of a solid isocyanato terminated polyether polyurethane resin and from 3 to 50% by weight of said combination of an isocyanato terminated polyether polyurethane liquid pre-elastomer, said resin having by weight 4 to 15% isocyanato groups and being the reaction product of a diisocyanate and a mixture of diols and triols having an average of approximately 2.5 to 2.67 hydroxyl groups per mole, at least 50 mole percent of said diols being a polypropylene ether glycol, and said pre-elastomer having by weight 2 to 9% isocyanato groups and being the reaction product of a diisocyanate and a polytetramethylene ether glycol having an average of approximately 2 hydroxyl groups per mole.

3,271,353
POLYESTERS AND PRESSURE-SENSITIVE ADHESIVE COMPOSITIONS

Theodore H. Szawlowski, Wonder Lake, Ill., and Louis A. Joo, Johnson City, Tenn., assignors, by mesne assignments, to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Filed Dec. 27, 1962, Ser. No. 247,515
9 Claims. (Cl. 260—40)

7. A pressure-sensitive adhesive composition formed by the esterification of complex carboxylic acids derived from solvent extracts obtained in the solvent extraction of mineral lubricating oils using a solvent selective for aromatic compounds by metalation, carbonation and acidification of said solvent extracts, maleic anhydride, triethylene glycol and diethylene glycol using an excess of total acid equivalents over the total hydroxyl equivalents.

8. A pressure-sensitive adhesive composition in accordance with claim 7 in which the ratio of total acid equivalents to total hydroxyl equivalents is about 1.1/1 to 2.5/1 and said esterification is conducted at a temperature of about 400° to 450° F.

9. An adhesive composition in accordance with claim 8 containing an inert filler of the group consisting of silica flour, zinc oxide, iron oxide, barium sulfate, glass wool, fiber glass, and powdered clay.

3,271,354
PIGMENT PREPARATIONS FOR THE COLORATION OF PLASTIC MASSES

Josef Weissert, Viktor Schönbach, and Ferdinand Memmel, Frankfurt am Main, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Filed Dec. 27, 1962, Ser. No. 247,484
Claims priority, application Germany, Jan. 4, 1962, F 35,709
6 Claims. (Cl. 260—41)

1. A method for coloring a plastic mass with a pigment comprising incorporating into said mass a preparation consisting essentially of from 40 to 75% by weight of a pigment and from 25 to 60% by weight of a carrier, said carrier consisting essentially of

(a) from 10 to 95 weight percent of a copolymer of ethylene and propylene having a propylene content of from 30 to 50 mol percent and

(b) from 5 to 90 weight percent of amorphous polypropylene having an intrinsic viscosity of

$$[\eta] \lim_{c \to 0} \frac{\eta_{spec.}}{c} = 0.2\text{–}0.5 \text{ cm.}^3/\text{g}$$

and a crystalline portion of 0.5 to 15% by weight.

3,271,355
HYDROCARBON POLYMER CONTAINING VINYL SILANE MODIFIED SILICA

Byron M. Vanderbilt, Westfield, and Charles F. Marsden, Jr., Bedminster, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Filed Feb. 9, 1961, Ser. No. 88,032
8 Claims. (Cl. 260—41.5)

1. A process which comprises admixing:

A. coarse silica having an average particle size of 10 to 100 microns; and

B. an organic silane containing an unsaturated hydrocarbon radical attached to the silicon atom; and

C. a thermosetting mix containing a mixture selected from the group consisting of:

(1)

(a) polymers of C_2–C_{12} olefins, and

(b) a peroxide catalyst; and

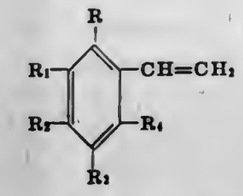
(2)

(a) homopolymers of C_4–C_6 conjugated diolefins,

(b) a peroxide catalyst, and

(c) 0 to 70%, based on the weight of said thermosetting mix, of at least one monomeric cross-linking agent selected from the group consisting of monovinyl aromatics, polyvinyl aromatics, acrylic acid esters of monobydric alcohols, methacrylic acid esters of monohydric alcohols, acrylic acid esters of polyhydric alcohols, alkyl fumarates, allyl esters, vinyl esters and mixtures thereof; and

(3)



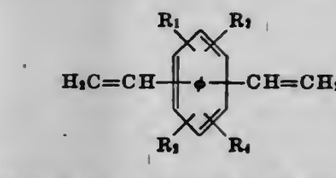
(a) copolymers of C_4–C_6 conjugated diolefins with minor amounts of ethylenically unsaturated monomers,

(b) a peroxide catalyst, and

(c) 0 to 70%, based on the weight of said thermosetting mix, of at least one monomeric cross-linking agent selected from the group consisting of monovinyl aromatics, polyvinyl aromatics, acrylic acid esters of monohydric alcohols, methacrylic acid esters of monohydric alcohols, acrylic acid esters of polyhydric alcohols, alkyl fumarates, allyl esters, vinyl esters and mixtures thereof; and

(4)

(a) amonomeric styrene compound having the formula:



wherein R, R_1, R_2, R_3 and R_4 are each independently selected from the group consisting of hydrogen, halogen and alkyl radicals containing not more than 18 carbon atoms, and

(b) 0 to 20%, based on the weight of said thermosetting mix, of monofunctional monomer selected from the group consisting of acrylonitrile, alpha chloroacrylonitrile, methyl methacrylate, n-butyl methacrylate, vinylidine chloride, diethyl fumarate, dibutyl fumarate, vinyl propionate, ethyl acrylate, butyl acrylate, allyl benzoate, allyl hexoate, vinyl n-butyl ether, and vinyl stearate, and

(c) a peroxide catalyst and

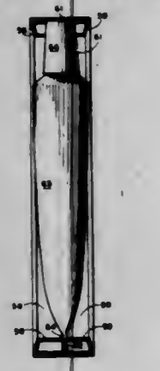
(d) at least 0.5 part, per 100 parts of said thermosetting mix, of a polyolefinic monomer selected from the group consisting of the methacrylate esters of polyhydric alcohols and polyvinyl compounds having the formula:

wherein R_1, R_2, R_3 and R_4 are each independently selected from the group consisting of hydrogen, halogen, alkyl groups and a vinyl group; and ϕ is an aromatic nucleus selected from the group consisting of benzene, naphthalene, biphenyl and phenanthrene.

3,271,356
GRANULES OF FINELY DIVIDED RUBBER REINFORCING SILICEOUS PIGMENT AND RUBBERY MATERIAL

Gerd Roderburg, Bad Godesberg, and Gerhard Steenken, Wesseling (Rhine), Germany, assignors to Deutsche Gold- und Silber-Scheideanstalt vormals Roessler, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Filed Dec. 4, 1961, Ser. No. 156,952
3 Claims. (Cl. 260—41.5)



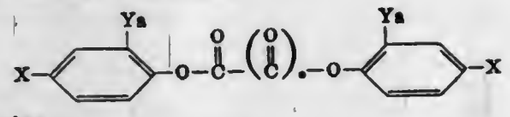
1. A method of preparing granules of siliceous pigmentary filler which comprises adding to an aqueous dispersion of solid siliceous pigmentary filler from 0.2 to 7.5 percent of rubbery latex by weight of the solid siliceous pigmentary filler content of the dispersion, said siliceous filler consisting essentially of finely divided particles having an average ultimate particle size below 1 micron and a specific surface area between 50 and 300 square meters per gram and being a member selected from the group consisting of precipitated hydrated silicas, alkaline earth metal silicates, aluminum silicates, and sodium aluminum silicates, said rubber consisting essentially of a material selected from the group consisting of natural rubber, butadiene-styrene copolymers, butadiene-acrylonitrile copolymers, butadiene homopolymers, 2-chlorobutadiene polymers, isoprene polymers and ethylene polymers, removing water and partially drying to form a dough of the resulting siliceous filler-rubber material,

granulating the dough and thereafter drying further to reduce the water content to below 2 weight percent to produce granules consisting essentially of said siliceous pigmentary filler and said rubber material.

3,271,357
DISPLAY PACKAGE FOR COLLAPSIBLE TUBES AND THE LIKE

Robert V. Burt, Cincinnati, Ohio, assignor to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio

Filed Oct. 12, 1964, Ser. No. 403,214
3 Claims. (Cl. 206—45.33)



1. A package for a collapsible tube comprising a frame, said frame being formed from a frame blank made of paperboard material and generally configured in the form of an elongated strip, said frame blank having two spaced parallel scores running longitudinally from one end of said elongated strip to the other end thereof, a plurality of transverse scores at intervals along the said frame blank and being substantially perpendicular to said parallel longitudinal scores thereby dividing the central portion of the frame blank into four panels including two side panels and two end panels, said side and end panels being alternately spaced along said frame blank, a flap articulated to and extending beyond the panel at one end of said frame blank, an extending portion projecting laterally outwardly from each of the longitudinal scores which define the edge portions of the said panels, each of said extending portions being at least partially separated by angular relief cut-outs outwardly of each of said transverse scores, each of said extending portions having three score lines all of which are parallel to the parallel scores running longitudinally from one end of said elongated strip to the other, said three score lines dividing the extending portions into an inner area, an inner intermediate area, an outer intermediate area and an outer area, each of said extending portions being folded into a tubular support with the outer area of each extending portion being adhered to its adjoining panel so that each side and end panel has a pair of substantially rigid tubular supports in parallel abutting relationship alongside the longitudinal scores forming the upper and lower extremities of said side and end panels, said tubular supports being formed so that the outer intermediate area of each is substantially perpendicular to the side and end panels, said outer intermediate areas of said tubular supports being adhered together and having a wedge-shaped trough formed at the inner juncture thereof, a collapsible tube having a closure cap at one end and a sealed end at the other end, an opening cut from both tubular supports extending from the upper end panel, said opening being shaped to receive the closure cap of the collapsible tube, said wedge-shaped trough being shaped to receive and engage the sealed end of the collapsible tube, said side and end panels being folded into a substantially rectangular frame by folding the said frame blank on said transverse scores so that the said tubular supports face inwardly and said cap of said collapsible tube is supported in said opening and said sealed end of said collapsible tube is engaged in the wedge-shaped trough at the inner juncture of the tubular supports at the bottom end panel and the side panels, said flap at one end of said frame blank being secured to the panel at the opposite end of said frame blank to complete the frame structure around said collapsible tube, said frame structure being overwrapped with a flexible and heat shrinkable plastic film, said film being heated and shrunk on said frame structure to impart greater rigidity to said frame structure and to retain said secured flap in the completed package.

3,271,358
POLYOLEFINS CONTAINING DI(SUBSTITUTED PHENYL) OXALATES OR CARBONATES AS STABILIZERS

Aubert Yaucher Coran, Charleston, W. Va., and Constantine Emmanuel Anagnostopoulos, St. Louis, Mo., assignors to Monsanto Company, a corporation of Delaware

No Drawing. Filed June 19, 1963, Ser. No. 288,926
13 Claims. (Cl. 260—45.85)

1. A composition comprising a normally solid polymer of a mono-olefinic aliphatic hydrocarbon monomer having from 2 to 4 carbon atoms, and a stabilizing amount, at least about 0.001% by weight of the polymer, of a compound of the formula,

wherein:
a is an integer from 0 to 1;
n is an integer from 0 to 1;
Y is alkyl of from 1 to 4 carbon atoms; and
X is selected from the group consisting of alkyl of from 4 to 18 carbon atoms and α-cumyl.

3,271,359
EQUILIBRATION OF ORGANOPOLYSILOXANES USING PHOSPHORUS-CONTAINING CATALYSTS

Ben A. Bluestein, Schenectady, N.Y., assignor to General Electric Company, a corporation of New York

No Drawing. Filed Dec. 24, 1962, Ser. No. 246,667
7 Claims. (Cl. 260—46.5)

1. A process for making a polymer having the formula,

$$(HOOCR'')_a(R')_b(R)_cSiO_{\frac{4-(a+b+c)}{2}}$$

which comprises heating to a temperature between 20° C. to 170° C., a mixture comprised of organopolysiloxane, and .01% to 10% by weight thereof of an equilibration catalyst, where said organopolysiloxane is selected from the class consisting of

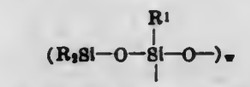
(a) an organsiloxane hydrolyzate consisting of components having chemically combined structural units included by the formula,

$$(R)_dSiO_{4-d/2}$$

(b) a carboxyalkyl hydrolyzate consisting of components having chemically combined structural units included by the formula,

$$HOOCR''SiO_{\frac{3-e}{2}}$$
$$(R')_e$$

and (c), a mixture of said organosiloxane hydrolyzate and said carboxyalkyl hydrolyzate,



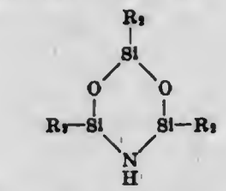
and where said equilibration catalyst is the product of reaction at a temperature in the range of from −10° C. to 100° C., of from 0.1, to less than about 3, moles of water, per mole of a phosphorous halogen compound, selected from the class consisting of phosphorous pentachlorides and phosphorous oxygen chlorides, *a* is equal to from 0 to 1, inclusive, *b* is equal to from 0 to 2, inclusive, *c* is equal to from 0 to 3, inclusive, and the sum of *a*, *b* and *c* is equal to from 1.5 to 3, inclusive, *d* is an integer equal to from 1 to 3, inclusive, *e* is an integer equal to from 1 to 2, inclusive, R is a member selected from the class consisting of monovalent hydrocarbon radicals, halogenated monovalent hydrocarbon radicals and cyanoalkyl radicals, and R' is a member selected from the class consisting of monovalent hydrocarbon radicals and halogenated monovalent hydrocarbon radicals, and R'' is an alkylene radical.

3,271,360
POLYMERIC ORGANOSILOXANES

Thomas C. Williams, Lancaster, N.Y., assignor to Union Carbide Corporation, a corporation of New York

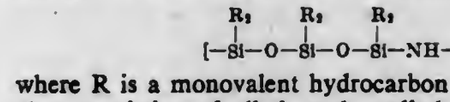
No Drawing. Filed Apr. 29, 1963, Ser. No. 276,175
1 Claim. (Cl. 260—46.5)

A cyclic polymeric organosiloxane compound of the formula:



wherein R is a monovalent aliphatic hydrocarbon radical, R^1 is a member of the class consisting of monovalent hydrocarbon radicals, halogenated monovalent hydrocarbon radicals, cyanoalkyl radicals and cyanoaryl radicals in which the cyano group of the cyanoalkyl and cyanaryl radicals is at least two carbon atoms removed from the silicon atom and (*w*) is an integer having a value from 3 to 7 inclusive.

3,271,361
PROCESS FOR MAKING ORDERED SILOXAZANE POLYMERS



James G. Murray, Scotia, N.Y., assignor to General Electric Company, a corporation of New York

No Drawing. Filed Jan. 13, 1965, Ser. No. 425,346
3 Claims. (Cl. 260—46.5)

1. The process which comprises effecting reaction between a cyclic siloxazane with the formula

with iodine, thereby, to obtain a polymer consisting essentially of recurring units of the formula

where R is a monovalent hydrocarbon selected from the class consisting of alkyl, aryl, aralkyl, and alkaryl radicals, with the proviso that where one R on a silicon is a member selected from the class consisting of aryl and alkaryl radicals, the other R is bonded to the same silicon atom and is selected from the same class of aryl and alkaryl radicals, and *n* is a whole number in excess of 50.

3,271,362
PROCESS FOR REACTION OF SILANIC HYDROGEN WITH UNSATURATED ORGANIC COMPOUNDS

Alan J. Chalk, Scotia, and John F. Harrod, Ballston Lake, N.Y., assignors to General Electric Company, a corporation of New York

No Drawing. Filed Feb. 7, 1966, Ser. No. 525,324
10 Claims. (Cl. 260—46.5)

1. A process for the production of organo-silicon compositions containing carbon-silicon bonds which comprises contacting (a) a silicon compound containing at least one hydrogen atom attached to silicon per molecule with (b) a compound containing aliphatic carbon atoms linked by multiple bonds, in the presence of a metallic carbonyl selected from the class consisting of dicobalt octacarbonyl, cyclopentadienyl cobalt dicarbonyl, and $Mn_2(CO)_{10}$.

3,271,363
EPOXIDE RESIN PROCESS AND COMPOSITION

Otho Leroy Nikles, Toms River, N.J., assignor to Ciba Corporation, New York, N.Y., a corporation of Delaware

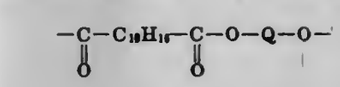
No Drawing. Filed July 19, 1962, Ser. No. 211,127
12 Claims. (Cl. 260—47)

1. A process for producing essentially linear 1,2-epoxy resins having an epoxy equivalency greater than 1 of higher molecular weight and higher melting point from low molecular weight, low melting point 1,2-epoxy resins having an epoxy equivalency greater than 1, which comprises reacting a low molecular weight 1,2-epoxy resin having an epoxy equivalency greater than 1 with a dihydric phenol free from reactive groups other than phenolic hydroxyl groups in the presence of calcium salt as catalyst.

3,271,364
PROCESS OF PREPARING POLYCARBONATES

André Jan Conix, Antwerp, and Leonard Marie Dohmen, Berchem-Antwerp, Belgium, assignors to Gevaert Photo-Producten N.V., Mortsel, Belgium, a Belgian company

No Drawing. Filed Aug. 27, 1962, Ser. No. 219,743
Claims priority, application Great Britain, Aug. 29, 1961, 31,147/61
4 Claims. (Cl. 260—47)



1. Process for the preparation of polycarbonates comprising reacting a dihalogenoformate of a diphenol with an alkali metal hydroxide, said hydroxide being present in an amount having a molar ratio to the amount of said dihalogenoformate of at least about 4:1.

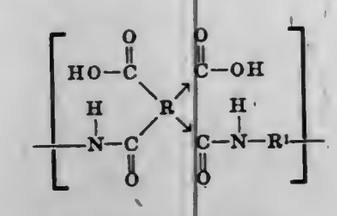
3,271,365
POLYESTERS OF DECAHYDRONAPHTHALENEDICARBOXYLIC ACID AND DIHYDRIC PHENOLS

Fred M. Parham, Kinston, N.C., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Nov. 5, 1962, Ser. No. 236,152
9 Claims. (Cl. 260—47)

1. A fiber-forming linear polyester of decahydronaphthalenedicarboxylic acid, at least 80 mol percent of the recurrent units being represented by the general formula

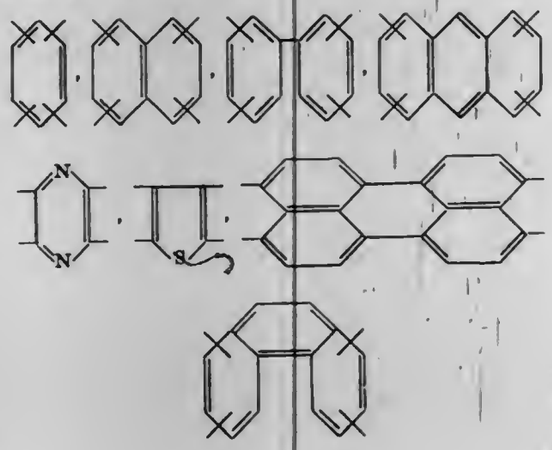
wherein —Q— is a divalent radical selected from the group consisting of 1,4-phenylene, 2,2-bis(4-phenylene)-propane, 4,4'-biphenylene, bis(4-phenylene)methane, 1,1-bis(4-phenylene)ethane and 1,2-bis(4-phenyleneoxy)ethane, the polyester being free from aliphatic unsaturation, melting above about 200° C. and having an intrinsic viscosity of at least about 0.3 as determined in trifluoroacetic acid/methylene chloride (1:3) solvent at 25° C.



3,271,366
PREPARATION OF AROMATIC POLYIMINOLACTONES

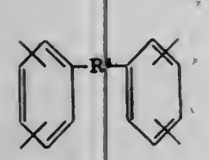
John Anthony Kreuz, Tonawanda, N.Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Nov. 21, 1963, Ser. No. 325,441
2 Claims. (Cl. 260—47)

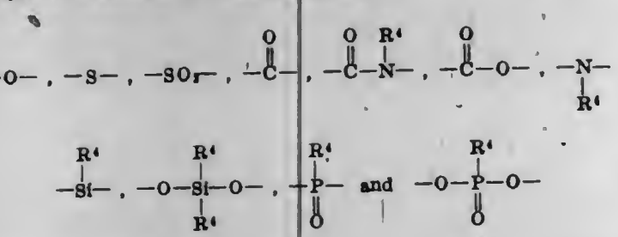


1. A process for preparing polyiminolactone which

comprises treating a polyamide-acid consisting essentially of recurring units of the formula:

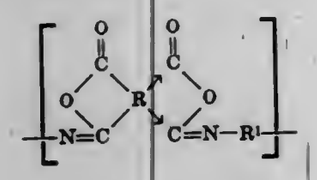


wherein the arrows denote isomerism;



R is an aromatic tetravalent organic radical selected from the group consisting of

and



where R^6 is selected from the group consisting of an alkylene chain of 1–3 carbon atoms,

where R^4 and R^5 are selected from the group consisting of alkyl and aryl; and

R^1 is arylene; said polyamide-acid having an inherent viscosity of at least 0.1 as measured at 30° C. on a 0.5% by weight solution in N,N-dimethylacetamide;

with a compound selected from the group consisting of lower fatty acid halides, halogenated lower fatty acid halides, halogenated lower fatty acid anhydrides, aryl phosphonic halides and thionyl halides, to form a polyiminolactone consisting essentially of recurring units of the formula

wherein

the arrows denote isomerism; and

R and R^1 have the same meaning as above.

3,271,367

THERMOPLASTIC POLYCARBONATES OF DIHYDROXYDIARYLENE SULFONES AND THEIR PREPARATION

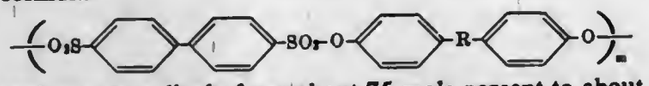
Hermann Schnell, Krefeld-Urdingen, and Heinrich Krimm and Ludwig Bottenbruch, Krefeld-Bockum, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Filed Mar. 21, 1956, Ser. No. 572,793
Claims priority, application Germany, Mar. 26, 1955, F 17,168
7 Claims. (Cl. 260—49)

6. A linear high molecular weight resinous polycarbonate of a compound of the formula:

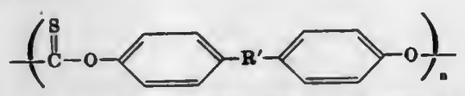
$$HO—Ar—SO_2—Ar—OH$$

wherein Ar is an aromatic hydrocarbon radical.



3,271,368

SULFONATE-THIOCARBONATE COPOLYMERS



Eugene P. Goldberg, Highland Park, and Frank Scardiglia, Arlington Heights, Ill., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois

No Drawing. Filed May 2, 1963, Ser. No. 277,482
6 Claims. (Cl. 260—49)

1. A linear copolymer composition comprising in its linear chain from about 25 mole percent to about 75 mole percent (1) sulfonate ester structural units of the formula

and correspondingly from about 75 mole percent to about 25 mole percent (2) thiocarbonate ester structural units of the formula

wherein *m* and *n* are at least one and R and R' are selected from the groups consisting of alkyl and alkylidene groups.

3,271,369

STABILIZATION OF POLYOXYMETHYLENES

Werner Kern, Mainz, Germany, Volker Jaacks, Menlo Park, Calif., and Heinrich Delbig, Mainz, Germany, assignors to Deutsche Gold- und Silber-Scheideanstalt vormals Roessler, Frankfurt am Main, Germany

No Drawing. Filed Sept. 9, 1964, Ser. No. 395,326
Claims priority, application Germany, Sept. 11, 1963, D 42,456
7 Claims. (Cl. 260—67)

1. In a process for stabilizing a polyoxymethylene diol by etherification of its terminal hydroxy groups with an epoxide compound having a terminal oxirane group, the step comprising reacting the polyoxymethylene diol with a combination of said epoxide compound and a compound selected from the group consisting of

an alkyl halide
an aralkyl halide
an acid halide of an aliphatic carboxylic acid
an acid halide of an aromatic carboxylic acid
an acid halide of a cyclic carboxylic acid
an α-chloro ether represented by the structure

$$R—O—CHCl—R_1$$

wherein R is selected from the group consisting of an alkyl group containing 1 to 5 carbon atoms, a cycloalkyl group containing 5 to 7 carbon atoms and an aryl group containing up to 10 carbon atoms; and R_1 is selected from the group consisting of hydrogen, an alkyl group containing 1 to 5 carbon atoms, an aryl group containing up to 10 carbon atoms and an aralkyl group containing up to 7 carbon atoms

and esters of halo acids.

3,271,370

POLY(1,4-CYCLOHEXYLENEDIMETHYLENE TEREPHTHALATE) PROCESS USING SUBSTANTIALLY EQUAL PROPORTIONS OF REACTANTS

George A. Akin, Sarah J. Rush, and Nicholas C. Russin, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Nov. 10, 1961, Ser. No. 151,455
6 Claims. (Cl. 260—75)

1. A process for preparing a prepolymer having an inherent viscosity of about 0.30 to about 0.40 as measured in a solution of 60% phenol and 40% tetrachloroethane, said propolymer being prepared by reacting a glycol comprising at least 90 mole percent of 1,4-cyclohexanedimethanol and at least one diester of a 1 to 4 carbon atom monohydric alkanol and a dicarboxylic acid, of which at least 50 mole percent is a terephthalate diester of a monohydric alkanol of 1 to 4 carbon atoms, said process comprising heating said glycol and said diester in a mole ratio of from about 0.95 to 1 up to about 1.05 to 1 under a pressure of at least about 30 but not exceeding about 100 pounds per square inch above atmospheric pressure at a temperature above the melting point of the reaction mixture, and removing by distillation from the reaction mixture the alkanol being formed while retaining substantially all of the unreacted glycol and substantially all of the unreacted diester in the reaction mixture until substantially all of said unreacted glycol and said unreacted diester are converted to said prepolymer.

3,271,371

CURED DIEPOXY SULFONE AND POLYFUNCTIONAL AMINE COMPOSITIONS

Samuel W. Tinsley, South Charleston, Paul S. Starcher, Charleston, and Charles W. McGary, Jr., and Charles T. Patrick, Jr., South Charleston, W. Va., assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Mar. 31, 1960, Ser. No. 18,865
15 Claims. (Cl. 260—79.3)

1. A polymerizable composition comprising a diepoxy sulfone having the formula

$$R—SO_2—R$$

wherein each R, individually, is selected from the group consisting of (a) vic-epoxyalkyl radical in which the vic-epoxy group is at least one carbon atom removed from the sulfonyl group, (b) a vic-epoxycycloalkyl radical which has from 5 to 7 carbon atoms in the cycloalkyl ring and in which the vic-epoxy group is at least one carbon atom removed from the sulfonyl group, (c) a vic-epoxycycloalkylalkyl radical which has from 5 to 7 carbon atoms in the cycloalkyl ring and in which the alkyl moiety contains up to 7 carbon atoms, (d) a 3-oxatricyclo [3.2.1.$0^{2,4}$]-oct-6-yl radical, and (e) a 3-oxatetracyclo-[4.4.0.$1^{7,10}$.$0^{2,4}$]undec-8-yl radical; and from about 0.2 to about 5.0 amino hydrogen atoms of a polyfunctional amine per epoxy group of said diepoxy sulfone, said polyfunctional amine having at least two active amino hydrogen atoms in the molecule.

3,271,372

METHOD OF REMOVING COORDINATION CATALYST RESIDUES FROM HYDROCARBON POLYMER SLURRIES WITH ALCOHOL

Stanley W. Caywood, Jr., Swarthmore, Pa., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Feb. 28, 1962, Ser. No. 176,441
9 Claims. (Cl. 260—80.5)

1. A process for the removal of vanadium catalyst residues from a methylene chloride slurry of a normally solid hydrocarbon copolymer comprising (A) forming dispersed granular copolymer particles having a general size of about 1/32 to 1/4 inch in diameter by adding an alcohol selected from the group consisting of an alcohol having up to 4 carbon atoms and mixtures of alcohols having up to 4 carbon atoms, said particles being swollen by the alcohol/methylene chloride mixture and said alcohol being added in amount of 10 to 35 percent by volume based on the total volume of said alcohol and methylene chloride and (B) separating the hydrocarbon copolymer from said slurry to obtain said copolymer having less than about 68 parts per million of vanadium; said solid hydrocarbon copolymer being a copolymer of ethylene and at least one other copolymerizable monomer and containing residues of a vanadium catalyst formed by mixing a vanadium salt with a member selected from the group consisting of an aluminum trialkyl, an alkyl aluminum halide and the reaction product of a molar proportion of an aluminum trialkyl and 0.5 to 2 molar portions of an aluminium halide.

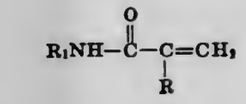
3,271,373

USE OF IONIZED SALTS OF UNSATURATED MONOCARBOXYLIC ACIDS TO PREVENT COAGULATION IN THE EMULSION POLYMERIZATION OF CARBOXYL CONTAINING MONOMERS

Vernon Clare Wolff, Jr., Orange, Tex., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

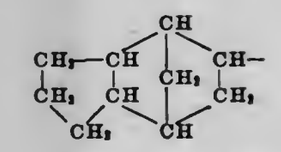
No Drawing. Filed June 22, 1964, Ser. No. 377,082
7 Claims. (Cl. 260—80.5)

1. In the process of preparing copolymers of ethylene, a monomer selected from the group consisting of vinyl chloride and vinyl acetate, and at least one monocarboxyl substituted monoolefin by free radical catalyzed aqueous emulsion copolymerization at superatmospheric pressure, the improvement comprising carrying out the copolymerization in the presence of coagulum reducing amount of an ionized salt of said monocarboxyl substituted monoolefin.



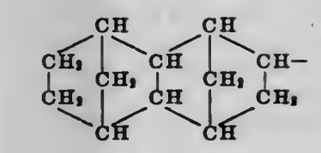
3,271,374

ACRYLIC COMPOUNDS

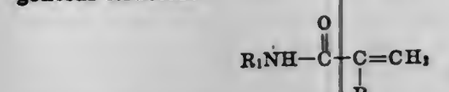


John R. Caldwell and Edward H. Hill, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

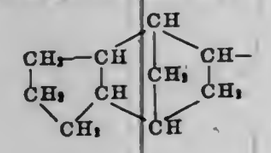
No Drawing. Filed Jan. 31, 1963, Ser. No. 255,172
16 Claims. (Cl. 260—82.1)



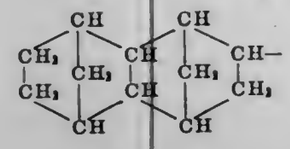
1. An acrylic monomer having the general structure



wherein R represents a member selected from the group consisting of —H and —CH_3 and R_1 represents a member selected from the group consisting of



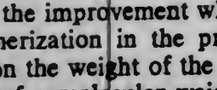
and



6. A resinous polymer of an acrylic amide having the general structure

wherein R represents a member selected from the group consisting of —H and —CH_3 and R_1 represents a member selected from the group consisting of

and



3,271,375
MOLECULAR WEIGHT REGULATION IN POLYMERIZATION OF VINYLIDENE MONOMERS USING HETEROCYCLIC COMPOUNDS AS REGULATORS

Richard E. Delacretaz and Speros P. Nemphos, Springfield, Mass., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed May 18, 1964, Ser. No. 368,372
4 Claims. (Cl. 260—85.5)

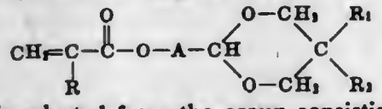
1. In a process for polymerizing a free radical polymerizable material consisting essentially of 90–10 percent by weight of at least one monovinylidene aromatic hydrocarbon and 10–90 percent by weight of a nitrile selected from the group consisting of acrylonitrile and methacrylonitrile in the presence of a free radical polymerization initiator, the improvement which comprises conducting the polymerization in the presence of 0.05–5.0 percent, based upon the weight of the free radical polymerizable material, of a molecular weight regulator which corresponds to the formula:

wherein Z represents a divalent organic radical having in its chain an atom selected from the group consisting of oxygen, nitrogen and sulphur and which, together with the two C's of the formula, forms a heterocyclic ring having at least four members.

3,271,376
CATALYST SYSTEM FOR THE COPOLYMERIZATION OF OLEFINS

Marco A. Achon, Chester, and John A. Price, Swarthmore, Pa., assignors to Avisun Corporation, Philadelphia, Pa., a corporation of Delaware

No Drawing. Filed Aug. 30, 1962, Ser. No. 220,556
10 Claims. (Cl. 260—88.2)



9. A process for the copolymerization of ethylene and propylene which comprises contacting, in an inert solvent, and at a temperature of from about 20° C. to about 200° C., a mixture of ethylene and propylene with a catalyst consisting essentially of the reaction product of an aluminum alkyl dihalide, a vanadium compound selected from the group consisting of vanadium tetrachloride, vanadium oxytrichloride, and a silane of the formula $R_3R'Si$ in which R' is an alkoxy radical and R is selected from the group consisting of alkoxy radicals and hydrocarbon radicals, wherein the mol ratio of aluminum alkyl dihalide to silane is from 1:1 to 100:1 and the mol ratio of aluminum alkyl dihalide to vanadium oxytrichloride is from 0.2:1 to 10:1.

3,271,377
POLYMERIZABLE 2-ALKYLENE-m-DIOXANYL ACRYLIC ESTERS

Gerald J. Mantell, Kansas City, Mo., David Rankin, Kansas City, Kans., and Francis R. Galiano, Kansas City, Mo., assignors, by mesne assignments, to Gulf Oil Corporation, Pittsburgh, Pa., a corporation of Pennsylvania

No Drawing. Filed May 23, 1962, Ser. No. 196,915
35 Claims. (Cl. 260—88.3)

1. A polymerizable 2-alkylene-m-dioxanyl acrylic ester represented by the following formula:

wherein R is selected from the group consisting of lower alkyl radicals and hydrogen, A represents a divalent alkylene radical having a carbon chain length of 1 to 4 carbons, R_1 and R_2 are selected from the group consisting of hydrogen, alkyl, phenyl and alkyl and phenyl having attached thereto substituents selected from the group consisting of lower alkyl, cycloalkyl, nitro, chloro, bromo and dialkylamino.

3,271,378
PROCESS OF POLYMERIZING ACETYLENE AND DERIVATIVES THEREOF

Wiley E. Daniels, Easton, Pa., assignor to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Nov. 8, 1963, Ser. No. 322,506
6 Claims. (Cl. 260—91.3)

1. The process of polymerizing an acetylenic compound of the formula:

$$R_I—C\equiv C—R_{II}$$

wherein R_I represents a member selected from the class consisting of hydrogen, alkyl of from 1 to 12 carbon atoms, cycloalkyl of from 5 to 6 carbon atoms, aryl, cyano, methylol and iso-propylol, and R_{II} represents a member selected from the class consisting of hydrogen, methyl, cyano, phenyl and methylol, which comprises polymerizing said compound at a temperature of from —40° to 200° C. and a pressure ranging from ambient to 200 p.s.i.g. in the presence of a non-reduced nickel halide trisubstituted phosphine complex having the formula:

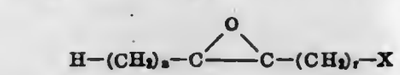
$$NiX_2.2R_3P$$

wherein X represents a halogen selected from the class consisting of bromine, chlorine and iodine and R represents at least one member of the group consisting of alkyl of from 1 to 12 carbon atoms, cycloalkyl of from 5 to 6 carbon atoms, aryl and aralkyl, and wherein the Ni is divalent.

3,271,379
PROCESS FOR PREPARING OPTICALLY ACTIVE POLYMERS

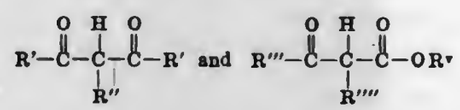
Giulio Natta, Milan, and Piero Pino and Gian Paolo Lorenzi, Pisa, Italy, assignors to Montecatini Società Generale per l'Industria Mineraria e Chimica, Milan, Italy

No Drawing. Filed May 8, 1961, Ser. No. 126,739
Claims priority, application Italy, May 13, 1960, 8,544/60
15 Claims. (Cl. 260—93.7)



1. A process for preparing a polymer having optical activity in solution, from an optically inactive polymer capable of being separated into the optically active antipodes, characterized in that an optically inactive poly (alpha-olefin) having the formula CH_2=CHR wherein the R group contains at least one carbon atom which is asymmetric, dissolved in a solvent, is subjected to a selective adsorption using an optically active crystalline polyhydrocarbon adsorbent and two polymer fractions having opposite optical activity are recovered.

3,271,380
PROCESS FOR CATALYST RESIDUE REMOVAL



Richard E. Dietz, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Filed Apr. 1, 1963, Ser. No. 269,769
15 Claims. (Cl. 260—93.7)

1. A method of removing catalyst residues from a polymer prepared by catalytic polymerization in the presence of a catalyst which forms on commingling at least two essential components, one of said components being a metal compound selected from the group consisting of Groups IV, V, VI and VIII metal compounds and another of said components being selected from the group consisting of organometals, metal hydrides and metals of Groups I, II and III, which comprises treating said polymers with an agent selected from the group consisting of (A) a halogen-containing alkylene oxide of the formula

wherein X is a halogen, *n* is an integer from 0 to 10 and *r* is an integer from 1 to 10; (B) a halogen-containing alkylene oxide according to (A) and a dicarbonyl compound selected from those of the formulas

wherein R' is a member of the group consisting of alkyl, cycloalkyl, aryl, aralkyl, alkaryl, alkylcycloalkyl and cycloalkylalkyl and wherein the R''s can be joined to form a cyclic structure; R'' is a member of the group consisting of hydrogen, alkyl, cycloalkyl, aryl, alkaryl, aralkyl, alkylcycloalkyl and cycloalkylalkyl; R''' is a member selected from the group consisting of alkyl, cycloalkyl, aryl, aralkyl, alkaryl, alkylcycloalkyl, cycloalkylalkyl and an OR^v group; R'''' is a member of the group consisting of hydrogen, alkyl, cycloalkyl, aryl, arylkyl, alkaryl, alkylcycloalkyl and cycloalkylalkyl; and R^v is a member selected from the group consisting of alkyl, cycloalkyl, aryl, aralkyl, alkaryl, alkylcycloalkyl and cycloalkylalkyl, and wherein each of said R', R'', R''', R'''' and R^v contains from 1 to 8 carbon atoms; and recovering the thus treated polymer from the solution thereof substantially free of catalyst residues.

3,271,381
POLYMERIZATION OF OLEFINS BY USE OF MODIFIED CATALYSTS

Harry M. Andersen and William R. Richard, Jr., Dayton, Ohio, assignors to Monsanto Company, a corporation of Delaware

No Drawing. Filed Sept. 15, 1958, Ser. No. 760,858
6 Claims. (Cl. 260—94.9)

1. In the polymerization of alpha-olefins of 2 to 10 carbon atoms over catalyst prepared by the interaction of (a) an aluminum compound of the general formula R_2AlX wherein R is selected from the group consisting of alkyl, cycloalkyl, and aryl radicals and X is selected from the group consisting of hydrogen, halogen, alkyl, cycloalkyl and aryl radicals, with (b) a metal halide:

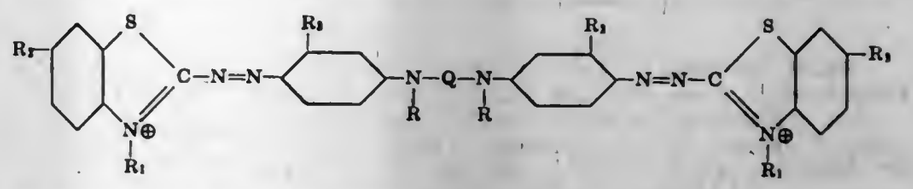
$$MeX_n$$

in which Me represents a metal of the beta-subgroups of Groups IV to VI, X represents halogen, and *n* represents the valence of the metal, the improvement which comprises utilizing such catalyst also comprising hydrochloric acid which has been added prior to contact with the alpha-olefins to effect control of the molecular weight of the resulting polyethylene, the amount of acid being within the range of 0.1 to 10 gram-equivalents per gram-atom metal in said metal halide.

3,271,382
RECOVERY OF LIGNOSULFONATES FROM SPENT SULFITE LIQUORS

George R. Quimby and Otto Goldschmid, Shelton, Wash., assignors to Rayonier Incorporated, Shelton, Wash., a corporation of Delaware

No Drawing. Filed Sept. 26, 1963, Ser. No. 311,669
2 Claims. (Cl. 260—124)



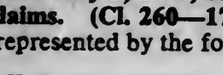
1. The process for the separation of lignosulfonate from spent sulfite liquor which comprises adding to said liquor a high molecular weight quaternary ammonium salt and precipitating the quaternary ammonium lignosulfonate, washing the precipitate with water, drying the precipitate, dissolving the dried precipitate in a lower aliphatic alcohol, adding to the alcoholic solution an alkali metal salt of the group consisting of sodium chloride and potassium chloride to precipitate alkali metal lignosulfonate, and separating the alkali metal lignosulfonate precipitate from the alcoholic solution.

3,271,383
DISAZO DYES CONTAINING AN N-SUBSTITUTED BENZOTHIAZOLYL GROUP

Wataru Yamaya, Kitakyushu-shi, Fukuoka-ken, and Kōji Matsui, Kiryu-shi, Gunma-ken, Japan, assignors to Mitsubishi Chemical Industries Limited, Tokyo, Japan

No Drawing. Filed June 11, 1963, Ser. No. 286,937
6 Claims. (Cl. 260—158)

1. Cationic azo dyestuffs having the following formula:



wherein R is a radical taken from the class consisting of methyl, ethyl, hydroxyethyl, hydroxypropyl, hydroxymethoxy-propyl and hydrogen; R_1 is a radical taken from the class consisting of methyl and ethyl; R_2 is a radical taken from a class consisting of hydrogen, methoxy, ethoxy, methyl, ethyl and chlorine; R_3 is a radical taken from the class consisting of hydrogen, methyl and chlorine; and Q is a divalent radical taken from the class consisting of ethylene, propylene, oxydiethylene, dioxytriethylene, hydroxypropylene and p-toluidino-N,N-diethylene.

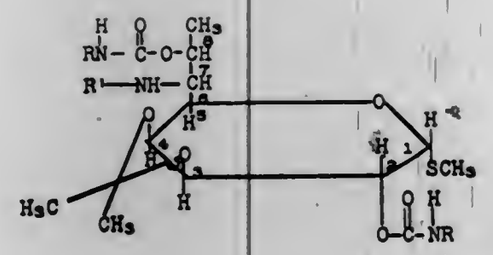
3,271,384
PHENYL AZOBENZOYL PEROXIDES

Howard C. Haas, Arlington, and Elbert M. Idelson, Newton Lower Falls, Mass., assignors to Polaroid Corporation, Cambridge, Mass., a corporation of Delaware

No Drawing. Filed May 9, 1963, Ser. No. 279,330
3 Claims. (Cl. 260—174)

1. A compound represented by the formula:

wherein each X is a phenylazo benzene radical.



3,271,385
CARBAMOYL DERIVATIVES OF LINCOMYCIN AND PROCESSES FOR PRODUCING THEM

David G. Martin, Kalamazoo, Mich., assignor to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware

No Drawing. Filed Apr. 13, 1964, Ser. No. 359,504
8 Claims. (Cl. 260—210)

1. A compound of the formula:

(I)

wherein R is lower-alkyl; and wherein R' is trans-4-propyl-L-hygroyl.

3,271,386
5-AMINO-4-IMIDAZOLECARBOXAMIDE RIBOSIDE RECOVERY PROCESS

Hsing T. Huang, Groton, Conn., assignor to Chas. Pfizer & Co., Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed June 1, 1964, Ser. No. 371,784
5 Claims. (Cl. 260—211.5)

1. A process for the recovery of 5-amino-4-imidazolecarboxamide riboside from a fermentation broth containing the same which comprises contacting said fermentation broth at a pH of from about 1 to about 3 with a strong cation exchange resin in the hydrogen cycle, eluting said resin with ammonium hydroxide, concentrating the eluate, contacting said concentrate at a pH of about 9 to 10 with a strong anion exchange resin operating in either the formate or the acetate cycle, and eluting said resin with water.

3,271,387
HIGH VISCOSITY STARCH DERIVATIVES

Chim Patel, St. Louis, Mo., and Ronald E. Pyle, Granite City, Ill., assignors to Union Starch & Refining Co., Inc., Columbus, Ind., a corporation of Indiana

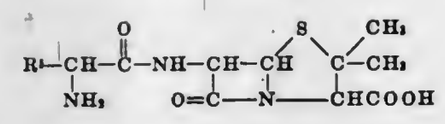
No Drawing. Filed Oct. 10, 1962, Ser. No. 229,724
14 Claims. (Cl. 260—233.5)

14. As a high viscosity starch derivative, the reaction product obtained by reacting starch with about 0.03 to about 0.3%, based on the dry starch, of a chlorothioformate ester of an alcohol selected from the group consisting of alkyl alcohols of 1–12 carbon atoms and phenyl alcohol, the reaction being carried out at a pH of 7–10 and at a temperature of 26–55° C.

3,271,388
AMYLOPECTIN SULFATES

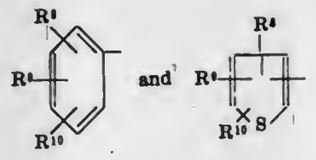
Peter S. Cammarata and Stephen Eich, Skokie, Ill., assignors to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware

No Drawing. Filed June 29, 1964, Ser. No. 379,035
Claims priority, application Great Britain, Mar. 17, 1964, 11,272/64
5 Claims. (Cl. 260—233.5)



1. A pepsin inhibitory and anti-coagulant but not significantly anti-lipemic compound selected from the class consisting of sulfated potato starch amylopectins and the highly and instantly water soluble ammonium, alkali metal and aliphatic amine salts thereof, said derivatives possessing about 1–1.8 sulfate groups per glucose unit and characterized also by a molecular weight of $1–30\times10^7$.

3,271,389
PROCESS FOR THE ISOLATION OF CERTAIN BASIC PENICILLINS

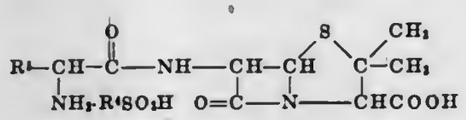


David A. Johnson, Fayetteville, and Glenn A. Hardcastle, Jr., Syracuse, N.Y., assignors to Bristol-Myers Company, New York, N.Y., a corporation of Delaware

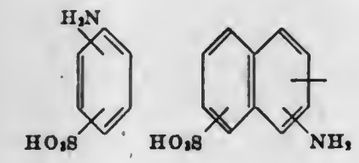
No Drawing. Filed June 8, 1964, Ser. No. 373,527
12 Claims. (Cl. 260—239.1)

1. The process of preparing in pure form and high yield a penicillin having the formula

wherein R^5 is a member selected from the group consisting of

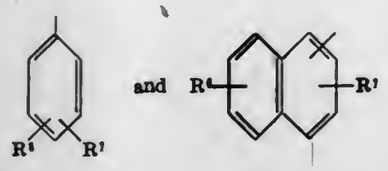


wherein R^6, R^9 and R^{10} each represent a member selected from the group consisting of hydrogen, nitro, di(lower)-alkylamino, (lower)alkanoylamino, (lower)alkanoyloxy, (lower)alkyl (including straight and branched chain saturated aliphatic groups having from 1 to 6 carbon atoms inclusive), (lower)alkoxy, sulfamyl, chloro, iodo, bromo, fluoro, trifluoromethyl, (lower)alkylthio, (lower)alkylsulfonyl, carbo(lower)alkoxy, benzyl, phenethyl, cycloheptyl, cyclohexyl and cyclopentyl which comprises mixing



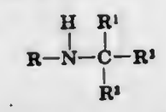
(a) water,

(b) a larger volume of a liquid, water-immiscible solvent,



(c) a penicillin sulfonate of the formula

wherein R_4 is a member selected from the group consisting of



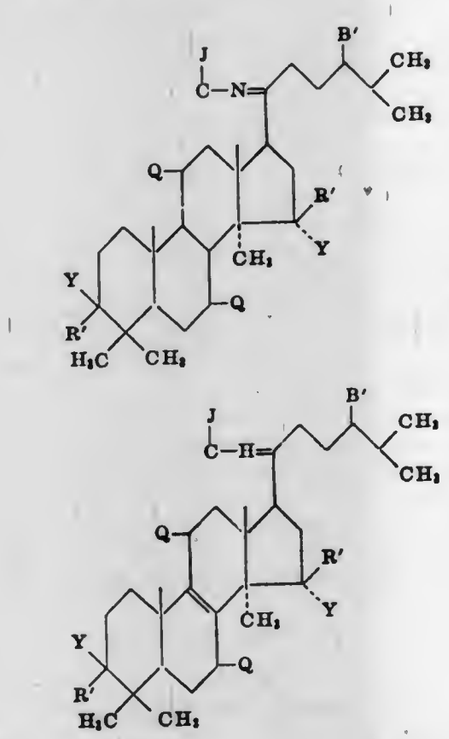
and

wherein R^6 and R^7 are each a member selected from the group consisting of hydrogen, alkyl containing from 1 to 12 carbon atoms (including straight and branched chain groups), (lower)alkoxy, (lower)alkylthio, nitro, (lower)alkanoylamino, (lower)alkanoyloxy, sulfamyl, chloro, iodo, bromo, fluoro, trifluoromethyl, (lower)-alkylsulfonyl, carbo(lower)alkoxy, benzyl, phenethyl, cycloheptyl, cyclohexyl and cyclopentyl, and wherein R^5 has the meaning set forth above, and

(d) a weight equal to at least one-half the weight of said penicillin sulfonate of a secondary amine selected from the group consisting of the secondary amines having the formula

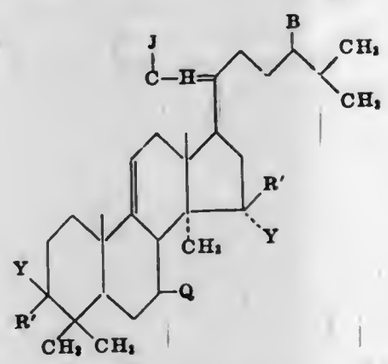
wherein R is an aliphatic group having from 10 to 14 carbon atoms and R^1, R^2 and R^3 are each alkyl groups having a total of from 11 to 14 carbon atoms, said secondary amine being liquid at room temperatures and soluble in said organic solvent;

(e) agitating said mixture; and



(f) recovering said penicillin after it forms and precipitates as a solid substantially free of any sulfonic acid contaminants.

3,271,390
SULFURENIC ACID AND DERIVATIVES THEREOF

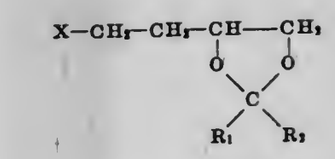


Josef Fried, Princeton, N.J., assignor, by mesne assignments, to E. R. Squibb & Sons Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Sept. 13, 1963, Ser. No. 308,677
20 Claims. (Cl. 260—239.5)

11. A compound selected from the group consisting of steroids of the formulae

and



wherein J is selected from the group consisting of morpholyl, piperidyl and pyrrolidyl; and Y, R', B' and Q are as hereinbefore defined.

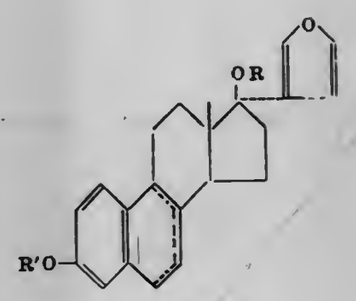
3,271,391
PROCESS FOR THE PREPARATION OF ω-(Δ⁴-ANDROSTENE-16β-OL-3-ONE-16α-YL) PROPIONIC ACID AND INTERMEDIATES FORMED THEREIN

Daniel Bertin, Montrouge, and Jacques Perronnet, Paris, France, assignors to Roussel-Uclaf, S.A., Paris, France, a corporation of France

No Drawing. Filed Apr. 11, 1963, Ser. No. 272,244
Claims priority, application France, Apr. 18, 1962, 894,926
18 Claims. (Cl. 260—239.55)

1. A process for the preparation of the lactone of ω-(Δ⁴-androstene-16β-ol-3-one-16α-yl)-propionic acid which comprises reacting Δ⁵-androstene-3β-ol-16-one with a magnesium derivative of a ketonide of 1,2-dihydroxy-4-halo-butane having the formula

wherein R_1 and R_2 are alkyl radicals having 1 to 10 carbon atoms and X is a halogen to form the corresponding ketonide of 16α-(3',4'-dihydroxybutyl)-Δ⁵-androstene-3β, 16β-diol, hydrolyzing the latter under acidic conditions to form 16α-(3',4'-dihydroxybutyl)-Δ⁵-androstene-3β,16β-diol, reacting the latter with periodic acid to simultaneously degrade and cyclize the lateral chain to form 1',16β-epoxy-16α-(1'ξ-hydroxypropyl)-Δ⁵-androstene-3β-ol, reacting the latter with a lower alkanol to form 1',16β-epoxy-16α-(1'ξ-alkoxypropyl)-Δ⁵-androstene-3β-ol, oxidizing the latter to form 1',16β-epoxy-16α-(1'ξ-alkoxypropyl)-Δ⁴-androstene-3-one, reacting the latter under acidic conditions to form the 1'ξ,1'ξ-ether oxide of 1',16β-epoxy-16α-(1'ξ-hydroxypropyl)-Δ⁴-androstene-3-one and oxidizing the latter to form the lactone of ω-(Δ⁴-androstene-16β-ol-3-one-16α-yl)-propionic acid.



14. 1',16β-epoxy-16α-(1'ξ-hydroxpyropyl)Δ⁵-androstene-3β-ol.

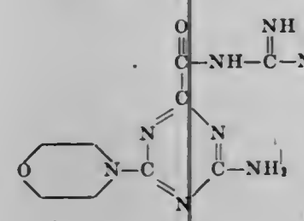
3,271,392
17α-[3'-FURYL]-ESTROGENS

Yvon Lefebvre, Pierrefonds, Quebec, Canada, assignor to American Home Products Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Sept. 14, 1965, Ser. No. 487,335
31 Claims. (Cl. 260—239.55)

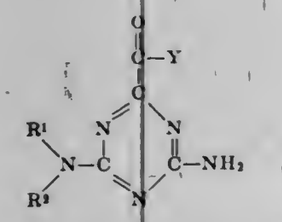
1. A compound of the formula

wherein R is selected from hydrogen and lower aliphatic acyl groups; and R' is selected from hydrogen, lower alkyl



groups containing from 1 to 4 carbon atoms, cycloalkyl groups containing from 5 to 6 carbon atoms, tetrahydropyranyl and acyl groups, and the group $X^+SO_3^-$ in which X represents a cation selected from the group consisting of sodium, potassium, and organic bases.

3,271,393
2,4-DIAMINO-6-NON-OXO-CARBONYLIC TRIAZINES

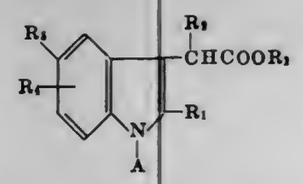


Takeo Ueda, 1066 Izumi, Komae-cho, Kitatama-gun, Tokyo, Japan; Shigeshi Toyoshima, 355 Funabashi-cho, Sedagaya-ku, Tokyo, Japan; and Mitsuru Furukawa, 897 Yukigaya-cho, Ota-ku, Tokyo, Japan

No Drawing. Filed Mar. 28, 1963, Ser. No. 268,551
Claims priority, application Japan, July 3, 1962, 37/27,519
4 Claims. (Cl. 260—247.2)

1.

3. A compound selected from the group consisting of compounds of the formula



3,271,394
ALPHA-INDOLYL-3-ACETIC ACID ESTERS

Tsung-Ying Shen, Westfield, N.J., assignor to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Filed Dec. 31, 1964, Ser. No. 422,567
7 Claims. (Cl. 260—247.2)

1. A compound selected from the group consisting of free bases and pharmaceutically acceptable acid addition salts of compounds represented by the formula:

wherein

A is selected from the group consisting of benzoyl, naphthoyl,

wherein Het is selected from the group consisting of furyl, thienyl, imidazolyl, thiazolyl, benzimidazolyl, indazolyl, oxoimidazolyl, pyridazinyl, pyrazolonyl, prazolyl, oxazolyl, isoxazolyl, isothiazolyl, pyridyl, pyrimidinyl, pyrazinyl and substituted benzoyl, naphthoyl and

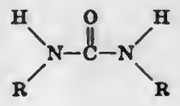
wherein said substituent is selected from the group consisting of halo, lower alkoxy, phenoxy, trifluoroacetyl, acetyl, formyl, dimethylcarbamoyl, cyano, carb-lower alkoxy, lower alkylthio, N-N dilower alkylsulfamoyl, methylsulfinyl, methylsulfonyl, nitro, di(lower alkyl)amino, dihalo, trihalo and dihalo lower alkoxy;

R_1 is selected from the group consisting of hydrogen, lower alkyl, lower alkenyl, methoxyphenyl, chlorophenyl, benzyl and phenyl;

R_2 is selected from the group consisting of hydrogen, lower alkyl, lower alkenyl and propargyl;

R_3 is selected from the group consisting of lower alkenyl, lower alkynyl, cyclopropylmethyl, lower alkoxy lower alkyl, poly lower alkoxy lower alkyl, dilower alkylamino lower alkyl, 1-piperidinyl(ethyl, 1-pyrrolidinyl(ethyl, 1-pyrrolidinyl(methyl), 1-morpholinyl(ethyl), 1-methyl-2-pyrrolidinyl(methyl), 1-methyl-2-piperidinyl(methyl), 3-(1-ethylpiperidinyl), N'-methyl-N-piperazinyl(ethyl), cyclopropylmethyl, p-acetaminophenyl, o-carboxyphenyl, o-carbamoylphenyl, β-phenethyl, β-(p-methoxyphenyl)ethyl, 3-phenylpropene-2-yl, tetrahydrofurfuryl and 4-dimethylaminocyclohexyl;

R_4 is selected from the group consisting of hydrogen, lower alkyl, lower alkoxy, fluorine and trifluoromethyl; and



R_5 is selected from the group consisting of hydrogen, halogen, lower alkyl, amino lower alkyl, trifluoromethyl, lower alkoxy, benzyloxy, p-methylbenzyloxy, p-methoxybenzyloxy, p-propoxybenzyloxy, p-chlorobenzyloxy, p-fluorobenzyloxy, lower alkenyloxy, cyclopropylmethoxy, cyclopropylpropoxy, amino, lower alkylamino, dilower alkylamino, lower alkanolamino, cyano, nitro, 1-pyrrolidinyl, 4-methyl-1-piperazinyl, 4-morpholinyl, bis(hydroxy lower alkyl) amino, dilower alkylsulfamoyl, acetyl, bis(benzyloxyethyl) amino, benzylthio, p-methylbenzylthio, p-methoxybenzylthio, p-chlorobenzylthio, p-fluorobenzylthio, N,N-dimethylcarbamoyl, cyclobutylmethoxymethyloxy, 1-azacyclopropyl, ethylphenyl, butylphenyl, fluorophenyl, p-fluoro-m-methoxyphenyl and vinylphenyl.

3,271,395
MELAMINE PRODUCTION

Kenzie Nozaki, El Cerrito, Calif., assignor to Shell Oil Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed Feb. 17, 1964, Ser. No. 345,110
4 Claims. (Cl. 260—249.7)

1. The process for preparing a melamine comprising reacting a mixture of sulfur trioxide, ammonia, and a carbamide of the formula

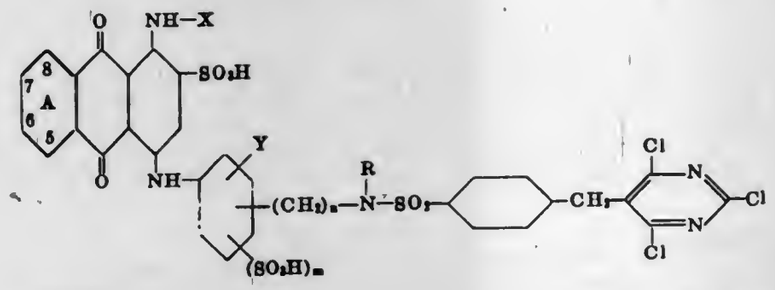
wherein the R's are independently selected from the group consisting of hydrogen, aryl of from 6–10 carbon atoms, and lower alkyl at a temperature from about 0° C. to about 450° C. and a pressure from about 50 p.s.i.g. to about 1000 p.s.i.g.

3,271,396
PYRIDO-QUINAZOLINE DERIVATIVES

Jack Bernstein, New Brunswick, and Ervin R. Spitzmiller, Highland Park, N.J., assignors, by mesne assignments, to E. R. Squibb & Sons, Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Aug. 17, 1964, Ser. No. 390,215
7 Claims. (Cl. 260—251)

4. 5 - (3 - dimethylaminopropyl) - 5,5a,6,7,8,9 - hexahydro-11H-pyrido[2,1-b]quinazolin-11-one.



7. 5,5a,6,7,8,9 - hexahydro - 11H-pyrido[2,1-b]quinazolin-11-one.

3,271,397
REACTIVE ANTHRAQUINONE DYES CONTAINING A TRICHLORO PYRIMIDYL GROUP

Peter Bitterli, Reinach, Basel-Land, Switzerland, assignor to Sandoz Ltd. (also known as Sandoz A.G.), Basel, Switzerland

No Drawing. Filed June 22, 1965, Ser. No. 466,111
Claims priority, application Switzerland, June 26, 1964, 8,361/64; Jan. 29, 1965, 1,275/65
7 Claims. (Cl. 260—256.5)

1. A reactive dye of the formula

wherein

R is a member selected from the group consisting of hydrogen, alkyl and lower hydroxyalkyl.

X is a member selected from the group consisting of hydrogen and methyl,

Y is a member selected from the group consisting of hydrogen, methyl and methoxy,

n is one of the integers 1 and 2,

m is one of the integers 1 and 2,

any substituents on the nucleus A are selected from the group consisting of chlorine, bromine, and fluorine in the positions 6 and 7 and $-SO_3H$ in one of the positions 5,6,7, and 8, and the group $-(CH_2)_n-$ stands in one of the meta- and para-positions with respect to —NH—.

3,271,398
OROTIC ACID SALT OF 4-AMINO-5-IMIDAZOLECARBOXAMIDE

Raitaro Haraoka, Osaka, and Takashi Kamiya, Toyanaka, Japan, assignors to Fujisawa Pharmaceutical Co., Ltd., Osaka, Japan, a company of Japan

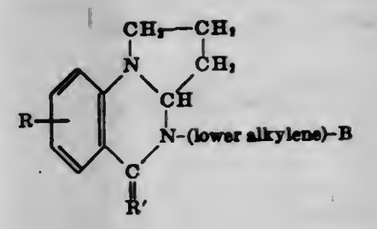
No Drawing. Filed Mar. 13, 1963, Ser. No. 264,769
Claims priority, application Japan, Mar. 15, 1962, 37/10,258
1 Claim. (Cl. 260—256.4)

The orotic acid salt of 4(or 5)-amino-5(or 4)-imidazolecarboxamide.

3,271,399
5-ACYLOXYURACILS AND THEIR PREPARATION

George H. Hitchings, Yonkers, and Gertrude B. Elion, Bronxville, N.Y., assignors to Burroughs Wellcome & Co. (U.S.A.) Inc., Tuckahoe, N.Y., a corporation of New York

No Drawing. Filed Feb. 10, 1964, Ser. No. 343,498
2 Claims. (Cl. 260—256.4)



1. 5-nicotinoyloxyuracil.

3,271,400
PYRROLOQUINAZOLINE DERIVATIVES

Jack Bernstein, New Brunswick, and Ervin R. Spitzmiller, Highland Park, N.J., assignors, by mesne assignments, to E. R. Squibb & Sons, Inc., New York, N.Y., a corporation of Delaware

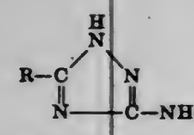
No Drawing. Filed Aug. 17, 1964, Ser. No. 390,217
11 Claims. (Cl. 260—256.4)

1. A compound selected from the group consisting of bases of the formula

and the pharmaceutically acceptable acid-addition and quaternary ammonium salts thereof, wherein R is selected from the group consisting of hydrogen, lower alkyl, halogen, halomethyl, lower alkoxy, mononuclear aryloxy, amino and di(lower alkyl)amino; R' is selected from the group consisting of two hydrogens and keto; and B is a basic nitrogen-containing radical selected from the group consisting of

amino,
(lower alkyl)amino,
di(lower alkyl)amino,
hydroxy(lower alkyl)amino,
halo(lower alkyl)amino,
di[hydroxy(lower alkyl)]amino,
(lower alkyl)phenyl(lower alkyl)amino,
piperidyl,
(lower alkyl)piperidyl,
di(lower alkyl)piperidyl,
homopiperidyl,
pyrrolidyl,
(lower alkyl) pyrrolidyl,
di(lower alkyl)pyrrolidyl,
piperazinyl,
homopiperazinyl,
(lower alkyl)piperazinyl,
di(lower alkyl)piperazinyl,
(lower alkoxy)piperazinyl,
R-phenylpiperazinyl,
R-phenyl(lower alkyl)piperazinyl,
pyridylpiperazinyl,
pyridyl(lower alkyl)piperazinyl,
(lower alkanoyloxy-lower alkyl)piperazinyl,
(hydroxy-lower alkyl)piperazinyl,
morpholinyl,
(lower alkyl)morpholinyl
di(lower alkyl)morpholinyl,
thiamorpholinyl,
(lower alkyl)thiamorpholinyl and
di(lower alkyl)thiamorpholinyl.

3,271,401
TETRAZAINDENE SYNTHESIS FOR PHOTOGRAPHIC PRODUCTS

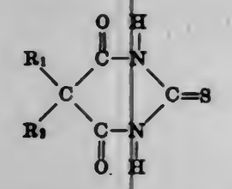


Leslie Alfred Williams, Wealdstone, England, assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Aug. 20, 1964, Ser. No. 391,050
6 Claims. (Cl. 260—256.4)

1. A method for preparing 6-oxo-1,3,3a,7-tetrazaindene compounds useful in stabilizing photographic silver halide emulsions comprising condensing under alkaline conditions at a pH of at least 8.0 one molecule of an alkoxymethylenemalonic acid ester having the following formula:

wherein R_2, R_3 and R_4 each represents a lower alkyl group, with one molecule of a triazole compound having the following formula:



wherein R represents a member selected from the class consisting of H, lower alkyl, phenyl, tolyl, amino, methylamino, mercapto, methylmercapto and ethylmercapto groups.

3,271,402
5-HIGHER ALKYL-5-LOWER ALIPHATIC HYDROCARBON-2-THIOBARBITURIC ACIDS

Peter Fahrni, Binningen, and Walter Mosimann and Otto Schnider, Basel, Switzerland, assignors to Hoffmann-La Roche Inc., Nutley, N.J., a corporation of New Jersey

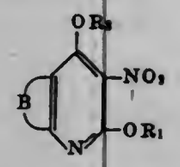
No Drawing. Filed Aug. 7, 1962, Ser. No. 215,288
Claims priority, application Switzerland, Sept. 29, 1961, 11,356/61
9 Claims. (Cl. 260—260)

1. A heterocyclic compound selected from the group consisting of members having the formula:

in which

R_1 is an alkyl group having from 11 to 18 carbon atoms, inclusive; and in which

R_2 is a propargyl radical



and medicinally acceptable metal salts thereof.

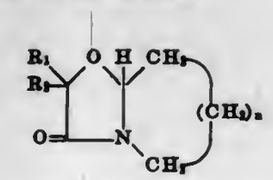
3,271,403
2,4-DIALKOXY-5,6-HYDROCARBYLENE-3-NITROPYRIDINES

André Grüssner and Otto Schnider, Basel, Switzerland, assignors to Hoffmann-La Roche Inc., Nutley, N.J., a corporation of New Jersey

No Drawing. Filed Sept. 3, 1963, Ser. No. 306,314
Claims priority, application Switzerland, Sept. 12, 1962, 10,829/62
12 Claims. (Cl. 260—289)

1. Compounds of the formula:

in which R_1 is a lower alkyl group selected from the group consisting of methyl and ethyl; R_2 is a lower alkyl group selected from the group consisting of methyl and ethyl; and B is a member selected from the group consisting of $-(CR_2{=}CR_4)_x-$ and $-(CR_3H)_x-$ wherein R_3 is a member selected from the group consisting of hydrogen, methyl and ethyl, R_4 is a member selected from the group consisting of hydrogen, methyl and ethyl and x is an integer selected from the group consisting of 4 and 5.



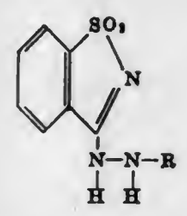
2. 2,4-dimethoxy-3-nitro-5,6,7,8-tetrahydroquinoline.

3,271,404
ANTI-CONVULSANT COMPOUNDS

Rudolf G. Griot, Florham Park, N.J., assignor to Sandoz, Inc., Hanover, N.J., a corporation of New York

No Drawing. Filed July 25, 1963, Ser. No. 297,708
7 Claims. (Cl. 260—294.7)

1. A compound of the formula:



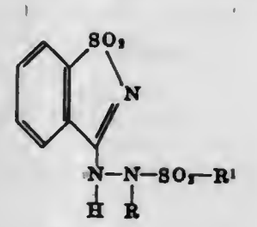
in which R_1 is selected from the group consisting of hydrogen, lower alkyl, benzyl, phenyl and cyclohexyl, R_2 is selected from the group consisting of lower alkyl, benzyl, phenyl and cyclo hexyl and n is an integer in the range of 2 to 3.

3,271,405
ACYLHYDRAZINO BENZISOTHIAZOLES

Calvert W. Whitehead and John J. Traverso, both of Indianapolis, Ind., assignors to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana

No Drawing. Filed Oct. 11, 1965, Ser. No. 494,892
4 Claims. (Cl. 260—301)

1. Compounds of the formula:



wherein R is acetyl or propionyl.

3,271,406
SUBSTITUTED-HYDRAZINO BENZISOTHIAZOLES

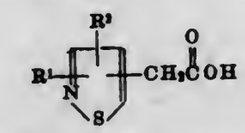
John J. Traverso and Calvert W. Whitehead, Indianapolis, Ind., assignors to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana

No Drawing. Filed Oct. 11, 1965, Ser. No. 494,915
6 Claims. (Cl. 260—301)

1. The compounds of the following formula:

wherein

R is hydrogen, lower alkyl, or lower alkenyl; and



R^1 is lower alkyl, phenyl, or naphthyl.

3,271,407
CERTAIN ISOTHIAZOLYLACETIC ACID COMPOUNDS

Rintje Raap, Raymond Urgel Lemieux, and Ronald George Micetich, Edmonton, Alberta, Canada, assignors to R & L Molecular Research Ltd., Edmonton, Alberta, Canada, a corporation of Canada

No Drawing. Filed June 28, 1965, Ser. No. 467,703
10 Claims. (Cl. 260—302)

1. A compound having the formula

wherein R^1 and R^2 each represent a member selected from the group consisting of hydrogen, chloro, bromo, iodo and methyl.

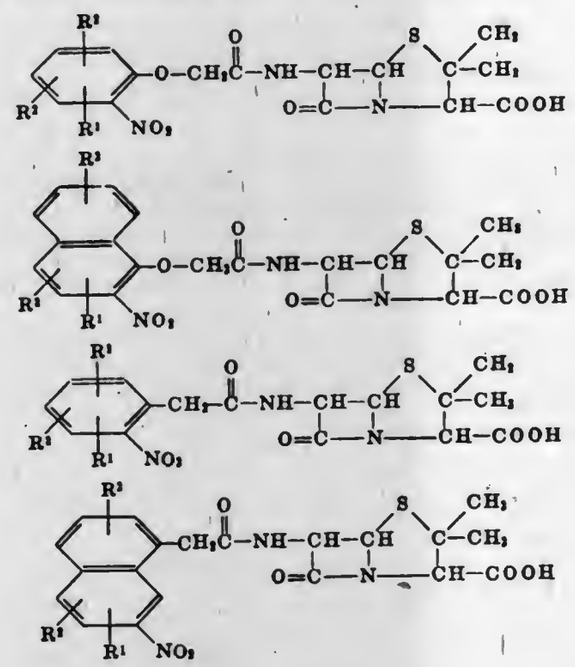
3,271,408
β-CYANOVINYL THIOETHERS OF CERTAIN THIAZOLE COMPOUNDS

Everett Joseph Frazza, Yorktown Heights, N.Y., and Lorence Rapoport, Stamford, Conn., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Connecticut

No Drawing. Original application July 19, 1960, Ser. No. 43,723. Divided and this application Apr. 27, 1964, Ser. No. 368,437
3 Claims. (Cl. 260—306.6)

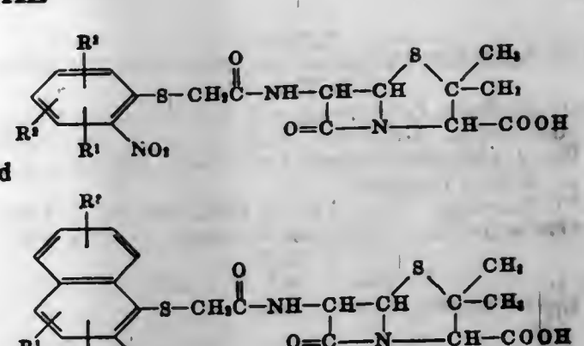
1. A compound of the formula:

NCCH=CHSR



in which R is a radical selected from the group consisting of thiazolinyl, thiazolyl, and benzothiazolyl.

3,271,409
CHEMICAL CONVERSION OF NITRO-PENICILLINS TO 6-AMINOPENICILLANIC ACID



David A. Johnson, Fayetteville, N.Y., assignor to Bristol-Myers Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed Apr. 6, 1964, Ser. No. 357,818
7 Claims. (Cl. 260—306.7)

1. The process for the production of 6-aminopenicillanic acid which comprises reducing to a group selected from the group consisting of hydroxylamino and amino the ortho-nitro group of a "nitropenicillin" selected from the group consisting of acids of the formulae

and

wherein R^1, R^2 and R^3 are each a member selected from the group consisting of hydrogen, (lower)alkyl, (lower) alkoxy, chloro, bromo, iodo, trifluoromethyl, cyano, nitro, di(lower)alkylamino, methylsulfonyl, (lower)alkanoyl, (lower)alkylthio, phenoxy, benzyloxy, allyloxy and carbalkoxy and salts thereof and subsequently maintaining the reaction product of such reduction in solution in an inert solvent for said reaction product for at least several minutes at a pH in the range of 1 to 6.

3,271,410
REHYDROGENATION OF HYDROGENATED FATTY ACIDS

Lucien J. Cagneron, Pekin, Ill., and Eugene A. Skaradzinski, Minneapolis, Minn., assignors to Archer-Daniels-Midland Company, Minneapolis, Minn., a corporation of Delaware

No Drawing. Filed July 19, 1965, Ser. No. 473,204
11 Claims. (Cl. 260—409)

1. The process of improving the quality of a catalytically-hydrogenated fatty acid which comprises catalytically rehydrogenating said hydrogenated fatty acid at a temperature of from 200° to 500° F. and at a pressure of from 10 p.s.i.g. to 5000 p.s.i.g.

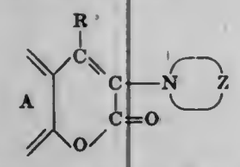
3,271,411
PROCESS FOR COOXYALKYLATION OF CYANOGUANIDINE AND A POLYFUNCTIONAL POLYOL AND COMPOSITIONS PRODUCED THEREBY

Donald W. Kaiser, Hamden, and John K. Zane, East Haven, Conn., assignors to Olin Mathieson Chemical Corporation, a corporation of Virginia

No Drawing. Filed May 1, 1963, Ser. No. 277,124
10 Claims. (Cl. 260—307)

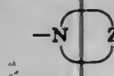
1. The process for preparing a coalkoxylation composition which comprises forming a reaction mixture by admixing (1) a basic catalyst, (2) cyanoguanidine, (3) a polyol having a functionality of at least two selected from the group consisting of glycerol, ethylene glycol, propylene glycol, 1,4-butanediol, diethylene glycol, dipropylene glycol, neopentyl glycol, triethylene glycol, hexamethylene glycol, hexanetriol, 2-butene-1,4-diol, 2-butyne-1,4-diol, butanetriol, oxypropylated trimethylolpropane, oxypropylated trimethylolethane, oxypropylated pentaerythritol, oxypropylated dipentaerythritol, oxypropylated erythritol, oxypropylated mannitol, oxypropylated sorbitol, oxypropylated diphenylolpropane, oxypropylated resorcinol, oxypropylated catechol, oxypropylated hydroquinone, oxypropylated methyl glucoside, oxypropylated 4,4'-dihydroxybenzophenone, monoethanolamine, diethanolamine, triethanolamine, and mixtures thereof, and heating said reaction mixture to a temperature of 75° and 175° C. while passing into said reaction mixture (4) an oxide selected from the group consisting of styrene oxide, propylene oxide, butylene oxide, isobutylene oxide, n-hexylene oxide, cyclobutylene oxide, cyclohexylene oxide, and mixtures thereof, the weight ratio of the sum of (2) plus (3) to said oxide (4) being between about 1:2 and 1:125, and the weight ratio of (2) to (3) being between about 10:90 and 90:10.

4. The product of the process of claim 1.



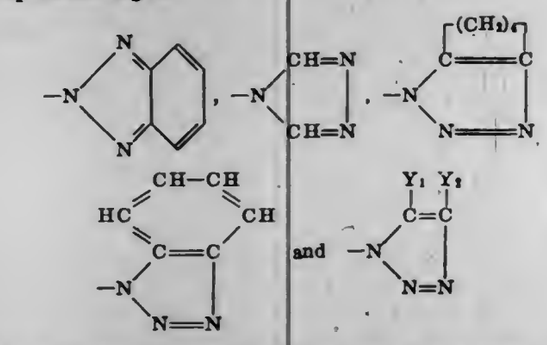
3,271,412

COUMARINE COMPOUNDS HAVING TRIAZOLE SUBSTITUENTS



Roderich Raue, Leverkusen, and Heinrich Gold, Cologne-Stammheim, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Filed Aug. 7, 1962, Ser. No. 215,294
Claims priority, application Germany, Aug. 19, 1961, F 34,735
7 Claims. (Cl. 260—308)

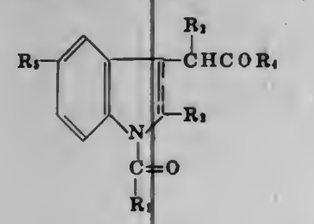


1. A compound of the formula

wherein R is a member selected from the group consisting of hydrogen and lower alkyl; A is a residue of an aromatic ring system selected from the group consisting of phenyl, chlorophenyl, dichlorophenyl, lower alkoxy phenyl, hydroxy-lower alkoxy phenyl, hydroxy phenyl, lower alkyl phenyl, di-lower-alkoxy phenyl, acetoxy phenyl, amino phenyl, sulfo-phenyl, acetylamino phenyl, naphthyl, hydroxy naphthyl, carbo-lower alkoxy naphthyl, hydroxy-lower alkoxy naphthyl;

is a 5–6 membered heterocyclic ring selected from the group consisting of

wherein Y_1 and Y_2 stand independently for a member selected from the group consisting of hydrogen and lower alkoxy alkyl; and the corresponding quaternization products effected with an alkylating agent selected from the group consisting of dimethyl sulfate, diethyl sulfate, methyl iodide, ethyl iodide, isopropyl iodide, butyl bromide, benzyl chloride, and 4-toluene-sulfonic acid methyl and ethyl esters.



3,271,413

α-HALOMETHYL-1-PYRAZOLE CARBONYL-3-INDOLYLACETIC ACIDS

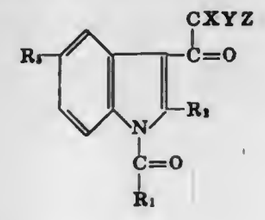
Tsung-Ying Shen, Westfield, and Lewis H. Sarett, Princeton, N.J., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Filed Apr. 29, 1965, Ser. No. 451,996
14 Claims. (Cl. 260—310)

1. A compound of the formula:

in which

R_1 is selected from the group consisting of pyrazole and substituted pyrazole in which the substituents are selected from the group consisting of halogen, lower alkyl, lower alkanoyl and phenyl;



R_2 is selected from the group consisting of hydrogen, lower alkyl, lower alkenyl, phenyl, tolyl and benzyl;

R_3 is selected from the group consisting of monohalomethyl, dihalomethyl and trihalomethyl in which said halogen has an atomic number less than 53;

R_4 is selected from the group consisting of hydroxy, lower alkoxy, benzyloxy, amino, lower alkylamino, di-lower alkylamino, lower alkanolamino, phenylamino, tolylamino, benzylamino, phenylethylamino, lower alkoxy-lower alkylamino and OM, where M is selected from the group consisting of ammonium, lower alkylammonium, morpholinium, cholinium, glucosammonium, methyl cyclohexylammonium, triethylammonium, N-butylammonium, anilinium, 2,3-xylidinium, piperizinium and an inorganic cation;

R_5 is selected from the group consisting of hydrogen, lower alkyl, lower alkoxy, CF_3, CHF_2, nitro, cyano, aminomethyl, amino, hydroxy, benzylmercapto, lower alkylthio, diphenylamino, benzylamino, β-phenylethylamino, chloro lower alkylamino, chloro phenylamino, chloro benzylamino, lower alkoxy-lower alkylamino, anisidino, lower alkylanilino and lower alkoxyanilino.

12. A compound of the formula:

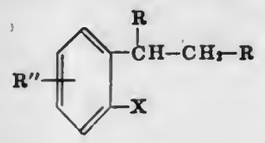
in which

R_1 is selected from the group consisting of pyrazole and substituted pyrazole in which the substituents are selected from the group consisting of halogen, lower alkyl, lower alkanoyl and phenyl;

R_2 is selected from the group consisting of hydrogen, lower alkyl, lower alkenyl, phenyl, tolyl and benzyl;

R_5 is selected from the group consisting of hydrogen, lower alkyl, lower alkoxy, CF_3, CHF_2, nitro, cyano, aminomethyl, amino, hydroxy, benzylmercapto, lower alkylthio, diphenylamino, benzylamino, β-phenylethylamino, chloro lower alkylamino, chloro phenylamino, chloro benzylamino, lower alkoxy-lower alkylamino, anisodino, lower alkylanilino and lower alkoxyanilino, and

XYZ are selected from the group consisting of hydrogen and halogen, no more than two being hydrogen at any one time.



3,271,414

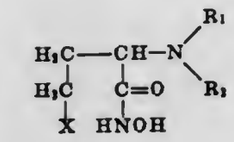
PREPARATION OF BENZOFURAN, BENZOTHIOPHENE, AND INDOLES

Gerrassimos Frangatos, Princeton, N.J., assignor to Mobil Oil Corporation, a corporation of New York

No Drawing. Filed May 12, 1964, Ser. No. 366,889
8 Claims. (Cl. 260—319.1)

1. The process of forming benzofuran, benzothiophene, and indole compounds by ring closure, which comprises heating a substituted aromatic compound with oxygen in the presence of a phosphorus oxymetal compound dehydrocyclization catalyst to a temperature sufficient to bring about catalytic dehydrocyclization of the aromatic compound, said aromatic compound having the formula:

wherein R and R'' are selected from the group consisting of hydrogen and lower alkyl (C_1–C_6), and X is a member of the group consisting of —NH_2, —NHR', —SH, and —OH where R' is lower alkyl (C_1–C_6), and the metal of said phosphorus oxymetal compound catalyst is selected from the group consisting of vanadium, thorium, tantalum, chromium, molybdenum, manganese, iron, nickel, and cobalt.



3,271,415

PREPARATION OF 1-HYDROXY-3-AMINO-PYRROLIDONE-2 AND DERIVATIVES THEREOF

Willem Jacob van der Burg, Oss, Netherlands, assignor to Organon Inc., West Orange, N.J., a corporation of New Jersey

No Drawing. Filed Feb. 11, 1965, Ser. No. 432,003
Claims priority, application Netherlands, Mar. 7, 1964, 6,402,375
2 Claims. (Cl. 260—326.5)

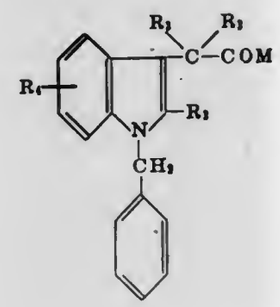
1. Process for the preparation of 1-hydroxy-3-amino-pyrrolidone-2 and derivatives thereof which comprises the cyclisation of a hydroxamic acid of the formula:

in which

X is selected from the group consisting of halogen, lower alkyl sulfonyloxy, benzene sulfonyloxy and tosyloxy, and

R_1 and R_2 are selected from the group consisting of hydrogen, lower alkyl, lower aliphatic carboxyl, benzoyl and benzyloxycarbonyl, benzyl and taken together with the adjacent N atom form a heterocyclic ring selected from the group consisting of a phthalimide and a morpholine ring, and the hydrogen atoms of α, β, and γ-C-atom may be substituted by lower alkyl, cyclohexyl, amino and hydroxyl,

by means of lithium hydroxide.



3,271,416

INDOLYL ALIPHATIC ACIDS

Tsung Y. Shen, Westfield, and Lewis H. Sarett, Princeton, N.J., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Filed Oct. 24, 1961, Ser. No. 147,161
The portion of the term of the patent subsequent to July 20, 1982, has been disclaimed
8 Claims. (Cl. 260—326.13)

1. A compound of the formula:

in which

R_2 is selected from the group consisting of lower alkyl, phenyl, carboxy, carboxy chloride, formyl, hydroxymethyl and benzylthiomethyl;

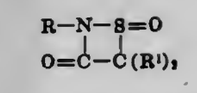
R_3 is selected from the group consisting of hydrogen, lower alkyl and, together with R_5, methylene and part of a cyclopropane ring;

R_5 is selected from the group consisting of hydrogen and, together with R_3, methylene and part of a cyclopropane ring;

R_4 is selected from the group consisting of nitro, amino, lower alkanoylamino, lower alkylamino, di(lower alkyl)amino, phenylamino, benzylamino, di(hydroxy lower alkyl)amino, N-pyrrolidinyl, N-piperazinyl, N-morpholinyl, cyano, aminomethyl, di(lower alkyl) aminomethyl, N-phenyl carboxamidino, lower alkylthiomethyl and N,N-di(lower alkyl) sulfamoyl, the said R_4 being on a position selected from the group consisting of the 5 and 6-positions;

and

M is selected from the group consisting of OH, NH_2, and lower alkoxy.



3,271,417

1,2-THIAZETIDINE-3-ONE-1-OXIDES AND THEIR PREPARATION

James C. Martin, Kingsport, Tenn., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Feb. 6, 1963, Ser. No. 256,525
4 Claims. (Cl. 260—327)

3. A compound of the formula

wherein R is alkyl of up to 18 carbon atoms or phenyl and R' is lower alkyl.

3,271,418

CATALYTIC CONVERSION OF HYDROCARBONS WITH A CRYSTALLINE ALUMINO-SILICATE IN A SILICA-ALUMINA MATRIX

Charles J. Plank, Woodbury, and Edward J. Rosinski, Deptford, N.J., assignors to Mobil Oil Corporation, a corporation of New York

Filed June 22, 1965, Ser. No. 466,096
24 Claims. (Cl. 208—120)

1. In a continuous cyclic process of cracking a petroleum gas oil to produce a selectively large yield of high octane gasoline, and selectively small yields of dry gas and coke, the steps of:

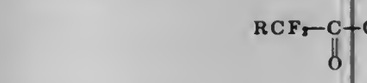
(a) continuously passing a gas oil through a cracking zone maintained under catalytic cracking conditions;

(b) in contact with a composite catalyst in said cracking zone;

(c) said composite catalyst comprising as a major proportion porous silica-alumina;

(d) which silica-alumina is capable, as a catalyst, of effecting at least 15 percent conversion of Mid-Continent gas oil having a boiling range of 450° to 950° F. at a liquid hourly space velocity of 2, a catalyst to oil volume ratio of 3, a temperature of 900° F. and substantially atmospheric pressure;

(e) and not more than about 25 percent by weight of a finely divided crystalline aluminosilicate intermixed with said silica-alumina, at least a substantial proportion of the original alkali metal content of said crystalline aluminosilicate having been replaced by ion exchange;



(f) said crystalline aluminosilicate having a structure of rigid three-dimensional networks characterized by a system of cavities with interconnecting pore openings having minimum diameters of greater than 4 Angstroms and less than 15 Angstroms, the cavities being connected with each other in three dimensions by said pore openings;

(g) said crystalline aluminosilicate having a catalytic activity which is substantially greater than that of said silica-alumina;

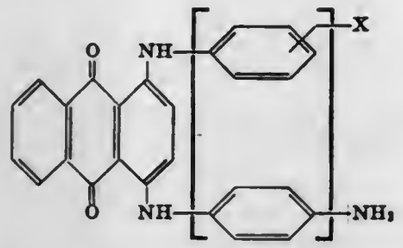
(h) the exchangeable sodium content of said composite catalyst being less than about 1% by weight;
(i) continuously recovering a liquid fraction rich in high octane gasoline;
(j) continuously withdrawing spent composite catalyst from the cracking zone;
(k) subjecting said withdrawn spent catalyst to an operation to regenerate catalytic activity of both said silica-alumina and said zeolite;
(l) and returning regenerated composite catalyst to said cracking zone.

3,271,419
PREPARATION OF FLUORO-CONTAINING LACTONES AND UNSATURATED ACIDS
William J. Linn, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed July 11, 1963, Ser. No. 294,270
12 Claims. (Cl. 260—343.9)

2. A process for preparing at least one member of the class consisting of fluorinated carboxylic acids and their lactones which comprises reacting a ketone of the formula

wherein R and R′ each are selected from the class consisting of fluorine, chlorine, bromine and hydrogen, with an anhydride of an aliphatically saturated hydrocarbyl carboxylic acid having from 2 to 8 carbon atoms inclusive at a temperature of at least 150° C.

3,271,420
STABILIZED DIKETENE AND METHOD FOR ITS PRODUCTION
Herbert Zima, Brig, Switzerland, assignor to Lonza Ltd., Gampel, Valais, Switzerland
No Drawing. Filed Nov. 27, 1964, Ser. No. 414,439
Claims priority, application Switzerland, Nov. 29, 1963, 14,627/63
6 Claims. (Cl. 260—343.9)

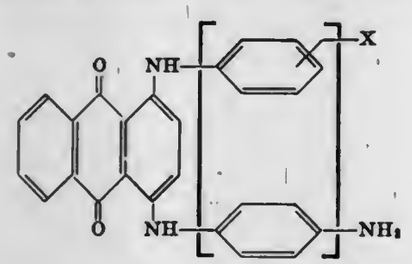


2. A method for reducing the resin formation in systems containing a member of the group consisting of ketene and diketene comprising adding to said system such an amount of elemental sulfur that said system contains at least 0.1% by weight of sulfur.

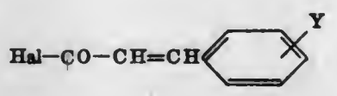
3,271,421
PROCESS FOR THE POLYCONDENSATION OF FURFURYL ALCOHOL
Mohammed Anwar Akbar, Bergen-Enkheim, and Herbert Simonis, Konigstein, Taunus, Germany, assignors to Hans J. Zimmer Verfahrenstechnik, Frankfurt am Main, Germany, a corporation
No Drawing. Filed Nov. 27, 1962, Ser. No. 240,401
Claims priority, application Germany, Dec. 9, 1961, Z 9,132
11 Claims. (Cl. 260—347.8

1. A process for the condensation of furfuryl alcohol which comprises polycondensing in homogeneous phase at a temperature below 100° C. furfuryl alcohol in a non-aqueous organic solvent forming azeotropes with water in the presence of between about 0.01 and 1% referred to the furfuryl alcohol of an acid catalyst and between about 0.1 and 1% referred to the furfuryl alcohol of a polymerization inhibitor under simultaneous removal of the water formed in the reaction and discontinuing the reaction after the chain length desired has been attained but not later than upon termination of water elimination.

3,271,422
DIRECT-DYEING DIANTHRAQUINONYL SULFONIC ACID DYESTUFFS
Leon Katz, Springfield, and Wilhelm Schmidt-Nickels, Little York, N.J., assignors to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware
No Drawing. Filed Dec. 18, 1964, Ser. No. 419,586
6 Claims. (Cl. 260—368)



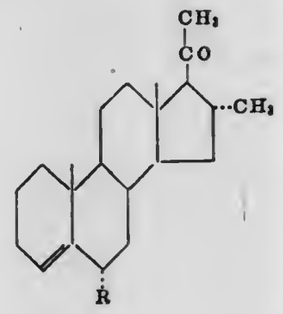
1. The product of the process which comprises
(1) reacting an intermediate of the formula



wherein X is H, lower alkyl, lower alkoxy, or halogen, with sulfuric acid of at least 96% concentration, including oleum, at temperatures of about 60–120° C. to introduce one —SO_3H group into one of the bracketed benzene rings and then
(2) reacting two moles of the resulting monosulfonated product with one mole of a dihalide of oxalic, maleic, malonic, fumaric, citraconic, adipic, butadiene-1,4-dicarboxylic, cumidic, isophthalic, terephthalic, azobenzoic, benzophenone-dicarboxylic, acetone-dicarboxylic, acetone-diacetic, cinnamic-carboxylic, diglycolic, pyridine-dicarboxylic, diphenic, diphenyldicarboxylic, succinic, isosuccinic, mesaconic, naphthalene-dicarboxylic, pyrotartaric, uvitic, or 4,4′-oxobisbenzoic acid; in an aqueous medium at a temperature of about −3 to +30° C. and a pH of about 7 to 11.5.

3,271,423
SUBSTITUTED 1,4-DIPHENYLAMINO ANTHRAQUINONE SULFONIC ACID DYESTUFFS
Leon Katz, Springfield, and Wilhelm Schmidt-Nickels, Little York, N.J., assignors to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware
No Drawing. Filed Dec. 18, 1964, Ser. No. 421,763
4 Claims. (Cl. 260—372)

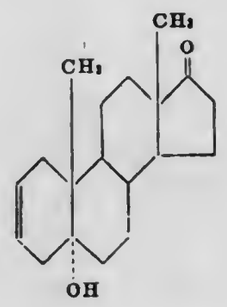
1. The product of the process which comprises
(1) reacting an intermediate of the formula



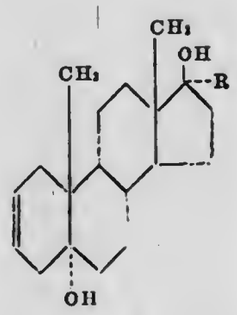
wherein X is H, lower alkyl, lower alkoxy, or halogen, with sulfuric acid of at least 96% concentration, including oleum, at temperatures of about 60–120° C. to introduce one —SO_3H group into one of the bracketed benzene rings and then
(2) reacting the resulting monosulfonated product with an equimolar amount of a cinnamoyl halide of the formula

wherein Hal is halogen and Y is H, nitro, amino, lower alkyl, or lower alkoxy, in an aqueous medium at a temperature of about −3 to +30° C. and a pH of about 7 to 11.5.

3,271,424
16α-METHYL PROGESTERONES
Irving Scheer, Somerville, and Robert Arthur Mallory, Branchburg Township, Somerset County, N.J., assignors to Ortho Pharmaceutical Corporation, a corporation of New Jersey
No Drawing. Filed Apr. 23, 1964, Ser. No. 362,176
3 Claims. (Cl. 260—397.3)



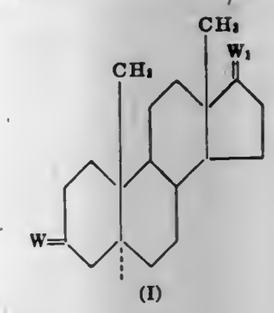
1.



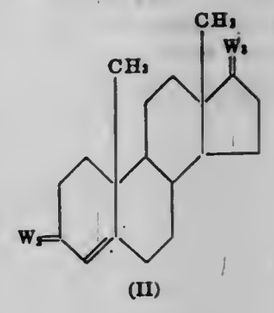
wherein R is selected from the group consisting of methyl and hydrogen.

3,271,425
ANDROST-2-ENE-5α,17β-DIOL, 17-ALKYL DERIVATIVES CORRESPONDING AND ESTERS THEREOF
Paul D. Klimstra, Northbrook, Ill., assignor to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware
No Drawing. Filed Oct. 13, 1964, Ser. No. 403,650
7 Claims. (Cl. 260—397.4)

1. A member selected from the class consisting of compounds represented by the formulas



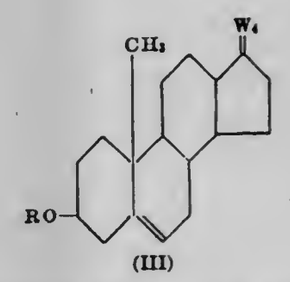
and



together with the 17-(lower alkanoates) corresponding, wherein R is selected from the group consisting of hydrogen and a lower alkyl radical.

3,271,426
NOVEL ANDROSTANE OXIMINO ETHERS AND METHODS FOR THEIR MANUFACTURE
Frank J. Villani, West Caldwell, N.J., assignor to Schering Corporation, Bloomfield, N.J., a corporation of New Jersey
No Drawing. Filed June 28, 1963, Ser. No. 291,262
9 Claims. (Cl. 260—397.5)

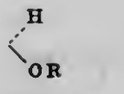
1. A steroid selected from the group consisting of androstane oximino ethers of the following Formulae I, II, and III:



(I)

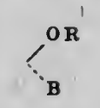
(II)

and



(III)

wherein R is a member selected from the group consisting of hydrogen and an acyl radical of a hydrocarbon carboxylic acid having up to 8 carbon atoms; W_4 is a dilower alkylaminoalkoximino; W is a member selected from the group consisting of dilower alkylaminoalkoximino, keto,



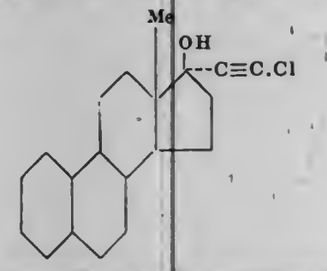
and

R being as defined hereinabove; W_1 is a member selected from the group consisting of dilower alkylaminoalkoximino, keto and

R being as defined hereinabove, at least one of W and W_1 being dilower alkylaminoalkoximino; W_2 is a member selected from the group consisting of keto and dilower alkylaminoalkoximino; W_3 being a member selected from the group consisting of keto and dilower alkylaminoalkoximino, and

R being as heretofore defined and B being a member selected from the group consisting of hydrogen, lower alkyl and ethinyl; and at least one of W_2 and W_3 being a dilower alkylaminoalkoximino; and the non-toxic, pharmaceutically acceptable acid addition salts and quaternary lower alkyl ammonium salts thereof.

2. 17-(β-dimethylaminoethoximino)-androstane-3β-ol.

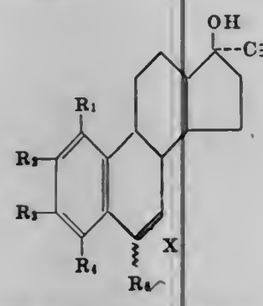


3,271,427

3-DESOXY-17α-CHLOROETHYNYL ESTROGENIC STEROIDS AND PROCESS FOR MAKING SAME

Vladimir Petrow, Colin Michael Burgess, and Peter Feather, all of London, England, assignors to British Drug Houses, Ltd.

No Drawing. Original application July 31, 1961, Ser. No. 127,805. Divided and this application Apr. 24, 1964, Ser. No. 362,497
Claims priority, application Great Britain, Aug. 5, 1960, 27,179/60
11 Claims. (Cl. 260—397.5)



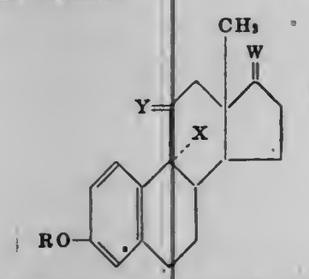
1. A process for the preparation of 17α-chloroethynyl steroids having, apart from substituents and unsaturated linkages in rings A, B, C and D, the formula

(I)

which process comprises reacting a corresponding 17-oxo steroid with lithium chloracetylide and subsequently regenerating the desired derivative from the complex so formed.

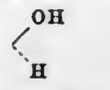
6. A 17α-chloroethynyl steroid of the oestrane series having the formula:

where R_1 is selected from the group consisting of hydrogen, methyl and hydroxyl; R_2, R_4 and R_6 are selected from the group consisting of hydrogen and methyl; R_3 is hydrogen; and X is selected from the group consisting of single and double bonds.



3,271,428

NOVEL ESTRATRIENE OXIMINO ETHERS AND METHODS FOR THEIR MANUFACTURE



Frank J. Villani, West Caldwell, N.J., assignor to Schering Corporation, Bloomfield, N.J., a corporation of New Jersey

No Drawing. Filed Sept. 28, 1964, Ser. No. 399,833
12 Claims. (Cl. 260—397.5)

1. A steroidal 17-oximino ether selected from the group consisting of 1,3,5(10)-estratrienes of the following structural formula, and the non-toxic, pharmaceutically acceptable acid-addition salts and quaternary lower alkyl ammonium salts thereof:

wherein W is a dilower alkylaminoalkoximino group defined by the formula (N—O—Z—A) wherein Z is alkylene having from two to five carbon atoms, and A is dilower alkylamino; R is a member selected from the group consisting of hydrogen, lower alkyl, and an acid radical of a hydrocarbon carboxylic acid having up to 8 carbon atoms; X is hydrogen; Y is a member selected from the group consisting of hydrogen, keto,

and W; and together X and Y are members selected from the group consisting of 9α,11β-dichloro and an additional bond.

3,271,429

PROCESS FOR PREPARATION OF 20-KETOXIMES OF Δ^{16}-20-KETO-PREGNENES

Octavio Mancera, Mexico City, Mexico, assignor to Syntex Corporation, Panama, Panama, a corporation of Panama

No Drawing. Filed Oct. 29, 1964, Ser. No. 407,554
Claims priority, application Mexico, Nov. 26, 1963, 74,766
3 Claims. (Cl. 260—397.5)

1. A process for preparing the 20 - ketoxime of Δ^{16}-pregnene compounds, which comprises treating the total product of the degradation of sapogenins, consisting of a mixture of a 3 - acyloxy - γ - methyl - δ - acyloxy valerate of a 20-keto 16-hydroxy pregnane and a Δ^{16}-20-keto pregnene, with hydroxylamine hydrochloride in an alcoholic solvent and in the presence of a weak alkaline salt selected from the group consisting of carbonates and oxides of alkaline earth metals.

3,271,430

N-PERFLUOROACYL POLYALKYLENIMINES

Fred N. Teumac, Lake Jackson, Tex., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Feb. 7, 1963, Ser. No. 256,844
4 Claims. (Cl. 260—404.5)

1. An N-perfluoroacyl polyalkylenimine wherein perfluoroacyl is the residue of a perfluorinated alkanoic acid of 2 to about 12 carbon atoms and there are present in the perfluoroacyl polyalkylenimine molecule from about 10 to about 100 alkylenimine units for each perfluoroacyl group, each alkenylenimine unit containing from 2–4 carbon atoms.

3,271,431

POLYAMIDES OF POLYBASIC ARALIPHATIC CARBOXYLIC ACIDS

Josef Baltes, Hamburg, and Friedrich Weghorst and Zdzislaw Makus, Hamburg-Harburg, Germany, assignors to Harburger Fettchemie Brinckman & Mergell G.m.b.H., Hamburg-Harburg, Germany, a corporation of Germany

No Drawing. Filed Apr. 15, 1963, Ser. No. 272,866
8 Claims. (Cl. 260—404.5)

1. A polyamide prepared by a process which comprises condensing a polyamine having 2 to 5 amino groups with a polybasic araliphatic carboxylic compound, said compound having been prepared by subjecting a conjugated unsaturated fatty acid compound selected from the class consisting of conjugated unsaturated fatty acids and C_1 to C_4 alkanol esters of said acids to ionic copolymerization with an aromatic vinyl compound selected from the class consisting of styrene, alpha-methyl styrene and vinyl toluene in the proportion of 1 mole of fatty acid compound to 0.2 to 5 moles of aromatic vinyl compound and controlling the temperature of the reacting mass to prevent the mass temperature from exceeding at any time a temperature of about 200° C., said polyamide forming process comprising controlling the mass temperature throughout the course of the resulting reaction to maintain the temperature within the range of 120 to 230° C., subsequently removing volatile products and unreacted amine from the reaction mass and recovering the polyamide as the product.

3,271,432

PROCESS FOR THE MANUFACTURE OF POLYBASIC ARALIPHATIC CARBOXYLIC ACIDS AND PRODUCTS THEREOF

Josef Baltes, Hamburg, Friedrich Weghorst and Zdzislaw Makus, Hamburg-Harburg, Germany, assignors to Harburger Fettchemie Brinckman & Mergell G.m.b.H., Hamburg-Harburg, Germany, a corporation of Germany

No Drawing. Filed Apr. 15, 1963, Ser. No. 272,873
Claims priority, application Germany, Apr. 25, 1962, H 45,567
16 Claims. (Cl. 260—407)

1. The process for the manufacture of polybasic araliphatic carboxylic compounds which include subjecting a conjugated unsaturated fatty acid compound selected from the class of conjugated unsaturated fatty acid and C_1 to C_4 alkanol esters of the said acids to ionic copolymerisation with an aromatic vinyl compound selected from the class consisting of styrene, alpha methyl styrene, and vinyl toluene in the proportions of 1 mol of fatty acid compound to 0.2–5 mols of aromatic vinyl compound and controlling the temperature of the reacting mass to prevent the mass temperature from exceeding at any time a temperature of about 200° C., subsequently removing volatile products of the reaction by distilling the mass at atmospheric pressure, and recovering the product.

2. A polybasic araliphatic carboxylic compound obtained by the process of claim 1.

3,271,433

PROCESS FOR SEMI-CONTINUOUS HYDROGENATION OF FAT

Irvin C. Bentz, Houston, Tex., assignor to Anderson, Clayton & Co., Houston, Tex., a corporation of Delaware

Filed June 17, 1963, Ser. No. 288,387
5 Claims. (Cl. 260—409)

1. In the semi-continuous process of hydrogenating fat, such process including post hydrogenating treatment, the steps comprising,

(a) hydrogenating a batch of fat in the absence of oxygen in a first closed container,

(b) flowing the batch of fat immediately upon completion of hydrogenation into a second closed container in the absence of oxygen, the second container having a capacity sufficient to hold all the hydrogenated fat from the first container,

(c) placing another batch of fat to be hydrogenated in the first container immediately upon emptying the first mentioned batch into the second container, and

(d) flowing the first mentioned batch of fat from the second container to at least a first stage of post hydrogenation treatment in the absence of oxygen and within the time required for hydrogenating the other batch of fat.

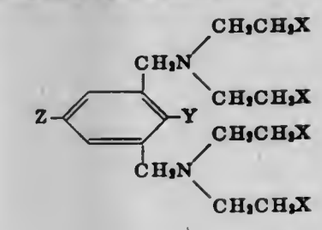
3,271,434

PROCESS FOR CONTROLLING THE MELTING POINT OF HARD AND BRITTLE FATS

Wolfgang Baenitz, Witten-Annen, Germany, assignor to Chemische Werke Witten G.m.b.H., Witten (Ruhr), Germany

No Drawing. Filed Aug. 7, 1962, Ser. No. 215,263
Claims priority, application Germany, Feb. 12, 1958, I 14,406
2 Claims. (Cl. 260—410.7)

1. A process for controlling the melting point of hard and brittle fats within a relatively narrow range which comprises esterifying a mixture of fatty acids having from 10 to 18 carbon atoms with glycerine in a ratio of 0.425 to 0.475 mole of glycerine per average mole of fatty acid mixture to produce an ester product of minimum melting point having a hydroxyl number in the range of 40 to 100 and containing at least 90% of di- and triglycerides.



3,271,435

BIS[DI(2-SUBSTITUTED ETHYL)AMINOMETHYL] BENZENE COMPOUNDS

David Irwin Randall, Easton, Pa., and Wilhelm Schmidt-Nickels, Little York, N.J., assignors to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Sept. 14, 1964, Ser. No. 396,410
5 Claims. (Cl. 260—458)

1. A compound of the formula

wherein

X is selected from the group consisting of hydroxy, chloro, bromo, sulfato, phosphato, and benzenesulfonyloxy,

Y is selected from the group consisting of H, lower alkyl and lower alkoxy, and

Z is selected from the group consisting of $—NO_2$ and $—NH_2$.

3,271,436

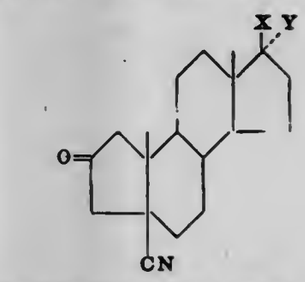
PROCESS FOR THE PRODUCTION OF HETEROCYCLIC BORON COMPOUNDS

Roland Koster, Mulheim (Ruhr), Germany, assignor to Studiengesellschaft Kohle m.b.H., Mulheim (Ruhr), Germany, a corporation of Germany

No Drawing. Filed Feb. 10, 1961, Ser. No. 88,248
Claims priority, application Germany, Feb. 13, 1960, St 16,117
2 Claims. (Cl. 260—462)

1. B - butoxy - 3 - methyl-borolane having a $B.P._{.18}$ of 72° C.

2. A borazane mixture comprising B-diethylamino-2-methyl-boracyclohexane, B-diethylamino - 2 - ethyl-boracyclopentane and B-diethylaminoboracycloheptane and having a $B.P._{.12}$ of 102–115° C.



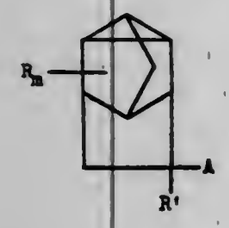
3,271,437

5β-CYANO SUBSTITUTED A-NORPREGNANE AND A-NORANDROSTANE COMPOUNDS

Seymour David Levine, Princeton, N.J., assignor, by mesne assignments, to E. R. Squibb and Sons Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Mar. 30, 1964, Ser. No. 355,913
7 Claims. (Cl. 260—464)

1. A composition of the formula

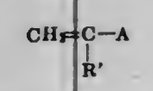


wherein X is selected from the group consisting of hydroxy the acyloxy radical of a hydrocarbon carboxylic acid of less than twelve carbon atoms and $—COCH_3$; Y is hydrogen; and together X and Y is oxo (O=).

3,271,438
PRODUCTION OF POLYCYCLIC COMPOUNDS

Lawrence G. Cannell, Lafayette, Calif., assignor to Shell Oil Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed May 14, 1964, Ser. No. 367,549
11 Claims. (Cl. 260—464)



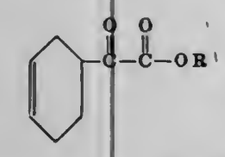
1. The process for the production of the 8-substituted quadricyclo(2.2.1.$2^{3,5}$.$0^{2,6}$)nonane of the formula

wherein R, *m*, R′ and A are as defined below, by reacting the hydrocarbon bicyclo(2.2.1)hepta-2,5-diene compound of the formula

wherein R is hydrocarbyl free from non-aromatic unsaturation of up to 10 carbon atoms and *m* is a whole number from 0 to 4, with the compound

wherein R′ is hydrogen or alkyl of up to 4 carbon atoms and A is cyano, carboalkoxy wherein the alkyl moiety has up to 8 carbon atoms, formyl, carbonylalkyl wherein the alkyl moiety has up to 8 carbon atoms or N,N-di-R′-carbamyl wherein R′ is hydrogen or alkyl of up to 4 carbon atoms, in the presence of from about 0.0001% mole to about 5% mole based on the limiting reactant of the tetrakis(trihydrocarbylphosphite)nickel(0) catalyst of the formula

$$[P(OR)_3]_4Ni(0)$$



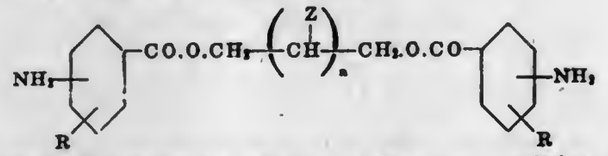
wherein R independently is hydrocarbyl free from non-aromatic unsaturation of up to 10 carbon atoms, at a temperature from about 80° C. to about 300° C. and a pressure from about 1 atmosphere to about 100 atmospheres.

3,271,439
3-CYCLOHEXENE-1-GLYOXYLIC ACID, SALTS AND ESTERS

Walter D. Celmer, New London, Conn., assignor to Chas. Pfizer & Co., Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Mar. 5, 1963, Ser. No. 262,829
5 Claims. (Cl. 260—468)

1. A compound having the formula



wherein R is selected from the group consisting of hydrogen, alkali metal, alkaline earth metal and alkyl of from 1 to 3 carbon atoms.

3,271,440
AMINO-BENZOIC AND AMINO-TOLUIC ACID DIESTERS OF POLYHYDRIC ALKANOLS

Telfer L. Thomas, Belleville, N.J., assignor to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 9, 1962, Ser. No. 229,481
6 Claims. (Cl. 260—471)

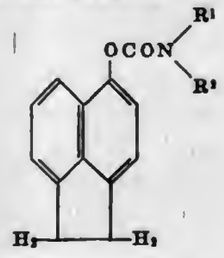
1. A compound of the formula:

wherein Z represents a member of the group consisting of H and —OH, R represents a member of the group consisting of H and —CH_3, *n* represents an integer from 0 to 4 inclusive and the amino groups occupy one of the positions in the benzene nucleus meta and para to the —CO—O— group.

3,271,441
PROCESS FOR PREPARING FLUOROALKYL SUBSTITUTED AROMATIC COMPOUNDS

Neal O. Brace, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed June 18, 1962, Ser. No. 203,392
2 Claims. (Cl. 260—476)



1. A process for preparing polyfluoroalkyl substituted aromatic compounds which process comprises heating together at a temperature from about 80° C. to about 190° C. (1) a polyfluoroalkyl iodide having the formula X—R_f—I, wherein X is selected from the group consisting of fluorine, chlorine, bromine and hydrogen and R_f is a perfluoroalkylene radical, (2) an aromatic compound selected from the group consisting of benzene, naphthalene, anthracene, phenanthrene, diphenyl, chrysene, pyridine, pyrimidine, pyridazine, pyrazine, quinoline, isoquinoline, cinnoline, quinazoline, quinooxaline, phthalazine, and the fused pyridopyridines, said aromatic compound containing from zero to two substituents other than hydrogen and said substituents selected from the group consisting of halogen, hydroxyl, alkoxyl, acyloxy, carboxyl, carboalkoxy, acyl, alkyl, chloroalkyl, bromoalkyl, aryl, cyano, sulfonyl, cyanoalkyl, carboxyalkyl, carboalkoxyalkyl, arylalkyl and sulfonylalkyl, and (3) a free radical generating compound selected from the group consisting of organic peroxides and aliphatic azo compounds; and recovering the product polyfluoroalkyl substituted aromatic compound from the reaction mixture.

3,271,442
5-ACENAPHTHENYL ESTERS OF CARBAMIC ACID AND N-SUBSTITUTED ALKYL CARBAMIC ACIDS

Joseph A. Lambrech, deceased, late of Charleston, W. Va., by Vallah G. Lambrech, executrix, Charleston, W. Va., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Original application Aug. 29, 1955, Ser. No. 531,274, now Patent No. 3,084,096, dated Apr. 2, 1963. Divided and this application June 26, 1962, Ser. No. 205,467
2 Claims. (Cl. 260—479)

1. Compounds of the formula

wherein R^1 and R^2 are individually selected from the class consisting of hydrogen and lower alkyl, with the proviso that the total number of carbon atoms in R^1 and R^2 does not exceed 7.

3,271,443
ALKYLAMINO-2-HYDROXYPROPYL QUATERNARY AMMONIUM COMPOUNDS

Donald M. Burness, Rochester, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Feb. 18, 1964, Ser. No. 345,579
4 Claims. (Cl. 260—501)

1. A compound selected from the group consisting of the compounds having the formula

$$R'\overset{R''}{N}CH_2CHOHCH_2\overset{+}{N}R_2\cdot X^-$$

wherein R′ is a linear hydrocarbon radical of 10–30 carbon atoms; R″ is hydrogen or a lower alkyl of 1–4 carbon atoms; R is lower alkyl of 1–4 carbon atoms; and X^- is an anion; and the compounds having the formula

$$R_3N^+CH_2CHOHCH_2ZCH_2CHOHCH_2N^+R_3\cdot 2X^-$$

wherein R is lower alkyl of 1–4 carbon atoms; X^- is an anion; and Z is a diamino group in which the amino groups are joined by an alkylene chain of at least 4 and not more than about 12 carbon atoms or an alkylene of at least 4 and not more than about 12 carbon atoms which is interrupted by at least one —O—, —S—, or

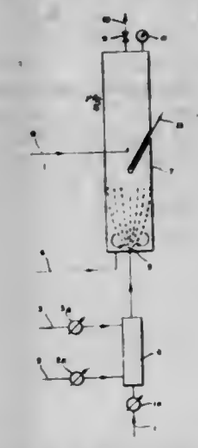
$$\overset{H}{\underset{|}{-N-}}$$

group.

3,271,444
SALTS OF C_{10} TO C_{20} 1,2-SULFONIC-SULFINIC ACIDS AND METHOD FOR THEIR PREPARATION

Douglas F. Percival, Martinez, Elmer E. Johnson, San Rafael, and Robert T. Adams, Lafayette, Calif., assignors to Chevron Research Company, a corporation of Delaware

No Drawing. Filed Aug. 12, 1964, Ser. No. 389,208
7 Claims. (Cl. 260—513)



1. A method of preparing a salt of an n-alkane-1,2-sulfonic-sulfinic acid from an olefinic hydrocarbon feed selected from the group consisting of normal terminal C_{10}–C_{20} olefins and mixtures thereof, which comprises reacting a bisulfite salt with said olefin by adding an aqueous bisulfite solution containing for each mol of said olefin from about 1 to 2.5 mols of bisulfite to said olefin dissolved in an alcohol solvent containing for each mol of said olefin from 0.001 to 0.10 mol of an organic tertiary-butyl perester, and by maintaining the resulting reaction solution pH in the range from about 3.5 to 6.5 during said addition and thereafter while removing said solvent, thereby recovering the resulting salt of the corresponding n-alkane-1,2-sulfonic-sulfinic acid.

3,271,445
NITRIC ACID OXIDATION OF BENZENE COMPOUNDS CONTAINING OXIDIZABLE SIDE CHAINS

Ernst Bartholome, Heidelberg, Hans Nienburg, Ludwigshafen am Rhine, Walter Schenk, Heidelberg, Karl Scherf, Ludwigshafen am Rhine, Norbert Loesch, Hanhofen, Albrecht Wallis, Ludwigshafen am Rhine, and Ludwig Vogel, Frankenthal, Pfalz, Germany, assignors to Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen am Rhine, Germany

Filed Apr. 17, 1963, Ser. No. 273,723
Claims priority, application Germany, Apr. 26, 1962, B 66,985
4 Claims. (Cl. 260—524)

1. In a continuous process for the production of aromatic carboxylic acids by oxidation of derivatives of benzene substituted by from 1 to 6 oxidizable side chains with 1 to 4 carbon atoms, said side chains being selected from the class consisting of alkyl groups, hydroxyalkyl groups, alkyl groups substituted by an aldehyde group, alkyl groups substituted by a keto group, monochloroalkyl groups and dichloroalkyl groups, said derivatives being further substituted by (x—1) inert substituents selected from the class consisting of nitro groups, halogen atoms and carboxylic groups, x denoting an integer from 1 to 4, at an oxidation temperature of from 150° to 400° C., comprising mixing the compound to be oxidized with nitric acid of from 10 to 40 weight percent concentration

in a mixing apparatus at a temperature below said oxidation temperature, leading the resultant mixture with turbulent flow into a reaction zone wherein a pressure of from 10 to 150 atmospheres is maintained and the temperature is maintained adiabatically at from 150° to 400° C., decreasing the velocity of flow of said mixture upon entry into said reaction zone to at least one third, avoiding a gas space at the upper end of said reaction zone, and withdrawing the reaction product at said upper end of said reaction zone, the improvement which comprises introducing 30 to 60% by weight of the nitric acid to be used from the bottom into the reaction zone and 40 to 70% into the middle third of the reaction zone.

3,271,446
PREPARING ACETIC ACID BY THE CATALYTIC OXIDATION OF METHACROLEIN

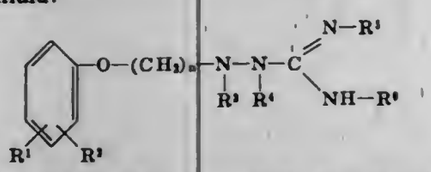
Ralph O. Kerr, Houston, Tex., assignor to Petro-Tex Chemical Corporation, Houston, Tex., a corporation of Delaware

No Drawing. Filed July 2, 1962, Ser. No. 207,061
6 Claims. (Cl. 260—530)

1. A process for preparing acetic acid which comprises contacting at a temperature in the range of above 200° C. to below 300° C. at a residence time of less than 5 seconds, a gaseous mixture of methacrolein, a molar excess of oxygen and at least a 20 volume percent of steam with a catalyst comprising a complex of vanadium atoms and atoms selected from the group consisting of manganese and copper in an atomic ratio of about 0.3 to 0.8 atom of vanadium and about 0.2 to 0.6 atom selected from the group consisting of manganese and copper, wherein said complex constitutes at least about 50 weight percent of the catalyst.

3,271,447
LIQUID PHASE OXIDATION OF PROPYLENE TO ACRYLIC ACID IN THE PRESENCE OF AN Mn OR Ni CATALYST

Marcus A. Naylor, Jr., Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

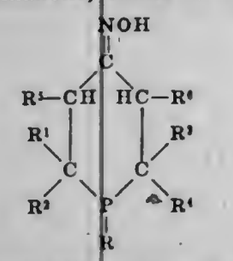


No Drawing. Filed May 11, 1964, Ser. No. 366,605
4 Claims. (Cl. 260—533)

1. An oxidation process which comprises simultaneously contacting propylene, oxygen, alkanoic acid solvent,

and salt of 1 to 100,000 parts by weight, per million parts by weight of said solvent, of catalytic metal from the group consisting of manganese and nickel, in liquid substantially anhydrous phase, at a temperature of 125° C. to 250° C. and a pressure of 5 to 200 atmospheres, continuing said contacting until acrylic acid is the principal oxidation product, and separating acrylic acid from the resulting reaction mixture.

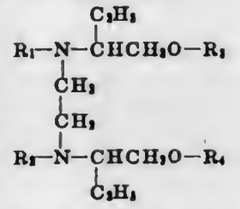
3,271,448
PHENOXYALKYL AMINOGUANIDINES
Joachim Augstein, Canterbury, Kent, William C. Austin, Bishops Stortford, Ronald J. Boscott, Deal, Kent, Sheila M. Green, Maidstone, Kent, and William H. Hunter, Orpington, Kent, England, assignors to Chas. Pfizer & Co., Inc., New York, N.Y., a corporation of Delaware
No Drawing. Filed Sept. 10, 1964, Ser. No. 395,588
Claims priority, application Great Britain, Mar. 15, 1962, 9,998/62; July 20, 1962, 28,075/62
11 Claims. (Cl. 260—564)



1. A compound selected from the class of organic bases of the formula:

and the pharmaceutically-acceptable acid addition salts thereof, wherein R^1 and R^2 are each a member selected from the group consisting of hydrogen, hydroxy, lower alkyl, lower alkoxy and halogen; *n* is an integer of from two to four; R^3 and R^4 are each a member selected from the group consisting of hydrogen and lower alkyl; R^5 and R^6 are each members selected from the group consisting of hydrogen, lower alkyl and amino, and when said R^5 and R^6 are taken together with the nitrogen atoms to which they are attached, they form a cyclic member selected from the group consisting of imidazolo and dihydropyrimidino.

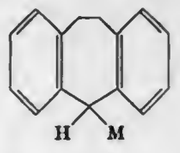
3,271,449
PHOSPHORINANONE OXIMES
Richard Parke Welcher, Old Greenwich, Conn., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine
No Drawing. Original application Dec. 22, 1961, Ser. No. 161,438, now Patent No. 3,225,103, dated Dec. 21, 1965. Divided and this application Aug. 9, 1965, Ser. No. 485,972
2 Claims. (Cl. 260—566)



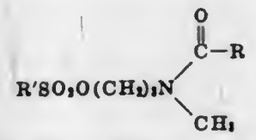
1. A 4-phosphorinanone, oxime of the formula

wherein R is a member selected from the group consisting of substituted and unsubstituted, branched and straight chain alkyl having from 1 to 18 carbon atoms, cycloalkyl, substituted and unsubstituted aryl; said substituents for alkyl being selected from the group consisting of lower alkoxy, phenyl and cyano, and said substituents for aryl being selected from the group consisting of halogen and lower alkyl; R^1, R^2, R^3, and R^4 each represent a member selected from the group consisting of hydrogen, lower alkyl, phenyl, chloro-substituted phenyl, lower alkyl-substituted phenyl, cyclohexyl and lower alkoxyalkyl; and R^5 and R^6 each represent a member selected from the group consisting of hydrogen, lower alkyl and phenyl.

3,271,450
2,2'-(ETHYLENEDIIMINO)-DI-1-BUTANOLS
Raymond George Wilkinson, Montvale, and Robert Gordon Shepherd, Ridgewood, N.J., assignors to American Cyanamid Company, New York, N.Y., a corporation of Maine
No Drawing. Original application Jan. 23, 1962, Ser. No. 168,241, now Patent No. 3,176,040, dated Mar. 30, 1965. Divided and this application Feb. 12, 1965, Ser. No. 432,419
Claims priority, application Great Britain, Feb. 7, 1961, 4,517/61, Patent 961,317
10 Claims. (Cl. 260—570.5)

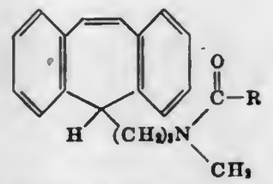


1. A member of the class consisting of symmetrical ethylenediamines of the formula:

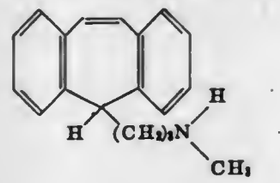


wherein R_1 and R_2 are the same and are selected from the group consisting of hydrogen, methyl and ethyl, and R_3 and R_4 are the same and are selected from the group consisting of methyl, ethyl and benzyl; and the non-toxic acid-addition salts thereof.

3,271,451
PROCESS FOR PREPARING 5-(3-METHYLAMINOPROPYL)-5H-DIBENZO[a,d]CYCLOHEPTENES
Max Tishler, Westfield, John M. Chemerda, Metuchen, and Janos Kollonitsch, Westfield, N.J., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey
No Drawing. Filed July 3, 1962, Ser. No. 207,405
2 Claims. (Cl. 260—570.8)

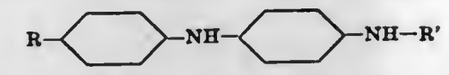


1. A process which comprises reacting a compound of the formula:



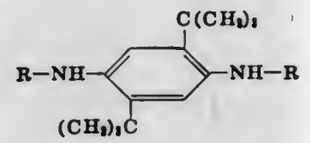
wherein M is an alkali metal with a compound of the formula:

wherein R is hydrogen, lower-alkyl or phenyl and R' is a phenyl, benzyl, tolyl or lower-alkyl, in an inert substantially anhydrous organic solvent to form a cycloheptene of the formula:



wherein R is as defined above and then hydrolyzing said cycloheptene to form a compound of the formula:

3,271,452
4-ALKOXY-4'-SECONDARY-ALKYLAMINO-DIPHENYL-AMINES
Paul L. Merz, Livermore, Calif., assignor to United States Rubber Company, New York, N.Y., a corporation of New Jersey
No Drawing. Filed Nov. 19, 1962, Ser. No. 238,784
4 Claims. (Cl. 260—571)



1. A chemical compound represented by the formula

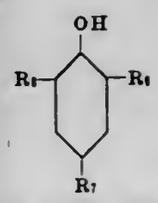
in which R is an alkoxy group having 1 to 4 carbon atoms and R' is a secondary alkyl group having 3 to 8 carbon atoms.

3,271,453
2,5-DI-TERT-BUTYL-N,N'-DIARYL-p-PHENYLENEDIAMINES
Ernest Csendes, Atlanta, Ga., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed Jan. 22, 1962, Ser. No. 167,938
5 Claims. (Cl. 260—576)

1. A 2,5-di-tert-butyl - N,N'-diaryl-p-phenylenediamine of the formula

wherein R is a member selected from the group consisting of phenyl, naphthyl, lower alkyl substituted phenyl and lower alkyl substituted naphthyl.

3,271,454
PRODUCTION OF UNSYMMETRICAL DIALKYLHYDRAZINES
Donald Pickens, Hopewell, Va., assignor to Allied Chemical Corporation, a corporation of New York
No Drawing. Filed Feb. 20, 1957, Ser. No. 641,237
2 Claims. (Cl. 260—583)



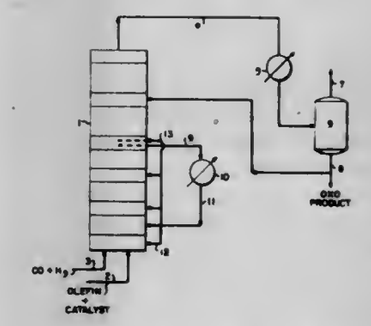
1. The process of hydrogenating nitrosodimethylamine to produce unsymmetrical-dimethylhydrazine which comprises producing a slurry of a platinum catalyst on an alumina support in an aqueous solution of nitrosodimethylamine, said solution having a concentration of 20 to 35 weight percent nitrosodimethylamine and said slurry containing from 7 to 15 grams of catalyst per mol of nitrosodimethylamine, introducing hydrogen at an initial pressure of 800 to 2000 pounds per square inch gauge into said slurry, maintaining the temperature during the introduction of said hydrogen within the range of 20° to 45° C. and continuing the introduction of the hydrogen until substantially all of the nitrosodimethylamine has been converted to unsymmetrical-dimethylhydrazine.

3,271,455
PROCESS FOR SEPARATING METHYLAMINES
Denys Cook and David M. Young, Sarnia, Ontario, Canada, assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Filed Sept. 22, 1961, Ser. No. 139,863
2 Claims. (Cl. 260—583)

1. A process for separating trimethylamine from mixtures containing trimethylamine and at least one other methylamine, comprising adding to said mixture at least about one mole of a lower alkyl borate ester per mole of other methylamines present in the mixture, thus to convert a major portion of said other amines to amine-borate adducts and separating the trimethylamine from said adducts.

3,271,456
OXYGENATED ORGANIC COMPOUNDS OF IMPROVED ODOR
Elaine Theodora Delaune and John Cecil Winkler, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware
No Drawing. Filed Mar. 26, 1962, Ser. No. 182,639
8 Claims. (Cl. 260—593)

1. A composition of matter comprising an oxygenated organic liquid selected from the group consisting of methanol, ethanol, tertiary butanol, isopropanol, secondary butanol, branched oxo alcohols having 1 to 16 carbon atoms per molecule, diethyl ether, methyl ethyl ether, diisopropyl ether, methyl ethyl ketone, methyl isobutyl ketone, and acetone having dissolved therein 0.5 to 5 p.p.m. of an alkyl-substituted phenol compound having the structural formula



wherein R_6 is a C_1 to C_5 alkyl group and R_7 and R_8 are selected from the group consisting of hydrogen and C_1 to C_5 alkyl groups.

3,271,457
PROCESS FOR THE PRODUCTION OF PHENOL
Thomas Bewley and Maurice Dudley Cooke, Epsom, England, assignors to The Distillers Company Limited, Edinburgh, Scotland, a British company
Filed Apr. 16, 1962, Ser. No. 187,738
Claims priority, application Great Britain, Apr. 22, 1961, 14,653
6 Claims. (Cl. 260—593)

1. A process for the production of phenol and acetone which comprises the steps of:
(a) thoroughly mixing cumene hydroperoxide with a recycle stream of liquid acetone;
(b) contacting the mixture with sulphuric acid under conditions wherein acetone vapor is given off from the reaction zone;
(c) condensing said vapor to form the recycle stream of (a); and
(d) recovering the phenol from the reaction mixture.

3,271,458
COOLING AND CATALYST RECYCLE IN OXO SYNTHESIS
William J. Ellis, Dover, and Charles Roming, Jr., Towaco, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware
Filed Nov. 23, 1962, Ser. No. 239,558
17 Claims. (Cl. 260—604)

1. In an oxo process wherein an olefin, carbon monoxide and hydrogen are contacted in a carbonylation zone with an oxo catalyst under conditions to produce an oxygenated reaction product comprising an aldehyde, the

improvement which comprises withdrawing from said carbonylation zone an effluent stream having an olefin content higher than the final oxygenated reaction product, cooling and recycling about 20 to 90% by volume of said stream to said carbonylation zone, and injecting at least a portion of the cooled recycle stream into the initial stages of said carbonylation zone.

3,271,459
PRODUCTION OF METHACROLEIN

William F. Brill, Skillman, and Alfio J. Besozzi, East Brunswick, N.J., assignors to Petro-Tex Chemical Corporation, Houston, Tex., a corporation of Delaware

No Drawing. Filed June 27, 1963, Ser. No. 290,916
6 Claims. (Cl. 260—604)

1. A process for the vapor phase production of methacrolein which comprises contacting an isobutylene mixture comprising about 0.5 to 3 mols of oxygen per mol of isobutylene at temperatures between about 450° C. to 650° C. with a catalyst containing silver and phosphorus in an atomic ratio of 1 to 10 atoms of silver per atom of phosphorus as the oxides for about 0.05 to about 0.5 second.

3,271,460
METHOD OF PREPARING ORGANOPHOSPHORUS COMPOUNDS

Albert Y. Garner, Yellow Springs, Ohio, assignor to Monsanto Research Corporation, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed June 28, 1962, Ser. No. 205,841
3 Claims. (Cl. 260—606.5)

1. The method of preparing the compound $(ArP)_n$ wherein Ar is an aromatic hydrocarbon radical of from 6 to 12 carbon atoms which is free of olefinic and acetylenic unsaturation and n is a number of from 2 to 6, which comprises contacting with magnesium a compound of the formula $ArPX_2$ wherein Ar is as above defined and X is halogen in the presence of a solvent selected from the class consisting of tetrahydrofuran, chloroform, acetone and acetonitrile.

3,271,461
SUBSTITUTED ALLYL ETHERS

Robert James Stephenson, Llanyravon, Cumbran, England, assignor to Monsanto Chemicals Limited, London, England, a British company

No Drawing. Filed Oct. 30, 1962, Ser. No. 234,218
Claims priority, application Great Britain, Nov. 13, 1961, 40,502/61
5 Claims. (Cl. 260—614)

1. A process for the production of a substituted allyl ether, in which a conjugated diene is contacted with an organic compound containing a reactive hydroxyl group at a pressure of up to 100 atmospheres, a temperature of between about 20° C. and about 150° C., and in the presence of up to 0.5 mol of cuprous salt catalyst per mol of conjugated diene and 0.1 to 50 equivalents of acid co-catalyst per mol of cuprous salt catalyst; wherein the acid co-catalyst is selected from the group consisting of hydrogen bromide, hydrogen chloride, phosphoric acid, boron trifluoride, aluminum chloride, sulphuric acid, sulphamic acid, benzenesulfonic acid, p-toluenesulfonic acid, methanesulfonic acid, ethyl hydrogen sulfate, and sulfonated styrene ion exchange resins; wherein the cuprous salt catalyst is selected from the group consisting of cuprous halides, cuprous sulfate, cuprous p-toluenesulphonate, cuprous acetate, cuprous ammonium iodide, cuprous arsenide, cuprous carbonate, cuprous cyanide, cuprous ferricyanide, cuprous sulfide and cuprous sulfite; wherein the conjugated diene is selected from the group consisting of butadiene and substituted butadiene wherein the substituted groups are selected from the group consisting of alkyls of from 1 to 8 carbon atoms, aryls selected from the group consisting of phenyl, tolyl and xylyl; alkoxys selected from the group consisting of ethoxy and methoxy and halogens selected from the group consisting of chlorine and bromine; and wherein the organic compound containing a reactive hydroxyl group is selected from the group consisting of substituted and unsubstituted saturated monohydric aliphatic alkyl alcohols of from 1 to 18 carbon atoms, wherein the substituted groups are substituents selected from the group consisting of ethoxy, methoxy, chlorine and bromine; unsubstituted alkyl polyhydric alcohols containing from 2 to 5 hydroxyl groups and from 4 to 24 carbon atoms, and phenol and substituted phenol selected from the groups consisting of naphthol, cresol, xylenol, p-chloro-m-xylenol, β-naphthol and γ-phenylphenol.

3,271,462
ELIMINATION OF POLYOXYALKYLENE UNSATURATION

Mason H. Earing, Grosse Ile, Mich., assignor to Wyandotte Chemicals Corporation, Wyandotte, Mich., a corporation of Michigan

No Drawing. Filed June 29, 1962, Ser. No. 206,169
20 Claims. (Cl. 260—615)

1. A method of removing unsaturation found in polyoxyalkylene polyol compounds which comprises intimately contacting said polyoxyalkylene polyol compound with a mixture, having a pH of less than 8.0, of water and a sulfonated polystyrene resin, at a temperature of about 15° C. to about 100° C., said sulfonated polystyrene resin being present in the minimum amount of 1 weight percent of the polyoxyalkylene compound and having been activated by the replacement of a portion of its acidic hydrogen atoms by mercuric ions; furthermore, said polyoxyalkylene polyol compounds being characterized by having an average oxygen:carbon atom ratio of less than 0.45 and a molecular weight from about 600 to about 25,000 and being a condensation product of an alkylene oxide containing from about 2 to 12 carbon atoms and an alkane polyol having from about 2 to 8 hydroxyl groups.

3,271,463
PREPARATION OF INDANOLS

William L. Howard, Jackson, Tex., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Mar. 23, 1962, Ser. No. 182,100
3 Claims. (Cl. 260—619)

1. A process for making indanols which comprises reacting by contacting p,p'-isopropylidenediphenol with aqueous sulfuric acid of from about 7 to about 15 molar concentration at about 90° C. to about 150° C. for a length of time sufficient for substantial reaction to take place, and separating from the reaction mixture thereby produced 3,3,3',3'-tetramethylbis-1,1'-spiro-6-indanol.

3,271,464
SELECTIVE DEHYDRATION OF SECONDARY ALCOHOL OVER 5–A SIEVE

James Richard Hays and Arthur Homer Neal, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Filed June 19, 1961, Ser. No. 117,826
6 Claims. (Cl. 260—643)

1. A process for selectively dehydrating secondary alcohols to olefins in the presence of primary alcohols which comprises contacting a mixture of alkanols selected from the group consisting of linear and methyl-branched C_1–C_{30} primary and C_3–C_{30} secondary alkanols with a crystalline alumino-silicate having a pore size of about 5 A. units molecular sieve at temperatures in the range of 250 to 650° F. and utilizing liquid space velocities of 8 to 12 volumes of alcohol/volume of molecular sieve/hour.

3,271,465
PREPARATION OF CHLOROALKYLATED BENZENES AND ALKYLSUBSTITUTED BENZENES

William A. Krewer, Arlington Heights, and George W. Ayers, Chicago, Ill., assignors, by mesne assignments, to Union Oil Company, of California, Los Angeles, Calif., a corporation of California

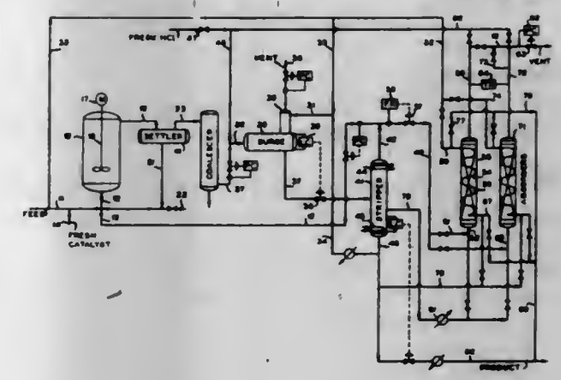
No Drawing. Filed Nov. 30, 1962, Ser. No. 241,175
9 Claims. (Cl. 260—651)

1. The process of preparing chloroalkylated derivatives of a member of the group consisting of benzene, toluene, o-xylene, m-xylene, p-xylene, ethylbenzene fractions from the alkylation of benzene with propylene tetramer and solvent extracts obtained in the solvent extraction of mineral lubricating oils with a solvent selective for aromatic compounds, which comprises heating at least one of said members with an alkanal of the group consisting of formaldehyde, paraldehyde, paraformaldehyde, s-trioxane, acetaldehyde, butyraldehyde, chloroacetaldehyde, propionaldehyde, and mixtures thereof, in the presence of a hydrohalide of the group consisting of hydrogen chloride, hydrogen iodide and hydrogen bromide, and a sulfur-chlorine compound of the group consisting of sulfur monochloride, sulfur dichloride, thionyl chloride and sulfuryl chloride, under essentially anhydrous conditions and at a temperature of about 50° to 150° C., the reaction mixture containing about 0.5 mole of said sulfur-chlorine compond per mole of said member and per monomer unit of said alkanal, and recovering said chloroalkylated derivatives therefrom.

3,271,466
PROCESS FOR THE PREPARATION OF 2-BROMO 3-HALO PROPENE-1

Hendricus Gerardus Peer, Hilversum, Netherlands, assignor to The Nederlandse Organisatie voor Toegepast-Natuurwetenschappelijk Onderzoek ten Behoeve van Nijverheid, Handel en Verkeer, The Hague, Netherlands, a corporation of the Netherlands

No Drawing. Original application Mar. 16, 1961, Ser. No. 96,102, now Patent No. 3,197,514, dated July 27, 1965. Divided and this application Dec. 24, 1964, Ser. No. 421,068
Claims priority, application Great Britain, Mar. 28, 1960, 10,897/60, 10,898/60; May 20, 1960, 10,889/60
1 Claim. (Cl. 260—654)



A process for the production of 2-bromo-3-chloro-propene-1, which consists of the steps of reacting a mixture of substantially equimolar amounts of chlorine and bromine with a solution of allene in an inert liquid solvent selected from the group consisting of methylene chloride, chloroform and carbon tetrachloride and recovering said 2-bromo-3-chloro-propene-1.

3,271,467
MAINTAINING HYDROGEN HALIDE CONCENTRATION IN THE CONVERSION OF HYDROCARBONS EMPLOYING METAL HALIDE CATALYSTS AND HYDROGEN HALIDE PROMOTER

Eddie U. Nakayama, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Filed Aug. 29, 1963, Ser. No. 305,407
8 Claims. (Cl. 260—666)

1. In a process for the conversion of a hydrocarbon in the presence of a metal halide catalyst and a hydrogen halide promoter in a reaction zone, wherein hydrocarbon effluent from said reaction zone is introduced into a stripping zone from which a gaseous stream rich in hydrogen halide is separated, non-condensible gases including hydrogen halide, gases lower boiling than hydrogen halide and other non-condensible gases boiling about the same as and higher than hydrogen halide are vented from the process system upstream from said stripping zone, and wherein said gaseous stream rich in hydrogen halide is recycled from said stripping zone to said reaction zone, the improvement comprising: venting non-condensible gases which are lower boiling than hydrogen halide, and a reduced amount of hydrogen halide from the process system upstream from said stripping zone; contacting a portion of said gaseous recycle in an adsorption zone with

a solid adsorbent to selectively adsorb hydrogen halide therefrom; venting said other non-condensible gases which boil about the same as and higher than hydrogen halide from said adsorption zone as non-adsorbed gases; and subsequently desorbing said adsorbed hydrogen halide and returning same to said process system.

3,271,468
PROCESS FOR THE CATALYTIC CO-OLIGOMERIZATION OF DIOLEFINS

Günther Wilke and Paul Heimbach, Mulheim (Ruhr), Germany, assignors to Studiengesellschaft Kohle m.b.H., Mulheim (Ruhr), Germany

No Drawing. Filed Mar. 22, 1963, Ser. No. 267,364
Claims priority, application Germany, Mar. 26, 1962, St 19,011
19 Claims. (Cl. 260—668)

1. The process which comprises contacting (a) 1,3-diolefin and (b) a member selected from the group consisting of ethylene, butyne-(2) and styrene with an amount sufficient to catalyze the co-oligomerization reaction between said 1,3-diolefin and said group member of a carbon monoxide free organo-metallic complex compound of nickel, and recovering the co-oligomer thus produced.

17. 1,2 - dimethyl cyclodecatri - (1,4,8) - ene having a boiling point of 32–33° C./0.05 mm. Hg and a refractive index, n_D^{20}, of 1.5098.

18. 1 - phenyl decatri - (1,4,9) - ene having a boiling point of 73–75° C./10^{-4} mm. Hg and a refractive index, n_D^{20}, of 1.5420.

3,271,469
PREPARATION OF ALKENYL SUBSTITUTED AROMATIC HYDROCARBONS

Herman S. Bloch, Skokie, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed Sept. 30, 1963, Ser. No. 312,363
13 Claims. (Cl. 260—669)

1. A method of preparing an alkenyl substituted aromatic hydrocarbon which comprises heating an alkyl substituted aromatic hydrocarbon at a temperature of from about 200° C. to about 400° C. in contact with a tetrahalide of carbon containing at least one halogen atom independently selected from the group consisting of bromine, chlorine, and iodine, the remaining halogen atoms thereof being of a lower atomic number.

3,271,470
DIMERIZATION METHOD

Sydney P. Spence, Westfield, Ulrich A. Steiner, North Plainfield, Larry Madestau, Martinsville, Robert E. Richardson, Newark, and Stephen Kaufman, East Brunswick, N.J., assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Filed June 22, 1964, Ser. No. 377,133
14 Claims. (Cl. 260—670)

1. Method for the preparation of cyclic di-p-xylylene which comprises:

(a) cooling a stream containing steam and p-xylylene radicals to a temperature between about 450° C. and about 800° C.;

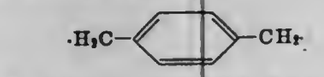
(b) thermally and physically isolating said stream from non-wetted surfaces maintained at temperatures below about 350° C.;

(c) absorbing a substantial portion of the p-xylylene diradicals from said stream by contacting said stream in a first spray zone with a spray of a quench liquor containing a solvent for the p-xylylene diradicals wherein said diradicals can dimerize to the cyclic dimer, di-p-xylylene, said quench liquor maintained at a temperature above the condensation temperature of the steam in said stream;

(d) desuperheating said stream in said first spray zone by contacting said stream with said spray of quench liquor and vaporizing a portion of said quench liquor spray without excessive reduction of spray volume;

(e) further contacting the effluent from said first spray zone with a fine spray of said quench liquor in a second spray zone, said quench liquor maintained at a temperature above the condensation temperature of the steam in said stream under conditions sufficient to remove substantially all of the residual p-xylylene diradicals from said stream;

(f) maintaining all surfaces in said first and second spray zones wet with said quench liquor;



(g) separating the quench liquor from the effluent from said second spray zone and recovering the cyclic di-p-xylylene from said quench liquor.

3,271,471
DIMERIZATION PROCESS

Leonard M. Baker, Plainfield, N.J., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Mar. 23, 1965, Ser. No. 442,151
12 Claims. (Cl. 260—670)

1. Process for the preparation of cyclic di-p-xylylene which comprises forming reactive p-xylylene diradicals having the structural formula:

by pyrolyzing a stream comprised of a p-xylylene diradical precursor at temperatures from about 900° C. to about 1000° C. in an oxygen enriched environment and contacting said stream in said environment with an iron base alloy composition consisting essentially of:

	Percent
Chromium	20–23
Nickel	25–40
Carbon	0.02–0.15
Rare earth metal	0.001–0.3
Molybdenum	1–3
Copper	Up to about 3.0
Manganese	Up to about 1.0
Silicon	Up to about 1.0
Columbium and tantalum	Up to about 1.0

and the remainder of said alloy being iron, condensing the reactive diradicals so formed in a fluid medium containing an inert organic solvent maintained at a temperature below about 300° C., and thereafter recovering the cyclic di-p-xylylene.

3,271,472
METHOD OF CONTROLLING A THERMAL CONVERSION PROCESS

Frank T. Ogle and Donald E. Berger, both of Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

Filed Sept. 22, 1961, Ser. No. 140,039
6 Claims. (Cl. 260—683)

1. A method of controlling a thermal conversion process which comprises measuring at least a first process variable representative of the operation of said process, passing a first signal representative of said measurement to a first control zone and a second control zone, passing a second signal representative of the operating limit of a second input process variable to said first and second control zones, said first control zone capable of transmitting a third signal representative of the difference between said first and second signals received by said first control zone, said second control zone capable of transmitting a fourth signal representative of one of two signals selected from the group consisting of said first and said second signals received by said second control zone, passing said third signal from said first control zone to a means of manipulating a third input process variable responsive to said third signal, and passing said fourth signal from said second control zone to a means of manipulating said second input process variable responsive to said fourth signal.

6. An apparatus for the thermal cracking of a light hydrocarbon which comprises in combination: a means for thermal cracking of a hydrocarbon, means for passing a light hydrocarbon feed stream to said means for thermal cracking, means for passing steam to said means for thermal cracking and therein contacting said light hydrocarbon feed with said steam, means for withdrawing from said means for thermal cracking an effluent hydrocarbon stream, a control means which comprises means for measuring a property of said light hydrocarbon feed stream which is representative of the chemical composition thereof, means for forming and passing a first signal representative of said measurement to a computing means, means for measuring a property of said effluent stream which is representative of the chemical composition thereof, means for forming and passing a second signal representative of said effluent stream measurement to said computing means, a primary control means, means for passing from said computer means a third signal representative of said percent conversion of said light hydrocarbon feed stream to said primary control means, means for forming in and passing from said primary control means a signal representative of a temperature desired in said thermal cracking means capable of producing a desired conversion in said thermal cracking means, a first control means, a second control means, means for passing said third signal to said first control means and to said second control means, means for passing a fourth signal representative of a maximum allowable temperature in said thermal cracking means to each of said first and said second control means, said first control means comprising means capable of forming and transmitting a fifth signal representative of the difference between said third and fourth signals received by said first control means, said second control means comprising means capable of forming and transmitting a sixth signal representative of the minimum of two signals selected from said third and said fourth signals received by said second control means, means for passing said fifth signal from said first control means to a means for manipulating the rate of flow of said light hydrocarbon feed to said thermal cracking means responsive to said fifth signal and means for passing said sixth signal from said second control means to a means for manipulating responsive to said sixth signal the rate of flow of heating medium to said thermal cracking means.

3,271,473
POLYMERIZATION PROCESS

Robert M. Engelbrecht, St. Louis, James M. Schuck, Webster Groves, and Robert G. Schultz, Vinita Park, Mo., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed July 12, 1963, Ser. No. 294,742
12 Claims. (Cl. 260—683.15)

1. The process for the polymerization of internally unsaturated acyclic mono-olefin hydrocarbons which comprises contacting such hydrocarbons at a temperature of 0 to 250° C. and a pressure within the range of from approximately atmospheric pressure to 2500 p.s.i.g. with a catalyst comprised of cobalt oxide supported on an activated carbon, said catalyst having been activated in a non-oxidizing atmosphere selected from the group consisting of nitrogen, helium, argon and combinations thereof at a temperature of 400 to 575° C.

3,271,474
POLYMERIZATION PROCESS

Robert M. Engelbrecht, St. Louis, James M. Schuck, Webster Groves, and Robert G. Schultz, Vinita Park, Mo., assignors to Monsanto Company, a corporation of Delaware

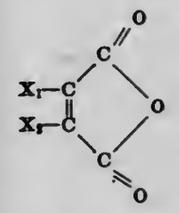
No Drawing. Filed July 12, 1963, Ser. No. 294,744
8 Claims. (Cl. 260—683.15)

1. A process for the polymerization of polymerizable terminally unsaturated olefin hydrocarbons which comprises contacting said hydrocarbons with a catalyst comprised of an activated carbon supported cobalt oxide, said catalyst having been prepared by (1) treating an activated carbon support with a material selected from the group consisting of a non-oxidizing gas and ammonium hydroxide, (2) impregnating the treated carbon support by contacting said support with a solution of a cobalt salt, (3) drying the catalyst mass at a temperature of 100 to 200° C., (4) treating the dried cobalt impregnated carbon with ammonium hydroxide, (5) treating the ammonium hydroxide treated cobalt impregnated carbon with pyridine, (6) drying the pyridine treated ammonium hydroxide treated cobalt impregnated carbon, and (7) activating the catalyst at a temperature of 200 to 550° C. and in the presence of an inert gas.

3,271,475
CATALYTIC POLYMERIZATION OF OLEFINS TO LIQUID POLYMERS

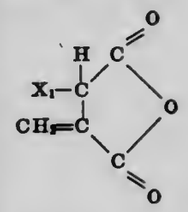
William E. Weesner, Dayton, Ohio, assignor to Monsanto Company, a corporation of Delaware

No Drawing. Filed Sept. 30, 1963, Ser. No. 312,310
16 Claims. (Cl. 260—683.15)



1. A process for the polymerization of a mono-olefin having from 2 to about 10 carbon atoms to a liquid olefin product which comprises contacting said mono-olefin under polymerization conditions with a catalyst consisting essentially of a major proportion of an adsorbent carbon and a minor proportion of a mixture of cobaltous oxide and an oxide of a metal selected from the group consisting of molybdenum, chromium, tungsten, and vanadium, the mole ratio of said cobaltous oxide to said oxide of a metal selected from the group consisting of molybdenum, chromium, tungsten, and vanadium being at least 1:1, and recovering the liquid polymer thus produced.

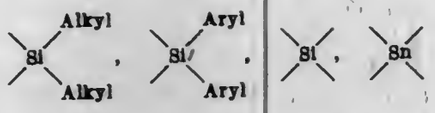
3,271,476
CURABLE MIXTURES OF EPOXY RESINS AND POLYANHYDRIDES OR POLYCARBOXYLIC ACIDS



Franz Rudolf Widmer, Basel, Alfred Renner, Allschwil, and Hans Orth, Binningen, Switzerland, assignors to Ciba Limited, Basel, Switzerland, a Swiss company

No Drawing. Filed Feb. 28, 1963, Ser. No. 261,890
Claims priority, application Switzerland, Mar. 1, 1962, 2,522/62
11 Claims. (Cl. 260—835)

1. A thermo-curable resin composition of matter, which comprises (1) a 1:2-epoxy compound and (2) as curing agent a polyanhydride obtained by reacting at most *n* molecular proportions of an unsaturated dicarboxylic acid anhydride selected from the group consisting of compounds of formula



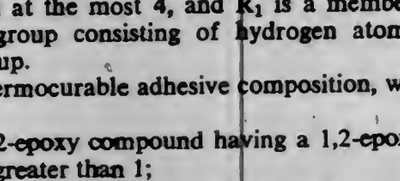
and compounds of formula

wherein X_1 and X_2 each are members selected from the group consisting of hydrogen atom and the methyl group, with 1 molecular proportion of a poly(cyclo-pentadienyl) compound of the formula

in which R is a member selected from the group consisting of

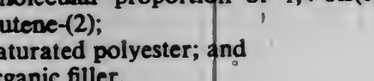
n-valent aliphatic hydrocarbon radicals, n-valent cycloaliphatic hydrocarbon radicals, n-valent araliphatic hydrocarbon radicals and n-valent aliphatic hydrocarbon radicals interrupted by oxygen bridges, *n* is an integer of at least 2 and at the most 4, and R_1 is a member selected from the group consisting of hydrogen atom and the methyl group.

11. A thermocurable adhesive composition, which comprises



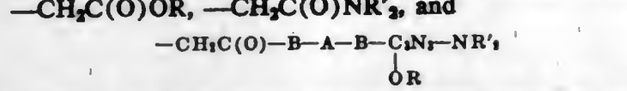
(1) a 1,2-epoxy compound having a 1,2-epoxy equivalency greater than 1;
(2) as curing agent the reaction product of less than 2 molecular proportions of maleic acid anhydride with 1 molecular proportion of 1,4-bis(cyclopentadienyl)-butene-(2);
(3) an unsaturated polyester; and
(4) an inorganic filler.

3,271,477
GRAFTED TERPOLYMERS
Edward N. Kresge, Elizabeth, N.J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Filed Nov. 4, 1963, Ser. No. 321,311
18 Claims. (Cl. 260—877)



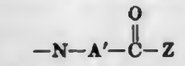
1. A grafted terpolymer that is sulfur-curable to an elastomeric, oil and solvent resistant vulcanizate, said grafted terpolymer consisting of a terpolymer having side chains grafted thereon and having been prepared from at least one ethylenically unsaturated free-radical polymerizable monomer grafted to a residually unsaturated terpolymer hydroperoxide, said terpolymer consisting of at least about 20% ethylene by wt., at least about 15% by wt. of a C_3 to C_{10} aliphatic alpha olefin, and at least about 0.01 gram-mole per 100 grams of said terpolymer and not over about 20% by wt. of a nonconjugated diolefin.

3,271,478
POLYMERIZABLE TRIAZINES AND PRODUCTS THEREOF
Gaetano F. D'Alelio, South Bend, Ind., assignor to Dal Mon Research Co., Cleveland, Ohio, a corporation of Delaware
No Drawing. Filed Jan. 24, 1963, Ser. No. 253,758
11 Claims. (Cl. 260—898)



7. A polymerization product having in the polymer molecule a plurality of repeating units having the formula

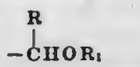
wherein X is selected from the class consisting of hydrogen, cyano, —C(O)OR, —C(O)NR'$_2$, and



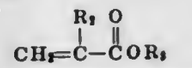
groups; Y is selected from the class consisting of hydrogen, alkyl groups of no more than six carbon atoms, and when X is hydrogen, Y can also be selected from the group consisting of chloro, fluoro, bromo, iodo, —$CH_2C(O)OR$, —$CH_2C(O)NR'_2$, and

groups; B is selected from the class consisting of oxygen and —N(R'')— radicals; A is a divalent hydrocarbon radical having at least two carbon atoms between said valencies; and when that B to which the

group is attached is oxygen, that part of A to which B is attached is aliphatic; R is selected from the class consisting of hydrogen and monovalent hydrocarbon radicals; R' is selected from the class consisting of hydrogen, monovalent hydrocarbon radicals, divalent hydrocarbon radicals representing two R''s with both valencies attached to the N, and divalent hetero groups representing two R''s with both valencies attached to the N; R'' is selected from the class consisting of hydrogen, monovalent hydrocarbon radicals, divalent hydrocarbon radicals in which the second valency is connected to A of the formula, and divalent hydrocarbon radicals in which the second valency is connected to the other B group when the latter also represents —N(R'')—; C_3N_3 represents the symmetrical triazine nucleus; B' is selected from the class consisting of B and



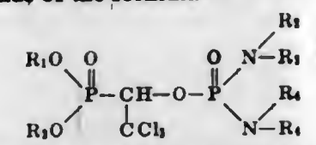
groups; A' is a divalent hydrocarbon radical; Z is selected from the class consisting of OR and NR'$_2$; D is any monovalent group not containing a polymerizable ethylenic group; and hydrocarbon groups of A, R, R', and R'' can have substituents thereon selected from the class consisting of chloro, fluoro, alkoxy, aryloxy and acyloxy groups.



11. A mixture comprising a polymerization product of claim 7 and a polymer of acrylonitrile.

3,271,479
RESINOUS COMPOSITIONS OF CARBOXYLIC AMIDE INTERPOLYMERS AND UNSATURATED ESTER POLYMERS
Henry A. Vogel and Harold G. Bittle, Gibsonia, Pa., assignors to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Filed Dec. 21, 1961, Ser. No. 161,269
18 Claims. (Cl. 260—901)

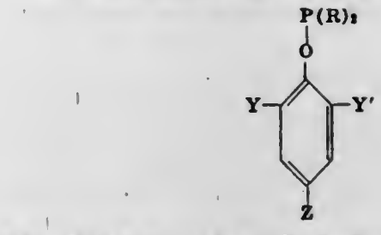
1. The resinous composition which consists essentially of a thermosetting interpolymer consisting of an unsaturated carboxylic acid amide and at least one other monomer containing a $CH_2{=}C<$ group, said interpolymer containing from about 2 percent to about 50 percent by weight of said amide in polymerized form and being characterized by having at least one hydrogen atom of the amido nitrogen replaced by the structure



wherein R is a member selected from the group consisting of hydrogen and lower alkyl and R_1 is a member selected from the group consisting of hydrogen, alkyl and alkoxy ethyl radicals, and a thermoplastic polymer consisting of one or more ethylenically unsaturated esters represented by the general formula

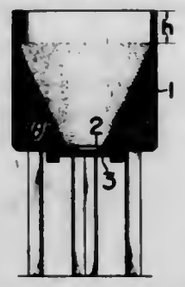
wherein R_2 represents a member selected from the group consisting of hydrogen and a lower alkyl group having from 1 to 4 carbon atoms and R_3 is an alkyl group having from about 1 to 20 carbon atoms.

3,271,480
BIS-N,N-DIALKYLAMINO PHOSPHORIC ACID ESTERS OF O,O-DIALKYL-α-HYDROXY-β,β,β-TRICHLOROETHYLPHOSPHONATES
Gerhard Schrader, Wuppertal-Cronenberg, Germany, assignor to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a German corporation
No Drawing. Filed Sept. 4, 1963, Ser. No. 306,588
Claims priority, application Germany, Sept. 11, 1962, F 37,781
4 Claims. (Cl. 260—931)



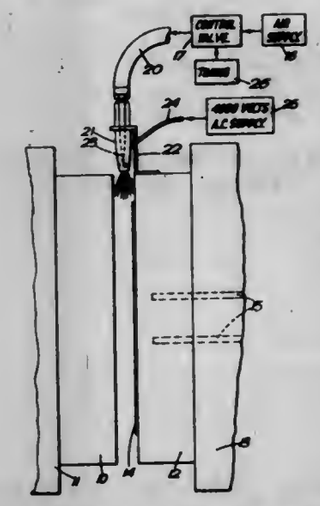
1. Compounds of the formula

in which R_1 and R_2 stand for members selected from the group consisting of lower alkyl radicals having 1 to 4 carbon atoms and R_3 and R_4 stand for members selected from the group consisting of methyl and ethyl radicals.



3,271,481
2,6-DISUBSTITUTED PRIMARY ARYL PHOSPHITES AND PHOSPHORODIHALIDITES AND PROCESSES FOR THE MANUFACTURE THEREOF
Francis M. Kujawa, Tonawanda, and Alvin F. Shepard and Bobby F. Dannels, Grand Island, N.Y., assignors to Hooker Chemical Corporation, Niagara Falls, N.Y., a corporation of New York
No Drawing. Filed Aug. 31, 1962, Ser. No. 220,902
12 Claims. (Cl. 260—960)

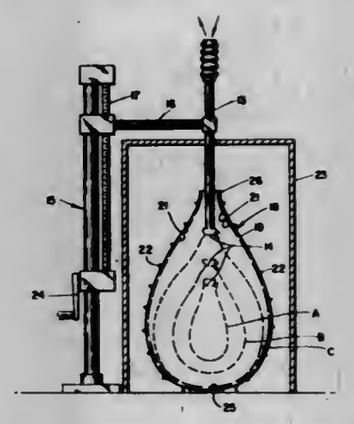
1. A compound of the formula:



where R is selected from the group consisting of hydroxyl, chlorine and bromine; Y and Y' are selected from the group consisting of tertiary alkyl, having at least four carbon atoms, and phenylethyl radicals; and Z is selected from the group consisting of chlorine, alkyl, having at least four carbon atoms, and phenylethyl radicals.

3,271,482
PROCESS OF RECOVERING WASTE SYNTHETIC RESIN MATERIAL
Kazuya Harada, Mishima-shi, Shizuoka-ken, and Tsutomu Aoyagi, Shizuoka-ken, Japan, assignors to Toyo Rayon Kabushiki Kaisha, Tokyo, Japan, a corporation of Japan
Filed Nov. 21, 1963, Ser. No. 325,355
Claims priority, application Japan, Dec. 7, 1962, 37/53,948
7 Claims. (Cl. 264—15)

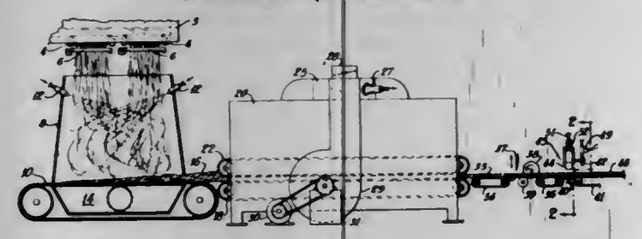
1. A process of recovering waste synthetic resin material which when it has such a size that it passes a 6 mesh wire gauze but not a 10 mesh gauze has an angle of rest of over 70°, the treatment comprising heating and deforming the waste material under agitation, until said waste material reaches a temperature above the deformation temperature but below the melting point thereof, and thereafter cooling and collecting the treated waste material.



3,271,483
METHOD AND APPARATUS FOR DISCHARGING STATIC DURING MANUFACTURE OF RECORD DISKS
Alan Phillipson, Basil Harry Royston Spiller, Robin Smith, and Harry Cheesman, all of London, England, assignors to Decca Limited, London, England, a British company
Filed Mar. 15, 1965, Ser. No. 439,646
Claims priority, application Great Britain, May 12, 1964, 19,707/64
8 Claims. (Cl. 264—22)

1. A method of making a phonograph record by injection moulding including the steps, when the mould is opened and the record disc has been forced away from the faces of the mould, of directing a jet of ionized air at the disc so as to discharge any static charges on the disc.

5. Injection moulding apparatus for moulding a phonograph record comprising a fixed die, a moving die, means for closing the dies together to form a mould, and means for automatically directing a jet of ionized air at the faces of the record disc after the mould has been opened.



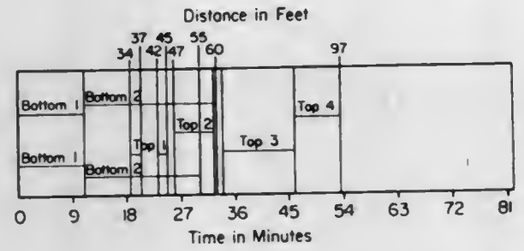
3,271,484
MANUFACTURE OF BALLOONS
James H. Brillinger, Belmont, Mass., assignor to W. R. Grace & Co., Cambridge, Mass., a corporation of Connecticut
Filed Dec. 31, 1963, Ser. No. 334,823
3 Claims. (Cl. 264—25)

1. The method of forming a permanently non-spherical balloon which includes fitting the neck portion of a partially crosslinked olefin polymer hollow balloon preform

on an inflater pipe, suspending the preform by the pipe within a permeable wall internal mold having the approximate size and shape of the intended balloon, heating the preform to above the crystalline transition temperature of the polymer, inflating the preform with a gas at moderate pressure and simultaneously raising the preform within the mold, thereby to prevent any but the pole portion of the expanding preform from touching the mold until the preform has expanded approximately to its final size, continuing the expansion until all areas save the neck extremity are in contact with the mold, cooling the balloon while maintaining the final inflation pressure, deflating the balloon and removing it from the mold.

3,271,485
METHOD AND APPARATUS FOR PRODUCING BONDED FIBROUS PRODUCTS
Sheldon A. Canfield, Newark, Ohio, assignor to Owens-Corning Fiberglas Corporation, a corporation of Delaware
Filed Feb. 6, 1963, Ser. No. 256,566
5 Claims. (Cl. 264—26)

2. A method for producing a bonded panel of fibrous glass which comprises forming fibrous glass, gathering the fibrous glass in the form of a panel with a binder carried in water dispersed through the panel, said binder being heat settable after removal by heat of the water component, moving the panel through an oven to remove the water component and to set the binder, then moving the panel in a path through the dielectric fields of a plurality of capacitors placed in side-to-side relation across said path, and when the electrical charge of any one of said capacitors increases to a magnitude to indicate the presence of an excessive amount of water remaining in the particular portion of the panel passing through the said one of said capacitors, applying an identifying mark upon said particular portion of the panel.



3. A method according to claim 2 in which the dielectric fields are provided with sufficient size and energy to heat and remove a portion of the water component.

3,271,486
METHOD OF PRODUCING AN ARTICLE FOR SIMULATING A DRINKING GLASS CONTAINING A DRINK
Robert George Dunlop, Glendow House, Oakmere, Potters Bar, England
Filed Jan. 9, 1963, Ser. No. 250,322
4 Claims. (Cl. 264—45)

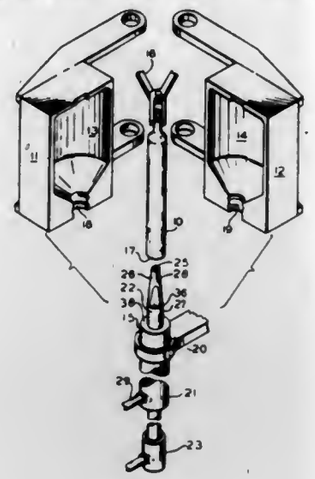
1. A method of producing an article for simulating a drinking glass containing a drink, comprising pouring into a drinking glass a polymerisable mixture, which by activation with a suitable catalyst system forms a solid material simulating the drink, the pouring being effected under conditions of temperature which will not damage the glass, the polymerisable liquid then being allowed to harden but before it is set being agitated near its upper surface so that when it sets the existence of a froth is simulated.

3,271,487
METHOD OF FIRING A TUNNEL KILN
David E. Tomkins, New Castle, Pa., assignor to Shenango China, Inc., New Castle, Pa., a corporation of Pennsylvania
Filed Mar. 13, 1961, Ser. No. 95,192
2 Claims. (Cl. 264—64)

1. A method of firing ceramic articles comprising the sequential steps of bottom firing said articles to evenly heat each article, top and bottom firing said articles to rapidly heat said articles to a high temperature, and top firing said articles while progressively decreasing said high temperature.

3,271,488
METHOD OF MAKING MASKS FOR VAPOR DEPOSITION OF ELECTRODES
Reinhard Dahlberg, Gundelfingen, Germany, assignor, by mesne assignments, to International Telephone and Telegraph Corporation, New York, N.Y., a corporation of Maryland
No Drawing. Filed Nov. 6, 1962, Ser. No. 235,879
Claims priority, application Germany, Nov. 21, 1961, I 20,864
1 Claim. (Cl. 264—81)

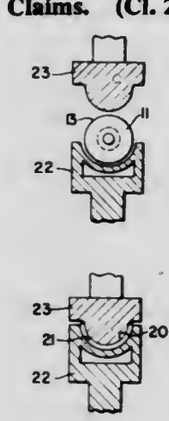
A method of making high precision masks of the type used for vapor deposition of electrodes in the production of semiconductor devices, comprising: making an exact replica of the mask out of a metal susceptible to chemical dissolution and adapted to the facile production of such a replica with high precision; vapor depositing on one surface of said replica under high vacuum conditions a cohesive coating of a non-metallic refractory material selected from the group consisting of SiO_2, Al_2O_3, BeO and ThO_2; and thereafter dissolving away the replica by chemical means to which the coating material is impervious.



ERRATUM

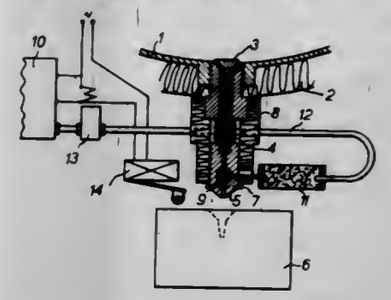
For Class 264—93 see:
Patent No. 3,271,064

3,271,489
METHOD AND APPARATUS FOR FORMING HOLLOW PLASTIC ARTICLES
Clement V. Fogelberg and Peter W. Dart, Boulder, Colo., assignors, by mesne assignments, to Ball Brothers Company, Muncie, Ind., a corporation of Indiana
Filed Mar. 25, 1963, Ser. No. 268,516
9 Claims. (Cl. 264—94)



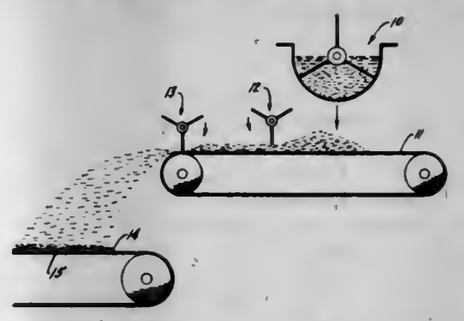
1. In a method for forming hollow plastic articles by the blow molding process wherein a portion of each article is press-formed substantially free from flash in

a multisectioned mold, the steps of exerting pressure against portions of the inner wall of the open end portion of a parison to distort said open end portion substantially independently of wall thickness variations, said inner wall portions being angularly displaced from abutment points



of the mold sections when said mold is closed, partially expanding said parison, gripping substantially the entire circumference of the open end portion of said parison, and further expanding said parison into forming contact with said mold.

3,271,490
METHOD FOR FABRICATING TUBES
Jean-Pierre Cattaneo, Geneva, Switzerland, assignor to Rexall Drug and Chemical Company, Los Angeles, Calif., a corporation of Delaware
Filed Oct. 5, 1962, Ser. No. 229,285
Claims priority, application Switzerland, Jan. 31, 1962, 1,246/62
3 Claims. (Cl. 264—92)

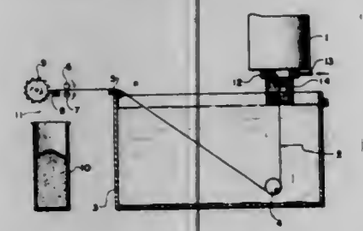


1. A method of producing a collapsible tube adapted for housing and dispensing a flowable commodity, said tube being fabricated from a flexible resinous thermoplastic material having a "memory," said tube having a generally tubular body portion and an integral head portion at one end of said body portion, the head portion having a dispensing passageway; said method comprising the step of deforming part of said body portion by application of heat and pressure differential to the part to cause the part to become more readily deformable than the remainder of the tube and to annul the convexity thereof, said part being a major segment of only an axial half of said body portion and said part being deformed to lie adjacent to and spaced from a corresponding part of the other axial head of said body portion such that said part may be flexibly expanded to its position prior to deformation upon filling the tube with said commodity and the part will return to its deformed position due to said "memory" upon dispensing the commodity from the tube.

3,271,491
METHOD OF PREPARING WITHIN A MOLD OF RUBBER OR OF A MATERIAL HAVING SIMILAR PROPERTIES SHAPES OF WAX OR SIMILAR MATERIALS FOR USE IN THE SO-CALLED LOST-WAX-MOLDING METHOD
Gunnar Mikkelborg, Villavelen 11, Notodden, Norway
Filed Jan. 23, 1962, Ser. No. 168,182
1 Claim. (Cl. 264—102)

A method for molding articles comprising the steps of pressing a mold member into engagement with a nozzle member connected to a zone provided with molding material, establishing communication between said nozzle and a vacuum zone by movement of said mold member toward said engagement, moving said nozzle member from a normally closed position by continued pressing of said mold member thereagainst to an operative position so that said nozzle member is simultaneously connected to said molding material zone to provide molding material thereto and to said vacuum zone, maintaining a valve member in said nozzle member in one position so that said molding material is prevented from entering said mold member while said vacuum zone is connected to said mold member to exhaust said mold member, moving said valve member to another position so that said vacuum zone is disconnected from said mold member and said molding material is allowed to enter said exhausted mold member, and then removing said mold member from said nozzle member so that said nozzle member moves to said normally closed position thereby disconnecting said nozzle member from both of said zones.

3,271,492
METHOD OF MAKING A NON-POROUS BOARD COMPOSED OF STRANDS OF WOOD AND PORTLAND CEMENT
Armin Elmendorf, Palo Alto, Calif., assignor to Elmendorf Research Inc., Palo Alto, Calif., a corporation of Illinois
Continuation of application Ser. No. 191,244, Apr. 30, 1962. This application Feb. 1, 1965, Ser. No. 431,760
6 Claims. (Cl. 264—122)



1. In the process of making a non-porous building board composed of wood shavings and Portland cement having a density of 0.9 to 1.4 in which the ratio of the weight of the cement to the weight of the wood shavings is more than 1.5 but less than 5, the steps of mixing water, shavings and cement until all the cement adheres to the shavings; moving a mass of said coated shavings toward a separating station; removing individual coated shavings

from the advancing mass, throwing the coated shavings through the air so they freely fall onto a moving support without loss of cement, forming a continuous layer of loosely felted coated shavings, and pressing said layer of loosely felted coated shavings.

3,271,493
MELT SPINNING PROCESS

Cornelis van den Berge, Emmen, Netherlands, assignor to American Enka Corporation, Enka, N.C., a corporation of Delaware

Filed Dec. 27, 1962, Ser. No. 247,755
Claims priority, application Netherlands, Jan. 8, 1962, 273,302
5 Claims. (Cl. 264—143)

1. A process for the manufacture of funicular structure comprising the steps of extruding a thermoplastic material through the atmosphere into a bath of cooling liquid, and flowing an annular stream of liquid about the freshly extruded funicular material to isolate the same from the ambient atmosphere extending between extrusion and the cooling liquid.

3,271,494
PRODUCTION OF SHAPED PRODUCTS FROM SOLUTIONS OF POLYVINYL FORMATE IN A LOWER ALKYL NITRILE

Kiyoshi Fujii, Saburo Imoto, Tadao Ashikaga, and Junji Ukida, Kurashiki, Japan, assignors to Kurashiki Rayon Co., Ltd., Kurashiki-shi, Okayama, Japan, a corporation of Japan

No Drawing. Filed Nov. 29, 1961, Ser. No. 155,809
Claims priority, application Japan, Dec. 3, 1960, 35/47,289
7 Claims. (Cl. 264—184)

5. A method of producing shaped forms of polyvinyl alcohol which comprises,

forming a solution of a vinyl formate homopolymer dissolved in a lower alkyl nitrile,

said lower alkyl having 1 to 5 carbon atoms,

and passing said solution through a shaping zone into a medium effective to form a shaped form of said vinyl formate homopolymer and to convert said polymer shaped form to a polyvinyl alcohol shaped form.

3,271,495
PROCESS FOR BIAXIALLY ORIENTING POLYPROPYLENE FILM

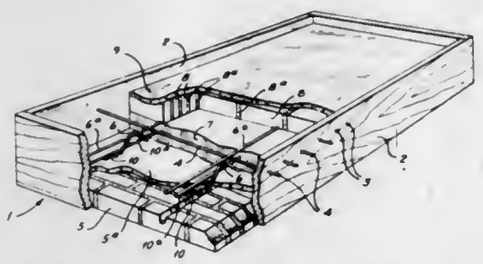
Le Roy Frederick Gronholz, Richmond, Va., and James Maurice Quinn, Tonawanda, N.Y., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Original application Aug. 31, 1961, Ser. No. 135,115. Divided and this application Jan. 21, 1965, Ser. No. 435,109
11 Claims. (Cl. 264—210)

1. A process for biaxially orienting polypropylene film which comprises the steps, in sequence, of extruding a molten polypropylene resin at a temperature within the range of 190° C. through 325° C. in the form of a film; quenching said film at a temperature within the range of —75° C. through 15° C.; heating said quenched film to a temperature within the range of from 36° C. to 10° C. below the crystalline melting point of said resin; stretching said film at least two times its original dimension in a direction transverse to the direction of extrusion at a rate of at least 350% per minute while maining the temperature of said film at T_1, T_1 being within the range of from 36° C. to 10° C. below the crystalline melting point of said resin; and, thereafter, stretching the film longitudinally at least two times its original length while maintaining the temperature of said film at not more than 20° C. above T_1; and cooling said film while holding it under tension to prevent any substantial change in its dimensions.

3,271,496
METHOD OF SHAPING POLYELECTROLYTE POLYMER

Alan S. Michaels, Lexington, Mass., assignor to Amicon Corporation, Cambridge, Mass.



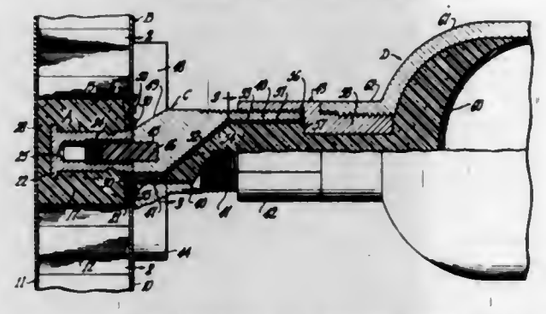
No Drawing. Filed Jan. 27, 1964, Ser. No. 340,560
9 Claims. (Cl. 264—232)

1. The method of shaping a solid non-plastic gel composition formed of two ionically cross-linked synethetic organic linear polymers, one of said polymers containing dissociable anionic groups and the other containing dissociable cationic groups, said ionic cross-linkages being the sole cross-linkages present, which method comprises imbibing into said composition from aqueous solution a salt selected from the class consisting of calcium nitrate, calcium bromide, calcium chloride, sodium bromide, and mixtures thereof, evaporating a portion of the solvent to leave a solid plastic composition, and shaping said composition under pressure at elevated temperature.

3,271,497
METHOD FOR PRODUCING WALL UNITS

Reinhold Magnus Elgenstierna, Engelbrektsgatan 29, and George Ohlson, Frejgatan 20, both of Stockholm, Sweden

Filed Apr. 19, 1962, Ser. No. 188,702
Claims priority, application Sweden, Apr. 19, 1961, 4,113/61
4 Claims. (Cl. 264—253)

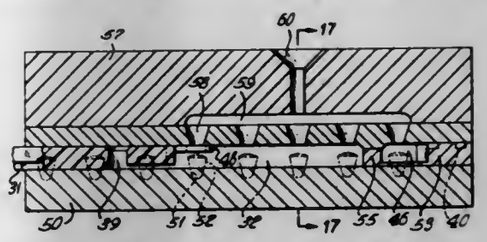


1. In a method of producing ready-to-erect wall units in a mainly horizontal position in a forming box-like jig having opposed sides, said wall units comprising at least three layers including a facade layer made of bricks, an inner layer spaced from said facade layer, means intermediate said facade layer and said inner layer securing them in spaced relation, and an intermediate layer of insulating material compressible by the weight of said inner layer, said method including applying said facade layer to the bottom of said jig, then applying the layer of insulating material to the upper surface of said facade layer, and then laying the inner layer onto said insulating layer, the improvement which comprises installing supporting means in the form of substantially horizontal supporting bars carried by the jig after the installation of the intermediate layer and before the application of said inner layer by pushing the bars through the intermediate insulating layer at a small distance from the top surface thereof and connecting the outer ends of the bars to opposite sides of the jig, said supporting means, during the application of said inner layer upon said insulating layer, carrying at least a major part of the weight of said inner layer until the inner layer has been assembled and has set, whereby to prevent substantial compression of said intermediate insulating layer.

3,271,498
METHOD OF INSTALLATION OF MOLDABLE INSERT IN SANDWICH PANEL

Frederick W. Rohe, 5191 S. Bradford, Placentia, Calif., and Charles S. Phelan, Tustin, Calif.; said Phelan assignor to said Rohe

Filed Jan. 27, 1964, Ser. No. 340,212
6 Claims. (Cl. 264—261)



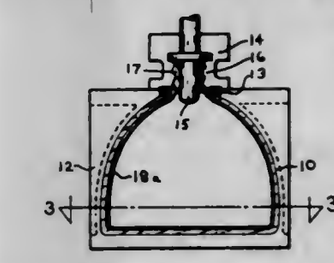
1. In the art of installing a fastener insert in a sandwich panel embodying a fragile, low density core sandwiched between spaced solid skin sheets, the method comprising the following steps: providing a hole in said panel beginning with an aperture in one of said skin sheets and extending into said core; utilizing an insert including a mounting head proportioned to fit snugly within said aperture, and having a pair of spaced ports therein, and a hollow body of smaller diameter than said head, extending axially therefrom and receivable in said hole within said core; projecting said insert into said hole and moving said head into closing relation to said aperture; providing a temporary supporting attachment between said head and skin sheet; subsequently injecting potting material through one of said ports into said hole by applying the nozzle of an injection gun to one of said ports; venting said hole through the other port as the potting material fills the hole and displaces air therefrom; visually inspecting said venting port to avoid injection of excess potting material into the hole; arresting the injection operation when sufficient potting material has been injected as thus determined; withdrawing said gun from the insert before said potting material has set and utilizing said temporary supporting attachment to hold said insert in position while said potting material hardens around said insert.

3,271,499
METHOD AND APPARATUS FOR MAKING ELONGATED FLEXIBLE BANDS OF ANY DESIRED LENGTH IN A STEP-WISE MANNER

Johann Schwaiger, Wattens, Tyrol, Austria, assignor to D. Swarovski & Co., Wattens, Tyrol, Austria

Filed Jan. 21, 1965, Ser. No. 426,767
Claims priority, application Austria, Aug. 18, 1964, 7,129/64
2 Claims. (Cl. 264—261)

1. A method of molding a flexible ornamental article, comprising the steps of introducing plastic material into a plurality of rows of mold cavities of ornamental configuration which communicate with each other longitudinally and transversely of said rows exclusively through restricted, filament-forming passages and which include annular eyelet cavities at at least one end of each row to form in one step a network of spaced ornamental elements and integral filaments, forming the only interconnection between said elements, as well as eyelet fasteners at at least one end of each row of ornamental elements, placing stones in all cavities except said eyelet cavities prior to said step of introducing plastic material, so that the plastic material will form in all except said eyelet cavities ornamental settings about said stones, said cavities, including the eyelet cavities, being uniformly spaced from each other at the ends of said rows with the eyelet cavities at one end of each row, and the other end of each row communicating with the exterior of the mold, and further including, before the step of introducing the



plastic material, the step of closing said other ends of said rows of cavities with a preformed article positioned with its eyelets in and partially filling mold cavities adjacent to said other ends of said rows, whereby plastic material introduced into said partially filled mold cavities will fuse with said eyelets therein for integrally connecting the preformed article with the molded article to form with the latter an uninterrupted network larger than the mold.

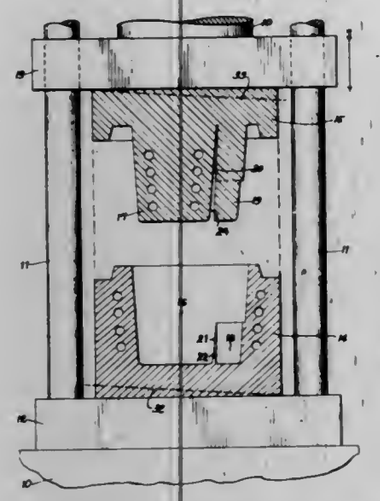
3,271,500
METHOD OF PRODUCING COMPOSITE PACKAGES

Thomas R. Santelli, Toledo, Ohio, assignor to Owens-Illinois Glass Company, a corporation of Ohio

Filed Dec. 17, 1962, Ser. No. 245,196
3 Claims. (Cl. 264—269)

1. The method of producing a composite package which consists in depositing a measured quantity of a powdered resinous material in a preformed shell having a mouth opening, closing the mouth opening with a neck forming mold, heating the shell and mold to the melting temperature of the resinous material and maintaining such temperature a predetermined period of time, imparting multidirectional movement to the shell and mold thereby distributing the resinous material as a permanent film over the shell interior surface and in part within and filling the neck forming mold, chilling the neck forming mold and shell to set the resinous material and separating the neck forming mold from the shell and film.

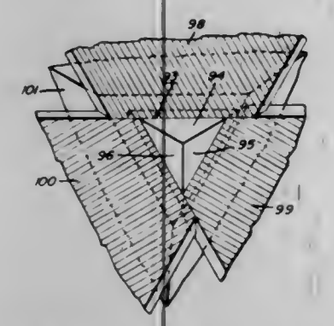
3,271,501
METHOD OF AND MEANS FOR MOLDING PLASTIC PARTS



Edward E. Heck, Berwyn, Ill., assignor to Republic Molding Corporation, Niles, Ill., a corporation of Illinois

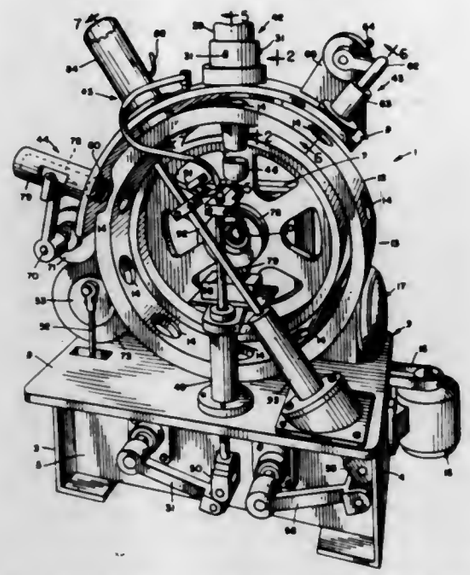
Filed May 28, 1965, Ser. No. 459,744
8 Claims. (Cl. 264—319)

1. In the method of molding a piece part having an undercut walled portion which comprises making the cavity part and the core part of the mold to produce said piece part, mounting said cavity and core parts upon platens of a molding machine, the platens having a substantially straight line movement toward and away from each other and angularly positioning said cavity and core parts to



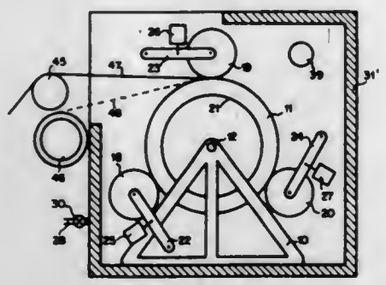
provide a mounting for said cavity and core parts upon the platens so as to bring the walls of said undercut portion of the piece part parallel to the straight line movement of said platens.

5. In combination, a core part and a cavity part of a mold to produce a molded piece part, both said mold parts adapted to be mounted upon opposing molding machine platens adapted to move in a substantially straight line



toward and away from each other, at least one corresponding and mating wall of each of said mold parts being at an angle to the straight line movement of said platens and constituting an undercut in said piece part before said mold parts are mounted upon said platens, and means for angularly mounting said mold parts upon said platens so that said corresponding angular walls of said mold parts lie parallel to said straight line movement of said platens.

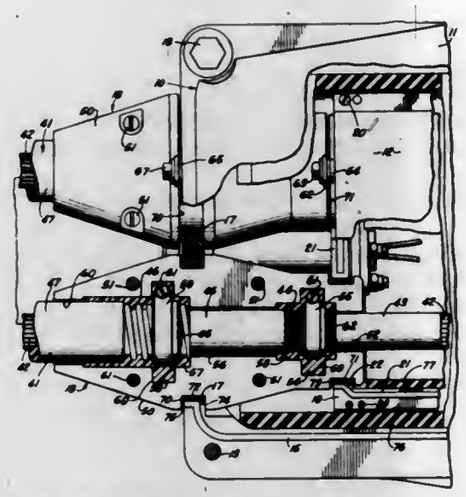
3,271,502
HIGH PRESSURE METHOD AND APPARATUS
Robert H. Wentorf, Jr., Schenectady, N.Y., assignor to General Electric Company, a corporation of New York
Filed Oct. 26, 1962, Ser. No. 233,292
5 Claims. (Cl. 264—320)



1. A method of compressing a specimen material comprising in combination:
- (a) defining a close reaction volume by means of at least four overlapping pressure resisting members which slide on each other,
- (b) placing the specimen in said volume, and
- (c) providing force on said pressure resisting members to slide and said pressure resisting members over each other to reduce the said volume and compress the said specimen therein,
  - (1) the directions of sliding of said pressure resisting members being such that no more than two of said pressure resisting members move in the same plane.

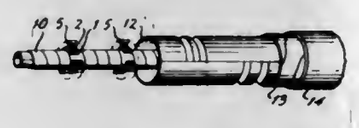
3,271,503
METHOD AND APPARATUS FOR FORMING PLASTIC ARTICLES
Richard K. Shelby, Chicago, Ill., assignor, by mesne assignments, to Monsanto Company, a corporation of Delaware
Filed May 8, 1961, Ser. No. 108,569
6 Claims. (Cl. 264—322)

6. A method of forming a plastic cup with a rolled rim comprising the steps of providing a molded plastic cup with a downturned skirt at its upper edge, said skirt defining an outer surface area, thereafter applying localized heat to the outer surface area of the downturned skirt to bring the temperature of the skirt to a substantially uniform formable level, immediately thereafter rolling the bottom edge of the skirt inwardly on a radius toward the cup wall, and thereafter discontinuing the application of heat to the skirt.



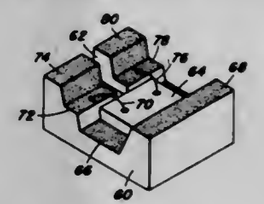
3,271,504
APPARATUS AND METHOD FOR VULCANIZING STRIPS OF MATERIAL CONTAINING AN ELASTOMER
Axel Emil Bergström, Lidingo, Rudolf Gotthard Hallhagen, Goteborg, and Leif Erik Roland Söderberg and Johan Eric Hayden Westberg, Lidingo, Sweden, assignors to AGA Aktiebolag, a corporation of Sweden
Filed Nov. 5, 1962, Ser. No. 235,565
Claims priority, application Sweden, Nov. 23, 1961, 11,658/61
5 Claims. (Cl. 264—347)

1. A method of vulcanizing an elongate weft impregnated with a vulcanizable elastomer, comprising winding said weft into a roll form and simultaneously interposing an intermediate layer member between adjacent turns of said weft to maintain said adjacent turns separate from each other, rotating said roll and applying external pressure to the periphery thereof, and passing a heated fluid in heat transfer relationship with said roll form, said intermediate layer member being formed of chlorosulfonated polyethylenes.



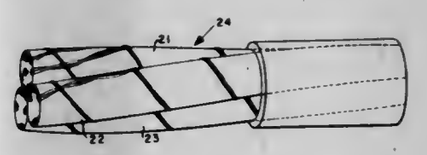
ELECTRICAL

3,271,505
CABLE SPLICE CASE
Harold W. Dellett, Los Angeles, and Woodford J. Crump, South Gate, Calif., assignors to A.T.I. Industries, Inc., Los Angeles, Calif., a corporation of California
Filed Sept. 9, 1963, Ser. No. 307,537
11 Claims. (Cl. 174—21)



8. In a cable splice case connecting electrical cables of the type having multiple layers of insulating and protective materials surrounding a bundle of insulated conductors where the interior of such cable is to be pressurized, the combination of:
- internal and external housings insulated from each other and having an aperture in each for each cable, a dielectric collar for each cable and having external means fitting a said aperture in each of said housings, the cable being progressively stripped of each layer to expose a portion of each layer, each collar having a plurality of longitudinally adjacent and aligned bores of preselected sizes loosely fitting each portion of exposed layer of the cable, and a dielectric adhesive material filling said collar between said bores and said exposed layers of the cable securing each said layer to the collar.

3,271,506
COAXIAL HIGH-FREQUENCY CABLE WITH INTERNAL SPACERS
Horst-Edgar Martin and Klaus Spinler, Berlin, Germany, assignors to Siemens & Halske Aktiengesellschaft, Berlin and Munich, Germany
Filed Mar. 23, 1965, Ser. No. 441,996
Claims priority, application Germany, Mar. 25, 1964, S 90,202
6 Claims. (Cl. 174—28)

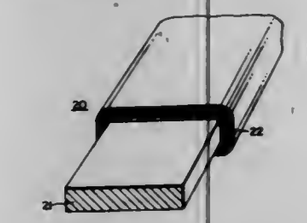


1. In a coaxial high-frequency cable having an inner conductor and an outer conductor coaxially surrounding the inner conductor, a plurality of annular spacers coaxially seated on said inner conductor and axially spaced from each other, each of said spacers comprising a foot portion forming a C-shaped spring clip clampingly seated on said inner conductor about a major portion of its circumference in engagement with said inner conductor, a plurality of angularly spaced legs extending radially away from said foot portion, each of said legs having a substantially cross-shaped cross-sectional area, and respective support members formed at the outer ends of said legs, said members being uniformly spaced from each other peripherally and individually engaging said outer conductor, said foot portion and said legs with said support members forming jointly an integral structure of insulating material.

3,271,507
FLAT PACKAGE FOR SEMICONDUCTORS
Charles G. Elliott, Setauket, N.Y., assignor to Alloys Unlimited, Inc., Melville, N.Y.
Filed Nov. 2, 1965, Ser. No. 506,030
10 Claims. (Cl. 174—52)

1. A package structure for containing semiconductor elements comprising:
- an insulating ceramic substrate having on one surface a channel section between first and second raised end sections;
- a step section between said channel section and said first end section along the entire length thereof and having a riser surface adjacent said channel surface and a tread surface adjacent said first end section;
- a first continuous conductive coating covering said tread surface, the top surface of said first end section, and the surface therebetween; and
- a second continuous conductive coating covering said channel surface, the top surface of said second end section, and the surface therebetween.

3,271,508
COMMUNICATION CABLE
Harvey Burr, De Kalb, Ill., assignor to Anaconda Wire and Cable Company, a corporation of Delaware
Filed Apr. 30, 1965, Ser. No. 452,225
4 Claims. (Cl. 174—113)



1. A communication cable comprising a large plurality of twisted pairs of insulated conductors,
- (A) all of said pairs of conductors being twisted with the same direction of lay,
- (B) each conductor being individually wrapped with an approximately double layer of spiralled insulating tape having a length of wrapping lay equal to the length of lay of twist of the pair comprising said conductor,
- (C) the direction of spiral of the tape on all conductors in said cable being the same,
- (D) said pairs being cabled together in a helix having a length of lay exceeding the length of lay of any of the component pair twists, and
- (E) a sheath surrounding said cabled conductors.

3,271,509

ELECTRICAL INSULATION FOR CONDENSER BUSHINGS AND THE LIKE

Robert H. Calderwood, Hampton Township, Allegheny County, Jacob Chottiner, McKeesport, and Harry R. Sheppard, Jr., Sharon, Pa., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Filed Apr. 12, 1963, Ser. No. 272,749
13 Claims. (Cl. 174—121)

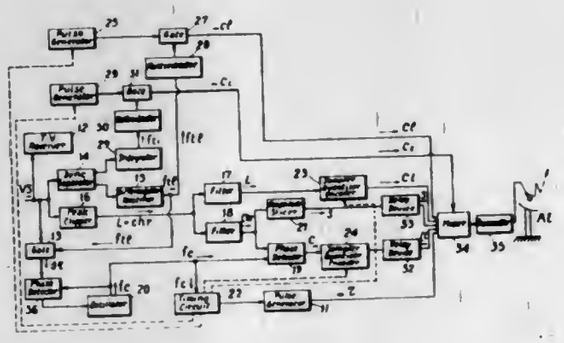
1. Laminated electrical insulation comprising plural layers of cellulosic fibers in sheet form having distributed throughout the sheet from about 0.02% to about 10%, based on the weight of the fibers, of at least one material selected from the group consisting of melamine, dicyandiamide and mixtures of melamine and dicyandiamide, the mixtures varying in proportions from 1 to 5 parts of dicyandiamide and 1 to 4 parts of melamine, by weight, said layers bound together into a unitary mass by a solid, infusible composition derived from the reaction of an epoxy resin selected from the group consisting of (1) 3,4-epoxy-6-methylcyclohexylmethyl-3,4-epoxy-6-methylcyclohexane carboxylate and (2) dicyclopentadiene dioxide with about 10 to 60 parts an anhydride cross-linking agent per 100 parts of epoxy resin, by weight.

3,271,510

REMOTELY APPLIED CONDUCTOR SPACER

Robert M. Decker, 8114 Covington Ave., Parma 29, Ohio, and Leonard J. Gierosky, 2125 Lincoln Ave., Parma 34, Ohio

Filed Dec. 1, 1964, Ser. No. 415,114
14 Claims. (Cl. 174—146)



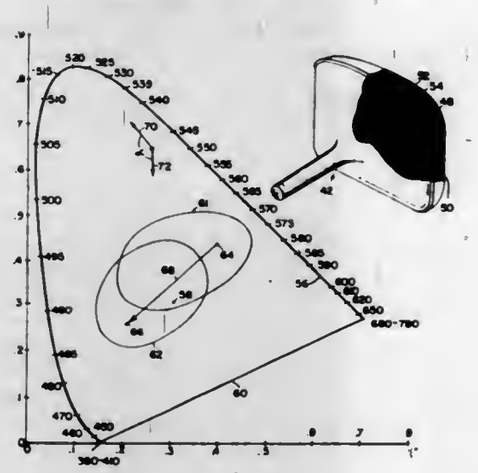
1. A remotely applied spacer for spacing at least a pair of elongated conductive elements and comprising first and second relatively movable nonconductive members, each member having a pair of spaced element receiving slots formed therein, the slots in said first member corresponding in spacing with those of said second member, said first and second members having an element locked position with respect to each other in which the slots of one member are in registry with corresponding slots in the other member and coact together to lock an element in place in each pair of corresponding slots, resilient means interposed between said members for resiliently biasing said members in said locked position, said first and second members having an element unlocked position with respect to each other in which the corresponding slots of said members are disposed relative to each other to permit entry and exit of an element, said slots in said first and second members being L-shaped slots, each having a first slot portion extending radially inward of said members to permit entry and exit of an element from the side of said spacer and a second slot portion extending axially of said members and wherein said second slot portion in said first member extends in an axially opposing direction from said second slot portion in said second member, and remotely actuated removable means securing said members in said element unlocked position until removed at which time said members are urged to said element locked position by said resilient means.

3,271,511

COLOUR TELEVISION TRANSMISSION SYSTEM FOR TRANSMISSION BY MEANS OF AT LEAST ONE SATELLITE

Georges Valensi, 3 Rue des Chaudronniers, Geneva, Switzerland

Filed Oct. 30, 1962, Ser. No. 234,194
Claims priority, application France, Nov. 3, 1961, 877,869; Nov. 29, 1961, 880,301; May 28, 1962, 898,897; July 13, 1962, 903,961; Sept. 21, 1962, 910,062
11 Claims. (Cl. 178—5.2)



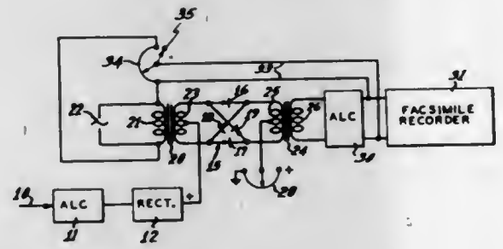
1. A colour television transmitting ground station comprising: means for deriving a luminance signal and n colour signals, where n is a positive integer smaller than three, relative to a scene to be televised; a timing circuit; sampling, quantizing and encoding means, controlled by said timing circuit, for deriving from said signals a first series of pulse coded signals carrying luminance information and n other series of pulse coded signals respectively carrying n colour informations; means for time positioning said pulse coded signals to derive therefrom successive sequences, each sequence comprising a pulse coded signal of the first series, and a pulse coded signal of each of said n other series; means, controlled by said timing circuit, for generating at the end of each scanning line and at the end of each scanning field a timing pulse; means for generating, after each timing pulse following a scanning line, a pulse coded line synchronization signal, and after each timing pulse following a scanning field, a pulse coded field synchronization signal; means for duration modulating said timing pulses in accordance with the sound accompanying said televized scene, the modulated timing pulses having a longer duration than the pulses of said pulse coded signals; mixing means fed with said duration modulated pulses and with said pulse coded signals for delivering a complex signal; means for modulating said complex signal on a carrier wave to obtain pulses of high frequency oscillations, and means for radiating said last mentioned pulses towards an artificial satellite.

3,271,512

COLOR TELEVISION METHOD AND APPARATUS EMPLOYING DIFFERENT SETS OF TARGET PHOSPHORS, ONE OF WHICH LUMINESCES IN A SINGLE COLOR AND ANOTHER OF WHICH LUMINESCES IN DIFFERENT COLORS

Nigel W. Daw, Baltimore, Md., assignor to Polaroid Corporation, Cambridge, Mass., a corporation of Delaware

Continuation of application Ser. No. 152,283, Nov. 14, 1961. This application Oct. 12, 1965, Ser. No. 500,482
15 Claims. (Cl. 178—5.2)



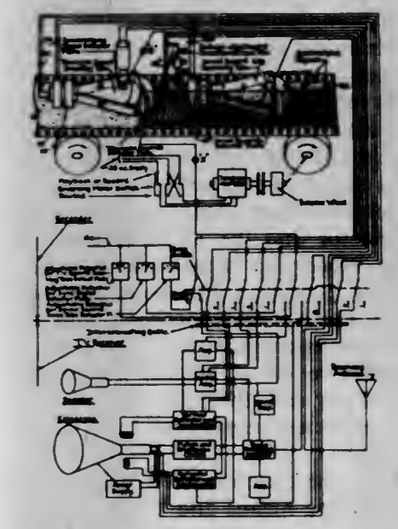
1. Cathode-ray tube means comprising a target screen having two types of luminescent elements adapted to emit light differentially in response to differences in irradiation, one of said types of elements emitting light of a predominantly reddish color substantially irrespective of variations in irradation current density, and the other of said types of elements emitting light having a relatively bluish hue in response to a relatively low irradiation current density and a relatively yellowish hue in response to a relatively high irradiation current density.

3,271,513

FACSIMILE RECORDING SYSTEM HAVING AUTOMATIC CONTRAST RANGE CONTROL

Peter R. Marzan, New City, N.Y., assignor to Litton Systems, Inc., Beverly Hills, Calif.

Filed Jan. 23, 1963, Ser. No. 253,390
8 Claims. (Cl. 178—6.6)



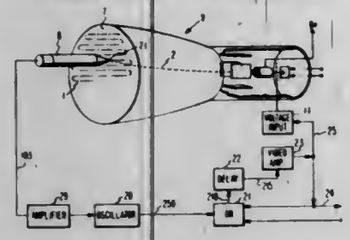
1. A facsimile recording system comprising:
input and output signal circuits, and
a first automatic level control,
a signal-inversion circuit, and
a second automatic level control, said first automatic level control, said signal-inversion circuit and said second automatic level control being connected in series relation between said input and output signal circuits to maintain constant output signal contrast.

3,271,514

RECORDING AND PLAYING-BACK TELEVISION PROGRAMS, BY WIDE-BAND CROSS-SCANNING RECORDINGS

Thomas A. Banning, Jr., Chicago, Ill., and Emil L. Ranseen, deceased, late of Chicago, Ill., by Agnes J. Ranseen, executrix, Evanston, Ill., assignors, by direct and mesne assignments, to Thomas A. Banning, Jr., trustee, Chicago, Ill.

Application Dec. 18, 1964, Ser. No. 419,612, which is a division of application Ser. No. 94,651, Mar. 9, 1961, which in turn is a division of application Ser. No. 427,428, May 4, 1954, now Patent No. 2,976,354, dated Mar. 21, 1961. Divided and this application Oct. 23, 1965, Ser. No. 504,250
1 Claim. (Cl. 178—6.6)



Means to produce a record of two continuing series of signals one such series comprising video signals of radio frequency which when sensed and translated comprise the video component of a television program, and the other such series comprising audio signals of audio frequency which when sensed and translated comprise the audio component of a television program; said recording means including a tape having a signal receiving and recording surface, means to drive said tape at substantially uniform rate; two deflectable beam units mounted in proximity to the tape surface, each including beam producing means mounted in proximity to the tape surface and including beam producing means and means constituted to cause cross-scanning deflections of such beam across the scan width of the tape, with production of a beam of force strength proportionate to the varying strength of one of the series of signals delivered to the corresponding deflectable beam unit, and production of a cross-scan recording on the tape of strength corresponding to the strength of such beam; means constituted to produce lateral deflection producing signals, and connections between such lateral deflection signal producing means and each of the deflectable beam units, constituted to cause both of the deflectable beam units to execute lateral deflections at the rate of production of such deflection producing signals; together with means to cause the beam strength of one of the deflectable beam units to vary according to the variations of strength of the video signals of such program, and means to cause the beam strength of the other deflectable beam unit to vary according to the variations of strength of the audio signals of such program.

3,271,515
ELECTRONIC HANDWRITING DETECTION AND DISPLAY APPARATUS

Thomas P. Harper, San Jose, Calif., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York

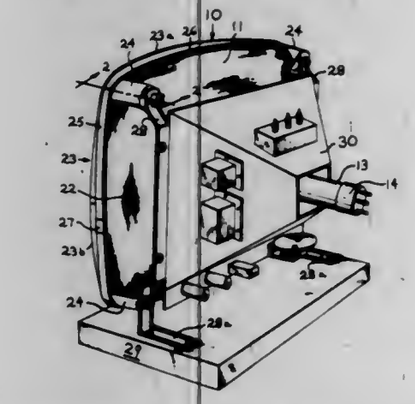
Filed Jan. 28, 1963, Ser. No. 254,150
4 Claims. (Cl. 178—6.8)

1. An electronic video writing and transmitting system comprising:

a writing surface means, said writing surface means comprising a display surface having separate luminescent cells of uniformly adjustable intensity, distributed homogenously thereacross, the intensity of said cells being uniform in the unwritten state, and having cell-intensity modifying means;

a manually manipulatable photodetector means adapted to generate a "write-pulse" whenever superposed upon said cells in "writing position" in response to the light energy of said cells; and

pulse synchronization means connected between said photodetector and the input of said adjustable cell intensity modifying means whereby said pulse may "write" by causing a change in the intensity of the cell over which it is superposed, said pulse synchronization means comprising:



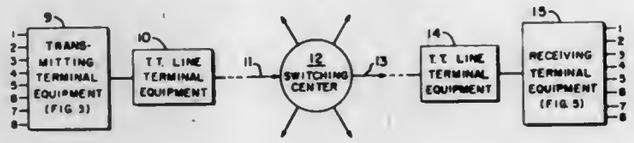
magneto-strictive delay means, including a magneto-strictive delay coil, the input of which includes drive means connected between said coil and said detector means; and

amplification means connected between said coil and said modifying means and being arranged to modify the delayed pulse from said photodetector and present it to beam-gating means associated with said modifying means so as to increase the intensity of said cell at said writing position and thereby "write" a brightened spot upon said display surface.

3,271,516
IMPLOSION RESISTANT CATHODE RAY TUBE WITH INTEGRAL MOUNTING ELEMENTS TO FACILITATE INSTALLATION

Daniel A. Damm, Toledo, Ohio, assignor, by mesne assignments, to Owens-Illinois, Inc., a corporation of Ohio

Filed Oct. 22, 1962, Ser. No. 231,887
18 Claims. (Cl. 178—7.8)

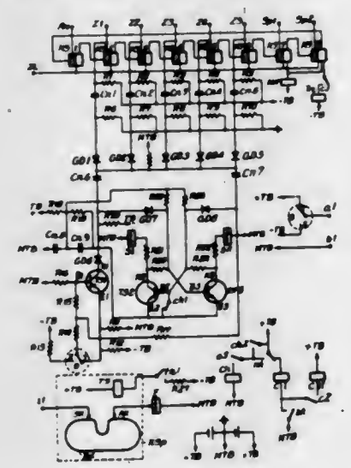


1. The combination comprising a television receiver cabinet, a cathode-ray tube having an essentially all-glass envelope, reinforcing means adhered to and extending over non-viewing frontal exterior surface portions of said tube envelope surrounding its viewing area, a rigid frame member disposed adjacent a rearward portion of said tube envelope to support the receiver components, and a series of spaced-apart mounting elements integrally attached to said reinforcing means and disengageably attached to, said rigid frame member and said cabinet at a frontal region of said tube.

3,271,517
DATA TRANSMISSION

Andrew C. De Rosa, Hazlet, N.J., assignor to the United States of America as represented by the Secretary of the Army

Filed Jan. 2, 1963, Ser. No. 249,101
5 Claims. (Cl. 178—26)

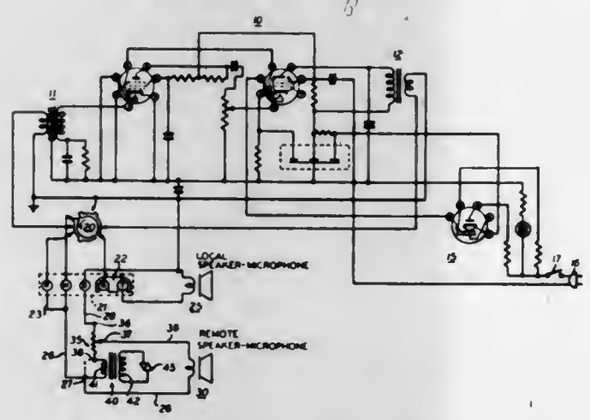


3. A means for transmitting eight bit per parallel character Fieldata over standard teletypewriter networks, comprising; means to split the information in each Fieldata character equally between two subcharacters of standard teletypewriter form, means to insert a dummy bit as the fifth bit of each of said teletypewriter subcharacters, means to provide said teletypewriter subcharacters with synchronizing pulses, means to serially apply said teletypewriter subcharacters to a teletypewriter network, means at a remote terminal of said teletypewriter network for re-assembling each group of two serial teletypewriter subcharacters into parallel Fieldata form.

3,271,518
DISTORTION CORRECTION OF TELEPRINTER SYMBOLS

Rudolf Krämer, Munich, Germany, assignor to Siemens & Halske Aktiengesellschaft Berlin and Munich, a German corporation

Filed July 6, 1961, Ser. No. 122,249
Claims priority, application Germany, July 7, 1960, S 69,265
9 Claims. (Cl. 178—53.1)

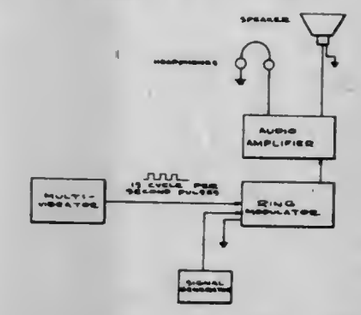


1. In a teleprinter system for start-stop telegraphy, a circuit arrangement for correcting distorted teleprinter symbols of a plurality of teleprinter messages which are respectively transmitted over separate lines, wherein the correcting is effected with the aid of center sampling of the individual teleprinter symbol elements, the combination of storage feed-in means allocated to each line, an intermediate storer operatively connected with each of said storage feed-in means and adapted to store at least one complete teleprinter symbol, means for conducting incoming teleprinter signals to said storage feed-in means for the storage thereof in said intermediate storer, storage feed-out means for each intermediate storer operatively connected thereto, a centrally disposed element former having means for delivering sampling pulses operative for the center sampling of the symbol elements, and means operatively connected to said element former and controlled by said element former, operable for the duration of the seizure of the respective intermediate storers, for operatively releasing the corresponding storage feed-out means of the respective intermediate storers at instants defined with respect to the position of the start element formed by the central element former.

3,271,519
VOLUME CONTROL CIRCUIT

Allan C. Bernstein, Kings Point, N.Y., assignor to Electone, Inc., Long Island City, N.Y., a corporation of New York

Filed Nov. 9, 1962, Ser. No. 236,526
4 Claims. (Cl. 179—1)



3. In an audio intercommunication system having a two-terminal sound transducer reversibly operable to generate a low level audio signal upon the application of a sound input thereto, and to audibly reproduce a higher level audio signal applied to such transducer, and a pair of conductors for transmitting such low level audio signals from the sound transducer and for transmitting such high level audio signals thereto, a volume control circuit which comprises a potentiometer and two-terminal voltage variable impedance means, said potentiometer having a resistance element connected in series with said variable impedance means and an adjustable resistance tap connected to one terminal of the sound transducer, one terminal of said resistance element being connected to one of said conductors, and the other of said conductors being connected in common with the other terminal of said variable impedance means and with the other terminal of said transducer, said variable impedance means having voltage-impedance characteristics whereby the effective impedance of said variable impedance means is sufficiently low as to constitute a short circuit when excited by a high level audio signal applied to said conductor pair, and sufficiently high as to constitute an open circuit when excited by a low level audio signal applied by the transducer through said resistance tap and the common connection to said variable impedance means, whereby low level audio signals generated by said transducer experience a limited and relatively low attenuation, and high level audio signals applied to said transducer experience a greater attenuation.

3,271,520
ACOUSTIC REFLEX EAR PROTECTIVE SYSTEM

John L. Fletcher, Fayetteville, Ark., and Arthur J. Riopelle, Orange Park, Fla., assignors to the United States of America as represented by the Secretary of the Army

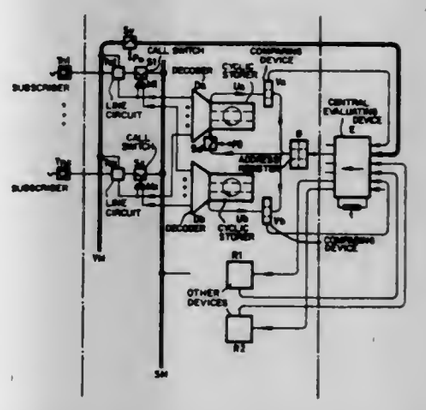
Filed Dec. 4, 1962, Ser. No. 242,337
1 Claim. (Cl. 179—1)

Apparatus for producing continuous sound for placing the ear in acoustic reflex condition for continuous protection against distressing noise comprising:

(a) a multivibrator continuously producing pulses at the rate of 15 cycles per second;

(b) a signal generator;

(c) a ring modulator electrically connected to said signal generator and said multivibrator;



(d) an audio amplifier electrically connected to said ring modulator; and

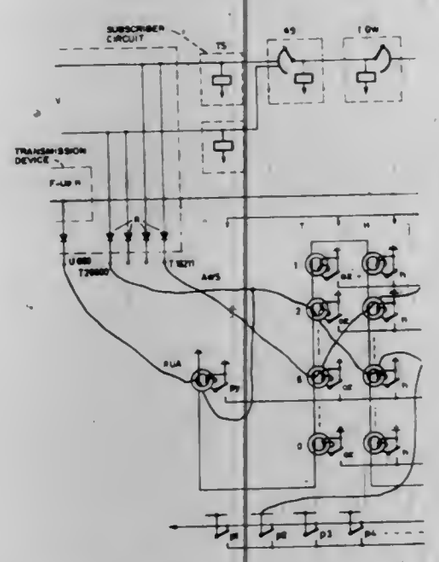
(e) a speaker electrically connected to said audio amplifier, said speaker impressing the continuous 15 cycle per second pulses upon the ear thereby producing the acoustic reflex condition.

3,271,521
CIRCUIT ARRANGEMENT FOR ASCERTAINING OPERATING CONDITIONS OF SUBSCRIBER STATIONS OF A TIME MULTIPLEX COMMUNICATION SYSTEM

Dieter von Sanden, Munich-Solln, Hubert Suckfüll, Munich-Obermenzing, and Allan Darré, Munich, Germany, assignors to Siemens & Halske Aktiengesellschaft Berlin and Munich, a corporation of Germany

Filed May 8, 1961, Ser. No. 108,330
Claims priority, application Germany, June 10, 1960, S 68,878
23 Claims. (Cl. 179—15)

1. A communication system, especially a telephone system, wherein two-wire connections are established between subscriber stations in accordance with the time multiplex principle, comprising line circuits respectively cooperatively connected with subscriber stations, means forming a call multiplex point, electronic call switches for connecting with said call multiplex point, over the



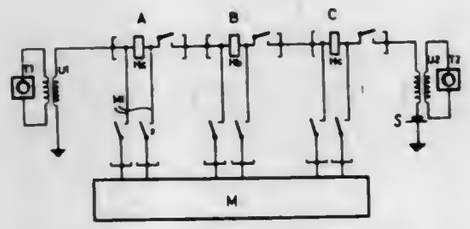
respective line circuits, subscriber stations which are to be interconnected, means for producing, under the control of addresses of subscribers involved in the extension of a call, phase shifted control pulses for controlling the operative actuation of said electronic call switches, the respective phase shifted pulses being cyclically allocated to the connection which is to be established between the involved subscriber stations, a common control device, means for inserting in the cycle of said control pulses a reading pulse with a pulse sequence frequency corresponding to that of the control pulses, means governed by said reading pulse for successively testing all line circuits as to the busy or idle condition of the respective subscriber stations and thereby producing in the line circuits a corresponding criterion, means for directly extending criteria to said common control device, and means in said common control device for evaluating a received criterion after comparison of the address of the corresponding tested subscriber station with the addresses of subscriber stations which are involved in extended calls.

3,271,522

CIRCUIT ARRANGEMENT FOR DETERMINING THE CALL NUMBERS OF PARTY LINE SUBSCRIBERS

Gerhard Polensky, Munich, Germany, assignor to Siemens & Halske Aktiengesellschaft Berlin and Munich, a corporation of Germany

Filed Sept. 28, 1962, Ser. No. 227,688
Claims priority, application Germany, Sept. 29, 1961, S 76,042
8 Claims. (Cl. 179—17)



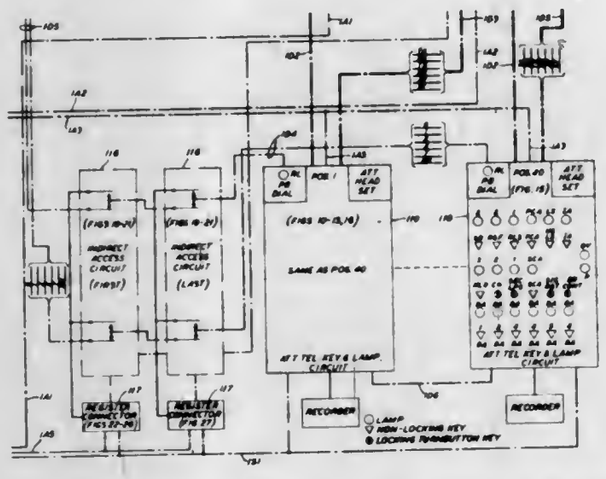
1. A circuit arrangement for the determination of call numbers of subscribers to party lines in telecommunication, particularly telephone installations, comprising evaluation circuits allocated to the individual call numbers, which characterize in a coordinate formed evaluation field the digits of the call numbers, said evaluation circuits marking the individual call numbers containing in each case one characterizing element less than there are places in each call number, the evaluation circuits for subscribers with line selector outlets in common for several subscribers being operative to mark all digits of the call number except the ordinal number of the correspondingly party line connection, means for storing such ordinal number of the corresponding party line connection and the evaluation circuits for subscribers with individual selector outlet being operative to mark all digits of the call number except the sub-office digit characterizing the appropriate group of subscribers, which digit is determined by associated connecting devices.

3,271,523

COUPLING FIELDS WITH SINGLE CONDUCTOR THROUGH-SWITCHING OF EXTENSIONS OVER ELECTROMAGNETICALLY ACTUATED CONTACTS

Korbinian Karrer, Munich, Germany, assignor to Siemens & Halske Aktiengesellschaft Berlin and Munich, a corporation of Germany

Filed Sept. 28, 1960, Ser. No. 59,029
Claims priority, application Germany, Oct. 14, 1959, S 65,425
11 Claims. (Cl. 179—22)



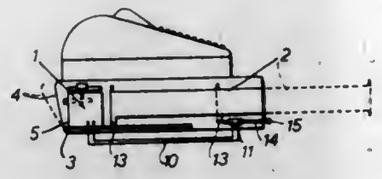
1. In a coupling field employed in a communication system, an arrangement for switching through connections over a single conductor of the speech current path extending over electromagnetically controlled coupling contacts, comprising a holding coil disposed in serial relationship with respect to each coupling contact, and circuit means operatively directing current flowing over said single conductor to the respective holding coils to energize the same and thereby maintain the coupling contacts respectively associated therewith in actuated condition.

3,271,524

KEY TYPE COMMON CONTROL TELEPHONE SWITCHING SYSTEM

Theodore E. Allen, Topsfield, Mass., Walter R. Baker, North Hollywood, Calif., Richard H. Bidlack, Boonton, N.J., Karl N. Gardner, San Gabriel, Calif., William E. Mullan, Jr., Washington, D.C., and Milton E. Ozenberger and Louis E. Van Damme, Summit, N.J., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed Sept. 27, 1961, Ser. No. 141,178
28 Claims. (Cl. 179—27)



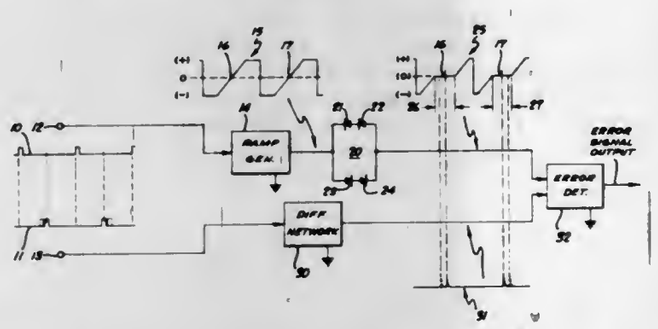
1. A switching system comprising, subscriber stations, an attendant position, a plurality of manually operable keys at said position each of which is individually associated with one of said stations, and common control switching facilities responsive to the operation of a selected one of said keys to alternatively complete incoming and outgoing connections between said position and the subscriber station associated with said selected key.

3,271,525

SOUND REPRODUCER EQUIPPED CASH REGISTER

Jörgen Sigurd Lien, 2–4 Mollendalsveien, Bergen, Norway

Filed July 11, 1962, Ser. No. 208,984
Claims priority, application Norway, Aug. 22, 1961, 137,064, Patent 100,021
5 Claims. (Cl. 179—100.2)



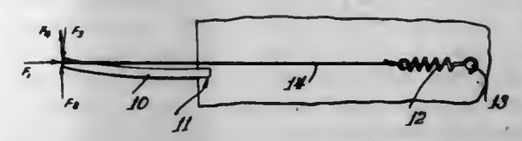
1. The combination of a cash register having a cash drawer movable from a closed position to an open position and versa versa; with a sound reproducing device having a playback head and an electric motor; a low frequency amplifier having a loud speaker; means supplying electrical current to said playback head, said motor and said amplifier and comprising a contact switch located in the path of movement of said cash drawer and closed by said cash drawer when it is adjacent its open position; a manually operable rod connected with said switch for closing said switch independently of the movement of the cash drawer, and means energized by the electrical current for maintaining the flow of electrical current after said switch is opened, magnetic recording tape adapted to engage said playback head, a drive for said magnetic tape, means operatively connecting said drive with said motor, and means connected with said tape and de-energizing the last-mentioned means after a predetermined length of tape has been moved by said drive.

3,271,526

SERVO SYSTEM THAT IS INSENSITIVE TO TAPE FLUTTER ERRORS

Donald James Cochran, Pacifica, and Donald Marvin Patterson, Sunnyvale, Calif., assignors to Ampex Corporation, Redwood City, Calif., a corporation of California

Filed Nov. 5, 1962, Ser. No. 235,376
6 Claims. (Cl. 179—100.2)



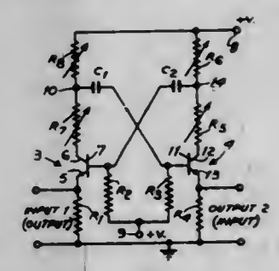
2. A speed control servo system for a magnetic tape record-playback apparatus comprising:
- means for generating ramp pulses from a first group of pulses, said ramp pulses having zero crossover points;
- means for differentiating a second group of pulses to produce sharp pulses;
- means for comparing the time between one sharp pulse and one ramp pulse; and
- diode means for shaping the ramp pulses at their zero crossover points to make the servo system insensitive to tape flutter errors.

3,271,527

TRANSDUCER ELEMENT MOUNTING

Robert J. Hammond, Stevensville, Mich., assignor to V-M Corporation, Benton Harbor, Mich., a corporation of Michigan

Filed Nov. 23, 1962, Ser. No. 239,542
9 Claims. (Cl. 179—100.41)



5. A transducer element assembly comprising, in combination, a bender element mounted in cantilever fashion so as to be adapted to be driven in a transverse direction at its free end to generate an output voltage proportional to the amplitude of the driving force, and a tension spring anchored at one end so as to be adapted to pivot about a point substantially rearwardly of the fixed end of said bender element and associated with said bender element so as to be adapted to apply a compressive spring force at the free end thereof, thereby to increase the effective lateral compliance of said bender element and reduce the transverse force required to drive the same, said tension spring being disposed approximately in the plane of said bender element when the latter is in its undeflected position.

3,271,528

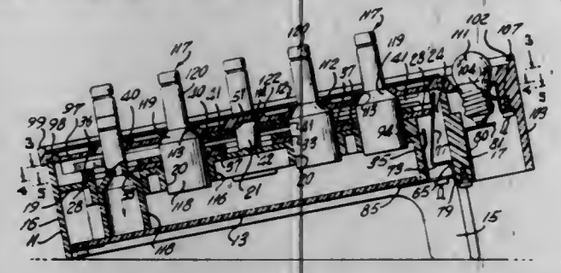
ADJUSTABLE INPUT IMPEDANCE AMPLIFIER

Lucio M. Vallese, Glen Ridge, N.J., assignor to International Telephone and Telegraph Corporation, Nutley, N.J., a corporation of Maryland

Filed Feb. 7, 1963, Ser. No. 256,918
16 Claims. (Cl. 179—170)

1. An amplifier comprising:
an input;
an output;
a first active element coupled to said input circuit;
a second active element coupled between the output of said first active element and said output;
first means coupling said second active element to said first active element to provide positive feedback for said first active element; and
second means coupled to said first means to control the amount of said feedback to adjust the input impedance of said amplifier between two values including zero impedance and a predetermined negative impedance while maintaining an amplified output signal at said output.

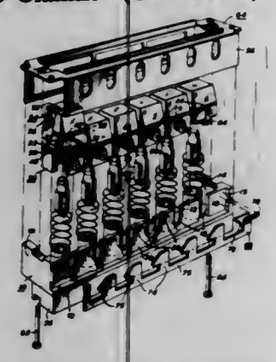
3,271,529



CODED SWITCH CONSTRUCTION

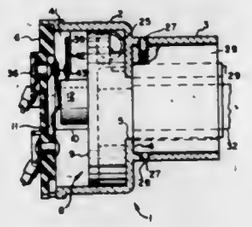
Gustav J. Pawelka, Sunset Ave., Glenwood Landing, N.Y., and Frederick H. Kroll, 72 Wood Hollow Lane, New Rochelle, N.Y.

Filed May 12, 1964, Ser. No. 366,725
9 Claims. (Cl. 200—5)



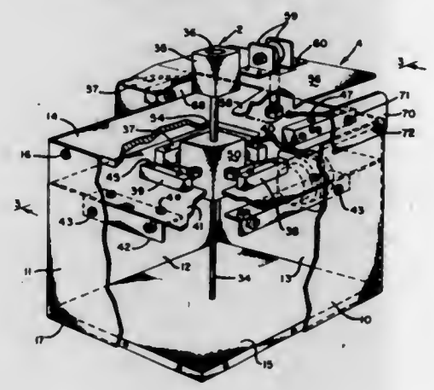
1. An electrical switching device comprising a base plate having formed therein a plurality of longitudinally and transversely aligned regularly spaced first apertures pro-

vided with sleeves depending from the peripheral edges of said apertures and integrally formed with said base plate, a plurality of longitudinally extending first bars, superimposed side by side on said base plate and individually movable along their lengths between advanced and retracted positions, said bars having formed therein second apertures substantially coinciding with said first apertures when said first bars are in retracted positions, a plurality of transversely extending second bars superimposed side by side on said first bars and individually movable along the lengths thereof between advanced and retracted positions, said second bars having formed therein third apertures substantially coinciding with said first and second apertures when said second bars are in retracted positions to define with said first and second aper-



tures a plurality of sets of three registering apertures, means individually resiliently urging said bars toward their advanced positions, a latching element registering with each of said aperture sets and axially movable between a raised and depressed position and including a latching section frictionally slidably engaged by a respective of said sleeves and engaging a respective aperture set when said latching element is in its raised position to lock the corresponding bars in their retracted positions, and out of engagement with said aperture set when said latching element is in its depressed position to release said corresponding bars for movement toward their advanced positions, and switch means responsive to the movement of any of said bars to its advanced position.

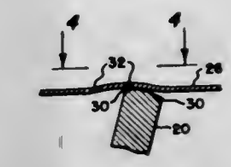
3,271,530
PUSHBUTTON SWITCH WITH LATCHING, LOCK-OUT AND INDICATOR LAMP STRUCTURE
Robert E. Wirsching, Greenfield, Ind., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Jan. 12, 1965, Ser. No. 424,997
8 Claims. (Cl. 200—5)



7. A multiple pushbutton switch comprising:
a dielectric housing including
a generally planar base portion,
a plurality of spaced sleeve portions extending upwardly from the base portion, the sleeve portions being intermediate the front and rear edges of the base portion,
a rear wall portion extending upwardly from the base portion, the rear wall portion lying along the rear edge of the base portion spaced from the sleeve portions,
and a terminal portion situated on the underside of the base portion, the terminal portion having a plurality of first and second spaced pockets therein, the terminal portion further having a plurality of parallel spaced grooves therein extending transverse to the front edge of the base portion, each groove communicating with an individual first pocket, and an individual pair of second pockets communicating through the base portion with the interior of each of the sleeve portions;
a plurality of generally L-shaped contact springs, the first leg of each contact spring having a socket portion and a second leg of each contact spring having a contact portion, the first leg of each contact spring being respectively received by an individual groove in the terminal portion of the housing with the socket portion thereof being accommodated in the first pocket communicating with the groove, the second leg of each contact spring extending upwardly transverse to the forward edge of the base portion of the housing;
a plurality of generally I-shaped contact springs having a socket portion at one end thereof and a contact portion at the other end thereof, each contact spring being positioned with the socket portion thereof in an individual second pocket in the terminal portion of the housing and with the contact portion thereof extending into a sleeve portion with which the pocket communicates;
an individual lamp positioned within each sleeve portion of the housing, each lamp when so positioned having contact portions thereon in engagement with the contact portions of the pair of I-shaped contact springs extending into the sleeve portion; and
an individual pushbutton disposed about each sleeve portion and movable along the length thereof, each pushbutton having a portion adapted to interact with the wall portion to guide the movement of the pushbutton, each pushbutton further having a cam portion for engaging the second legs of certain of the contact springs, the cam portion deflecting these contact springs into engagement with adjacent contact springs when the plunger is moved to a downward position, each pushbutton further having a light transmitting portion at the upper end thereof.

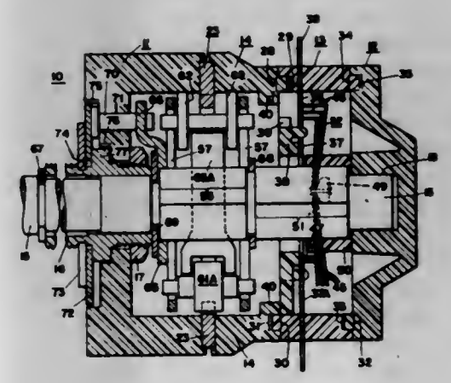
3,271,531
OSCILLATORY SWITCH WITH IMPROVED ROTOR CAM MECHANISM
Ray F. Winogrocki, East Detroit, and Walter T. Stoi, Warren, Mich., assignors to Boyne Products, Inc., Detroit, Mich., a corporation of Michigan
Filed Nov. 19, 1964, Ser. No. 412,422
11 Claims. (Cl. 200—6)

1. A switch construction comprising a casing; a plurality of spaced apart, fixed contacts supported by said casing in spaced planes; at least one bridging contact supported by said casing for movement between said planes to positions in and out of engagement with selected ones of said fixed contacts; a rotor member rotatably mounted in said casing for movement from a first position to any selected one of a plurality of other positions; biasing means reacting between said casing and said rotor member and constantly urging the latter to said first position, said biasing means being yieldable to permit rotation of said rotor member from said first position to any selected one of said other positions; and means carried by said rotor member for engaging said bridging contact and moving the latter from one of said positions to the other in response to movement of said rotor member.



3,271,532
THREE-AXIS FINGER TIP CONTROLLER FOR SWITCHES
Armando E. Lopez, Sunnyvale, Calif., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Feb. 18, 1965, Ser. No. 433,821
8 Claims. (Cl. 200—6)

1. A finger-tip controller comprising a first control member engageable by the index finger, means supporting said first control member for sideways movement selectively in either of two planes, means responsive to movement of said first control member in said two planes for transmitting a control command to an element to be controlled, a second control member projecting on two sides of said first control member and spaced around the first control member to permit said movement of the first control member, said second control member being engageable by the thumb and second finger of an operator whose index finger engages said first control member, means pivotally supporting said second control member for rocking motion about an axis extending toward said first control member, and means responsive to said rocking motion of said second control member for transmitting a control command to an element to be controlled.

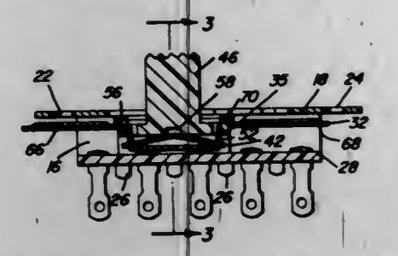


3,271,533
ROTARY SWITCH, WITH VIBRATION RESISTANT RESILIENT DISPLACEABLE FIXED CONTACT STRUCTURE
Maurice C. Butler, San Diego, Calif., assignor to Kinetics Corporation, Solana Beach, Calif., a corporation of California
Filed Oct. 28, 1963, Ser. No. 319,107
6 Claims. (Cl. 200—9)

1. A rotatable electrical switch, comprising in combination:
(A) a rotatable element;
(B) a conductor carried by and extending radially of the axis of the element, said conductor having:
(1) a section having highly conductive characteristics;
(2) a leading section having relatively high resistance to electric arc characteristics;
(C) a yielding contact;
(D) and means for rotatably supporting the rotatable element and for fixedly supporting the yielding contact under tension constantly and spaced from said

element and in a position to be engaged first by said leading section and thereafter by the first mentioned section of the conductor upon rotation of said element.

3,271,534
MULTI-POINT ROTARY SWITCH WITH IMPROVED DETENT ARRANGEMENT
Harold E. McFadden, Dresher, Pa., assignor to Leeds and Northrup Company, Philadelphia, Pa., a corporation of Pennsylvania
Filed Mar. 23, 1965, Ser. No. 442,072
4 Claims. (Cl. 200—11)

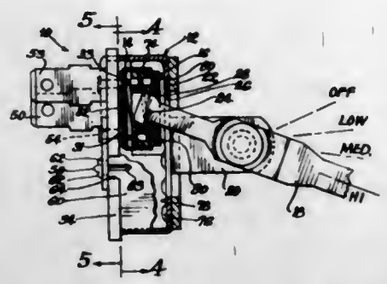


1. A multi-position rotary switch comprising
a housing for at least one group of angularly spaced fixed contacts,
a rotatable shaft carrying at least one movable contact assembly, each of said contact assemblies comprising resilient brush structure extending radially from said shaft for selectively engaging a corresponding group of said fixed contacts and applying contact pressure in direction axially of said shaft,
a pair of carriage members mounted on said shaft for rotation therewith, each of said members having radial slots on opposite sides of the shaft and paired with parallel radial slots of the other carriage member,
a stationary internally-notched annulus mounted on said housing concentric to said shaft and in a plane which extends between said carriage members,
a pair of rollers having axles respectively received by a corresponding one of the pairs of said radial slots, and
a leaf spring structure freely spanning said shaft and having its opposite ends respectively engaging said axles to bias said rollers in opposite directions away from said shaft, each of said spring ends being shaped to provide a bearing for the axle of the associated roller and at least one of said rollers cooperating with said internally notched annulus and said leaf spring structure to apply detent pressure in direction radially of said shaft.

3,271,535
SWITCH DEVICE WITH IMPROVED DETENT STRUCTURE

Joseph M. Vananzi, Meadowbrook, Pa., assignor to Continental-Wirt Electronics Corporation, a corporation of Pennsylvania

Filed June 16, 1965, Ser. No. 464,380
4 Claims. (Cl. 200—16)



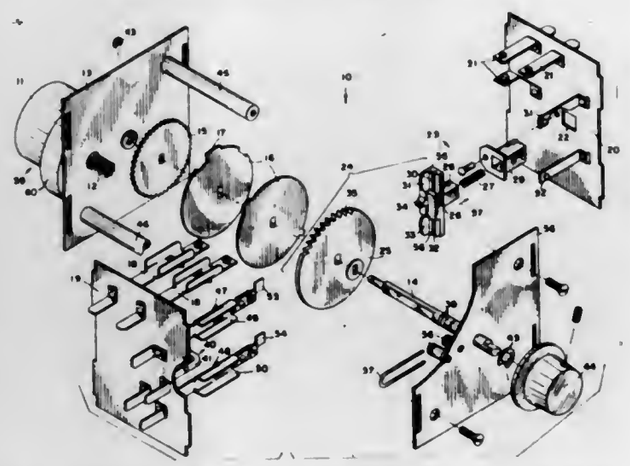
1. In an electrical switch assembly having a rectilinearly slidable switch actuator, electrical contact members held captive by and movable with said actuator, an insulating support underlying said contact members and having paired contact terminals respectively adapted to be bridged by said contact member upon shifting movement of said switch actuation relatively to said support and an enclosing casing for said switch assembly having a substantially flat top wall part overlying the top of said switch actuator and opposed depending side wall parts secured to said insulating support to embrace therebetween said switch actuator, said contact members and said insulated contact terminals, said casing having an elongated slot in its said top wall part extending lengthwise of said casing in parallel relation to said opposite side wall parts thereof, and said switch actuator having an upwardly projecting part integral therewith extending through said slot for shifting movement within the limits of said slot, the improvement comprising a detent plate formed of resilient sheet material disposed in intervening relation between the top wall part of the casing and the top of said switch actuator, said detent plate being centrally apertured to non-rotatably captivate the upwardly projecting part of said switch actuator for shifting movement of the plate with said actuator, said detent plate being provided with laterally spaced relatively narrow parallel coplanar side strips respectively disposed at opposite sides of the central aperture of the plate and extending lengthwise along opposite sides of the upwardly projecting part of the actuator in respective parallel relation to the casing side wall parts, each of said narrow strips of the detent plate substantially mid-point of its length having an integrally formed detent of generally inverted U-shape as viewed from a side edge of said strip, each said detent extending transversely across the full width of its associated strip to provide in the latter a pair of substantially parallel flex lines spaced longitudinally along and extending transversely of the strip to permit flexing of the strip and corresponding movement of the detent orthogonally with respect to the plane of said detent plate.

3,271,536
ELECTRICAL SWITCH WITH CONTACT GROUNDING STRAP

William N. Schink, Crystal Lake, Ill., assignor to Indak Manufacturing Corp., Northbrook, Ill., a corporation of Illinois

Filed Nov. 8, 1965, Ser. No. 506,699
9 Claims. (Cl. 200—16)

1. An electrical switch,
comprising the combination of a metal casing,
an insulating board mounted on said casing,
a plurality of contacts in said casing and mounted on said insulating board,
a contactor movable in said casing into engagement with said contacts,
a metal strap mounted on said insulating board and connected to one of said contacts,
said strap having a slot therein,



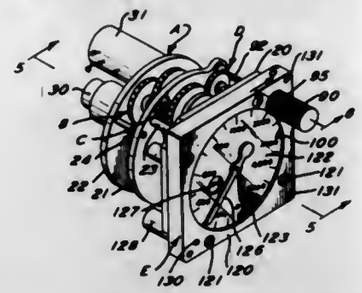
and a tab projecting from said casing and through said slot,
said tab having an upset end portion for securing said strap to said tab to ground said one contact to said casing.

3,271,537
SEQUENTIAL TIMER

Harold T. Simmons and George A. Hamilton, Indianapolis, Ind., assignors to P. R. Mallory & Co. Inc., Indianapolis, Ind., a corporation of Delaware

Filed Dec. 3, 1964, Ser. No. 415,697
17 Claims. (Cl. 200—38)

1. A time controlled switching mechanism comprising: mounting means, an axially displaceable cam carrying shaft rotatably journalled in said mounting means; coded indicia means carried by said shaft; a plurality of contact carrying blades carried by said mounting means; fixed contacts spaced from said contacts of said blades and connected to said mounting means; and displaceable actuator means carried by said mounting means and having discrete steps and engaging said coded indicia of said coded indicia means, one of said steps engaging with said blades so as to bias said blades in engagement with said fixed contacts as said shaft is axially displaced, rotational displacement of said coded indicia means causes said actuator means to be displaced from an engaged position with said blades so that said blades disengage with said fixed contacts.

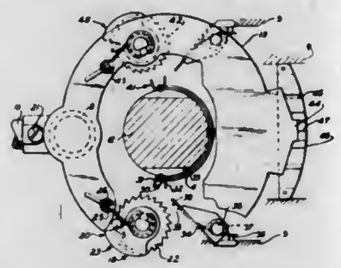


3,271,538
SERVO SYSTEM INDICATOR-CONTROLLER

David A. Burrows, Coral Gables, Fla., assignor to Rex Systems Corporation, a corporation of Florida

Filed Apr. 3, 1964, Ser. No. 357,106
12 Claims. (Cl. 200—52)

1. A servo system indicator-controller comprising a servo gear train; a pointer drive shaft driven by said gear train; rotational stops for said pointer drive shaft; biasing means urging said shaft against one of said stops;

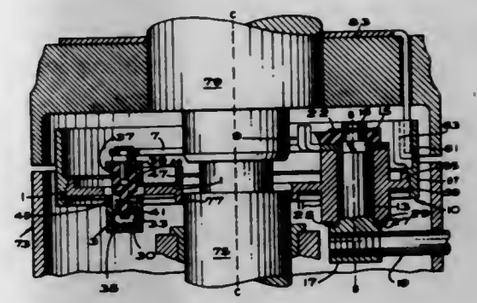


a fixed limit switch; means operating said fixed limit switch when said shaft is against one of said stops; a manually rotatable control shaft; a dial; a first dial pointer driven by said pointer drive shaft; a second pointer on said dial and positioned with respect thereto by rotation of said control shaft; an "on-off" switch operated by rotation of said control shaft; a variable limit switch; and means activating said variable limit switch as a combined function of the position of said pointer drive shaft and the setting of said second pointer.

3,271,539
TURN SIGNALING CANCELING MECHANISM

Robert T. W. Liang, Southfield, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware

Filed Dec. 19, 1961, Ser. No. 160,581
13 Claims. (Cl. 200—61.34)

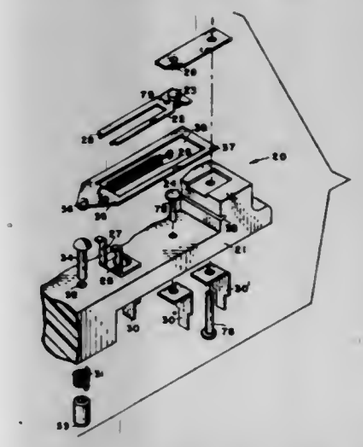


7. In a turn signaling mechanism, the combination comprising: a vehicle steering member, said steering member having a zero position for steering the venicle in a straight path, a movable switch member positioned adjacent said steering member, said switch member having an operative and an inoperative position, a switch operating member connected to said switch member for moving said switch member from an inoperative position to an operative position, means operatively coupling said steering member and said switch member for sensing the small adjustments of said steering member about said zero position and for returning said switch member to an inoperative position when a predetermined number of said small adjustments of said vehicle steering member are sensed.

3,271,540
TURN SIGNALING CANCELING MECHANISM

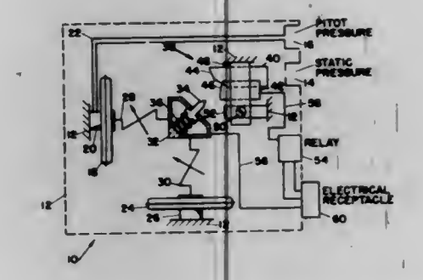
Hugh R. White, Chelmsford, England, assignor to The Ford Motor Company, Dearborn, Mich., a corporation of Delaware

Filed Sept. 9, 1964, Ser. No. 395,114
9 Claims. (Cl. 200—61.34)



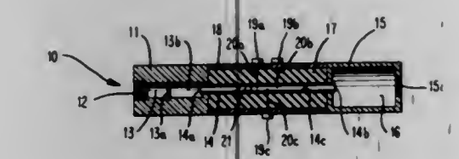
6. In a turn signaling mechanism, a vehicle steering member, said steering member having a zero position for steering the vehicle in a straight path, a base member fixedly mounted and having a central aperture, said steering member extending through said central aperture, a movable switch member pivotally mounted on said base member, said switch member having an operative and an inoperative position, a manual arm connected to said switch member for moving said switch member from an operative to an inoperative position, a cylindrical canceling ring rotatably mounted on said base member about an axis concentric to the axis of said steering member, said cylindrical canceling ring having a pair of spaced inwardly extending projections, means connecting said cylindrical canceling ring and said steering member whereby said cylindrical canceling ring rotates with said steering member, and resilient means mounted on said switch member and engaging said projections on said cylindrical canceling ring for returning said switch member to the inoperative position when said steering member is rotated in the opposite direction of the movement of said manual arm when said switch member is moved from an inoperative to an operative position.

3,271,541
MULTI-POSITION SNAP SWITCH



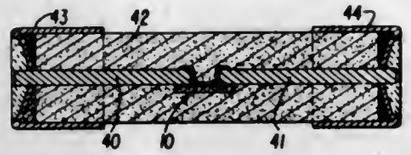
Gianni A. Dotto, Dayton, Ohio, and Wallace Leon Linn, Indianapolis, Ind., assignors to P. R. Mallory & Co., Inc., Indianapolis, Ind., a corporation of Delaware

Filed June 29, 1964, Ser. No. 378,659
7 Claims. (Cl. 200—67)



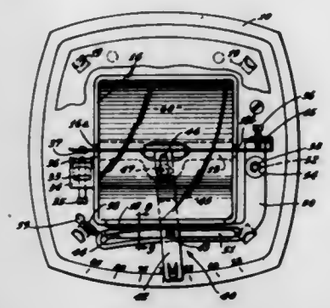
1. A snap action switch means having first, equilibrium and third positions comprising: a mounting means; a means mounted on said mounting means, said means including members extending therefrom; an actuator means having an extremity coupled to said mounting means, said actuator means slidably interfitting with said members and extending therebeyond; a contact carrying blade pivotably coupled to said members; energy storage means connected to said blade and to said actuator means and extending through the plane of said members, said actuator means slidably displaced along said members by a condition thereby causing pivotable displacement of said blade through said energy storage means with a snap action motion until the plane of said blade and the plane of said actuator substantially coincide thereby causing said blade to maintain an equilibrium position, thereafter said blade is displaced with said actuator until a predetermined displacement is attained by said actuator, thereafter said blade is snapped into said third position.

3,271,542
MAXIMUM SAFE SPEED INDICATING SWITCH WITH CONTACT SHAPED AS THE SPEED CURVE
Richard W. Hradek, Davenport, Iowa, assignor to The Bendix Corporation, Davenport, Iowa, a corporation of Delaware
Filed Mar. 2, 1964, Ser. No. 348,402
9 Claims. (Cl. 200—81.5)



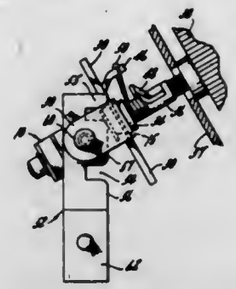
1. An instrument for activation at a predetermined maximum speed of its speed schedule comprising an instrument housing, static pressure responsive means mounted within said housing for producing movement with pressure variations incident to changes in ambient pressure, differential pressure responsive means mounted within said housing for producing movement with pressure variations incident to changes in total pressure and static pressure, a movable contact, first and second mechanical linkage couplings connecting said movable contact with said static pressure responsive means and said differential pressure responsive means respectively, a second contact disposed in the path of said movable contact for engagement therewith when a predetermined maximum speed of said speed schedule is reached, said second contact comprising electrical contact means having its electrical contact surface defining said speed schedule.

3,271,543
PRESSURE RESPONSIVE SWITCH WITH LIQUID CONTACT MEANS
Arnold Schonfeld, Levittown, and John C. Schulte, Maple Glen, Pa., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed July 17, 1964, Ser. No. 383,398
6 Claims. (Cl. 200—81.6)



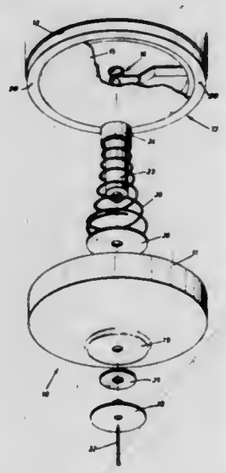
1. Apparatus comprising an open-ended capillary tube; at least two spaced electrical contacts within the bore of said capillary tube; a free segment of conductive liquid enclosed within the bore of said capillary tube and intermediate the ends thereof; means defining a first closed chamber communicating with one open-end of said capillary tube, said first chamber including a first diaphragm portion having an outer face thereof adapted to communicate with the ambient atmosphere; means defining a second closed chamber communicating with the other open-end of said capillary tube, said second closed chamber including a second diaphragm portion having an outer face; and means communicating with said second diaphragm outer face for monitoring gas pressure.

3,271,544
PRECISION ELECTRICAL FUSE
Randall C. Ragan, Tarzana, Calif., assignor to Electra Manufacturing Company, Independence, Kans., a corporation of Missouri
Filed Apr. 14, 1964, Ser. No. 359,569
5 Claims. (Cl. 200—135)



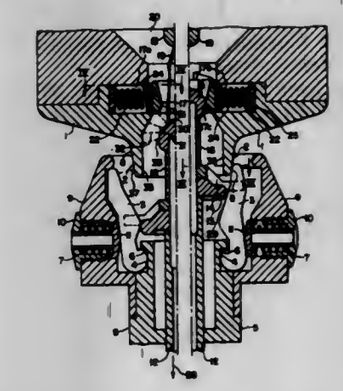
1. A precision electrical fuse for protecting an electric circuit, said fuse comprising the combination of an electrically insulating substrate which has a low thermal conductivity and is resistant to high temperatures, a pair of spaced apart electrically conductive fuse electrodes deposited on the surface of said substrate in intimate contact therewith, a composite metal-glass fuse element extending between said electrodes and including a thin layer of electrically conductive fuse metal selected from the group consisting of gold and platinum on the surface of said substrate, said metal layer extending between and electrically connecting said electrodes, said fuse metal being adapted to blow when the electrical current therethrough exceeds a predetermined level, and a layer of electrically insulating glass having a melting point below that of said substrate bonded to said substrate on opposite sides of said fuse metal and covering said fuse metal in intimate contact therewith for quenching and absorbing the fuse metal as it is blown whereby any arcs which tend to develop between the fuse electrodes are effectively suppressed, said substrate and said fuse element being adapted to maintain an electrical connection between said electrodes until the current through said metal layer increases sufficiently to vaporize the same.

3,271,545
RADIATION AND CONVECTION RESPONSIVE THERMOSTAT
Earle W. Ballentine, 27 Packet Road, Portuguese Bend, Calif.
Filed Jan. 23, 1964, Ser. No. 339,759
16 Claims. (Cl. 200—138)



1. A temperature-responsive control device comprising:
a flat element having a thermoradiation-emitting coating and being capable of changing its configuration when subjected to a variable flow of conductive heat transfer;
lever means for pivotally mounting said flat element, there being a curved slot in said lever means;
a pivotally mounted handle having a pin extending into said slot for guidance therein and for pivoting said lever means upon pivoting of said handle; and
optical means positioned to focus incoming radiation onto said flat element and the coating thereon.

3,271,546
PENDULUM ACTUATED TILT RESPONSIVE ELECTRIC SWITCH
Amos E. Chesnut, Columbus, Ind., assignor to Arvin Industries, Inc., Columbus, Ind., a corporation of Indiana
Filed Mar. 16, 1964, Ser. No. 352,226
9 Claims. (Cl. 200—138)

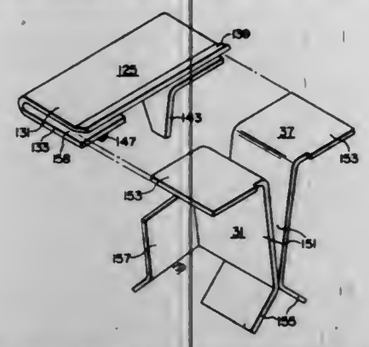


1. An electric switch, comprising a base, first and second blades fixedly mounted at one of their ends on said base and respectively having first and second contacts adjacent their opposite ends, a bimetallic blade mounted on said base and engageable with one of said first and second blades to vary the position of said contacts with respect to each other, a rigid generally L-shaped arm mounted on said base, a screw adjustably mounted on said arm and engageable with one of said first and second blades to vary the position of said contacts relative to each other, and a pendulum having a first portion of electrically insulating material swingably connected to said arm, and a weighted second portion, said pendulum being gravity actuated and said switch being mounted in an attitude wherein said pendulum will hang vertically with said first portion out of engagement with said first and second blades, said first portion being engageable with one of said first and second blades upon tipping of the switch in either direction in a plane generally parallel to the plane of said first portion to cause said first portion to move one of said first and second blades relative to the other to move said contacts into spaced relation to each other.

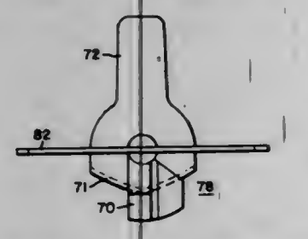
3,271,547
FIRE DETECTOR DEVICE
Peter L. Seeley, Don Mills, Ontario, Canada, assignor to Fire Devices Manufacturing Limited, Willowdale, Ontario, Canada
Filed June 14, 1965, Ser. No. 469,036
12 Claims. (Cl. 200—142)

1. A fire detector device comprising a head, circuit closing means thereon, a flexible diaphragm supported by said head movable towards said circuit closing means, a shell having an opening and held onto said head, a thin wall tubular member disposed in said opening and turned out at its lower end for a predetermined distance to define a heat collector plate, means securing said tubular member within said opening, means insulating said heat collector plate from the exterior of said shell, a releasable detent member mounted in said shell and adapted on release to move said diaphragm towards said circuit closing means and fusible means in heat conducting relationship sealing said tubular member and holding said detent in inoperative position.

3,271,548
CONTACT CONSTRUCTIONS FOR CIRCUIT INTERRUPTERS
Fritz Kesselring, Kusnacht, Zurich, Switzerland, assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Sept. 16, 1964, Ser. No. 396,905
Claims priority, application Germany, Oct. 11, 1963, S 87,834
8 Claims. (Cl. 200—148)



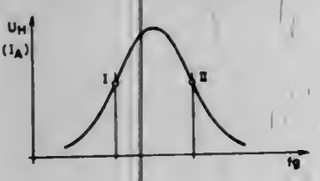
1. Separable contact structure for a circuit interrupter including means defining a conducting nozzle portion having an outlet portion and a tubular depending main contact portion on the upstream side thereof, a plurality of circumferentially-disposed pivotally-mounted contact fingers making main contacting engagement with the external portion of said depending contact portion, a movable arcing contact having a cam actuator for engaging the main contact fingers and effecting opening operation thereof, means providing a relatively stationary arcing contact structure within said nozzle portion, means separating the movable arcing contact from the stationary arcing contact following separation of the main contact fingers from the external sides of the depending main contact portion, whereby restriking of the extinguished arc will take place at a location remote from the main contacting area.



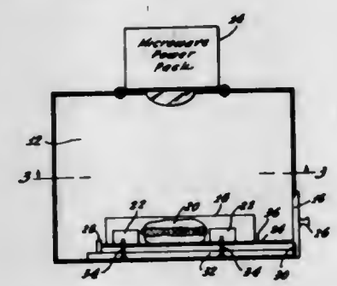
3,271,549
CIRCUIT BREAKER WITH IMPROVED TERMINAL MEANS
Francis L. Gelzheiser, Fairfield, Conn., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Dec. 30, 1963, Ser. No. 334,089
12 Claims. (Cl. 200—170)

1. In combination, two adjacent insulating compartments, a circuit-breaker mechanism supported in each of said compartments, each of said mechanisms comprising a stationary contact and a movable contact cooperable with the stationary contact to open and close an electric circuit, said mechanisms being independently operable, a separate externally accessible load terminal supported at one end of each of said compartments, a separate line terminal disposed at the other end of each of said compartments,

and a separate unitary spring member biasing said separate line terminals toward each other whereby when said separate line terminals are connected to a common conducting stab said separate unitary spring member provides contact pressure between each of said separate line terminals and the common conducting stab.

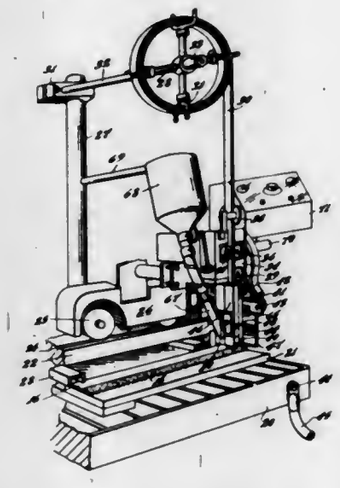


3,271,550
SWITCH DEVICE WITH UNITARY SUPPORT, PIVOT AND ACTUATING STRUCTURE
Roy O. Wiley, Huntington, Conn., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Filed June 25, 1964, Ser. No. 377,986
7 Claims. (Cl. 200—172)



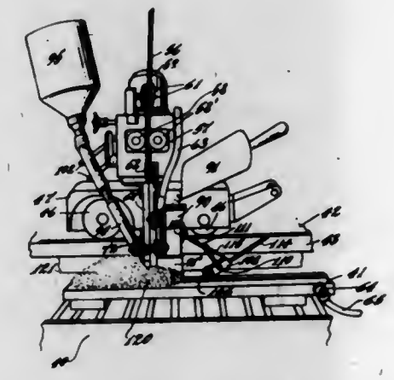
1. A switch device comprising an insulative housing in which circuit making and breaking means are disposed for operation, and an integral actuator unit formed from a single piece of flexible material and having a lever actuator with an actuating portion thereof disposed for operating said circuit making and breaking means, said actuator unit further having a support portion, pivot means integrally interconnecting said support portion with said lever actuator, and means securing said support portion to said housing so as substantially to fix the pivot support points of said lever actuator and thereby substantially eliminate pivot backlash noise.

3,271,551
METHOD FOR CRUCIBLE FREE ZONE MELTING
Wolfgang Keller, Pretzfeld, Germany, assignor to Siemens-Schuckertwerke Aktiengesellschaft, Berlin-Siemensstadt, Germany, a corporation of Germany
Filed Sept. 8, 1964, Ser. No. 394,834
Claims priority, application Germany, Sept. 6, 1963, S 87,138
1 Claim. (Cl. 219—10.41)



In a method of zone melting a semiconductor rod in which the rod is vertically supported at both ends and a molten zone is formed in the rod by a surrounding inductive heating coil connected in parallel with a capacitor and forming therewith a heating circuit having specific resonance curve characteristics, the heating circuit is energized by current from a high-frequency generator varying in accordance with a change in the diameter of the rod for actuating a regulating device to vary the axial spacing between the rod ends until the current assumes a datum value, and the zone is caused to move lengthwise of the rod, the improvement which comprises operating the high-frequency generator at a frequency in the capacitive leg of the resonant curve of the heating circuit for melting the rod at the zone while moving the zone upwardly along the rod, and operating the high-frequency generator at a frequency in the inductive leg of the resonant curve of the heating circuit for maintaining the zone as an incandescent solid while moving the zone downwardly along the rod.

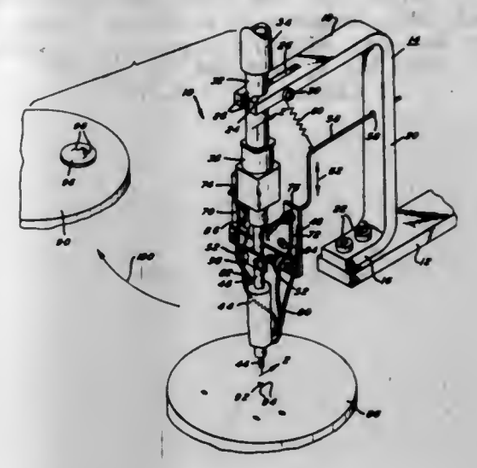
3,271,552
MICROWAVE HEATING APPARATUS
Edward Z. Krajewski, Belmont, Calif., assignor to Litton Precision Products, Inc., a corporation of Delaware
Filed Feb. 1, 1963, Ser. No. 255,639
5 Claims. (Cl. 219—10.55)



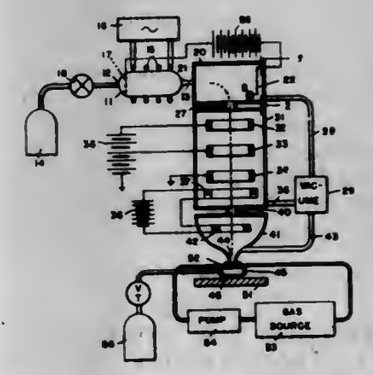
1. In a microwave heating apparatus, a conductively bounded chamber, a plurality of substantially quarter wave length conducting elements mounted in the wall of and extending into said chamber, and means for supporting food to be heated between said elements and spaced from said wall.

3,271,553
OVERLAY WELDING
Wallace C. Johnson, St. Davids, Pa., assignor to Arcos Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Filed June 24, 1965, Ser. No. 466,709
4 Claims. (Cl. 219—76)

1. A process of electric arc overlay welding on a base metal which has welded thereto at least one previous overlay weld bead extending along one surface of the base metal, which comprises laying down a layer of metallic particles approximately adjoining the edge of the previous weld bead and against the surface of the base metal, said layer of metallic particles being of uniform height, bringing the end of a strip electrode that is wider than it is thick into arcing proximity to the layer of metallic particles and to the edge of the previous weld bead, said strip electrode overhanging the edge of the previous weld bead and also the layer of metallic particles, maintaining an arc to a weld pool formed by melting the particles, the strip electrode, the edge of the previous weld bead, and the surface of the base metal, and advancing the strip electrode in the general direction of its thickness lengthwise of the layer of metallic particles and the adjoining weld bead.



3,271,554
OVERLAY WELDING
Wallace C. Johnson, St. Davids, Pa., assignor to Arcos Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Filed June 24, 1965, Ser. No. 466,726
22 Claims. (Cl. 219—76)

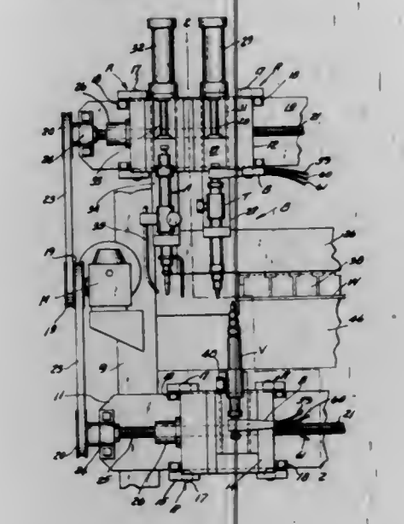


1. A process of overlay welding on a base metal which has welded thereto a previous overlay weld bead extending lengthwise along one surface of the base metal, which comprises laying down a consumable barrier strip adjoining the edge of the previous weld bead and against the surface of the base metal, said barrier strip being wider than it is thick and the thickness of the barrier strip extending transversely to the surface of the base metal, arcing from a strip electrode which is wider than it is thick and which overhangs the barrier strip and overhangs the edge of the previous weld bead, to a weld pool formed by melting all of the barrier strip, all of the strip electrode, the edge of the previous weld bead and the surface of the base metal, and advancing the strip electrode in the direction of its thickness lengthwise of the barrier strip and the adjoining edge of the previous weld bead.

3,271,555
HANDLING AND BONDING APPARATUS
Jack M. Hirshon, Doylestown, Pa., and Philip D. Warner, Melville, N.Y., assignors to International Resistance Company, Philadelphia, Pa.
Filed Mar. 29, 1965, Ser. No. 443,330
8 Claims. (Cl. 219—85)

1. An apparatus for positioning and bonding an electrical component to a supporting plate comprising an elongated, vertical tube, means at the upper end of said tube for connecting the tube to means for drawing air upwardly through said tube, a heater sleeve surrounding said tube and movable longitudinally along said tube, a heater surrounding and secured to said heater sleeve, means supporting the tube and the heater sleeve and adapted to move the tube and the heater sleeve in unison horizontally and vertically, and means independently supporting said heater sleeve on said first supporting means for longitudinal movement along said tube.

3,271,556
ATMOSPHERIC CHARGED PARTICLE BEAM WELDING
William J. Harris, Sunnyvale, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Filed Oct. 31, 1963, Ser. No. 320,399
8 Claims. (Cl. 219—121)

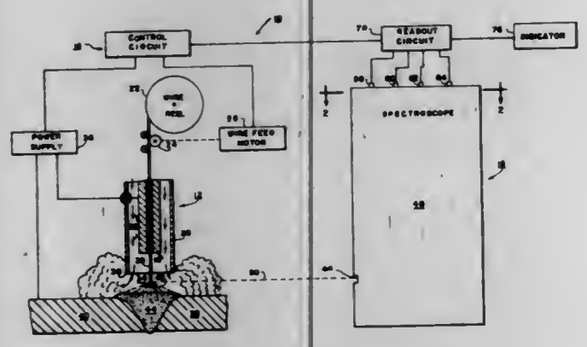


1. In a device for projecting a beam of high-energy positive charged particles including protons;
a plurality of interconnected partially evacuated chambers, said chambers including a first chamber having an input aperture for receiving an incoming flow of gas suitable for ionizing and means for ionizing said gas to produce a flow of plasma;
said partially evacuated chambers further including charged electrode means disposed in the path of said plasma to attract negative charged particles of said plasma thereto and means for extracting the positive charged particles from said plasma, said means including a magnet disposed on the outside portion of a second chamber such that its magnetic field is directed normal to the flow of plasma through the input aperture of said second chamber, said partially evacuated chambers further including means for accelerating the positive charged particles, means for forming said positive charged particles into a highly focused beam and an aperture providing an exit for discharging said beam of high energy particles from said device, said magnet's magnetic field deflecting the positive charged particles out of the flow of plasma and deflected toward said means for accelerating said positive charged particles.

3,271,557
OVER AND UNDER TIG ARC WELDING MACHINES

Robert O. Wight, Bay City, Mich., and Harvey Walsey, Poland, Ohio, assignors to Resistance Welder Corporation, Bay City, Mich., a corporation of Michigan

Filed Jan. 6, 1965, Ser. No. 423,757
1 Claim. (Cl. 219—125)



An over and under butt welding machine comprising: a main frame; a work table; vertically spaced top and bottom tracks mounted on said frame; an individual carriage slidably mounted on each track; roller units mounted on each corner of each carriage and having rolling engagement with the side wall and upper edge of the track; an electrode torch mounted on the upper carriage; brackets mounted on the main frame and spring pressure pads pivotally mounted on said brackets for yielding engagement with the "work"; a torch support on the lower carriage; a lower torch adjustably mounted on said support, in advance of the electrode torch, and means for traveling said carriages on said tracks.

3,271,558
SPECTRAL METHOD FOR MONITORING ATMOSPHERIC CONTAMINATION OF INERT-GAS WELDING SHIELDS

Billy K. Davis, Huntsville, Ala., assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration

Filed Feb. 19, 1965, Ser. No. 434,143
14 Claims. (Cl. 219—131)

1. The method of monitoring and controlling an arc welding system, comprising the steps of:

(a) positioning the welding means of said welding system above the work piece to be welded;

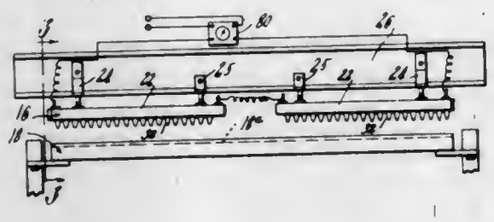
(b) applying an electrical potential between said welding means and said work piece for establishing a welding arc of such intensity that the foreign materials present within the welding zone are brought to a glowing state;

(c) spectroscopically analyzing said glowing materials as the welding process progresses for the presences of contaminating materials that would adversely affect the quality of the weld bead being formed; and

(d) applying the information derived from said spectroscopic analysis to the control circuit of said welding system for controlling the welding process so that a suitable weld bead is continuously formed.

3,271,559
METHOD OF ARC WELDING

Bernhard W. A. Weber, Scarsdale, N.Y., assignor, by mesne assignments, to Air Reduction Company Incorporated, New York, N.Y., a corporation of New York



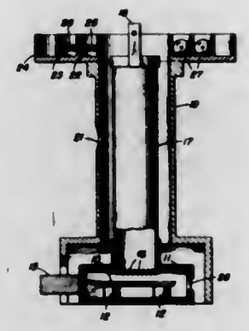
No Drawing. Filed May 9, 1961, Ser. No. 108,713
5 Claims. (Cl. 219—137)

1. The method of welding which comprises juxtaposing a conductive member on which metal is to be deposited and a steel electrode containing 0.01%–1% uranium; melting said electrode at the point of juxtaposition; depositing on said conductive member molten steel containing uranium; and permitting said molten steel containing uranium to coalesce on said conductive member.

3,271,560
DIE

Charles M. Schott, Jr., Gloucester, Mass., assignor, by mesne assignments, to The First National Bank of Boston

Filed Nov. 29, 1963, Ser. No. 326,755
6 Claims. (Cl. 219—243)



1. A die apparatus comprising first and second die members mounted to be moved together to form spaced-apart holes in plastic film, wherein the first of said die members comprises an elongated support surface terminating at an edge, for supporting the film, and the second die member comprises a thin, elongated, electric resistance means, the means shaped to define a multiplicity of spaced-apart columnar projections directed generally towards said other die member, said projections exposed to engage the film, every projection arranged in electrical series with a multiplicity of other ones, a support means engaging said shaped resistance means at a location spaced from the tips of said projections, reinforcing and positioning said tips in a predetermined free-standing with the face of plastic film arrangement, the opposite ends of said resistance means having electrical connections for passing electric current therethrough, and mounting means adapted to move said second member relative to the first to carry the tips of said projections, when heated, past, and close to the edge of said first member whereby, while said film is supported by said first member, said resistance-heated projections form a corresponding arrangement of holes in said plastic film.

3,271,561
APPARATUS FOR THERMALLY EVAPORATING VARIOUS MATERIALS IN VACUUMS FOR PRODUCING THIN FILMS

Wallace A. Fiedler, Englewood, and Gilbert H. Ross and Robert A. Estock, Denver, Colo., assignors to Martin-Marietta Corporation, Baltimore, Md., a corporation of Maryland

Filed Mar. 2, 1964, Ser. No. 348,594
6 Claims. (Cl. 219—271)

1. Apparatus for producing an isothermal vapor from a normally solid coating material comprising:

a hollow chamber formed of an electrically conductive material,

a first set of electrical terminals connected at spaced-apart portions of said chamber for evenly heating all sides of said chamber by the passage of electrical currents therethrough,

a container open at the top for supporting a vaporizable material at the approximate center of said chamber to be heated radiantly from the inner surfaces of said chamber,

an aperture in said chamber over said container, louvered baffle means in electrical contact with said container and covering said aperture to prevent the escape of solid particles therethrough but permitting the passage of vapors therethrough,

a hollow chimney-like extension of electrically conductive material communicating vertically with said aperture in said chamber defining a passage to conduct vaporized substances toward a surface to be coated,

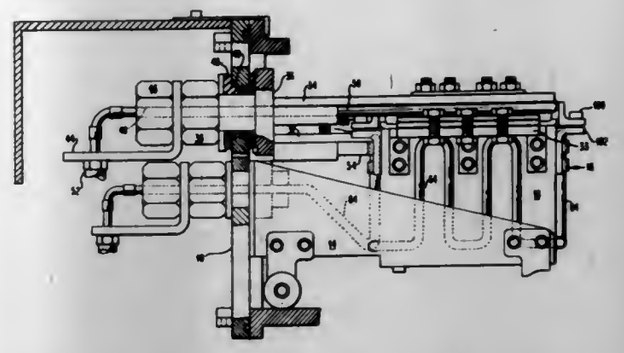
a second set of electrical terminals at opposite extremities of said chimney-like extension for evenly heating all of said extension to the temperature of said chamber by the passage of electrical currents therethrough,

whereby said chamber and said chimney-like extension approximate a perfect black body for the issuance of vaporized substances therefrom.

3,271,562
EVAPORANT SOURCE

Gilbert C. Roberts, Jr., Owego, N.Y., and Giorgio G. Via, Rockville, Md., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed June 30, 1964, Ser. No. 379,307
8 Claims. (Cl. 219—275)



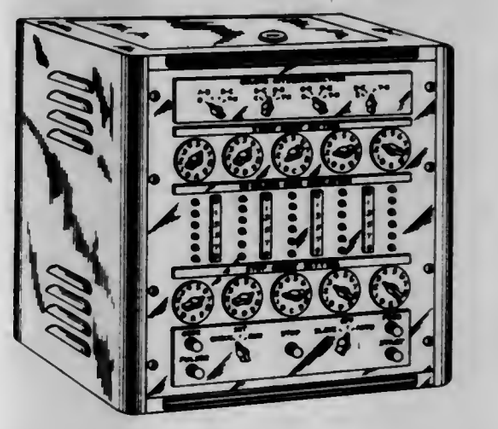
1. In a vacuum deposition apparatus, an evaporant source comprising

an evaporant charge vessel,

said vessel comprising a box structure and an evaporant charge heater mounted by said box structure,

said heater comprising a vertically finned structure of resistance metal formed to provide a plurality of vertically opening pockets,

and means on said heater and on said box structure for maintaining the pocketed configuration of said heater,



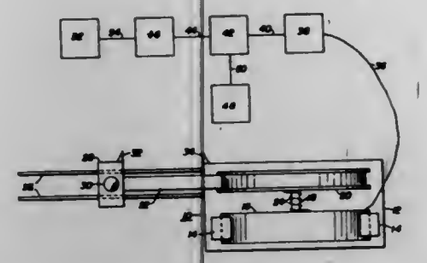
and baffle means disposed to intercept vapors emanating from said vessel.

3,271,563
SEQUENCE COUNTER

Clifford J. Maloney and Douglas H. Walker, Satellite Beach, Fla., assignors to the United States of America as represented by the Secretary of the Army

Filed June 26, 1963, Ser. No. 290,874
4 Claims. (Cl. 235—92)

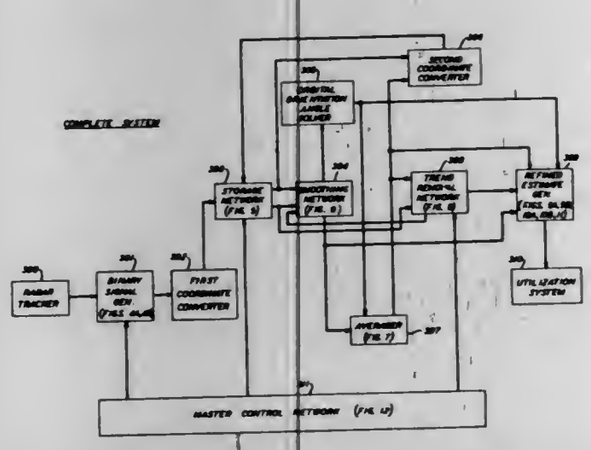
1. A sequence counter for supplying a sequence of identifying numbers to be impressed on a series of punch cards comprising a series of multiple pole stepping switches in number corresponding to the number of integers in the identifying number, start count switch means for each integer to determine the initial number in the sequential series of numbers, stop count switch means to determine the terminal number in the sequential series of numbers supplied, column interconnecting switch means to enable combining the integers into double and triple integer numbers, switch control means for enabling the counter to be interconnected with and operated with a card punching means, circuit means for interconnecting the several means recited.



3,271,564
DIGITAL MEASURING APPARATUS

Melvin A. Rosenfeld, Barrington, and Robert G. Moyer, Crystal Lake, Ill., assignors, by mesne assignments, to Union Oil Company of California, Los Angeles, Calif., a corporation of California

Filed June 18, 1962, Ser. No. 203,269
20 Claims. (Cl. 235—151.32)



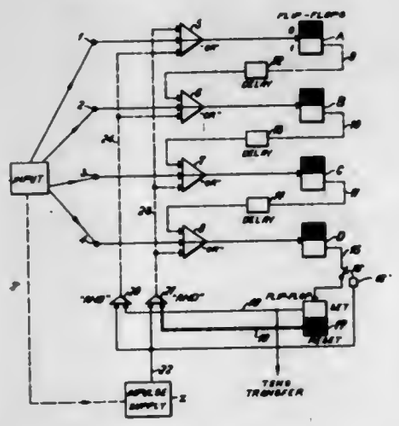
1. A measuring device comprising an elongated flexible member wound on a rotatably mounted carrier and adapted to be extended from said carrier, the extension

of said flexible member from said carrier causing said carrier to rotate, electrical signal-producing means responsive to movement of said flexible member and adapted to produce a plurality of electrical signals as binary

digital quantities, each of said signals being indicative of a discrete distance said flexible member is extended from said carrier, and indicating means electrically connected to said signal-producing means to indicate the output of same.

3,271,565
SYSTEM FOR DETERMINING THE ORBITAL PARAMETERS OF A TERRESTRIAL SATELLITE
Ralph B. Blackman, Cranford, N.J., assignor to Bell Telephone Laboratories, Inc., New York, N.Y., a corporation of New York
Filed Jan. 16, 1962, Ser. No. 166,612
13 Claims. (Cl. 235—152)

2. A system for rapidly determining from a large number of position measurements at different observation times the orbital parameters of a terrestrial satellite at a single predetermined reference time which comprises

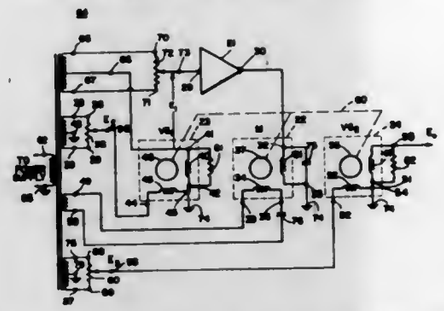


a source of a first plurality of chronological sequences of signals indicative of the observed positions of a terrestrial satellite at various instants of time during a first pass and a second plurality of chronological sequences of signals indicative of the observed positions of said satellite at various instants of time during a second pass,

means supplied with said first and second pluralities of sequences of observed position signals for obtaining first and second sets of orbital parameter signals closely approximating the orbital parameters of said satellite at first and second reference times during said first and second passes, respectively,

means responsive to said first and second pluralities of sequences of observed position signals and said first and second sets of orbital parameter signals for deriving first and second groups of variance and covariance signals respectively representing estimates of the sample-mean variances and sample-mean covariances associated with said first and second sets of orbital parameter signals, respectively, and

means for combining said first and second sets of orbital parameter signals and said first and second groups of variance and covariance signals to obtain a third set of orbital parameter signals and a third group of variance and covariance signals at said second reference time.



3,271,566
ADDING SYSTEM FOR BINARY CODED EXCESS THREE NUMBERS
Günter Martens, Schliersee, Upper Bavaria, Germany, assignor to Kienzle Apparate G.m.b.H., Villingen, Black Forest, Germany
Filed Sept. 18, 1962, Ser. No. 224,431
Claims priority, application Germany, Sept. 18, 1961, K 44,737
10 Claims. (Cl. 235—174)

2. An arrangement for parallel adding multi-digit binary coded numbers representing one-digit decimal numbers in terms of an excess-three code comprising, in combination, electronic storage means including a series of flip-flop stages respectively assigned to the binary digit positions of multi-digit numbers according to an excess-three binary code; a plurality of input means respectively associated with said flip-flop stages for applying sequentially in parallel to said flip-flop stages, respectively, electrical input pulses respectively representing binary digits of multi-digit binary numbers respectively representing the decimal numbers to be added, each of said input means comprising an "OR" circuit means having three inputs for receiving input, carry and correction impulses, respectively, and one output connected to the input of the respectively associated flip-flop stage; a plurality of binary carry transmitting means respectively arranged between each of said flip-flop stages and the respective input means of that of the flip-flop stages which is assigned to a binary digit position of respectively next higher significance for applying a transfer representing pulse thereto, and including delay means for delaying for a predetermined time period the carry transmission after such carry appears in the respective one of said flip-flop stages; correction means arranged between a selected flip-flop stage being assigned to the highest binary digit position and said plurality of input means and applying, when actuated to selected ones of said input means electrical correction impulses representing a first predetermined binary correction number when the algebraic sum of said one-digit decimal numbers is less than **10**, and a second predetermined binary correction number when the algebraic sum of said one-digit decimal numbers is at least **10** after two binary numbers have been introduced into said storage means by application of said input pulses; and actuating means for actuating said correction means after two binary numbers have been introduced into said storage means, said actuating

means including switch means for disconnecting said correction means from said selected flip-flop stage when said correction means are actuated.

3,271,567
CONTROL APPARATUS
Daniel J. Sikorra, Champlin, Minn., assignor to Honeywell Inc., a corporation of Delaware
Filed Oct. 11, 1962, Ser. No. 229,791
5 Claims. (Cl. 235—195)

1. A four quadrant analog multiplier-divider device comprising:

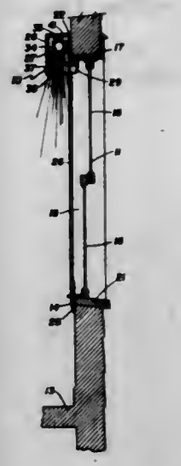
an amplifier, having input and output circuits, capable of amplifying an input signal and controlling an electric motor, the input circuit being electrically connected to receive an input E.M.F.;

an electric motor having a main field winding and a control winding, the control winding being connected in electrical circuit to receive control power from the output circuit of said amplifier, the main field winding being connected in electrical circuit to receive fixed phase excitation;

a first tachometer, having an excitation winding and an output winding, mechanically connected to said electric motor so as to rotate at the same speed, the output winding of said first tachometer being connected in electrical circuit to the input circuit of said amplifier so as to provide a negative feedback signal, the excitation winding of said first tachometer being connected in electrical circuit with a first variable control signal; and

a second tachometer, having an excitation winding and an output winding, mechanically connected to said electric motor so as to rotate at the same speed, the excitation winding of said second tachometer being connected in electrical circuit to receive a second variable control signal.

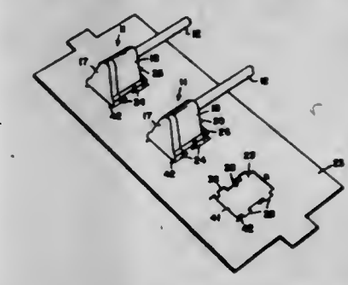
3,271,568
MURAL APPARATUS
George W. Lundberg, Browning Pond Road, Spencer, Mass.
Filed Aug. 29, 1963, Ser. No. 305,467
1 Claim. (Cl. 240—10)



Mural apparatus for use with a window, comprising

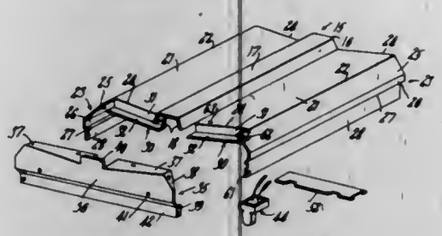
(a) a sheet of flexible translucent material adapted to be mounted over the window and to extend substantially over its entire area, the sheet carrying a picture on its surface,

(b) an elongated fluorescent lamp extending along the upper edge of the window,



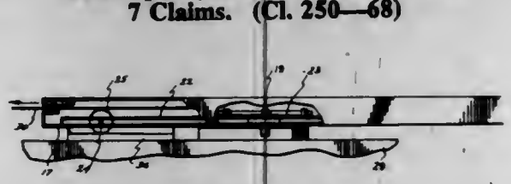
(c) an enclosure for the lamp mounted along the said upper edge of the window and serving to direct the light downwardly in the direction of the surface of the sheet while serving to prevent substantial passage of light in other directions, the enclosure being of an elongated box-like form with a front wall extending parallel to the surface of the sheet and extending above and below the level of the light source by substantial distances, the enclosure being open in a downward direction,

(d) a spring-loaded roller mounted along the said upper edge of the window on which the sheet is mounted, and



(e) a hook located at the bottom edge of the window and an eye located at the bottom edge of the sheet to hold the sheet tightly across the window.

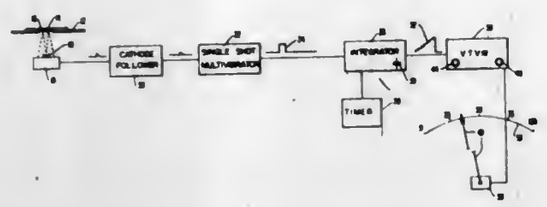
3,271,569
FLUORESCENT LAMPHOLDER
Richard Eisenhardt, Cheltenham, Pa., assignor to H. H. Fluorescent Parts, Inc., Cheltenham, Pa., a corporation of Pennsylvania
Filed May 4, 1964, Ser. No. 364,394
5 Claims. (Cl. 240—51.11)



1. A fluorescent lampholder comprising a housing made of insulating material and having a base portion and an upright portion, the upright portion having front, rear and side walls forming a recess with an opening in the front wall providing access thereto for a lamp base, said side walls being tapered inwardly from bottom to head for easy insertion of said upright portion head first into a closed slot of a socket plate, a pair of spaced apart support shoulders projecting from each of the side walls, said base portion of the housing having a ledge extending outwardly from each side wall of the upright portion and said support shoulders being spaced away from said ledges to form a pair of support slots on each side of said housing which are adapted to receive and hold side edges of a closed slot of a socket plate, said support shoulders having a bottom surface parallel to the top surface of said ledges so that, after the lampholder is mounted in the socket plate, said support shoulders and ledges prevent movement of the lampholder through the socket-plate slot in the direction perpendicular to the plane of the socket plate, whereby the lampholder may be inserted head first into a closed slot of a socket plate and the support shoulders passed through shoulder openings therein, and then the lampholder may be moved rearwardly so that its support slots receive and hold the side edges of the closed slot of the socket plate, with the porch of the lampholder covering the portion of said closed slot which is forward of the lampholder upright portion, thereby preventing an unsightly gap.

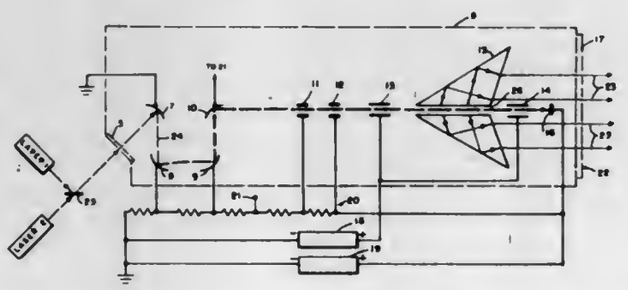
3,271,570
LIGHT FIXTURE ASSEMBLY
Michael Henry Kruger, Chestnut Hill, Mass., assignor to Smithcraft Corporation, Chelsea, Mass., a corporation of Massachusetts
Filed Nov. 29, 1963, Ser. No. 326,987
8 Claims. (Cl. 240—51.11)

1. A lighting fixture assembly adapted to suspend elongated fluorescent lamps in lamp holders having socket-bearing portions, comprising a main fixture with secondary lamp-holder locating and supporting channels extending along the opposite ends of said housing transverse to the direction of extension of said lamps, each said channel having a pair of transversely extending opposing walls, and primary lamp holder locating and supporting elongated spacer strips sized to slide transversely into said channels, said spacer strips being removably located and supported by said channels between said walls and having openings for receiving and in turn locating and supporting said lamp holders.



3,271,571
X-RAY FILM CASSETTE WITH FILM FEEDING MEANS
Stanley J. Klem, Jr., and Heinz F. Nitka, Binghamton, N.Y., assignors to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware
Filed Apr. 8, 1963, Ser. No. 271,166
7 Claims. (Cl. 250—68)

1. A cassette for photographic film, comprising a shallow tray structure accommodating a sheet of film, a cover hinged thereto which when closed, exerts pressure on said film and forms a light-tight enclosure, latching means for locking said cover upon closure and means, supported by said cassette, frictionally engaging said film to advance the same partially out of said cassette upon release of said latching means.

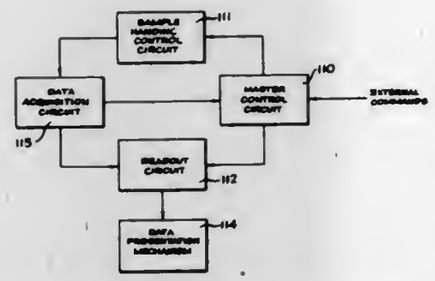


3,271,572
DIRECT READING BETA RAY COMPARATOR
Sidney U. Lieber, Bayside, and Jerome Leiner, Brooklyn, N.Y., assignors to Unit Process Assemblies, Inc., Woodside, N.Y., a corporation of New York
Filed Aug. 24, 1962, Ser. No. 219,322
6 Claims. (Cl. 250—83.3)

1. In a beta backscatter instrument for measuring the thickness of thin coatings on a basal substrate wherein a beta ray detector element emits discrete pulses each representative of randomly received backscattered radiation, means for converting said emitted pulses into a potential whose magnitude is proportional to the summation of the number thereof, indicating means including a removably mountable dial plate member selectively scaled in accordance with the backscatter count characteristics of the composite coating and basal substrate materials being subjected to measurement and a member arcuately displaceable relative thereto in accordance with the magnitude of said potential and means for varying the response band of said arcuately displaceable member to permit selective prealignment of the threshold response characteristic and a predetermined operational response characteristic there-

of relative to said selectively scaled dial independent of said potential for providing direct visual indicia of the magnitude of said potential within a predetermined range of values thereof.

3,271,573
GENERATION OF COHERENT MILLIMETER AND SUB-MILLIMETER WAVELENGTH RADIATION
Emerson L. Frost, Manasquan, N.J., assignor to the United States of America as represented by the Secretary of the Army
Filed Sept. 17, 1963, Ser. No. 309,582
12 Claims. (Cl. 250—84)



1. A generator of electromagnetic energy at frequencies intermediate the microwave and infra-red regions of the spectrum comprising, an electron beam tube, said tube including a photoemissive cathode, means to simultaneously illuminate said cathode with a plurality of coherent light beams, the frequency of said light beams being separated in steps of the desired output frequency, means to multiply the current of the bunched electron beam emitted by said cathode, means to pass said electron beam through a Cerenkov radiator, means to accelerate said electron beam to a velocity greater than the phase velocity of light in said Cerenkov radiator, said Cerenkov radiator being shaped to unidirectionally collimate the radiation generated therein.

3,271,574
DATA HANDLING AND CONTROL CIRCUIT FOR LIQUID SCINTILLATION SPECTROMETERS
John W. Dawson, Clarendon Hills, and Michael J. Long, Chicago, Ill., assignors to Vanguard Instrument Corporation, Berwyn, Ill., a corporation of Illinois
Filed Apr. 16, 1963, Ser. No. 273,499
2 Claims. (Cl. 250—106)

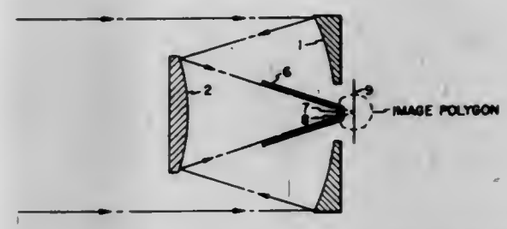
1. A data handling and control circuit for apparatus for automatically measuring the radioactivity of a series of samples including a sample detection chamber wherein radioactive samples are successively positioned by suitable sample handling devices and wherein detecting operations are effected by means for detecting radioactive decay events which take place in and characterize the samples and for producing output signals corresponding

to said decay events; which control circuit comprises a synchronizing circuit including circuit means conditioned by external commands for producing output signals in a preestablished sequence; a motor control circuit connected electrically to said synchronizing circuit for selectively and sequentially actuating the sample handling devices in response to output signals from said synchronizing circuit so that samples are successively introduced to the detection chamber, maintained therein during a detecting operation and removed therefrom upon the termination of a detecting operation; said synchronizing circuit supplying an output signal to said detecting means to initiate the detection of radioactive decay events thereby in response to the positioning of a sample in the detection chamber; data storage circuitry electrically connected to the output of said detecting means for storing the output signals produced thereby; first circuit means electrically connected to said data storage circuitry for establishing a normal duration for detecting operations to be performed, said first circuit means including means responsive to the termination of a complete detecting operation for producing an output signal corresponding thereto,

said responsive means being electrically connected to said synchronizing circuit so that said output signal is supplied thereto; a second circuit means electrically connected to said synchronizing circuit and said data storage circuitry, said output signal from said responsive means causing an output signal to be produced by said synchronizing circuit that is supplied to said second circuit means to effect the readout of stored information upon the termination of a complete detecting operation; and a reject circuit electrically connected between said data storage circuit and said synchronizing circuit, said reject circuit including timing means and responding to signals from said data storage circuit to produce an output signal when the signals from said data storage at a predetermined elapsed time correspond to the detection of less than a predetermined number of events, said output signal being supplied to said synchronizing circuit, said synchronizing circuit thereupon effecting the premature termination of the detecting operation.

3,271,575
CATOPTRIC RADIOMETRIC DETECTOR
Gerald Falbel, Stamford, Conn., assignor to Barnes Engineering Company, Stamford, Conn., a corporation of Delaware
Filed Dec. 4, 1961, Ser. No. 156,817
2 Claims. (Cl. 250—216)

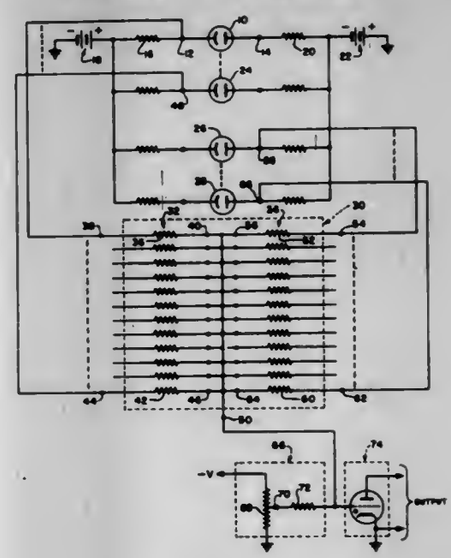
1. An instrument for detecting optical radiation from targets comprising in combination and in optical alignment,



(a) optical imaging means positioned to produce a real image of the targets substantially in the focal plane of the imaging means,

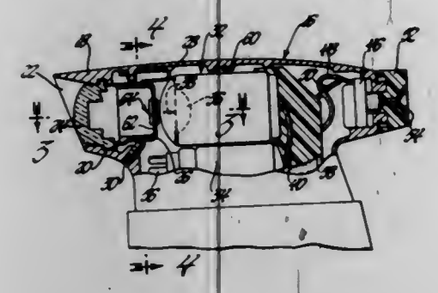
(b) a truncated cone in the optical path between the optical imaging means and the focal plane, the inner surface of said cone being reflective at the wavelength of the radiation to be detected,

(c) a radiation detecting element mounted at the truncated end of the cone,



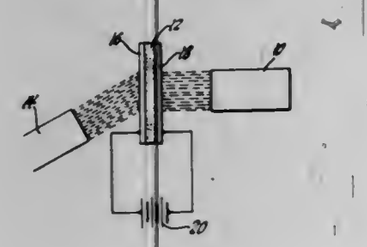
(d) the cone angle and cone location being such that the cone apex, if the cone had not been truncated, would be located in the focal plane, and

(e) the truncation being chosen so that the diameter of a circle circumscribed about an image polygon centered at the point in the focal plane where the



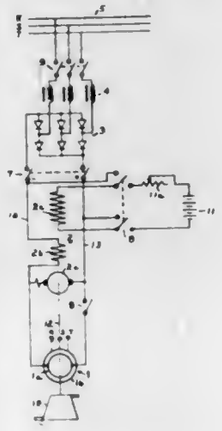
cone apex would have been located if the cone had not been truncated, the sides of the image polygon being equal to the width of the cone truncation, the diameter of said circumscribed circle being large as compared to the length of a polygon side but not more than about fifteen times as large, the diameter of said circumscribed circle, therefore, constituting the field stop for the optical system.

3,271,576
PHOTOELECTRIC MATRIX NETWORK
Frank T. Turner, Hampton Bays, N.Y., assignor to The Western Union Telegraph Company, New York, N.Y.
Filed Jan. 29, 1963, Ser. No. 254,785
3 Claims. (Cl. 250—206)



1. A network comprising a plurality of light sensitive means each having an impedance which varies substantially linearly with changes in light intensities arranged to form a matrix each having a first terminal and a second terminal, a source of positive potential coupled to the first terminal of each light sensitive means, a source of negative potential coupled to the second terminal of each light sensitive means, a first impedance interposed between said source of positive potential and the first terminal of each light sensitive means, a second impedance interposed between said source of negative potential and the second terminal of each light sensitive means, a first group of resistors coupled to predetermined first terminals, a second group of resistors coupled to predetermined second terminals, output means fed by said first and second groups of resistors, and bias means coupled to said output means.

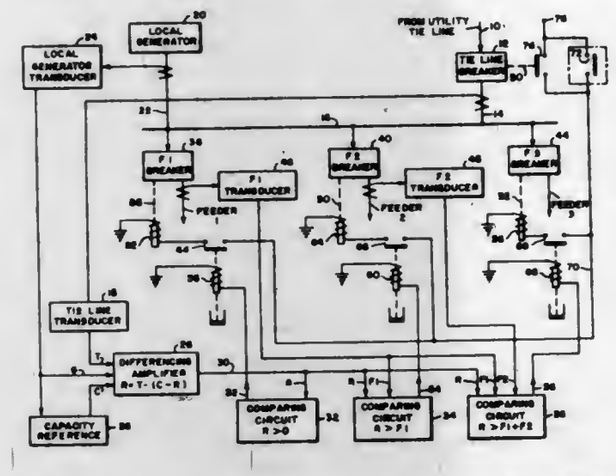
3,271,577
LIGHT COLLECTOR FOR PHOTOSENSITIVE ELEMENTS
Charles W. Miller, Anderson, and William E. Griner, Pendletop, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed June 20, 1963, Ser. No. 289,246
4 Claims. (Cl. 250—239)



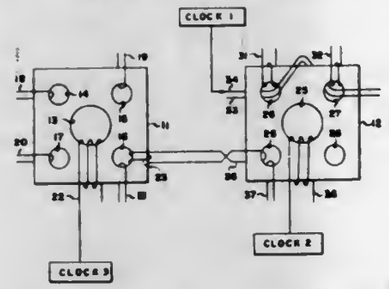
1. A light-gathering device for a photosensitive element mounted in a vehicle, said device comprising a housing enclosing said photosensitive element and having an opening therein, a light-condensing lens in said opening, a shield supported in said housing between said lens and said photosensitive element and having an irregular-shaped aperture therein located at the focal plane of said lens, said aperture limiting the light falling on said photosensitive element to that approaching said opening from within predetermined vertical and horizontal angles, a filter element mounted in said shield to reduce the amount of light falling on said photosensitive element which approaches said opening from a horizontal angle of greater than one degree to the right of the centerline of the vehicle.

3,271,578
RADIATION MODULATOR
Robert R. Bockemuehl, Bloomfield Hills, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Feb. 14, 1963, Ser. No. 258,465
7 Claims. (Cl. 250—213)

1. Apparatus for modulating electromagnetic energy including: a semiconductor element having an absorption edge wavelength, the element being thin along at least one dimension to be relatively transparent to energy directed along said one dimension and which energy is of a wavelength longer than the absorption edge wavelength; a first source of electromagnetic energy having a predetermined wavelength longer than the absorption edge wavelength and disposed to direct radiation onto the semiconductor element substantially along the one dimension; biasing means to produce a depletion layer in the semiconductor element transverse to the direction of the output from the first source and having therein a high space charge density thereby to effectively shift the absorption edge wavelength to a wavelength longer than said predetermined wavelength; and a second source of electromagnetic energy of a wavelength substantially longer than said predetermined wavelength and positioned to direct the output thereof into the depletion layer thereby to shift the effective absorption edge wavelength toward a wavelength shorter than the predetermined wavelength.



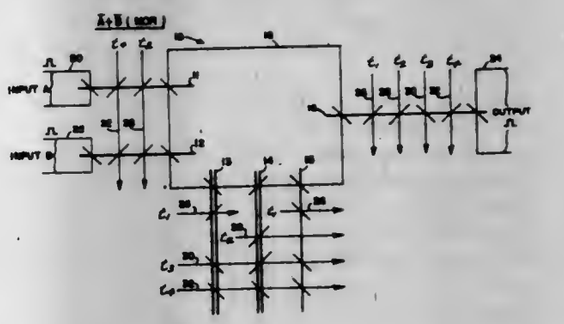
3,271,579
STARTING A GAS TURBINE BY USING AN EXCITER DYNAMO AS THE STARTING MOTOR
Oskar Erismann, Baden, Switzerland, assignor to Aktiengeselischaft Brown, Boveri & Cie, Baden, Switzerland, a joint-stock company
Filed Oct. 8, 1963, Ser. No. 314,801
Claims priority, application Switzerland, Nov. 14, 1962, 13,332/62
5 Claims. (Cl. 290—32)



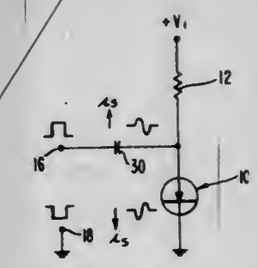
1. An arrangement for starting up a power group comprising a prime mover such as a gas turbine coupled to a synchronous generator for driving the rotor element thereof and an exciter generator for supplying field current to the rotor of said synchronous generator, the rotor of said exciter generator being also coupled to said gas turbine, the improvement wherein a rectifier system is supplied from an alternating current source, there being a variable impedance choke in the circuit connections between said rectifier system and its alternating current supply source and wherein for starting purposes the direct current output from said rectifier system is supplied to the rotor of said exciter generator in series with an auxiliary field winding thereof whereby to cause it to operate temporarily as a series motor, there being a switch provided between the rotor of said exciter generator and the rotor of said synchronous machine for disconnection during the start-up and a second switch between the direct current output side of said rectifier system and the rotor of said exciter generator which is closed only during the start-up.

3,271,580
LOAD SHEDDING APPARATUS
Jack R. Pope, Murrysville, Pa., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Aug. 15, 1963, Ser. No. 302,414
6 Claims. (Cl. 307—29)

1. In load shedding apparatus for use in a local system receiving energy from a plurality of generating sources and operative to drop circuits from the local system in case of interruption of at least one of the generating sources, the combination of: transducer means for providing supply signals indicative of the power being supplied to the local system; reference means for providing reference signals indicative of the local power supplying capacity; differencing means for receiving said supply and reference signals and providing shedding signals indicative of the amount of load required to be shed in case of interruption of at least one of the generating sources; means for providing load signals indicative of the load being carried by each of a plurality of circuits designated preferentially in the order to be shed in case of interruption of at least one of the generating sources; comparison means to compare said shedding signals with one of said load signals plus the sum of the circuit signals from circuit means of higher preference to be shed in case of interruption of at least one of the generating sources and being operative to provide preset signals; preset means to provide an indication of which circuits are to be shed in case of interruption of at least one of the generating sources in response to said preset signals; and interruption means to drop the indicated circuits from the local system when interruption of at least one of the generating sources occurs.



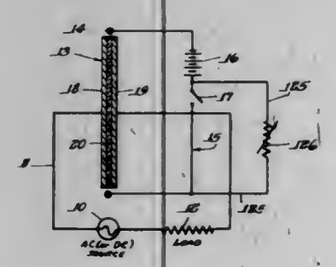
3,271,581
MAGNETIC NOR DEVICE
Paul T. Harper, Los Altos, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Filed May 15, 1961, Ser. No. 110,058
3 Claims. (Cl. 307—88)



1. A device comprising a first magnetic element having a first minor aperture, a second minor aperture and a major aperture, a second magnetic element having a first minor aperture, a second minor aperture and a major aperture, first, second, and third clock devices for continuously providing first, second and third current pulses at consecutive periods of time, respectively, from said first, second and third clock devices, means for coupling said first pulses from said first device with said second minor aperture of said second element, means for coupling said second pulses from said second device with said major aperture of said second element, means for coupling said third pulses from said third device with said major aperture of said first element, biasing winding means for coupling a direct current source with said second minor aperture of said first element, biasing winding means for coupling a direct current source with said second minor aperture of said second element, means for coupling said second minor aperture of said first element with said first minor aperture of said second element, input means coupling said first minor aperture of said first element for receiving a current pulse and output means coupling said second minor aperture of said second element for providing an output current pulse.

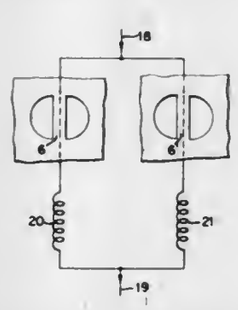
3,271,582
MAGNETIC CORE LOGIC CIRCUITS
Saul B. Yochelson, Northridge, Calif., assignor to Goodyear Aircraft Corporation, Akron, Ohio, a corporation of Delaware
Filed Apr. 10, 1962, Ser. No. 186,527
8 Claims. (Cl. 307—88)

4. A magnetic core circuit capable of performing the logical $\overline{A}+B$ function comprising
an input A and an input B coupling magnetic cores having two stable magnetic states,
said input cores having substantially the same physical dimensions,
an output coupling magnetic core having two stable magnetic states,
first, second and third load cores each having two stable magnetic states,
said second load core being substantially twice the physical size of the input A coupling core,
conductor means connecting the individual cores to each other in a loop,
the polarity of the conductor means windings on the cores being such that the circuit performs the logical $\overline{A}+B$ function, and
means coupled to all the cores to selectively hold and reset the flux patterns of the cores in a four phase time cycle to control the directivity of information flow.



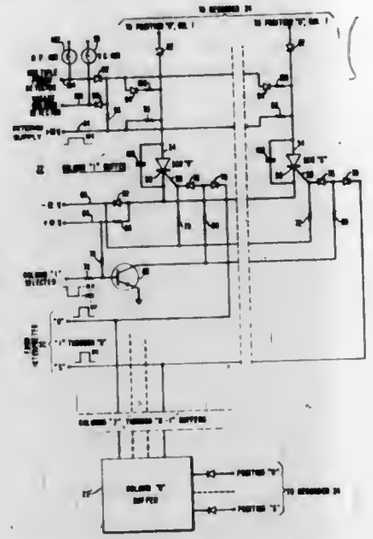
3,271,583
COMPLEMENTING FLIP-FLOP
Robert H. Okada, Hillsborough, Calif., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Filed Dec. 1, 1961, Ser. No. 156,290
1 Claim. (Cl. 307—88.5)

A complementing flip-flop comprising
(a) a tunnel diode comprising an anode and a cathode element,



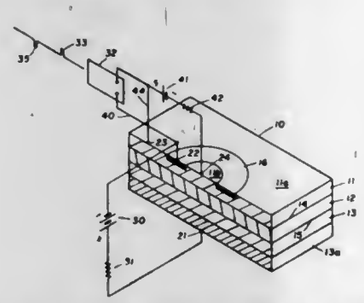
(b) a resistor in series with one of said elements of said tunnel diode,
(c) a bias voltage source and a reference voltage point,
(d) said resistor and tunnel diode being connected between said bias voltage source and said reference voltage point such that the tunnel diode is forwardly biased,
(e) said resistor being of impedance load value such that the tunnel diode may be operated at a first high current and a second low current stable state,
(f) inductor means comprising the lead and tunnel diode natural inductance alone,
(g) a source of input pulses of predetermined magnitude and duration,
(h) means to couple said input pulses to the junction between said resistor and said tunnel diode, said last-named coupling means comprising a differentiating capacitor of value such that bidirectional pulse doublets occur at the junction between the resistor and the tunnel diode,
(i) said source pulses being of magnitude and duration to provide said differentiated bidirectional pulse doublets at said junction of magnitude of excursions and duration and said inductor means and said resistor being selected of inductance and resistance value such as to provide a time constant which is large compared to the duration of one of said pulse doublets such that one of said pulse doublets appearing at said junction causes switching of said tunnel diode from the stable state at which it is then operating until the occurrence of said one of said doublets to the other said stable state and such that said tunnel diode is caused to remain in said other stable state until another pulse doublet is coupled to said junction and such that said another pulse doublet appearing at said junction causes switching back to and remaining in said then operating stable state until still another pulse doublet is coupled to said junction,
(j) the parameters of said tunnel diode resistor and inductance being such that said complementing flip-flop is responsive to pulse doublets wherein selectively and at random a positive excursion or a negative excursion may be the first excursion of each pulse doublet of succeeding pulse doublets.

3,271,584
RESISTANCE SWITCHES AND THE LIKE
Stanford R. Ovshinsky, Detroit, Mich., assignor, by mesne assignments, to Energy Conversion Devices, Inc., Troy, Mich., a corporation of Delaware
Filed May 28, 1962, Ser. No. 198,348
The portion of the term of the patent subsequent to Aug. 17, 1982, has been disclaimed
11 Claims. (Cl. 307—88.5)



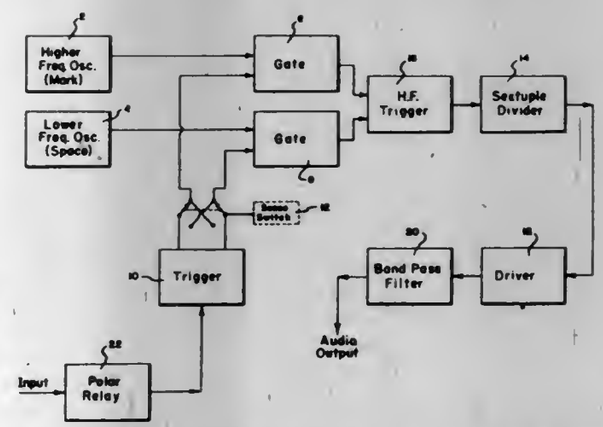
2. A relay switch device for an electrical load circuit, comprising spaced apart metallic electrodes, a solid state composition containing a mixture of at least one lithium compound and a self supporting solid diluent having a melting point higher than said at least one lithium compound and being interposed between and in electrical contact with the electrodes, means connected to said electrodes for connecting said solid state composition in series with the electrical load circuit for controlling the current flow therethrough in accordance with the resistance value of said composition, said solid state composition being in a condition of high resistance to "open" the electrical load circuit when said at least one lithium compound is in a solid condition and being in a condition of low resistance sufficient to "close" the electrical load circuit when said at least one lithium compound is in a molten condition, said self-supporting solid diluent of said composition serving to maintain said at least one molten lithium compound in place at all times in said solid state composition, and means including an electrical control circuit for changing the temperature of said solid state composition to transform it from its said one condition of high electrical resistance to its said other condition of low electrical resistance for selectively "switching" the electrical load circuit from "opened" to "closed" circuit conditions.

3,271,585
SUPERCONDUCTIVE DEVICES
James W. Crowe, Red Hook, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Application Oct. 26, 1959, Ser. No. 848,870, now Patent No. 3,100,267, dated Aug. 6, 1963, which is a continuation of application Ser. No. 680,456, Aug. 27, 1957. Divided and this application Dec. 3, 1962, Ser. No. 250,972
2 Claims. (Cl. 307—88.5)



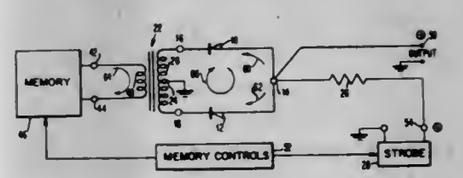
1. A superconductor circuit comprising:
first and second superconductor paths extending in a parallel circuit relationship between first and second terminals;
first and second current supply leads respectively connected to said first and second terminals supplying current to said superconductor paths;
first means for introducing resistance into at least a portion of said first path for a time sufficient to cause the current from said supply leads to flow in said second path and thereafter allow said first path to become superconductive;
said current flowing in said second path being ineffective to introduce resistance into said first path and said first and second paths remaining entirely superconductive with said current flowing in said second path.
second means for thereafter introducing resistance into at least a portion of said second path for a time sufficient to cause the current flowing in said second path to be switched to said first path and thereafter allow said portion of said second path to become superconductive;
said current then flowing in said first path being ineffective to introduce resistance into said second path and said first and second paths remaining entirely superconductive with said current flowing in said first path.

3,271,586
CHARACTER RECOGNITION CONVERTER
Virgil A. Hinds, Farmers Branch, Tex., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Sept. 7, 1962, Ser. No. 221,991
8 Claims. (Cl. 307—88.5)



1. A column buffer storage means comprising a plurality of parallel connected silicon controlled rectifiers, means for supplying an interim supply voltage to the anodes of all of said rectifiers, means to apply biasing potentials to the gates and to the cathodes of said rectifiers wherein said cathodes are more positive with respect to the gate potentials but negative with respect to the interim supply voltage on the anodes, a first circuit and a second circuit coupled to the gate of each of said rectifiers and in parallel with said biasing potentials, means included in said first circuit establishing a current path through said rectifier to turn it on when said second circuit is at a first predetermined potential and diverting and maintaining the current path through said second circuit when said second circuit is at a second predetermined potential.

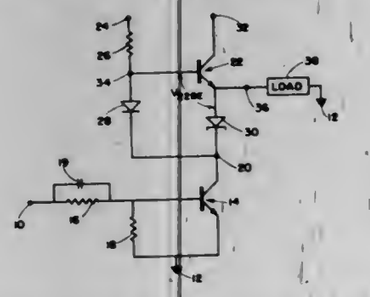
3,271,587
FOUR-TERMINAL SEMICONDUCTOR SWITCH CIRCUIT
Max P. Schreiner, Richardson, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware
Filed Nov. 13, 1962, Ser. No. 236,842
12 Claims. (Cl. 307—88.5)



1. A semiconductor switching circuit which comprises:
(a) a four-layer negative resistance device having an anode, cathode and multiple base control terminals, and normally capable of being turned off only by a control pulse of magnitude substantially exceeding the magnitude of a turn-on pulse,
(b) a current source and a load connected in series with the anode and cathode terminals of said device,
(c) means connected between said cathode and one of said base control terminals to apply a bias function to modify the switching character of said device, and
(d) means to apply turn-on and turn-off pulses to at least one of said base control terminals, the relative magnitudes of which are dependent upon the magnitude and polarity of said bias function.

3,271,588
DIGITAL KEYER FOR CONVERTING D.C. BINARY SIGNALS INTO TWO DIFFERENT OUTPUT AUDIO FREQUENCIES
Anatole Minc, Upper Brookville, N.Y., assignor to Tele-Signal Corporation, Hicksville, N.Y., a corporation of New York
Filed Aug. 7, 1963, Ser. No. 300,604
4 Claims. (Cl. 307—88.5)

3. Apparatus for the generation of successive pulses of electric oscillations of two frequencies comprising two independent oscillators producing output signals of unlike frequencies, a plurality of cascaded counters, two gate circuits each coupling one of said output signals to the input of said plurality of counters, and means responsive to two-level input signals to control said gates in opposite phases with one of said gates being opened for one level of said input signals and the other of said gates being opened for the other level of said input signals.



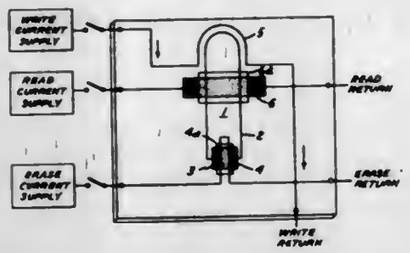
3,271,589
STROBED SENSE AMPLIFIER
Duane W. Baxter, Putnam Valley, Bruce C. Felton, Saugerties, Anton Werner, Greenville, and James R. Winnard, Marbletown, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 9, 1963, Ser. No. 328,823
9 Claims. (Cl. 307—88.5)

1. An electrical signal sensing apparatus comprising,
an electrical current signal source,
a strobe electrical current source,
control means connected to actuate said sources concurrently,
and gating means responsive to concurrent outputs from said sources, said gating means comprising
a pair of tunnel diodes connected in parallel across said strobe source for being forward biased by the output thereof,

the parallel connection of said diodes comprising a circuit loop including said diodes in opposite polarity orientation with respect to each other in said loop,
means adapted to introduce a circulating current component in said circuit loop corresponding to said output of said signal source,
and output means connected to be sensitive to the impedance state of said diodes.

3,271,590
INVERTER CIRCUIT
John C. Sturman, 4336 Granais, Fairview Park 26, Ohio
Filed May 14, 1963, Ser. No. 280,472
2 Claims. (Cl. 307—88.5)

1. A transistor logic inverter circuit consisting of a first stage, said first stage including a first transistor having a collector, a base, and an emitter, said emitter being connected to ground, a first resistor serially connected to said base between an input signal and said base, a capacitor connected parallel to said first resistor, and a second resistor interconnected between ground and said base of said first transistor, and a second stage, said second stage including a second transistor having a collector, a base, and an emitter, a backward diode for connecting the emitter of said second transistor to the collector of said first transistor, a first voltage source impressed on said collector of said second transistor, a second voltage source impressed on base of said second transistor through a first junction, said second voltage source having potential greater than that of said first voltage source, a third resistor interconnected between said second voltage source and said first junction, and a diode interconnected between said first junction and said first transistor collector through a second junction connected to said first transistor collector and said backward diode, the resistance of said backward diode being negligible in the backward direction from the emitter of said second transistor to said second junction whereby the capacitance of a load connected to said second transistor emitter is discharged upon actuation of said first stage, the voltage drop across said backward diode in the opposite direction being quite high so that the resistance in the reverse direction across said diode in series with said backward diode is greater than the base emitter voltage of said second transistor to provide an effective open circuit upon actuation of said second stage.



3,271,591
SYMMETRICAL CURRENT CONTROLLING DEVICE
Stanford R. Ovshinsky, Birmingham, Mich., assignor, by mesne assignments, to Energy Conversion Devices, Inc., Troy, Mich., a corporation of Delaware
Filed Sept. 20, 1963, Ser. No. 310,407
33 Claims. (Cl. 307—88.5)
